Introduction

The DFRobot heart rate sensor is a thumb-sized heart rate monitor designed for Arduino microcontrollers. It includes a Gravity interface, for easy plug-and-play connectivity. This sensor is a pulse sensor which is developed based on PPG (PhotoPlethysmoGraphy) techniques. This is a simple and low-cost optical technique that can be used to detect blood volume changes in the microvascular bed of tissues. It is relatively easy to detect the pulsatile component of the cardiac cycle according to this theory. The sensor has two holes that you can use to attach to your belt. You can wrap on your finger, wrist, earlobe or other areas where it has contact with skin. The heart sensor has two kinds of signal output mode: analog pulse mode and digital square wave mode. You can change its output mode using the dial switch. There are many user scenarios, including education, sports or maker/interactive projects!

Please Note: This product is NOT a medical device and is not intended to be used as such or as an accessory to such nor diagnose or treat any conditions.

Specification

- Input Voltage (Vin): 3.3 - 6V (5V recommended)
- Output Voltage: 0 - Vin (Analog), 0/ Vin (Digital)
- Operating current: <10mA
- Dimension: 28 x 24(mm), 1.102” x 0.945“(in)
- Interface Type: PH2.0-3P
NOTE: The switch is to set the working mode, it will change the signal type to be Digital or Analog. If it was NOT set as consistent as the code or wiring, i.e. the switch was set as “A”, but you write your code as digitalWrite and(or) you wire the module onto Arduino digital pin, in this case, you will fail to get any readings, vice versa.

Tutorial

In this tutorial, you will learn how to use this Heart Rate sensor in digital mode as well as analog mode, more than this, at the end of this tutorial, we will show you how to use this sensor to draw the ECG (https://en.wikipedia.org/wiki/Electrocardiography) to a LCD module.

Requirements

- **Hardware**
  - 1 x DFRduino UNO (https://www.dfrobot.com/product-838.html) (or similar)
  - 1 x This Heart Rate Sensor
  - Some wires

- **Software**
  - Arduino IDE 1.6.6+, Click to Download Arduino IDE from Arduino®
Before start

Once you opened the box, you can find a black belt inside of the package. Thread it through the holes of the sensor as indicted in the photo. And then you could attach it on your finger (suggested), wrist or any other places where exposes blood vessels. Do not attach the belt too tight or too loose to your finger or the reading might be not stable. During the test, you should steady your finger and do not move too much, or the readings might be unstable.

1. Thread the belt through the holes

2. Wrap on finger
3. Wrap on wrist
4. Wrap on the back of wrist

Connection Diagram

Sample Code

The sample code could be found in the Github Page

https://wiki.dfrobot.com/Heart_Rate_Sensor_SKU__SEN0203
The sample code could be found in the Github Page
(https://github.com/DFRobot/DFRobot_Heartrate), open the example
"DFRobot_Heartrate_Digital_Mode".

```c
/*!
 * @file DFRobot_Heartrate.h
 * @brief DFRobot_Heartrate.h detailed description for Heartrate.cpp
 *
 * This is written for the heart rate sensor the company library. Mainly used for real-time measurement of blood oxygen saturation, based on measured values calculate heart rate.
 *

Digital Mode

1. Wiring
   - Select the sensor’s mode switch as "D" for Digital
   - Connect it with UNO’s A1 as the code indicates (you could change it as you wish)
2. Upload the code
3. Open the Serial monitor.
4. Adjust the finger's position until you notice the LED is flashing regularly as your heartbeat, after several seconds, the Serial Monitor will print your heart rate.

Expected results:

Draw the ECG (Electrocardiography)

https://wiki.dfrobot.com/Heart_Rate_Sensor_SKU__SEN0203
Digital Mode

1. Attach this sensor to Arduino D2

2. Set the sensor mode switch as D (digital)

3. Upload the code below

4. Open the Arduino Serial Plotter (Baud: 9600)

```c
/*
   DigitalReadSerial
   Reads a digital input on pin 2, prints the result to the serial monitor
   
   This example code is in the public domain.
*/

// digital pin 2 has a pushbutton attached to it. Give it a name:
int pushButton = 2;

// the setup routine runs once when you press reset:
void setup() {
  // initialize serial communication at 9600 bits per second:
  Serial.begin(9600);
  // make the pushbutton's pin an input:
  pinMode(pushButton, INPUT);
}

// the loop routine runs over and over again forever:
void loop() {
  // read the input pin:
  int buttonState = digitalRead(pushButton);
  // print out the state of the button:
  Serial.println(buttonState);
  delay(10);             // delay in between reads for stability
}
```

Analog Mode

1. Attach this sensor to Arduino A1

2. Set the sensor mode switch as A (analog)

3. Upload the code below

4. Open the Arduino Serial Plotter (Baud: 9600)
4. Open the Arduino Serial Plotter (Baud: 9600)

/*
   AnalogReadSerial
   Reads an analog input on pin 0, prints the result to the serial monitor.
   Graphical representation is available using serial plotter (Tools > Serial Plotter menu)
   Attach the center pin of a potentiometer to pin A0, and the outside pins to +5V and ground.

   This example code is in the public domain.
*/

// the setup routine runs once when you press reset:
void setup() {
  // initialize serial communication at 9600 bits per second:
  Serial.begin(9600);
}

// the loop routine runs over and over again forever:
void loop() {
  // read the input on analog pin 0:
  int sensorValue = analogRead(A1);
  // print out the value you read:
  Serial.println(sensorValue);
  delay(10);  // delay in between reads for stability
}

1. Please download and install the library for LCD12846
   (https://github.com/lfwag/Lcd12864Shield).
2. Upload the code below
3. It will display the heart rate and ECG on the LCD(12846) screen.
