

AC/DC Converter IC

# Non-isolated Type PWM DC/DC Converter IC Built-in Switching MOSFET

## BM2Pxx1Y-Z Series

### General Description

The PWM type DC/DC converter for AC/DC provides an optimum system for all products that include an electrical outlet. It enables simpler design of a high effective converter specializing in non-isolation. By a built-in startup circuit that tolerates 650 V, this IC contributes to low power consumption. A current detection resistor as internal device realizes the small power supply designs. Since a current mode control is utilized, the current can be restricted in each cycle and an excellent performance is demonstrated in the bandwidth and transient response. The switching frequency is fixed to 25 kHz / 65 kHz. A frequency hopping function is also on chip, and it contributes to low EMI. In addition, a built-in super junction MOSFET with 650 V withstand voltage makes the design easy.

### Features

- PWM Current Mode Method
- Frequency Hopping Function
- Burst Operation at Light Load
- Built-in 650 V Startup Circuit
- Built-in 650 V Super Junction MOSFET
- VCC UVLO (Under Voltage Lockout)
- VCC OVP (Over Voltage Protection)
- Over Current Detection Function per Cycle
- Soft Start Function
- Sleep Mode

### Applications

- Household Appliances such as Washing Machines, Air-conditioners, and Cleaners

### Key Specifications

- Power Supply Voltage Range  
VCC Pin: 11.10 V to 26.00 V  
DRAIN Pin: 730 V (Max)
- Current at Switching Operation: 650  $\mu$ A (Typ)
- Current at Burst Operation: 350  $\mu$ A (Typ)
- Switching Frequency: 25 kHz / 65 kHz (Typ)
- Operation Temperature Range: -40 °C to +105 °C
- MOSFET ON Resistor: 1.2  $\Omega$  (Typ)

**Package**  
DIP7K

**W (Typ) x D (Typ) x H (Max)**  
9.27 mm x 6.35 mm x 8.63 mm  
pitch 2.54 mm

### Lineup

Product Name	Switching Frequency	Frequency Reduction	Over Current Detection Current
BM2PAA1Y-Z	65 kHz	Yes	1.76 A
BM2PAB1Y-Z	25 kHz	No	
BM2PDA1Y-Z	65 kHz	Yes	0.93 A
BM2PDB1Y-Z	25 kHz	No	

### Typical Application Circuit

○Product structure : Silicon integrated circuit ○This product has no designed protection against radioactive rays.

Pin Configuration

Pin Descriptions

Pin No.	Pin Name	I/O	Function	ESD Diode	
				VCC	GND_IC
1	N.C.	-	Non connection	-	-
2	SLEEP	I	Sleep/Normal mode exchange control	-	✓
3	GND_IC	I/O	GND pin	✓	-
4	FB	I	Output voltage feedback pin	-	✓
5	VCC	I	Power supply input pin	-	✓
6	DRAIN	I/O	MOSFET DRAIN pin	-	✓
7	DRAIN	I/O	MOSFET DRAIN pin	-	✓

Block Diagram

Description of Blocks

1 Buck Converter

This IC is for exclusive use of non-isolated type buck converter.  
Basic operations of buck converter are as shown below.

1.1 When the Switching MOSFET is ON

Current  $I_L$  flows to coil L and energy is stored when the MOSFET turns ON. At this moment, the GND\_IC pin voltage becomes near the DRAIN pin voltage, and the diode D1 is OFF.  
In discontinuous mode, the formula of  $I_L$  when MOSFET turns ON is as shown below.

$$I_L = \frac{(V_{IN} - V_{OUT})}{L} \times t_{ON} \quad [A]$$

Where:

$I_L$  is the current flowing to the coil.

$V_{IN}$  is the voltage applied to the DRAIN pin.

$V_{OUT}$  is the output voltage.

$L$  is the inductance value of coil.

$t_{ON}$  is the time after MOSFET turns on.

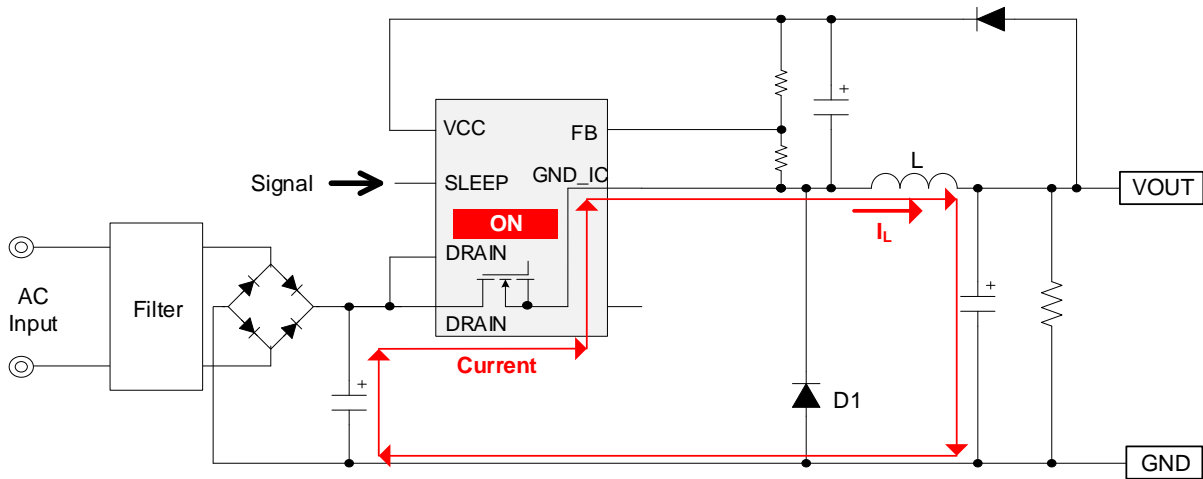

Figure 1. Buck Converter Operation (MOSFET = ON)

1 Buck Converter – continued

1.2 When the Switching MOSFET is OFF

The energy stored in coil L is output via diode D1 when the MOSFET turns OFF.  
 In discontinuous mode, the formula of  $I_L$  when MOSFET turns OFF is as shown below.

$$I_L = \frac{V_{OUT}}{L} \times t_{OFF} \quad [A]$$

Where:

$I_L$  is the current flowing to the coil.

$V_{OUT}$  is the output voltage.

$L$  is the inductance value of coil.

$t_{OFF}$  is the time from the MOSFET turns off to  $I_L$  becomes 0.

