Microchip has released a new Product Documents for the MCP6476/6R/6U/7/9 Family Data Sheet of devices. If you are using one of these devices please read the document located at [MCP6476/ 6R/ 6U/ 7/9 Family Data Sheet](#).

Notification Status: Final

Description of Change: The following is a list of changes:1) Updated Figure 4-2. 2) Updated Section 6.0, Packaging Information. 3) Updated the Product Identification System to include Automotive models. 4) Minor corrections and editorial changes.

Impacts to Data Sheet: None

Reason for Change: To Improve Productivity

Change Implementation Status: Complete

Date Document Changes Effective: 29 Jun 2021

NOTE: Please be advised that this is a change to the document only the product has not been changed.

Markings to Distinguish Revised from Unrevised Devices: N/A

3 MHz Operational Amplifier with EMI Filtering

Features

- **Low Quiescent Current:**
 - 170 μ A (maximum)/amplifier
- **Low Input Offset Voltage:**
 - ± 1.6 mV (maximum)
- **Enhanced EMI Protection:**
 - Electromagnetic Interference Rejection Ratio (EMIRR) at 1.8 GHz: 90 dB
- Supply Voltage Range: 1.8V to 5.5V
- Gain Bandwidth Product: 3 MHz (typical)
- Rail-to-Rail Input/Output
- Unity Gain Stable
- No Phase Reversal
- Quick Start-up Time: 6 μ s (typical)
- Small Packages
- Extended Temperature Range: -40°C to +125°C
- AEC Q100 Qualified, Grade 1

Applications

- Smoke Detectors
- Automotive, see [Product Identification System \(Automotive\)](#)
- Battery-Powered Systems
- Sensor Conditioning
- Battery Current Monitoring

Design Aids

- SPICE Macro Models
- Microchip Advanced Part Selector (MAPS)
- Analog Demonstration and Evaluation Boards
- Application Notes

Description

The Microchip Technology Inc. MCP6476/6R/6U/7/9 operational amplifier (op amp) operates with a single supply voltage as low as 1.8V, while drawing low quiescent current (170 μ A, maximum per amplifier). This op amp also has low input offset voltage (± 1.6 mV, maximum), and rail-to-rail input and output operation. In addition, the MCP6476/6R/6U/7/9 is unity gain stable and has a gain bandwidth product of 3 MHz (typical). This combination of features supports battery-powered and portable applications.

The MCP6476/6R/6U/7/9 has enhanced EMI protection minimizing Electromagnetic Interference from external sources. This feature makes it well-suited for EMI-sensitive applications, such as power lines, radio stations and mobile communications.

This product family is offered in single (MCP6476), dual (MCP6477) and quad (MCP6479) packages. All devices are designed using an advanced CMOS process and fully specified in the extended temperature range, from -40°C to +125°C.

1.0 ELECTRICAL CHARACTERISTICS

1.1 Absolute Maximum Ratings†

$V_{DD} - V_{SS}$	6V
Current at Analog Input Pins (V_{IN+} , V_{IN-})	± 5 mA
Analog Inputs (V_{IN+} , V_{IN-})††	$V_{SS} - 0.5V$ to $V_{DD} + 0.5V$
Difference Input Voltage	$ V_{DD} - V_{SS} $
Output Short-Circuit Current (Note 1)	Continuous
Storage Temperature	$-65^{\circ}C$ to $+150^{\circ}C$
Maximum Junction Temperature (T_J)	$+150^{\circ}C$
ESD Protection on All Pins (HBM; CDM; MM)	≥ 3 kV; 2 kV; 300V

Note 1: Short-circuit to ground, one amplifier per package.

† **Notice:** Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

MCP6476/6R/6U/7/9

3.1 Analog Outputs

The analog output pins (V_{OUTx}) are low-impedance voltage sources.

3.2 Analog Inputs

The noninverting and inverting inputs (V_{INx+} , V_{INx-}) are high-impedance CMOS inputs with low bias currents.

3.3 Power Supply Pins (V_{SS} , V_{DD})

The positive power supply (V_{DD}) is 1.8V to 5.5V higher than the negative power supply (V_{SS}). For normal operation, the other pins are at voltages between V_{SS} and V_{DD} .

