EVHF920-S-00B

85VAC/60Hz~350VAC/50Hz 16.5V/300mA;16.5V/100mA Off-line Switching Regulator

DESCRIPTION

HF920 is a flyback regulator with a monolithic 900V MOSFET. HF920 provides excellent power regulation in AC-DC applications that require high reliability. The switching frequency can be programmed with a single resistor. Also a special frequency doubling mode, designed for strong magnetizing application, can be enabled through a simple external setup.

EVHF920-S-00B evaluation board is specially designed for a better EMC performance with very few EMI filters, which provides reference to effective PCB design for the customer. It features an off-line wide input voltage (85VAC~350VAC) with dual outputs (16.5V/300mA, 16.5V/100mA), and a highly strong anti-interference ability to external magnetic field with the use of transformer core EF20, and is very suitable for the power meter application.

EVHF920-S-00B can meets EN55022 conducted EMI requirements easily with frequency jittering function. It offers a full suite of protective features such as over-temperature **VCC** under-voltage protection. lockout. over-voltage protection, over-load protection and short-circuit protection.

ELECTRICAL SPECIFICATION

Parameter	Symbol Value		Units
Input Voltage	V _{IN}	85 to 350	VAC
Output Voltage1	V _{OUT1}	16.5	V
Output Current1	I _{OUT1}	300	mA
Output Voltage2	V _{OUT2}	16.5	V
Output Current2	Іоит2	100	mA

FEATURES

- Wide input voltage (85VAC~350VAC)
- Fixed switching frequency, programmable up to 150kHz
- Frequency doubling operation mode
- **Excellent EMC performance**
- Over Temperature Protection
- Time-based Over Load Protection
- **Short Circuit Protection**
- Strong anti-interference ability to external magnetic field
- Power line communications

APPLICATIONS

- E-Meters
- Industrial controls
- Large appliances

All MPS parts are lead-free, halogen free and adhere to the RoHS directive. For MPS green status, please visit MPS website under Quality Assurance. "MPS" and "The Future of Analog IC Technology", are Registered Trademarks of Monolithic Power Systems, Inc.

Warning: Although this board is designed to satisfy safety requirements, the engineering prototype has not been agency approved. Therefore, all testing should be performed using an isolation transformer to provide the AC input to the prototype board.

EVB TEST RESULTS

Performance waveforms are tested on the evaluation board. VIN = 230VAC, VOUT1 = 16.5V, IOUT1 = 300mA, VOUT2 = 16.5V, IOUT2 = 100mA, TA = 25°C, unless otherwise noted.

TYPICAL PERFORMANCE CHARACTERISTICS (continued)

Performance waveforms are tested on the evaluation board.

VIN = 230VAC, VOUT1 = 16.5V, IOUT1 = 300mA, VOUT2 = 16.5V, IOUT2 = 100mA, TA = 25°C, unless otherwise noted.

TRANSFORMER SPECIFICATION

Electrical Diagram

Figure 4: Transformer Electrical Diagram

Notes:

- All winding terminals are added tube; 1
- 2. N5 is flying out from the bobbin. Terminal A is labeled with white and terminal B is labeled with black;
- Remove Pin1, Pin8 and Pin10;
- Varnish the transformer.

Winding Order

Electrical Specifications

Winding Order

Winding No.	Tape Layer No.		Start & End Mag		net Wire φ(mm)	Turns
N1	1		2—> NC 0.22mm*2		0.22mm*2	25
N2	1		3—⟩ 2	0.15mm*1		120
N3	1		5—〉 4	0.22mm*3		13
N4	1		6—〉 7	0.28mm*1 TIW		19
N5	1		B—〉A	0.28mm*1 TIW		19
Primary Indu	Primary Inductance		s 2-3, all other windings open easured at 60kHz, 0.1VRMS			

Materials

Item	Description
1	Core: EF20, UI=2300±25%, AL=1570nH/N ² ±25% UNGAPPED
2	Bobbin: EF20 Horizontal, 6+6PIN 1SECT T-H
3	Wire: Φ0.22mm, 2UEW, Class B
4	Wire: Φ0.15mm, 2UEW, Class B
5	Wire: Φ028mm, 2UEW, Class B
6	Tape: 12.5mm(W) ×0.06mm(TH)
7	Tube: #26 BLACK; #26 CLEAR; #30 CLEAR; #23 CLEAR
8	Varnish: JOHN C. DOLPH CO, BC-346A or equivalent
9	Solder Bar: CHEN NAN: SN99.5/Cu0.5 or equivalent

CIRCUIT DESCRIPTION

EVHF920-S-00B is designed for smart power meter application with a total two output power of 6.6W. One output with GND2 connected to L line is designed for the power line communications (PLC) supply, the other is used to power the LCD for MCU.

FR1 is used to protect for the component failure or some excessive short events, also it can restrain the inrush current.

To meet the EN55022 standard, X-CAP CX1 and differential mode inductor LX1 is employed to filter EMI noise.

The diode-bridge rectifier, which is composed of D3, D4, D7 and D8, transforms input AC voltage to the dc-bus voltage.

C6 and C8 are connected in series for a high input voltage energy storage, which help to reduce line noise and protect the input against the line surge. R2, R6, R10, R12 and R20 are employed to balance the voltage on C6 and C8, and prevent the input over voltage.

The primary RCD consists of R7, C4 and D5, and it can restrain the high voltage spike to protect the MOSFET from damage.

R15 is for switching frequency options, which should be positioned far away from the data sampling frequency in power meter applications to avoid unwanted noise disturbance. Moreover, a low switching frequency is commonly used to get good thermal performance under high input voltage application. C19, typically 1nF, is used for double frequency mode selection.

C11 is the power supply capacitor for Vcc, and the ceramic C12 is used in parallel with C11 to decouple the voltage noise, it should be positioned to IC as close as possible.

R21, R22 are the current sense resistors with 1% tolerance for peak current setup.

The output electrolytic capacitor C3, C9 is used to satisfy the requirement for output voltage ripple.

R4 is dummy load to regulate the output voltage within designed value.

R14, R18 are configured to set the output voltage. The control loop composed of U1, U3, R19 and C13 feedbacks output voltage instantaneous value to FB pin. To obtain good dynamic response and high stability of system, the control loop has been carefully designed.

The input L Line is connected to GND2 for the PLC in power meter.

QUICK START GUIDE

- 1. Preset power supply to $85VAC \le V_{IN} \le 350VAC$.
- 2. Turn power supply off.
- 3. Connect the Line and Neutral terminals of the power supply output to L and N port.
- 4. Connect different loads to corresponding outputs:
 - a. Positive (+): VOUTX
 - b. Negative (-): GNDX
- 5. Turn power supply on after making connections.
