

CMOS Digital Integrated Circuit Silicon Monolithic

TPM4K Group(2)

General Description

- Arm® Cortex®-M4 processor with FPU
Operating frequency: 1 to 160 MHz, Operating voltage: 2.7 to 5.5 V
- Code flash: 128 to 256 KB, Data flash: 32KB
- Package: 44-pin to 100-pin. 6 types of packages are available.
- Hardware IPs such as A-VE+, 12-bit ADC, and A-PMD are provided for implementation of vector control and PFC control

Applications

Motors, major appliances using motors, and industrial equipment.

Features

- Arm Cortex-M4 processor with FPU
 - Operating frequency: 1 to 160 MHz
 - Memory Protection Unit (MPU)
 - Low-power consumption mode
 - Operating voltage: 2.7 to 5.5 V
 - 4.5 to 5.5 V (All Functions)
 - 2.7 to 4.5 V (Without OPAMP, ADC)
 - Low-power consumption operation: IDLE, STOP1
 - Operating temperature: -40 to +105°C
 - Internal memory
 - Code flash: 128 to 256 KB, rewritable up to 100,000 times
 - Data flash: 32KB rewritable up to 100,000 times
 - Data flash is rewritable in parallel with instruction execution
 - RAM: 24KB, with parity
 - Clock
 - External high speed oscillator: 6 to 12 MHz(Ceramic, Crystal)
 - External high speed clock input: 6 to 10 MHz
 - Internal high speed oscillator (IHOSC1): 10 MHz, user trimming function
 - PLL: 160 MHz output(System clock)
 - Oscillation frequency detection (OFD): Abnormal system clock detection
 - Voltage Detection (LVD): 8 level, Generate interrupts and reset outputs
 - Interruption
 - External factors: 8 to 20
 - (External pins: 10 to 32 pins, with DNF)
 - Internal factors: 80 to 100
 - I/O ports: 31 to 87 (Input:2, Output:1)
 - 5V-tolerant, open-drain, pull-up/-down
- On-chip debug (JTAG/SW), NBDIF(RAM monitor)
 - Trigger Selector (TRGSEL)
 - Expand Trigger request for DMA, Timer, others
 - DMA controller (DMAC): 1 unit
 - DMA requests: 26 to 32 factors, internal/external triggers
 - CRC Calculation Circuit (CRC): CRC32, CRC16
 - Asynchronous Serial Interface (UART): 3 to 4 channels
 - 5Mbps(Max), FIFO(Transmission 8-stage, Reception 8-stage)
 - Serial Peripheral Interface (TSPI): 1 to 2 channels
 - SIO/SPI mode, 10MHz(MAX), FIFO(Transmitter: 16bitx8, Receive: 16bitx8)
 - I²C Interface
 - I²C Interface (I²C): 1 to 2 channels, Multi Master
 - I²C Interface Version A (EI²C): 1 to 2 channels
 - Multi Master, support 10bit Slave addressing
 - 12-bit Analog to Digital Converter (ADC): 8 to 22 inputs in 3 units
 - Conversion time: 0.91 µs (Fastest)
 - Self-diagnosis support function
 - Operational Amplifier (OPAMP): 3 units
 - Gain selectable
 - Advanced programmable motor control circuit (A-PMD): 1, 3 channels
 - 3-phase complementary PWM output, Synchronized with ADC
 - PFC control: support 3-phase interleaved PFC
 - Emergency stop function by external inputs (EMG pin, OVV pin)

Start of commercial production
2021-04

- Advanced vector engine plus (A-VE+): 1 channel
 - Vector control coprocessor cooperates with ADC/A-PMD
 - 1-shunt current detection area can be enlarged
 - Dead time compensation control, non-interference control
- Advanced Encoder input circuit (32-bit) (A-ENC32): 0 to 1, 3 channels
 - Encoder/sensor (3 types)/Timer /Phase counter mode
- 32-bit Timer Event Counter (T32A)
 - 6 channels as 32-bit Timers, 12 channels as 16-bit Timers
 - Interval Timer, event counter, input capture, phase difference input, PPG output, Sync Start, Trigger start
- Watchdog timer (SIWDT): 1 channel
 - Clock system other than the system clock can be selected
 - Clear window, interrupts and reset output