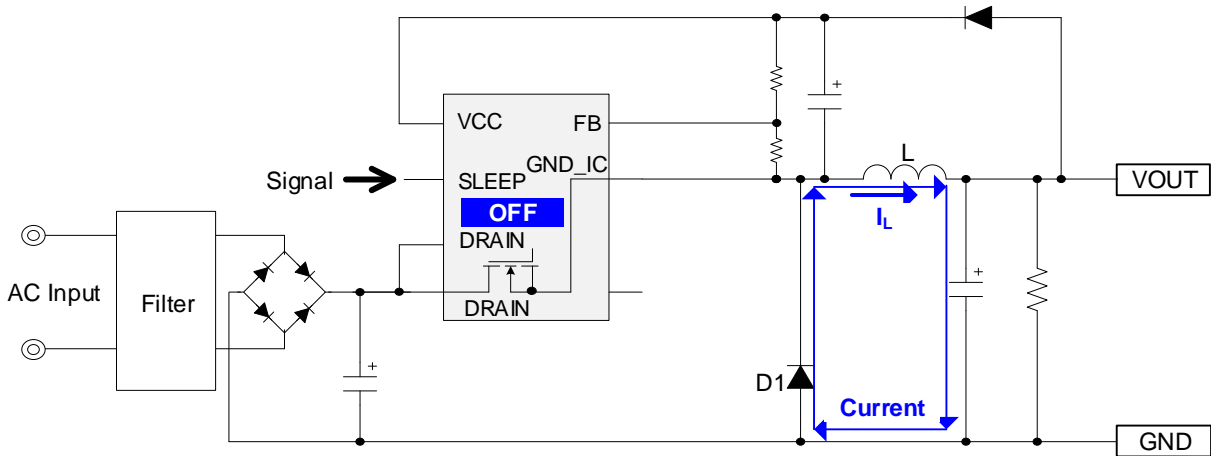

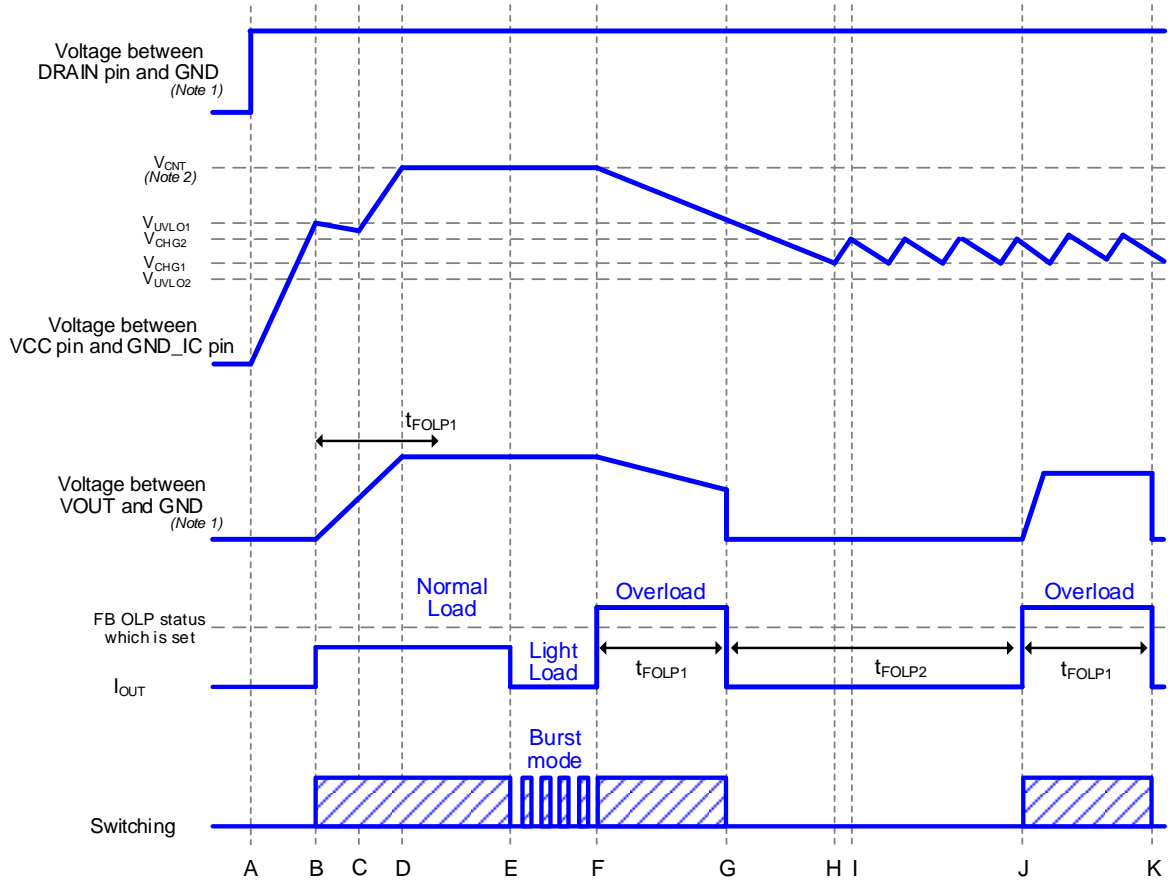

Figure 2. Buck Converter Operation (MOSFET = OFF)

Description of Blocks – continued

2 Startup Sequences

Startup sequences are as shown in Figure 3. See the sections below for detailed descriptions.

(Note 1) This GND does not mean the GND\_IC pin of the IC.  
 (Note 2)  $V_{CNT}$  is the set output voltage of normal mode. It is calculated by the formula below.

