

## MAX20429 Evaluation Kit

Evaluates: MAX20429

### General Description

The MAX20429 evaluation kit (EV kit) is a fully assembled and tested application circuit for the MAX20429: a high-efficiency independent phase dual 6A low-voltage buck converter. The EV kit is created with automotive grade components and can test each of the outputs to full load. Various test points and jumpers are included for evaluation. The standard EV kit comes with the MAX20429CAFNA/VY+ installed, which is factory configured for a resistor adjustable output voltage. The default EV kit resistor divider is bypassed with an output voltage of 0.6V on both  $V_{OUT1}$  and  $V_{OUT2}$ .

### Features

- Single Supply Operation with 3.0V to 5.5V Input Supply Range
- Individual Factory Programmable Output Voltages Available from 0.5V to 3.8V
- Resistor Adjustable Output Voltage
- Individual Output Current Up to 6A
- $\pm 1\%$  Output Voltage Accuracy
- Frequency-Synchronization Input
- Individual Enable Inputs
- Individual  $\overline{\text{RESET}}$  Outputs
- Jumpers and Test Points on Key Nodes for Simplified Evaluation
- $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$  Automotive Temperature Range
- Automotive Grade External Components
- Proven PCB Layout
- Fully Assembled and Tested

### Quick Start

#### Required Equipment

- MAX20429 EV kit
- 5V, 5A DC power supply (PS1)
- 2x Digital Multimeters (DMM)
- Electronic load, 30W capable (EL1)

#### Procedure

The EV kit is fully assembled and tested. Follow the steps below to verify board operation:

- 1) Verify that all jumpers are in their default positions, as shown in [Table 1](#).
- 2) Connect the PS1 positive terminal to  $V_{SUP}$  and PS1 negative terminal to PGND1 on the EV kit.
- 3) Set DMM1 to measure Volts, DC and connect probes to  $V_{OUT1}$  and PGND on the EV kit.
- 4) Set DMM2 to measure Amps, DC and connect in series between  $V_{OUT1}$  and EL1.
- 5) Set PS1 to 5V and enable supply output.
- 6) Verify that the DMM1 measures approximately 0.6V.
- 7) Set EL1 to 6A and enable load.
- 8) Verify that the DMM1 measures approximately 0.6V while DMM2 measures approximately 6A.
- 9) Repeat steps 3 through 8 on  $V_{OUT2}$ , verifying DMM1 measures approximately 0.6V at 0A load and 6A load.
- 10) EV kit operation verification is complete.

*[Ordering Information](#) appears at end of data sheet.*

**Table 1. Default Jumper Settings**

JUMPER	SHUNT POSITION	FUNCTION
J1	1-2	Enable buck controller 1 (EN1)
J2	1-2	Enable buck controller 2 (EN2)
J3	Installed	Pull-up to $V_{SUP}$ for $\overline{\text{RESET1}}$
J4	Installed	Pull-up to $V_{SUP}$ for $\overline{\text{RESET2}}$
J5	1-2	SYNC pulled to $V_{SUP}$ enabling forced pulse-width modulation (FPWM) mode

## Detailed Description

### Synchronization (SYNC)

A logic-high on SYNC enables fixed-frequency, forced PWM mode. In FPWM mode the converter switches at a constant frequency with variable on-time. Apply an external clock on the SYNC input to synchronize the internal oscillator to an external clock. The SYNC input accepts signal frequencies in the range of  $1.9\text{MHz} < f_{\text{SYNC}} < 2.3\text{MHz}$  when  $f_{\text{SW}} = 2.1\text{MHz}$ , and  $2.9\text{MHz} < f_{\text{SYNC}} < 3.6\text{MHz}$  when  $f_{\text{SW}} = 3.2\text{MHz}$ . When the pin is open-circuited or logic-low, the SYNC input enables the device to enter a low-power skip mode under light-load conditions if the IC is configured to allow that behavior.

### Enable Input (EN1, EN2)

The enable control input EN1/EN2 activates the device channel from its low-power shutdown state. EN1/EN2 have an input high threshold of 1.5V (typ), an input-low threshold of 0.5V, and a hysteresis of 50mV (typ). When an enable input goes high the output voltage ramps up according to the factory programmed soft-start time. When an enable input goes low the output voltage ramps down with the soft-start time or enters a Hi-Z state depending on the device option selected.

### RESET Output

The device features open-drain  $\overline{\text{RESET}}$  outputs that assert low when the corresponding output voltage is outside of the OV/UV window. The OV/UV comparators run from a separate reference to provide drift detection on the outputs.  $\overline{\text{RESET}}$  remains asserted for a fixed timeout

period after the corresponding output returns to its regulated voltage. The fixed timeout period is selectable between 0.5ms, 3.7ms, 7.4ms, or 14.9ms. Refer to the MAX20429 IC data sheet for specific part details. To obtain a logic signal, place a resistor pull-up between the RESET pins to the system I/O voltage.

### Resistor Adjustable Output Option

MAX20429 features an adjustable output option where output voltage can be set by external resistors in addition to the factory programmed  $V_{\text{OUT}}$  options. Desired output voltage can be calculated using the following method:

$$\text{Output 1: } V_{\text{OUT}} = (R_8 + R_9)/R_9 \times 0.6\text{V}$$

$$\text{Output 2: } V_{\text{OUT}} = (R_{10} + R_{11})/R_{11} \times 0.6\text{V}$$

See [Figure 1](#) and [Figure 2](#) of the MAX20429 EV kit schematics for location of the available resistor footprints.

### Evaluating Other Variants

The MAX20429EVKIT# comes installed with the MAX20429CAFNA/VY+ variant.

Maxim Integrated offers factory programming of preset output voltages from 0.5V to 3.8V, and an adjustable output option. If selecting a different device variant, the output inductor and capacitor components may need to be modified for optimal performance. Refer to the MAX20429 IC data sheet for specific part details regarding component selection and contact factory to request any additional variants.