Preface

Conventions

- Numeric formats follow the rules as shown below:
Hexadecimal: 0xABCD
Decimal: 123 or 0d123 – Only when it needs to be explicitly shown that they are decimal numbers.
Binary: 0b111 – It is possible to omit the "0b" when the number of bit can be distinctly understood from a sentence.
- "_N" is added to the end of signal names to indicate low active signals.
- It is called "assert" that a signal moves to its active level, "deassert" to its inactive level.
- When two or more signal names are referred, they are described like as [m: n].
Example: S[3: 0] shows four signal names S3, S2, S1 and S0 together.
- The characters surrounded by [] defines the register.
Example: [ABCD]
- "n" substitutes suffix number of two or more same kind of registers, fields, and bit names.
Example: [XYZ1], [XYZ2], [XYZ3] → [XYZn]
- "x" substitutes suffix number or character of units and channels in the Register List.
In case of unit, "x" means A, B, and C ...
Example: [ADACR0], [ADBCR0], [ADCCR0] → [ADxCR0]
In case of channel, "x" means 0, 1, and 2 ...
Example: [T32A0RUNA], [T32A1RUNA], [T32A2RUNA] → [T32AxRUNA]
- The bit range of a register is written like as [m: n].
Example: Bit[3: 0] expresses the range of bit 3 to 0.
- The configuration value of a register is expressed by either the hexadecimal number or the binary number.
Example: [ABCD]<EFG>=0x01 (hexadecimal), [XYZn]<VW>=1 (binary)
- Word and Byte represent the following bit length.
Byte: 8 bits
Half word: 16 bits
Word: 32 bits
Double word: 64 bits
- Properties of each bit in a register are expressed as follows:
R: Read only
W: Write only
R/W: Read and Write are possible
- Unless otherwise specified, register access supports only word access.
- The register defined as reserved must not be rewritten. Moreover, do not use the read value.
- The value read from the bit having default value of "-" is unknown.
- When a register containing both of writable bits and read-only bits is written, read-only bits should be written with their default value. In the cases that default is "-", follow the definition of each register.
- Reserved bits of the Write-only register should be written with their default value.
In the cases that default is "-", follow the definition of each register.
- Do not use read-modified-write processing to the register of a definition which is different by writing and read out.

4.1.3. Control Pins

Table 4.3 Control pin names and their function

	Pin name	Input or Output	Function
Control Pin	X1	Input	High speed oscillator connection pin
	X2	Output	High speed oscillator connection pin
	EHCLKIN	Input	External Clock signal input pin
	BOOT_N	Input	BOOT mode control pin The BOOT mode control pin is sampled on the rising edge of the RESET_N input. It's not sampled by internal Reset factor. If the BOOT mode control pin is "Low" level, the MCU enters single boot mode. If it is "High", the MCU enters single chip mode. For details, refer to "Flash Memory" of Reference Manual.
	RESET_N	Input	Reset signal input pin
	MODE	Input	Mode Pin This pin must be fixed to "Low" level.

4.1.4. Power Supply Pins

Table 4.4 Power supply pin names and their function

	Pin name	Function
Power Supply	DVDD5A (Note1) DVDD5B (Note1)	Power supply pin for digital DVDD5A/B supplies the power to the following pins: PA to PH, PN, PU, PV, MODE, RESET_N, BOOT_N A power supply is supplied to an oscillating circuit from a built-in regulator. X1, X2
	DVSSA (Note2) DVSSB (Note2) DVSSC (Note2)	GND pin for digital
	REGOUT1 (Note3)	Capacitor for a regulator connection pin (Note4)
	REGOUT2 (Note3)	Capacitor for a regulator connection pin (Note4)
	AVDD5 VREFH	Power supply pin for analog and reference power pin for analog (VREFH). AVDD5 supplies the power to the following pins: PL, PM, PK, PJ
	AVSS VREFL	GND pin for analog and reference GND pin for analog (VREFL)

Note1: Apply the voltage to DVDD5A and DVDD5B at the same potential except the case that the pins are not provided.

Note2: Apply the external voltage to DVSSA, DVSSB, and DVSSC at the same potential except the case that the pins are not provided.

Note3: For REGOUT1 and REGOUT2, do not cause a short circuit with DVDD5A, DVDD5B, or DVSSA, DVSSB, or DVSSC.