Typically, these parts are used in a single (positive) supply configuration. In this case, V_{SS} is connected to ground and V_{DD} is connected to the supply. V_{DD} needs bypass capacitors.

4.0 APPLICATION INFORMATION

The MCP6476/6R/6U/7/9 operational amplifier is unity gain stable and suitable for a wide range of general purpose applications.

4.1 Rail-to-Rail Input

4.1.1 PHASE REVERSAL

The MCP6476/6R/6U/7/9 op amp is designed to prevent phase reversal when the input pins exceed the supply voltages. Figure 2-37 shows the input voltage exceeding the supply voltage with no phase reversal.

4.1.2 INPUT VOLTAGE LIMITS

In order to prevent damage and/or improper operation of the amplifier, the circuit must limit the voltages at the input pins (see Section 1.1 “Absolute Maximum Ratings”).

The Electrostatic Discharge (ESD) protection on the inputs can be depicted as shown in Figure 4-1. This structure was chosen to protect the input transistors against many, but not all, overvoltage conditions, and to minimize the Input Bias (I_B) current.

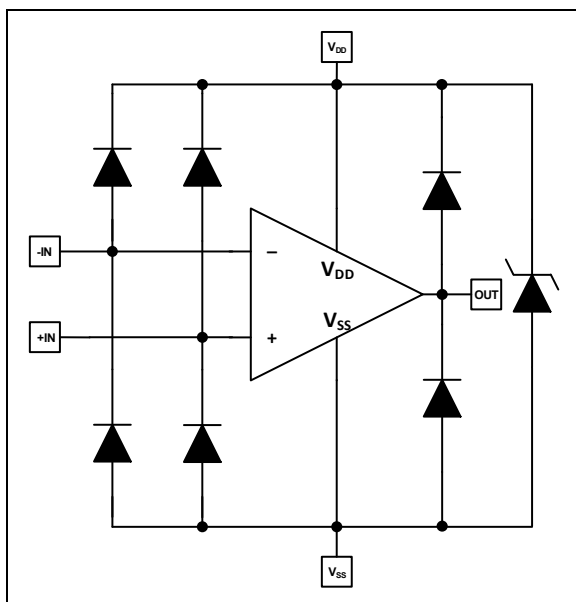

FIGURE 4-1: Simplified Analog Input ESD Structures.

The input ESD diodes clamp the inputs when they try to go more than one diode drop below V_{SS} . They also clamp any voltages that go well above V_{DD} ; their breakdown voltage is high enough to allow normal operation. At 0.5V above V_{DD} or below V_{SS} , the input currents are typically less than 5 mA. Very fast ESD events that meet the specification are limited so that damage does not occur.

4.1.3 INPUT CURRENT LIMITS

In order to prevent damage and/or improper operation of the amplifier, the circuit must limit the currents into the input pins (see Section 1.1 “Absolute Maximum Ratings”).

Figure 4-2 shows one approach to protecting these inputs. The resistors, R_1 and R_2 , limit the possible currents in or out of the input pins through the ESD diodes to either V_{DD} or V_{SS} .

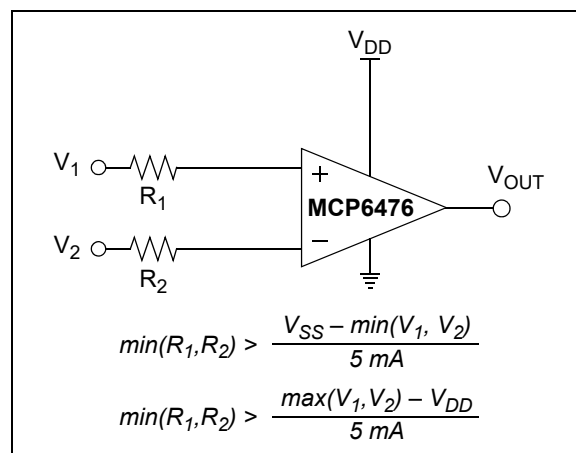

FIGURE 4-2: Protecting the Analog Inputs.