$$V_{CNT} = V_{FB} \times \frac{R_{FB1} + R_{FB2}}{R_{FB2}} \quad [V]$$

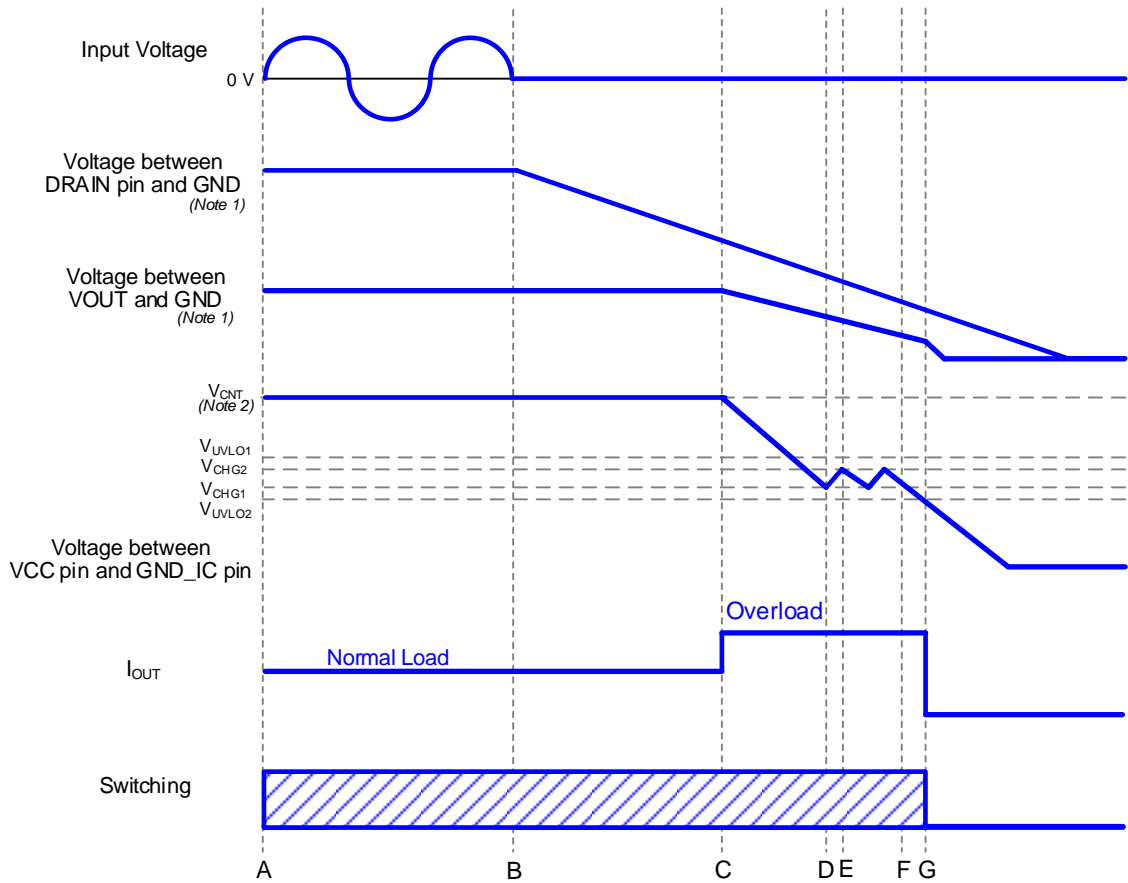

Figure 3. Startup Sequences Timing Chart

- A: The input voltage is applied to the DRAIN pin and the VCC pin voltage rises.
- B: If the VCC pin voltage exceeds  $V_{UVLO1}$ , the IC starts to operate. In addition, if the IC judges the other protection functions as normal, it starts the switching operation. The soft start function limits the over current detection voltage and the switching frequency to prevent any excessive voltage or current rising. When the switching operation starts, the output voltage rises.
- C: Until the output voltage becomes a constant value or more from startup, the VCC pin voltage drops by the VCC pin current consumption.
- D: After the switching operation starts, it is necessary to make sure that the output voltage reaches the set voltage within  $t_{FOLP1}$  by setting the external components.
- E: At light load, the IC starts the burst operation to reduce the power consumption.
- F: When the load exceeds a certain electric power, the IC starts the overload operation.
- G: If the set overload state lasts for  $t_{FOLP1}$ , the switching operation is turned off.
- H: When the VCC pin voltage drops to less than  $V_{CHG1}$ , the VCC recharge function operates.
- I: When the VCC pin voltage rises to more than  $V_{CHG2}$ , the recharge function stops operating.
- J: After  $t_{FOLP2}$  period from G, the switching operation starts.
- K: Same as G.

Description of Blocks – continued

3 Stop Sequences

Stop sequences are as shown in Figure 4.

(Note 1) This GND does not mean the GND\_IC pin of the IC.

(Note 2)  $V_{CNT}$  is the set output voltage of normal mode. It is calculated by the formula below.

$$V_{CNT} = V_{FB} \times \frac{R_{FB1} + R_{FB2}}{R_{FB2}} \quad [V]$$

Figure 4. Stop Sequences Timing Chart

- A: Normal operation
- B: When the input voltage is stopped, the DRAIN pin voltage starts to drop.
- C: If the DRAIN pin voltage drops under a certain level, the ON duty of the switching becomes maximum and FB OLP operates. The VCC pin voltage starts to drop because of the drop of output voltage.
- D: When the VCC pin voltage drops to less than  $V_{CHG1}$ , the VCC recharge function operates.
- E: When the VCC pin voltage rises to more than  $V_{CHG2}$ , the VCC recharge function stops operating.
- F: When the VCC pin voltage drops to less than  $V_{CHG1}$ , the VCC recharge function operates. However, the current supply to the VCC pin decreases and the VCC pin voltage continues dropping, because the DRAIN pin voltage is low.
- G: When the VCC pin voltage drops to less than  $V_{UVLO2}$ , the switching operation stops.

Description of Blocks – continued

4 Startup Circuit

Owing to a built-in startup circuit, this IC achieves low standby electric power and high-speed startup. The current consumption after startup is only OFF current  $I_{START3}$ . The startup current flows from the DRAIN pin.

Figure 5. Startup Circuit

Figure 6. Startup Current vs VCC Pin Voltage

Description of Blocks – continued

5 The VCC Pin Protection Function

This IC has the internal protection functions at the VCC pin as shown below.

5.1 VCC UVLO / VCC OVP

VCC UVLO and VCC OVP are auto-recovery typed comparators that have voltage hysteresis. VCC OVP has an internal mask time, and it is detected when the state which VCC pin voltage exceeds  $V_{OVP1}$  lasts for  $t_{COMP}$ . The recovery condition is that the VCC pin voltage drops under  $V_{OVP2}$ .

5.2 VCC Recharge Function

Once the VCC pin voltage exceeds  $V_{UVLO1}$ , and the IC starts up, then if it drops under  $V_{CHG1}$ , the VCC recharge function operates. At this time, the VCC pin is recharged from the DRAIN pin through the startup circuit. When the VCC pin voltage rises to more than  $V_{CHG2}$ , the recharge stops.

(Note 1) This GND dose n not mean the GND\_IC pin of the IC.