Note4: For the capacitor value, refer to the "7.12. Regulator"

4.1.5. Capacitors between power supply pins

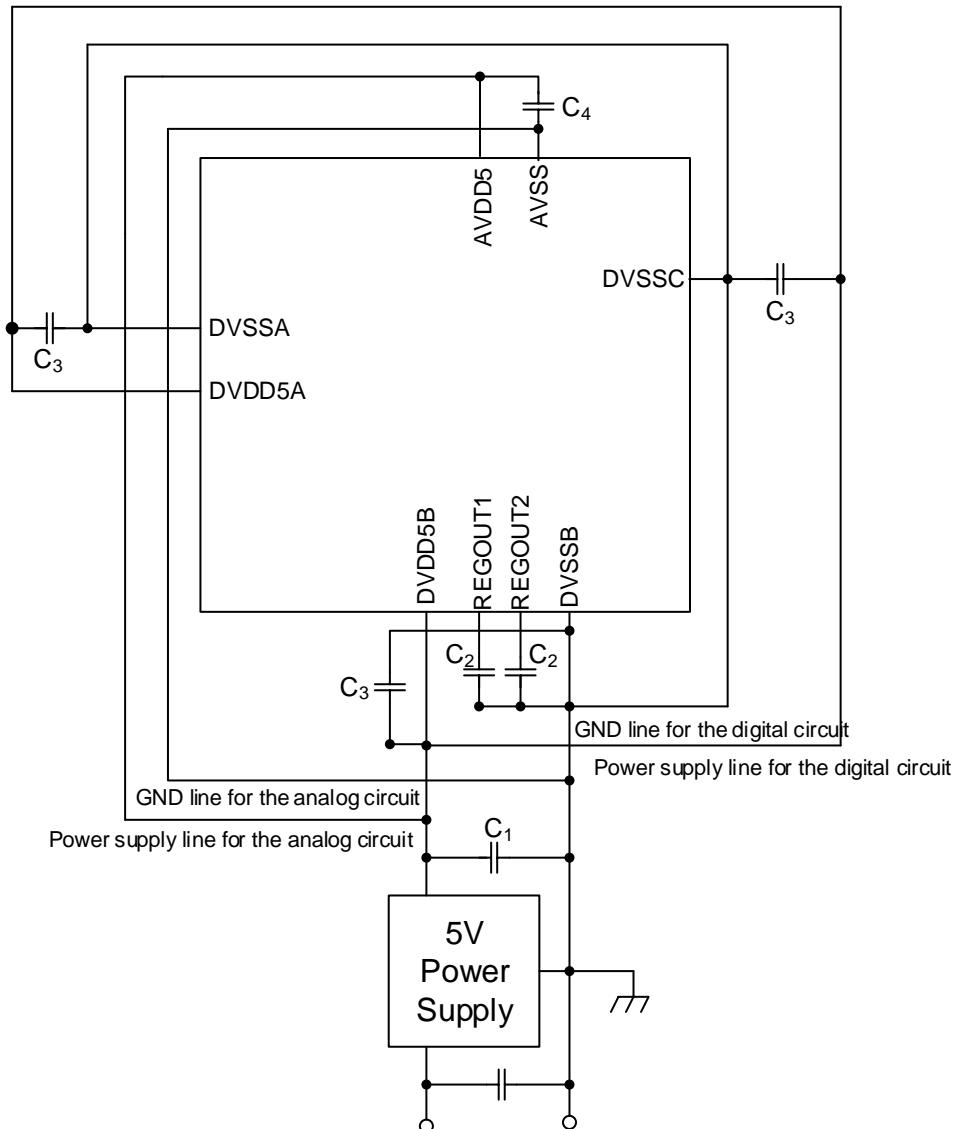

Figure 4.1 Capacitors for power supply pins connection circuit

- Note1: Insert a ceramic capacitor (C_1) near the output terminal of the 5V power supply. The power gradient with C_1 must be satisfied VPON and VPOFF in "7.6. Characteristics of Internal processing at RESET".
- Note2: Insert the bypass capacitor ((C_3, C_4) : $0.01\ \mu F$ to $0.1\ \mu F$) between the power supply and GND near each MCU power supply pin.
- Note3: Insert the power supply stabilizing ceramic capacitor (C_2) of the same capacity into the capacitor connection pin for the internal regulator (REGOUT1, REGOUT2). The capacitor should be placed near DVSSB pin. Regarding value of capacitor, refer to "7.12. Regulator".
- Note4: In order to suppress noise mixing from the digital power supply to the analog circuit, separate the analog power supply line and the digital power supply line near the 5V power supply output.
- Note5: In order to suppress noise mixing from the peripheral circuit to the analog circuit, when inserting a filter circuit or pull-up / down resistor to the input / output terminal of the analog power supply system, connect the components that make up these circuits to the analog power supply line.
- Note6: In order to suppress high frequency noise received from the loop circuit by the power supply line, the GND line and the capacitor, do not separate the power supply line and the GND line from each other.