MCP6476/6R/6U/7/9

4.1.4 NORMAL OPERATION

The input stage of the MCP6476/6R/6U/7/9 op amp uses two differential input stages in parallel. One operates at a low Common-Mode Input Voltage (V_{CM}), while the other operates at a high V_{CM} . With this topology, the device operates with a V_{CM} up to 300 mV above V_{DD} and 300 mV below V_{SS} . The input offset voltage is measured at $V_{CM} = V_{SS} - 0.3V$ and $V_{DD} + 0.3V$ to ensure proper operation.

The transition between the input stages occurs when V_{CM} is near $V_{DD} - 0.9V$ (see Figures 2-3 and 2-4). For the best distortion performance and gain linearity, with noninverting gains, avoid this region of operation.

4.2 Rail-to-Rail Output

The output voltage range of the MCP6476/6R/6U/7/9 op amp is 0.006V (typical) and 5.494V (typical) when $R_L = 10\text{ k}\Omega$ is connected to $V_{DD}/2$ and $V_{DD} = 5.5V$. Refer to Figures 2-16 and 2-17 for more information.

4.3 Start-up

The MCP6476/6R/6U/7/9 family of parts quickly controls the output when power (V_{DD}) is initially applied to the device (start-up). Bypass capacitors are removed during the start-up testing to minimize inrush currents (see Figure 4-3). When the op amp is controlled and is off, the output impedance is high and V_{OUT} will be V_L or 1V. When the op amp turns on, the output becomes low-impedance and V_{OUT} will follow the input sine wave; this is used as the start-up time.

FIGURE 4-3: Start-up Test Circuit.

Figure 4-4 shows the input voltage (blue line) for the MCP6477 and the output voltage (black line). When power is first applied to the MCP6477, the output is turned off (Point A) and driven by the load. After 6 μs , the output is turned on (Point B) and V_{OUT} follows the input sine wave.

FIGURE 4-4: Start-up Time Voltages.

4.4 Capacitive Loads

Driving large capacitive loads can cause stability problems for voltage feedback op amps. As the load capacitance increases, the feedback loop's phase margin decreases and the closed-loop bandwidth is reduced. This produces gain peaking in the frequency response, with overshoot and ringing in the step response. While a unity gain buffer ($G = +1\text{ V/V}$) is the most sensitive to the capacitive loads, all gains show the same general behavior.

When driving large capacitive loads with the MCP6476/6R/6U/7/9 op amp, a small series resistor at the output (R_{ISO} in Figure 4-5) improves the feedback loop's phase margin (stability) by making the output load resistive at higher frequencies. The bandwidth is generally lower than the bandwidth with no capacitance load.

FIGURE 4-5: Output Resistor, R_{ISO} , Stabilizes Large Capacitive Loads.

4.5 Supply Bypass

The MCP6476/6R/6U/7/9 op amp's power supply pin (V_{DD} for single-supply) should have a local bypass capacitor (i.e., 0.01 μF to 0.1 μF) within 2 mm for good high-frequency performance. It can use a bulk capacitor (i.e., 1 μF or larger) within 100 mm to provide large, slow currents. This bulk capacitor can be shared with other analog parts.

4.6 PCB Surface Leakage

In applications where low input bias current is critical, Printed Circuit Board (PCB) surface leakage effects need to be considered. Surface leakage is caused by humidity, dust or other contamination on the board. Under low humidity conditions, a typical resistance between nearby traces is $10^{12}\Omega$. A 5V difference would cause 5 pA of current to flow, which is greater than the MCP6476/6R/6U/7/9's bias current at +25°C (± 1 pA, typical).

The easiest way to reduce surface leakage is to use a guard ring around sensitive pins (or traces). The guard ring is biased at the same voltage as the sensitive pin. An example of this type of layout is shown in Figure 4-6.

FIGURE 4-6: Example Guard Ring Layout for Inverting Gain.