(Note 2)  $V_{CNT}$  is the set output voltage of normal mode. It is calculated by the formula below.

$$V_{CNT} = V_{FB} \times \frac{R_{FB1} + R_{FB2}}{R_{FB2}} \quad [V]$$

Figure 7. VCC UVLO/VCC OVP/VCC Recharge Function Timing Chart

- A: The input voltage is applied to the DRAIN pin and the VCC pin voltage rises.
- B: When the VCC pin voltage exceeds  $V_{UVLO1}$ , the IC starts operating. If the IC judges the other protection functions as normal, it starts switching operation. The soft start function limits the over current detection current and the switching frequency to prevent excessive voltage or current rising. When the switching operation starts, the output voltage rises.
- C: When the VCC pin voltage exceeds  $V_{OVP1}$  by some anomaly, VCC OVP timer starts to operate.
- D: When the condition that the VCC pin voltage exceeds  $V_{OVP1}$  lasts for  $t_{COMP}$ , the IC detects VCC OVP and stops switching operation.
- E: When the VCC pin voltage drops to less than  $V_{OVP2}$ , VCC OVP is released and the switching operation restarts.
- F: When the input power supply is turned OFF, the DRAIN pin voltage drops.
- G: If the DRAIN pin voltage drops under a certain level, the output voltage drops. The VCC pin voltage starts to drop because of the drop of the output voltage.
- H: When the VCC pin voltage drops to less than  $V_{CHG1}$ , the VCC recharge function is started.
- I: When the VCC pin voltage rises to more than  $V_{CHG2}$ , the VCC recharge function is stopped.
- J: When the VCC pin voltage drops to less than  $V_{CHG1}$ , the VCC recharge function is started. However, the current supply to the VCC pin decreases and the VCC pin voltage continues to drop because of the low DRAIN pin voltage.
- K: When the VCC pin voltage drops to less than  $V_{UVLO2}$ , VCC UVLO starts operating.

Description of Blocks – continued

6 DC/DC Driver

This IC performs current mode PWM control. An internal oscillator fixes the switching frequency  $f_{sw}$ . This IC has a built-in switching frequency hopping function. The maximum duty is  $D_{MAX}$ . To achieve the low power consumption at light load, it also has an internal burst mode circuit.

6.1 Setting of the Output Voltage  $V_{OUT}$

Because of adopting the non-isolated type without optocoupler, it operates to keep the FB pin voltage at the regulated value. This FB pin voltage means the voltage between the FB pin and the GND\_IC pin. The output voltage  $V_{OUT}$  is defined using  $R_{FB1}$  and  $R_{FB2}$  by the formula below. The voltage when the MOSFET is off is as shown in Figure 8.

$$V_{OUT} = V_{FB} \times \frac{R_{FB1} + R_{FB2}}{R_{FB2}} + V_{FD2} - V_{FD1} \quad [V]$$

Where:

$V_{FD1}$  is the forward voltage of diode D1.

$V_{FD2}$  is the forward voltage of diode D2.

$V_{FB}$  is the FB pin control voltage.

$R_{FB1}$  is the upside divider resistor for  $V_{OUT}$  setting.

$R_{FB2}$  is the downside divider resistor for  $V_{OUT}$  setting.

Figure 8. Output Voltage Setting

The output voltage may rise at light load because it is different from the VCC pin voltage. In this case, the output voltage should be dropped by adjusting the value of the resistor  $R_{OUT}$  that is connected to the VOUT. The position of the resistor  $R_{OUT}$  is as shown in Figure 9.

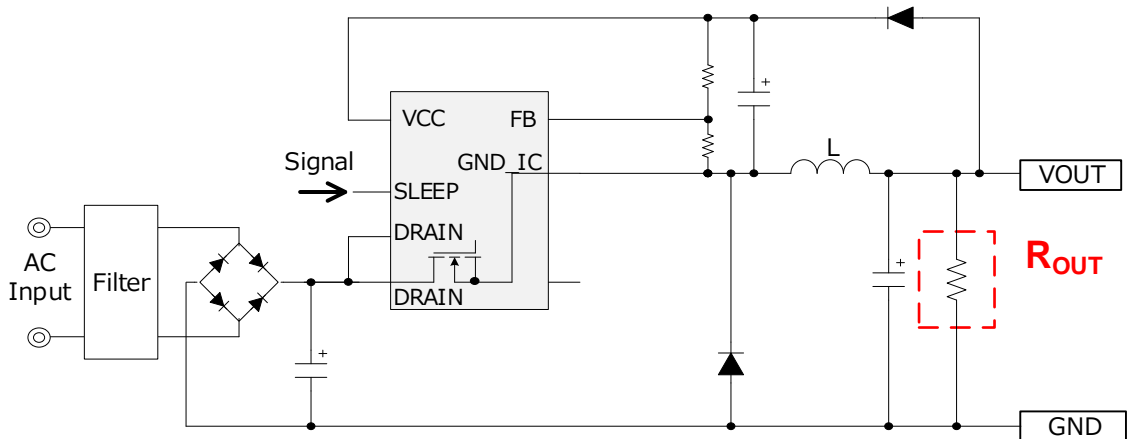

Figure 9. Location of Resistor  $R_{OUT}$

6 DC/DC Driver – continued

6.2 Frequency Circuit

6.2.1 With the Frequency Reduction Operation (BM2PAA1Y-Z, BM2PDA1Y-Z)

- mode 1: Burst Mode (The intermittent operation starts.)
- mode 2: Frequency Reduction Mode (It reduces the frequency.)
- mode 3: Fixed Frequency Mode (It operates at the maximum frequency.)
- mode 4: Overload Mode (The intermittent operation starts.)

Figure 10. State Transition of Switching Frequency (BM2PAA1Y-Z, BM2PDA1Y-Z)

6.2.2 Without the Frequency Reduction Operation (BM2PAB1Y-Z, BM2PDB1Y-Z)

- mode 1: Burst Mode (The intermittent operation starts.)
- mode 2: Fixed Frequency Mode (It operates in the maximum frequency.)
- mode 3: Overload Mode (The intermittent operation starts.)

Figure 11. State Transition of Switching Frequency (BM2PAB1Y-Z, BM2PDB1Y-Z)

6.3 Frequency Hopping Function

Frequency hopping function achieves low EMI by changing the frequency randomly. The upper limit of the frequency's hopping is  $\pm 6\%$  (Typ) to the basic frequency.

6 DC/DC Driver – continued

6.4 Over Current Detection Function

This IC has a built-in cycle-by-cycle over current detection function. This function stops the switching operation if the coil current  $I_L$  rises to  $I_{PEAK\_A}$  or  $I_{PEAK\_D}$  or more. Additionally, an internal current detection resistor contributes to the reduction of parts count and improvement on efficiency. The peak current while the IC is in overload mode is determined by the formula below.

$$Peak\ current = I_{PEAK} + \frac{(V_{DRAIN} - V_{OUT})}{L} \times t_{delay} \quad [A]$$

Where:

$I_{PEAK}$  is the over current detection current. ( $I_{PEAK\_A}$ ,  $I_{PEAK\_D}$ )

$V_{DRAIN}$  is the DRAIN pin voltage.

