

# EVQ4462-N-00A

## 3.5A, 36V, 4MHz Step-Down Converter Evaluation Board AEC-Q100 Qualified

### DESCRIPTION

The EVQ4462-N-00A is an evaluation board for the MP/MPQ4462, a high frequency step-down regulator with an integrated power MOSFET.

The MP/MPQ4462 integrates a 100mΩ MOSFET that provides 3.5A load current over a wide operating input voltage of 6V to 36V. A 5μA shutdown mode quiescent current allows use in battery-powered applications.

Current mode control provides fast transient response and eases loop stabilization. An internal soft-start prevents inrush current at turn-on.

The MPQ4462 is available in SOIC8E package.

### ELECTRICAL SPECIFICATIONS

Parameter	Symbol	Value	Units
Input Voltage	$V_{IN}$	8 – 36	V
Output Voltage	$V_{OUT}$	3.3	V
Output Current	$I_{OUT}$	3.5	A

### FEATURES

- 3.5A Output Current
- Wide 8V to 36V Operating Input Range
- Adjustable Output from 0.8V to 33V
- Fully Assembled and Tested

### APPLICATIONS

- Game Machines
- Automotive Systems
- Industrial Power Systems
- Distributed Power Systems
- Printer Systems
- Battery Powered Systems

All MPS parts are lead-free, halogen free, and adhere to the RoHS directive. For MPS green status, please visit MPS website under Quality Assurance. "MPS" and "The Future of Analog IC Technology" are Registered Trademarks of Monolithic Power Systems, Inc.

### EVQ4462-N-00A EVALUATION BOARD

## QUICK START GUIDE

1. Connect the positive and negative terminals of the load to the VOUT and GND pins, respectively.
2. Preset the power supply output to between 8V and 36V, then turn it off.
3. Connect the positive and negative terminals of the power supply output to the VIN and GND pins, respectively.
4. Turn the power supply on. The MP/MPQ4462DN will automatically startup.
5. To use the Enable function, apply a digital input to the EN pin. Drive EN higher than 1.6V to turn on the regulator, drive EN less than 1.2V to turn it off.
6. An input under voltage lockout (UVLO) function is implemented by the addition of a resistor divider R1 and R2. The EN threshold is 1.2V (falling edge), so  $V_{IN}$  UVLO threshold is  $1.2V \times \left(1 + \frac{R2}{R1}\right)$ . It is preset to 6V on this board.
7. Use R3 to re-program switching frequency if needed,

$$f_s(\text{kHz}) = \frac{70000}{R3(\text{k}\Omega)^{0.93}}$$

The switching frequency is preset to 500kHz on this board. Please note that an external bootstrap diode from 5Vsupply to BST pin is necessary to boost gate drive voltage if switching frequency is above 2MHz because the charge time is reduced at high switching frequency.

8. Use R6 and R8 to set the output voltage with  $V_{FB} = 0.8V$ . For  $R6 = 40.2\text{k}\Omega$ , R8 can be determined by:  $R8 = \frac{40.2}{0.8} \times (V_{OUT} - 0.8)$  (k $\Omega$ ).

Follow the Application Information section in the device datasheet to recalculate the compensation, inductor and output capacitor values when output voltage is changed.