1. Noninverting Gain and Unity Gain Buffer:
 - a) Connect the noninverting pin (V_{IN+}) to the input with a wire that does not touch the PCB surface.
 - b) Connect the guard ring to the inverting input pin (V_{IN-}). This biases the guard ring to the Common-mode input voltage.
2. Inverting gain and transimpedance gain amplifiers (convert current to voltage, such as photo detectors):
 - a) Connect the guard ring to the noninverting input pin (V_{IN+}). This biases the guard ring to the same reference voltage as the op amp (e.g., $V_{DD}/2$ or ground).
 - b) Connect the inverting pin (V_{IN-}) to the input with a wire that does not touch the PCB surface.

4.7 Unused Op Amps

An unused op amp in a dual (MCP6477) or quad (MCP6479) package should be configured as shown in Figure 4-7. These circuits prevent the output from toggling and causing crosstalk. Circuit A sets the op amp at its minimum noise gain. The resistor divider produces any desired reference voltage within the output voltage range of the op amp; the op amp buffers that reference voltage. Circuit B uses the minimum number of components.

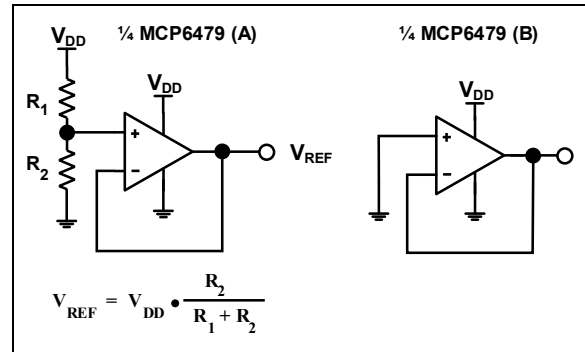

FIGURE 4-7: Unused Op Amps.

4.8 Electromagnetic Interference Rejection Ratio (EMIRR) Definitions

The Electromagnetic Interference (EMI) is the disturbance that affects an electrical circuit due to either electromagnetic induction or electromagnetic radiation emitted from an external source.

The parameter which describes the EMI robustness of an op amp is the Electromagnetic Interference Rejection Ratio (EMIRR). It quantitatively describes the effect that an RF interfering signal has on op amp performance. Internal passive filters make EMIRR better compared with older parts. This means that with good PCB layout techniques, your EMC performance should be better.

EMIRR is defined as:

EQUATION 4-1:

$$EMIRR(dB) = 20 \cdot \log\left(\frac{V_{RF}}{\Delta V_{OS}}\right)$$

Where:

V_{RF} = Peak Amplitude of RF Interfering Signal (V_{PK})

ΔV_{OS} = Input Offset Voltage Shift (V)

4.9 Application Circuits

4.9.1 CARBON MONOXIDE GAS SENSOR

A Carbon Monoxide (CO) gas detector is a device that detects the presence of carbon monoxide gas. Usually this is battery powered and transmits audible and visible warnings.

The sensor responds to CO gas by reducing its resistance proportionally to the amount of CO present in the air exposed to the internal element. On the sensor module, this variable is part of a voltage divider formed by the internal element and potentiometer R_1 . The output of this voltage divider is fed into the noninverting inputs of the MCP6476 op amp. The device is configured as a buffer with unity gain and is used to provide a nonloaded test point for sensor sensitivity.

Because this sensor can be corrupted by parasitic electromagnetic signals, the MCP6476 op amp can be used for conditioning this sensor.

In Figure 4-8, the variable resistor is used to calibrate the sensor in different environments.

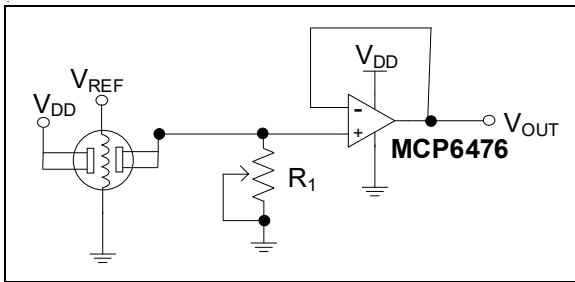

FIGURE 4-8: CO Gas Sensor Circuit.

4.9.2 PRESSURE SENSOR AMPLIFIER

The MCP6476/6R/6U/7/9 is well-suited for conditioning sensor signals in battery-powered applications. Many sensors are configured as Wheatstone bridges. Strain gauges and pressure sensors are two common examples.