$V_{OUT}$  is the output voltage.

$L$  is the inductance value of coil.

$t_{delay}$  is the delay time after the over current detection.

6.5 Dynamic Over Current Detection Function

This IC has a built-in dynamic over current detection function.

In the case that the coil current  $I_L$  exceeds  $I_{DPEAK\_A}$  or  $I_{DPEAK\_D}$  two times consecutively, it stops the switching operation for  $t_{DPEAK}$ .

Figure 12. Dynamic Over Current Detection

6 DC/DC Driver – continued

6.6 Soft Start Function

This function restricts the over current detection value and the switching frequency to prevent excessive voltage or current rising at startup. The details are as shown in Figure 13, 14. The IC achieves the soft start operation by changing the over current detection value and switching frequency with time.

Figure 13. Over Current Detection Current vs Time

Figure 14. Switching Frequency vs Time

7 FB OLP (Overload Protection)

FB OLP is a function that monitors load state and stops the switching operation at the overload state. In the overload condition, the output voltage drops. Therefore, this function judges the state as overload and the switching operation is stopped when the state of the setting electricity power or more lasts for  $t_{FOLP1}$ . The switching operation recovers  $t_{FOLP2}$  later after the detection of FB OLP.

8 TSD (Thermal Shutdown)

TSD is a function that stops the switching operation if the temperature of IC becomes  $T_{SD1}$  or more.

Description of Blocks – continued

9 Sleep Mode

This IC goes into sleep mode by controlling the SLEEP pin voltage with the optocoupler. The low standby power consumption is achieved by the sleep mode.

Figure 15. Application Circuit (Sleep Mode)

9.1 Settings of Switching the Modes

The SLEEP pin is controlled by an inverter input. The operation states are determined by the settings shown below. Short the SLEEP pin to the GND\_IC if it is not used.

Table 1. Control of Sleep Operation

SLEEP pin voltage	Mode
Open	Sleep
< V <sub>INL</sub>	Normal

9.2 Timing Chart

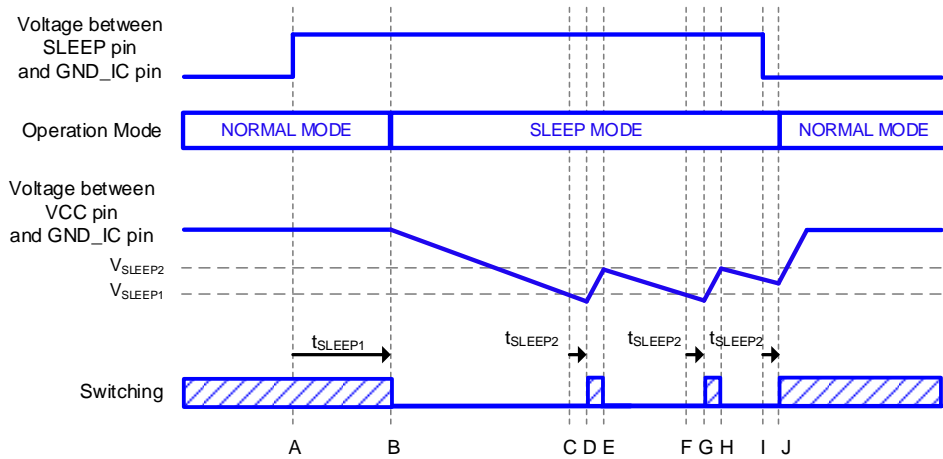

Figure 16. Mode Transition Sequences Timing Chart

- A: The SLEEP pin voltage changes from Low to High.
- B: When  $t_{SLEEEP1}$  passes from A, switching operation stops and is contained in a sleep mode. The IC reduces the current consumption in sleep mode and the over current detection value and the switching frequency shifts to  $I_{PEAK\_D}$  and  $f_{SW\_B}$ . (Note)
- C: When the VCC pin voltage drops to less than  $V_{SLEEEP1}$ , the switching recovery delay timer starts to operate.
- D: The switching operation starts after  $t_{SLEEEP2}$  from C.
- E: When the VCC pin voltage exceeds  $V_{SLEEEP2}$ , the switching operation is stopped.
- F: Same as C.
- G: Same as D.
- H: Same as E.
- I: The SLEEP pin voltage changes from High to Low.
- J: The IC returns to normal mode after  $t_{SLEEEP2}$  with the soft start operation.

(Note) This  $I_{PEAK\_D}$  and  $f_{SW\_B}$  are not only for BM2PDB1Y-Z but also for all of this series.

Description of Blocks – continued

10 Operation Modes of Protection Functions

The operation modes of each protection function are as shown in Table 2.

Table 2. The Operation Modes of Protection Functions

	VCC UVLO	VCC OVP	TSD	FB OLP
Detection Condition	VCC pin voltage < $V_{UVLO2}$ (while the voltage is dropping)	VCC pin voltage > $V_{OVP1}$ (while the voltage is rising)	Junction temperature > $T_{SD1}$ (while the temperature is rising)	Coil current $I_L$ $\geq I_{PEAK\_A}$ or $I_{PEAK\_D}$
Release Condition	VCC pin voltage > $V_{UVLO1}$ (while the voltage is rising)	VCC pin voltage < $V_{OVP2}$ (while the voltage is dropping)	Junction temperature < $T_{SD2}$ (while the temperature is dropping) or VCC UVLO detection	Coil current $I_L$ < $I_{PEAK\_A}$ or $I_{PEAK\_D}$ or VCC UVLO detection
Detection Timer (Reset Condition)	–	$t_{COMP}$ (VCC pin voltage < $V_{OVP2}$ )	$t_{COMP}$ (Junction temperature < $T_{SD2}$ )	$t_{FOLP1}$ (Coil current $I_L$ < $I_{PEAK\_A}$ or $I_{PEAK\_D}$ )
Release Timer (Reset Condition)	–	–	–	$t_{FOLP2}$ (Coil current $I_L$ $\geq I_{PEAK\_A}$ or $I_{PEAK\_D}$ )
Auto Recovery or Latch	Auto recovery	Auto recovery	Auto recovery	Auto recovery

## Description of Blocks – continued

## 11 External Components

Use the parts that match the input and load conditions.  
Figure 17 shows the application circuit.

Figure 17. Application Circuit

11.1 Output Capacitor  $C_{OUT}$ 

The output capacitor  $C_{OUT}$  should be set to satisfy the specification of the ripple voltage, and guarantee that the output voltage rises to the set value within  $t_{FOLP1}$  after startup. It is recommended to set  $C_{OUT}$  to 100  $\mu\text{F}$  or more.