4.2. Functional Pin and Ports Assignment (Pin Number)

Following table shows a pin number of the port assignment and each product which were seen from the functional pin. "-" means that it not have a pin or there is no assignment of a function.

5.2. Processor Core

The TPMPM4K Group(2) incorporates a high-performance 32-bit processor core (Arm Cortex-M4 processor with FPU).

For the operation of the processor core, refer to the Arm documentation set for "Cortex-M series processors". This section explains the product-specific information.

5.2.1. Core Information

The revision of Cortex-M4 processor with FPU used in the TPMPM4K Group(2) is shown as below:

For details of the CPU core and the architecture, refer to the documentation of the Arm in the following URL:

<http://infocenter.arm.com/help/index.jsp>

Table 5.2 Core revision

Group name	Core revision
TPMPM4K Group(2)	r0p1

5.2.2. Configurable Options

In the Cortex-M4 processor with FPU, some blocks can be selected to implement. The following table shows the configurations of the TPMPM4K Group(2).

Table 5.3 Configurable options and their implementations

Configurable option	Implementation
FWB	Literal comparator: 2 Instruction comparator: 6
DWT	Comparator: 4

5.3. Clock Control and Operation Mode (CG)

The CG selects a clock gear ratio and the prescaler clock, or warm up time of the oscillator.

There are NORMAL mode and low-power consumption mode as operation modes. Power consumption can be decreased by mode transition.

The system clock consists of "High speed system clock" and "Middle speed system clock". The former is a high speed oscillation clock and the latter is generated by dividing High speed system clock.

The outline of the clock/mode control circuit is as follows:

- Internal high speed oscillator: 10MHz
- Selectable from the external high speed oscillator or internal high speed oscillator.
- PLL (Clock Multiplication Circuit)
 - For System clock, Capable of 160 MHz output by changing the multiplication ratio according to the frequency of the high speed oscillation circuit.
- Clock gear:
 - The high speed clock can be divided by 1, 2, 4, 8, or 16 and the clock is used as the system clock (f_{sys}).
- Low-power consumption mode:
 - IDLE: Only the CPU is stopped in this mode. Each peripheral circuit can enable or disable operation in the IDLE mode.
 - STOP1: The system clock is stopped in this mode.

5.4. Flash Memory (Code FLASH, Data FLASH)

TMPM4K Group(2) has 256KB/128KB of Code flash and 32KB of Data flash.

The code flash stores instruction code, and CPU reads instruction code and executes. The data flash stores data, and even if a power supply is off, data can be kept.

It has the dual mode that possible to write and erase data flash while executing an order by a code flash. And it's also possible to continue executing an application program during writing or erasing data flash memory.

It has protection function which prohibits write or erase by the block unit and it has the security function which prohibits the reading of the program code by the 3rd person.

5.5. Oscillator

External High Speed Oscillator (EHOSC):

Connect crystal resonator or ceramic resonator to terminals. Use clock source for System clock.

Internal High Speed Oscillator 1 (IHOSC1):

The oscillation frequency is 10MHz. Use clock source for System clock.

Internal High Speed Oscillator 2 (IHOSC2):

The oscillation frequency is 10MHz. Use clock source for OFD and SIWDT.

Table 5.4 Built-in Oscillator

	M4KN	M4KM	M4KL	M4KH
EHOSC	✓	✓	✓	✓
IHOSC1	✓	✓	✓	✓
IHOSC2	✓	✓	✓	✓

Note: ✓: Available, -: N/A

5.6. Trimming Circuit (TRM)

The TRM can adjust oscillation frequency of the internal high speed oscillator (IHOSC1).