Figure 4-9 shows a strain gauge amplifier, using the MCP6476/6R/6U/7/9 Enhanced EMI protection device. The difference amplifier with EMI robustness op amp is used to amplify the signal from the Wheatstone bridge. The two op amps, configured as buffers and connected at the outputs of pressure sensors, prevents resistive loading of the bridge by resistors, R_1 and R_2 . Resistors, R_1 , R_2 and R_3 , R_5 , need to be chosen with very low tolerance to match the CMRR.

5.0 DESIGN AIDS

Microchip provides the basic design tools needed for the MCP6476/6R/6U/7/9 op amp.

5.1 Microchip Advanced Part Selector (MAPS)

MAPS is a software tool that helps semiconductor professionals efficiently identify the Microchip devices that fit a particular design requirement. Available at no cost from the Microchip website at www.microchip.com/maps, MAPS is an overall selection tool for Microchip's product portfolio that includes Analog, Memory, MCUs and DSCs. Using this tool, you can define a filter to sort features for a parametric search of devices and export side-by-side technical comparison reports. Helpful links are also provided for data sheets, purchase and sampling of Microchip parts.

5.2 Analog Demonstration and Evaluation Boards

Microchip offers a broad spectrum of Analog Demonstration and Evaluation Boards that are designed to help you achieve faster time to market. For a complete listing of these boards and their corresponding user's guides and technical information, visit the Microchip website at www.microchipdirect.com.

Some boards that are especially useful are:

- MCP6XXX Amplifier Evaluation Board 2 (P/N DS51668)
- MCP6XXX Amplifier Evaluation Board 3 (P/N DS51673)
- 8-Pin SOIC/MSOP/TSSOP/DIP Evaluation Board (P/N SOIC8EV)
- 5/6-Pin SOT-23 Evaluation Board (P/N VSUPEV2)
- 14-Pin SOIC/TSSOP/DIP Evaluation Board (P/N SOIC14EV)

5.3 Application Notes

The following Microchip Analog Design Notes and Application Notes are available on the Microchip website at www.microchip.com/appnotes, and are recommended as supplemental reference resources:

Temperature Range:	E	= -40°C to +125°C			c) MCP6477T-E/SN: Tape and Reel, Extended Temperature, 8-Lead SOIC Package.
Package:	LT	= Plastic Package (SC70), 5-Lead (MCP6476 only)			d) MCP6477T-E/MS: Tape and Reel, Extended Temperature, 8-Lead MSOP Package.
	OT	= Plastic Small Outline Transistor (SOT-23), 5-Lead (MCP6476 only)			a) MCP6479-E/ST: Extended Temperature, 14-Lead TSSOP Package.
	SN	= Plastic Small Outline (3.90 mm), 8-Lead (MCP6477 only)			b) MCP6479-E/SL: Extended Temperature, 14-Lead SOIC Package.
	MS	= Plastic MSOP, 8-Lead (MCP6477 only)			c) MCP6479T-E/ST: Tape and Reel, Extended Temperature, 14-Lead TSSOP Package.
	ST	= Plastic Thin Shrink Small Outline (4.4 mm), 14-Lead (MCP6479 only)			d) MCP6479T-E/SL: Tape and Reel, Extended Temperature, 14-Lead SOIC Package.
	SL	= Plastic Small Outline, (3.90 mm), 14-Lead (MCP6479 only)			
Class	(Blank)	= Non-Automotive			
	VAO	= Automotive			
Note 1: The Tape and Reel identifier only appears in the catalog part number description. This identifier is used for ordering purposes and is not printed on the device package. Check with your Microchip Sales Office for package availability with the Tape and Reel option.					
2: Automotive parts are AEC-Q100 qualified, Grade 1

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is secure when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods being used in attempts to breach the code protection features of the Microchip devices. We believe that these methods require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Attempts to breach these code protection features, most likely, cannot be accomplished without violating Microchip's intellectual property rights.
- Microchip is willing to work with any customer who is concerned about the integrity of its code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is "unbreakable." Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