11.2 Inductance Value of Coil  $L$ 

The inductance value of coil  $L$  should be set depending on the input voltage and output voltage. If the inductance value is too large, the switching operation becomes continuous mode that deteriorates the heat. In the other hand, if the inductance value is too small, the control of IC is impossible during  $\text{ON time} < t_{\text{MINON}}$ , so there is a possibility that the over current detection operates even under a normal load condition.

11.3 VCC Pin Capacitor  $C_{VCC}$ 

The VCC pin capacitor  $C_{VCC}$  adjusts the startup time of the IC and the response of Error AMP. It is recommended to be set to 1/100 of  $C_{OUT}$  or less.

11.4 Output Voltage Feedback Resistor  $R_{FB1}$ ,  $R_{FB2}$ 

For reducing the electronic power consumption,  $R_{FB1}$  is recommended to be set to 1 M $\Omega$  to 3 M $\Omega$  as a reference. For restricting the tolerance of output voltage, use high precision resistors for  $R_{FB1}$  and  $R_{FB2}$ .

11.5 Phase Compensation Capacitor  $C_{FB1}$ 

According to the input and output conditions, the phase compensation capacitor  $C_{FB1}$  may be used. It is recommended to be set to 1 nF to 10 nF.

Evaluate with sufficient consideration of the tolerances and temperature characteristics of the components.

11.6 Noise Filter Capacitor  $C_{SLEEP}$ 

In case of using an optocoupler to control the SLEEP pin, for preventing the malfunction on mode transition, it is recommended to use the noise filter capacitor  $C_{SLEEP}$ .

It is recommended to be set to 10 nF to 100 nF.

Notice that the time of mode transitions may become longer by using  $C_{SLEEP}$ .

**Absolute Maximum Ratings (Ta = 25 °C)**

Parameter	Symbol	Rating	Unit	Conditions
Maximum Applied Voltage 1	V <sub>MAX1</sub>	650	V	DRAIN pin voltage
		730	V	DRAIN pin voltage (tpulse < 10 μs) <sup>(Note 1)</sup>
Maximum Applied Voltage 2	V <sub>MAX2</sub>	-0.3 to +32	V	VCC pin voltage
DRAIN Pin Current (Pulse)	I <sub>DD</sub>	12.00	A	Consecutive operation
Power Dissipation	P <sub>d</sub>	1.00	W	<sup>(Note 2)</sup>
Maximum Junction Temperature	T <sub>jmax</sub>	150	°C	
Storage Temperature Range	T <sub>stg</sub>	-55 to +150	°C	

**Caution 1:** Operating the IC over the absolute maximum ratings may damage the IC. The damage can either be a short circuit between pins or an open circuit between pins and the internal circuitry. Therefore, it is important to consider circuit protection measures, such as adding a fuse, in case the IC is operated over the absolute maximum ratings.

**Caution 2:** Should by any chance the maximum junction temperature rating be exceeded the rise in temperature of the chip may result in deterioration of the properties of the chip. In case of exceeding this absolute maximum rating, design a PCB with power dissipation taken into consideration by increasing board size and copper area so as not to exceed the maximum junction temperature rating.

<sup>(Note 1)</sup> Duty is less than 1 %.

<sup>(Note 2)</sup> In case of being mounted on a glass epoxy single layer PCB (70 mm x 70 mm x 1.6 mm). Derate by 8 mW/°C if the IC is used at the ambient temperature 25 °C or above.

**Thermal Dissipation**

Make the thermal design by making the IC operates in the following conditions.

(Because the following temperature is guaranteed value, it is necessary to consider a margin.)

1. The ambient temperature must be 105 °C or less.
2. The IC's loss must be the power dissipation P<sub>d</sub> or less.

The thermal abatement characteristic is as follows.

(In case of being mounted on a glass epoxy single layer PCB with size of 70 mm x 70 mm x 1.6 mm)

Figure 18. Thermal Abatement Characteristic

**Recommended Operating Conditions**

Parameter	Symbol	Min	Typ	Max	Unit	Conditions
Power Supply Voltage Range 1	V <sub>DRAIN</sub>	-	-	650	V	DRAIN pin voltage
		-	-	730	V	DRAIN pin voltage (tpulse < 10 μs) <sup>(Note 1)</sup>
Power Supply Voltage Range 2	V <sub>CC</sub>	11.10	-	26.00	V	VCC pin voltage
Operating Temperature	T <sub>opr</sub>	-40	-	+105	°C	Surrounding temperature

<sup>(Note 1)</sup> Duty is less than 1 %.

Application Examples

Show a flyback circuitry example in Figure 43.

High voltage is produced by such as ringing in turn OFF at the DRAIN pin. The voltage during this ringing can be tolerated up to 730 V.

## Operational Notes

### 1. Reverse Connection of Power Supply

Connecting the power supply in reverse polarity can damage the IC. Take precautions against reverse polarity when connecting the power supply, such as mounting an external diode between the power supply and the IC's power supply pins.

### 2. Power Supply Lines

Design the PCB layout pattern to provide low impedance supply lines. Furthermore, connect a capacitor to ground at all power supply pins. Consider the effect of temperature and aging on the capacitance value when using electrolytic capacitors.

### 3. Ground Voltage

Ensure that no pins are at a voltage below that of the ground pin at any time, even during transient condition.

### 4. Ground Wiring Pattern

When using both small-signal and large-current ground traces, the two ground traces should be routed separately but connected to a single ground at the reference point of the application board to avoid fluctuations in the small-signal ground caused by large currents. Also ensure that the ground traces of external components do not cause variations on the ground voltage. The ground lines must be as short and thick as possible to reduce line impedance.

### 5. Recommended Operating Conditions

The function and operation of the IC are guaranteed within the range specified by the recommended operating conditions. The characteristic values are guaranteed only under the conditions of each item specified by the electrical characteristics.

### 6. Inrush Current

When power is first supplied to the IC, it is possible that the internal logic may be unstable and inrush current may flow instantaneously due to the internal powering sequence and delays, especially if the IC has more than one power supply. Therefore, give special consideration to power coupling capacitance, power wiring, width of ground wiring, and routing of connections.

### 7. Testing on Application Boards

When testing the IC on an application board, connecting a capacitor directly to a low-impedance output pin may subject the IC to stress. Always discharge capacitors completely after each process or step. The IC's power supply should always be turned off completely before connecting or removing it from the test setup during the inspection process. To prevent damage from static discharge, ground the IC during assembly and use similar precautions during transport and storage.