Table 5.5 Built-in TRM

	M4KN	M4KM	M4KL	M4KH
TRM	✓	✓	✓	✓

Note: ✓: Available, -: N/A

5.7. Oscillation Frequency Detection Circuit (OFD)

The OFD is a function that detects an abnormal state of the clock. It measures the external high speed oscillation (f_{EHOSC}) or high speed clock (f_c) based on the internal reference clock (f_{IHOSC2}). If an oscillation or clock frequency is out of the specified range, a reset signal occurs.

The upper limit and the lower limit of detection frequency ranges can be specified.

	M4KN	M4KM	M4KL	M4KH
OFD	✓	✓	✓	✓

Note: ✓: Available, -: N/A

5.8. Voltage Detection Circuit (LVD)

The LVD is a peripheral function that detects whether a power supply voltage is lower or higher than the preset voltage. When a low voltage or higher voltage than the preset voltage is detected, the LVD generates an interrupt request or reset the MCU.

Setting voltage can be chosen from eight kinds. LVD is set to enable from the Reset state at the Power on.

	M4KN	M4KM	M4KL	M4KH
LVD	✓	✓	✓	✓

Note: ✓: Available, -: N/A

5.9. Digital Noise Filter circuit(DNF)

The DNF can eliminate the noise of input signals from external interrupt pins at the certain range. The noise of the High level / Low level input of the external interrupt signal INTx is removed.

Table 5.8 Number of DNF

	M4KN	M4KM	M4KL	M4KH
Number of DNF	32	24	20	10

Note: INT05a and INT11b are assigned to same pin.

5.10. Debug Interface (DEBUG)

TPM4K Group(2) contains interface for connecting debug tool, which is the Serial Wire Debug Port (SWCLK, SWDIO) and the JTAG Debug Port (TDI, TDO, TMS, TCK, TRST_N). These are connected with the Debug tool and used for program development. And also it contains the trace clock(TRACECLK) and data output (TRACEDATA0to3) to reduce the Debug Process.

TPM4K Group(2) products support serial wire debug ports, JTAG debug ports, trace outputs, and NBDIF.

5.10.1. Non Break Debug Interface (NBDIF)

Connecting debug tools supporting NBDIF can provide RAM monitor function.

NBDIF support vary depending on the product. Please refer to "Table 5.9 Built-in Debug Interface".

5.11. DMA Controller (DMAC)

The DMAC is the peripheral function to move the data between peripheral functions and the memory, or between memories. These operations are performed separately from the CPU control; thus, the CPU load can greatly be reduced by using the DMA.

TMPM4K Group(2) product has one DMA controller (DMAC) unit, and there are up to 32 channels of activation factors per unit.

Table 5.10 Built-in DMAC

Unit	M4KN	M4KM	M4KL	M4KH
Unit A	✓	✓	✓	✓

5.12. Asynchronous Serial Communication Circuit (UART)

The UART is asynchronous serial communication function. It can choose the data length of 7, 8 or 9bits, parity existence, and a STOP bit length function. Moreover, selection of the MSB first / LSB first and reversal of data polarity can be performed and Terminal exchanged of TXD/RXD can be performed in a Port setting.

The FIFO buffer supports data communication on 8-stage at transmission; and on 8-stage at reception. The telecommunication control by CTS/RTS is supported.

Channel	M4KN	M4KM	M4KL	M4KH
Channel 0	✓	✓	✓	✓
Channel 1	✓	✓	✓	✓
Channel 2	✓	✓	✓	✓
Channel 3	✓	✓	-	-

Note1: ✓: Available, -: N/A

Note2: External pins vary depending on the product. Please refer to section "2.Pin Assignment".

5.13. Serial Peripheral Interface (TSPI)

The TSPI supports two communication methods and enables serial communication to perform between other devices at high speed. The SPI bus type, which uses a CS (Chip Select) signal at communications, and SIO bus type, which does not use a CS signal at communications can be selected.

The data length can be changed from 7 bits (with a parity bit) to 32 bits (without a parity bit) in the unit of one bit. There is an 8-stage 16-bit FIFO for reception and transmission, each. The TSPI supports the master and slave communications.

It can support frame mode (frame length (8 to 32 bit)) or sector mode (8 to 128 bit of frame length is configured in 2 to 4 sectors).

5.14. I²C Interface

The following table shows the List of Built-in I²C Interface.