### 8. Inter-pin Short and Mounting Errors

Ensure that the direction and position are correct when mounting the IC on the PCB. Incorrect mounting may result in damaging the IC. Avoid nearby pins being shorted to each other especially to ground, power supply and output pin. Inter-pin shorts could be due to many reasons such as metal particles, water droplets (in very humid environment) and unintentional solder bridge deposited in between pins during assembly to name a few.

### 9. Unused Input Pins

Input pins of an IC are often connected to the gate of a MOS transistor. The gate has extremely high impedance and extremely low capacitance. If left unconnected, the electric field from the outside can easily charge it. The small charge acquired in this way is enough to produce a significant effect on the conduction through the transistor and cause unexpected operation of the IC. So unless otherwise specified, unused input pins should be connected to the power supply or ground line.

Operational Notes – continued

10. Regarding the Input Pin of the IC

This IC contains P+ isolation and P substrate layers between adjacent elements in order to keep them isolated. P-N junctions are formed at the intersection of the P layers with the N layers of other elements, creating a parasitic diode or transistor. For example (refer to figure below):

When  $GND > Pin A$  and  $GND > Pin B$ , the P-N junction operates as a parasitic diode.  
 When  $GND > Pin B$ , the P-N junction operates as a parasitic transistor.

Parasitic diodes inevitably occur in the structure of the IC. The operation of parasitic diodes can result in mutual interference among circuits, operational faults, or physical damage. Therefore, conditions that cause these diodes to operate, such as applying a voltage lower than the GND voltage to an input pin (and thus to the P substrate) should be avoided.

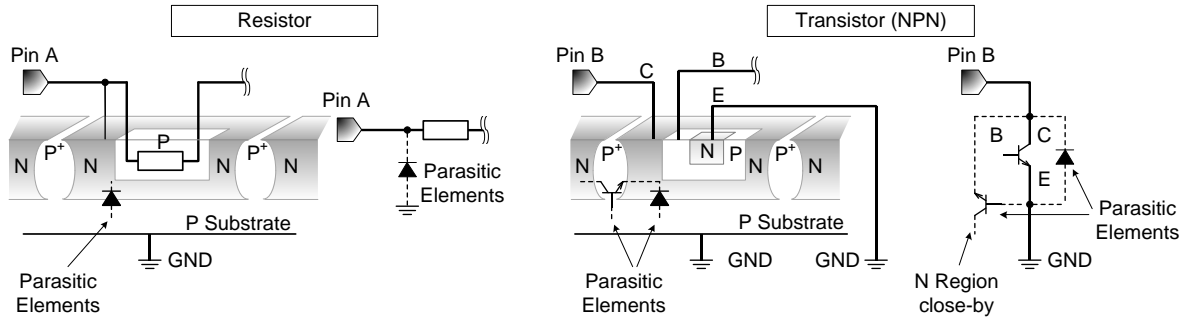

Figure 45. Example of IC Structure

11. Ceramic Capacitor

When using a ceramic capacitor, determine a capacitance value considering the change of capacitance with temperature and the decrease in nominal capacitance due to DC bias and others.

12. Thermal Shutdown Circuit (TSD)

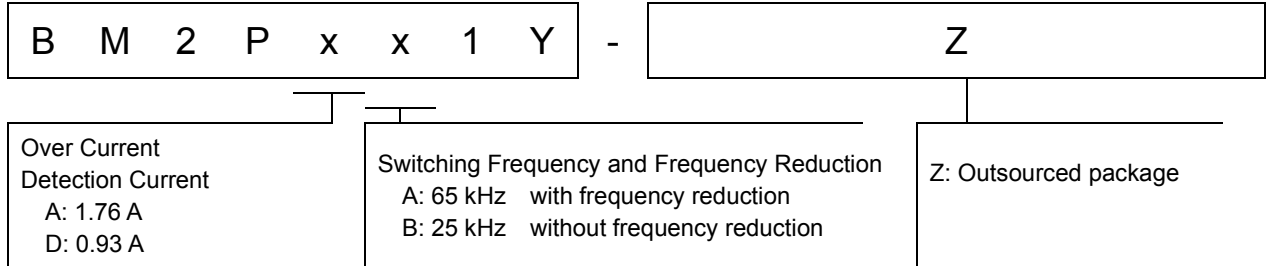

This IC has a built-in thermal shutdown circuit that prevents heat damage to the IC. Normal operation should always be within the IC's maximum junction temperature rating. If however the rating is exceeded for a continued period, the junction temperature ( $T_j$ ) will rise which will activate the TSD circuit that will turn OFF power output pins. When the  $T_j$  falls below the TSD threshold, the circuits are automatically restored to normal operation.

Note that the TSD circuit operates in a situation that exceeds the absolute maximum ratings and therefore, under no circumstances, should the TSD circuit be used in a set design or for any purpose other than protecting the IC from heat damage.

13. Over Current Protection Circuit (OCP)

This IC incorporates an integrated overcurrent protection circuit that is activated when the load is shorted. This protection circuit is effective in preventing damage due to sudden and unexpected incidents. However, the IC should not be used in applications characterized by continuous operation or transitioning of the protection circuit.

Ordering Information

Marking Diagram

Lineup

Part Number Marking	Orderable Part Number	Oscillatory Frequency	Frequency Reduction	Over Current Detection Current
BM2PAA1Y	BM2PAA1Y-Z	65 kHz	Yes	1.76 A

# Notice

## Precaution on using ROHM Products

- Our Products are designed and manufactured for application in ordinary electronic equipment (such as AV equipment, OA equipment, telecommunication equipment, home electronic appliances, amusement equipment, etc.). If you intend to use our Products in devices requiring extremely high reliability (such as medical equipment <sup>(Note 1)</sup>, transport equipment, traffic equipment, aircraft/spacecraft, nuclear power controllers, fuel controllers, car equipment including car accessories, safety devices, etc.) and whose malfunction or failure may cause loss of human life, bodily injury or serious damage to property ("Specific Applications"), please consult with the ROHM sales representative in advance. Unless otherwise agreed in writing by ROHM in advance, ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of any ROHM's Products for Specific Applications.

(Note1) Medical Equipment Classification of the Specific Applications

JAPAN	USA	EU	CHINA
CLASS III	CLASS III	CLASS II b	CLASS III
CLASS IV		CLASS III	

- ROHM designs and manufactures its Products subject to strict quality control system. However, semiconductor products can fail or malfunction at a certain rate. Please be sure to implement, at your own responsibilities, adequate safety measures including but not limited to fail-safe design against the physical injury, damage to any property, which a failure or malfunction of our Products may cause. The following are examples of safety measures:
  - Installation of protection circuits or other protective devices to improve system safety
  - Installation of redundant circuits to reduce the impact of single or multiple circuit failure
- Our Products are designed and manufactured for use under standard conditions and not under any special or extraordinary environments or conditions, as exemplified below. Accordingly, ROHM shall not be in any way responsible or liable for any damages, expenses or losses arising from the use of any ROHM's Products under any special or extraordinary environments or conditions. If you intend to use our Products under any special or extraordinary environments or conditions (as exemplified below), your independent verification and confirmation of product performance, reliability, etc. prior to use, must be necessary:
  - Use of our Products in any types of liquid, including water, oils, chemicals, and organic solvents
  - Use of our Products outdoors or in places where the Products are exposed to direct sunlight or dust
  - Use of our Products in places where the Products are exposed to sea wind or corrosive gases, including Cl<sub>2</sub>, H<sub>2</sub>S, NH<sub>3</sub>, SO<sub>2</sub>, and NO<sub>2</sub>
  - Use of our Products in places where the Products are exposed to static electricity or electromagnetic waves
  - Use of our Products in proximity to heat-producing components, plastic cords, or other flammable items
  - Sealing or coating our Products with resin or other coating materials
  - Use of our Products without cleaning residue of flux (Exclude cases where no-clean type fluxes is used. However, recommend sufficiently about the residue.) ; or Washing our Products by using water or water-soluble cleaning agents for cleaning residue after soldering
  - Use of the Products in places subject to dew condensation
- The Products are not subject to radiation-proof design.
- Please verify and confirm characteristics of the final or mounted products in using the Products.
- In particular, if a transient load (a large amount of load applied in a short period of time, such as pulse, is applied, confirmation of performance characteristics after on-board mounting is strongly recommended. Avoid applying power exceeding normal rated power; exceeding the power rating under steady-state loading condition may negatively affect product performance and reliability.
- De-rate Power Dissipation depending on ambient temperature. When used in sealed area, confirm that it is the use in the range that does not exceed the maximum junction temperature.
- Confirm that operation temperature is within the specified range described in the product specification.
- ROHM shall not be in any way responsible or liable for failure induced under deviant condition from what is defined in this document.

## Precaution for Mounting / Circuit board design

- When a highly active halogenous (chlorine, bromine, etc.) flux is used, the residue of flux may negatively affect product performance and reliability.
- In principle, the reflow soldering method must be used on a surface-mount products, the flow soldering method must be used on a through hole mount products. If the flow soldering method is preferred on a surface-mount products, please consult with the ROHM representative in advance.

For details, please refer to ROHM Mounting specification

### Precautions Regarding Application Examples and External Circuits

1. If change is made to the constant of an external circuit, please allow a sufficient margin considering variations of the characteristics of the Products and external components, including transient characteristics, as well as static characteristics.
2. You agree that application notes, reference designs, and associated data and information contained in this document are presented only as guidance for Products use. Therefore, in case you use such information, you are solely responsible for it and you must exercise your own independent verification and judgment in the use of such information contained in this document. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of such information.

### Precaution for Electrostatic

This Product is electrostatic sensitive product, which may be damaged due to electrostatic discharge. Please take proper caution in your manufacturing process and storage so that voltage exceeding the Products maximum rating will not be applied to Products. Please take special care under dry condition (e.g. Grounding of human body / equipment / solder iron, isolation from charged objects, setting of Ionizer, friction prevention and temperature / humidity control).

### Precaution for Storage / Transportation

1. Product performance and soldered connections may deteriorate if the Products are stored in the places where:
  - [a] the Products are exposed to sea winds or corrosive gases, including Cl<sub>2</sub>, H<sub>2</sub>S, NH<sub>3</sub>, SO<sub>2</sub>, and NO<sub>2</sub>
  - [b] the temperature or humidity exceeds those recommended by ROHM
  - [c] the Products are exposed to direct sunshine or condensation
  - [d] the Products are exposed to high Electrostatic
2. Even under ROHM recommended storage condition, solderability of products out of recommended storage time period may be degraded. It is strongly recommended to confirm solderability before using Products of which storage time is exceeding the recommended storage time period.
3. Store / transport cartons in the correct direction, which is indicated on a carton with a symbol. Otherwise bent leads may occur due to excessive stress applied when dropping of a carton.
4. Use Products within the specified time after opening a humidity barrier bag. Baking is required before using Products of which storage time is exceeding the recommended storage time period.

### Precaution for Product Label

A two-dimensional barcode printed on ROHM Products label is for ROHM's internal use only.

### Precaution for Disposition

When disposing Products please dispose them properly using an authorized industry waste company.

### Precaution for Foreign Exchange and Foreign Trade act

Since concerned goods might be fallen under listed items of export control prescribed by Foreign exchange and Foreign trade act, please consult with ROHM in case of export.

### Precaution Regarding Intellectual Property Rights

1. All information and data including but not limited to application example contained in this document is for reference only. ROHM does not warrant that foregoing information or data will not infringe any intellectual property rights or any other rights of any third party regarding such information or data.
2. ROHM shall not have any obligations where the claims, actions or demands arising from the combination of the Products with other articles such as components, circuits, systems or external equipment (including software).
3. No license, expressly or implied, is granted hereby under any intellectual property rights or other rights of ROHM or any third parties with respect to the Products or the information contained in this document. Provided, however, that ROHM will not assert its intellectual property rights or other rights against you or your customers to the extent necessary to manufacture or sell products containing the Products, subject to the terms and conditions herein.

### Other Precaution

1. This document may not be reprinted or reproduced, in whole or in part, without prior written consent of ROHM.
2. The Products may not be disassembled, converted, modified, reproduced or otherwise changed without prior written consent of ROHM.
3. In no event shall you use in any way whatsoever the Products and the related technical information contained in the Products or this document for any military purposes, including but not limited to, the development of mass-destruction weapons.
4. The proper names of companies or products described in this document are trademarks or registered trademarks of ROHM, its affiliated companies or third parties.

**General Precaution**

1. Before you use our Products, you are requested to carefully read this document and fully understand its contents. ROHM shall not be in any way responsible or liable for failure, malfunction or accident arising from the use of any ROHM's Products against warning, caution or note contained in this document.
2. All information contained in this document is current as of the issuing date and subject to change without any prior notice. Before purchasing or using ROHM's Products, please confirm the latest information with a ROHM sales representative.
3. The information contained in this document is provided on an "as is" basis and ROHM does not warrant that all information contained in this document is accurate and/or error-free. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties resulting from inaccuracy or errors of or concerning such information.