I²C and EI2C assigned to the same channel and the same pin cannot be used at the same time.

Channel 0	✓	✓	✓	✓
Channel 1	✓	✓	✓	-

Note1: ✓: Available, -: N/A

Note2: External pins vary depending on the product. Please refer to section "2.Pin Assignment".

5.14.1. I²C Interface (I²C)

I²C is two-wire bi-directional serial communications between Master and Slave device. The mode in which two or more masters can exist on the same bus called a multi-master is supported. It supports Standard mode (Max 100kHz), Fast mode (Max 400kHz). It supports 7-bit slave addressing.

5.14.2. I²C Interface Version A (EI2C)

EI2C is two-wire bi-directional serial communications between Master and Slave device. The mode in which two or more masters can exist on the same bus called a multi-master is supported. It supports STD mode (Max 100kHz), Fast mode (Max 400kHz), Fast mode plus (Max 1MHz), and 7-bit addressing and more 10-bit addressing.

5.15. 12-bit Analog to Digital Converter (ADC)

The ADC is a 12-bit successive-approximation analog-to-digital converter. The combination of a conversion result register and analog input can be programmed in each startup trigger of AD conversion. A startup trigger for analog to digital conversion can be selected from software or peripheral functions (A-PMD trigger outputs, timer/event counter outputs, port inputs). A motor is easily controllable by cooperating especially with A-PMD.

The monitor function of conversion result is also available and it can generate an interrupt when the compare conditions are matched.

This ADC incorporates a selector to connect VREFH/VREFL with reference power supply. Controlling by software can support self-diagnosis function.

ADC	M4KN	M4KM	M4KL	M4KH
Unit A Analog Inputs Pin count	11	8	8	6
Unit B Analog Inputs Pin count	5	5	3	2
Unit C Analog Inputs Pin count	6	4	3	0

Note: External pins vary depending on the product. Please refer to section "2.Pin Assignment".

5.16. Operational Amplifier (OPAMP)

This MCU incorporates an OPAMP to amplify weak analog signals inputting to the ADC. The input gain is selectable.

5.17. Advanced Programmable Motor Control Circuit (A-PMD)

The A-PMD enables users to control brushless DC motors easily. It incorporates the pulse modulation circuit and dead-time circuit, and easily generates signals for motor control that makes 3-phase complementary PWM output and ADC cooperate.

It also provides the over-voltage detection input and abnormal detection input to support safety measures.

Furthermore, 3-phase interleaved PFC control for power-factor improvement can be provided.

Channel 1	✓	✓(Note3)	✓(Note3)	-
Channel 2	✓	✓(Note3)	✓(Note3)	-

Note1: ✓: Available, -: N/A

Note2: External pins vary depending on the product. Please refer to section "2.Pin Assignment"

Note3: There is no OVVx pin in M4KM and M4KL. There are no EMG0 pin and OVV0 pin in M4KH.

5.18. Advanced Encoder Input Circuit (32-bit) (A-ENC32)

The A-ENC32 supports an incremental encoder to acquire the motor position easily. The noise canceller is installed in the input pins, so that the signals from an incremental encoder or Hall sensor can be input directly.

The A-ENC32 provides six operation modes: encoder mode, sensor modes (3 kinds), timer mode, and phase counter mode.

5.19. Advanced Vector Engine Plus (A-VE+)

The advanced vector engine plus executes vector control by hardware. In this vector operation, the ADC and A-PMD operate in a coordinated fashion without software involvement.

Also, it provides 1-shunt current detection area enlargement process, dead time compensation control, and non-interfere control.

5.20. 32-bit Timer Event Counter (T32A)

The T32A is a timer event counter that can operate as a 32-bit timer or two 16-bit timers. 16-bit Timer or 32-bit Timer can be selected. In 16-bit Timer, the T32A is comprised of Timer A and Timer B incorporating a 16-bit counter. In 32-bit Timer, the T32A operates as Timer C incorporating a 32-bit counter.

The T32A have an interval timer, event counter, input capture, 2-phase counter input, PPG output, Synchronous Start, and Trigger start/stop functions.

5.21. Clock Selective Watchdog Timer (SIWDT)

The SIWDT is a peripheral function that detects an overflow of the binary counter and generates an interrupt request or resets the MCU. This state occurs when a binary counter cannot be cleared within the preset detection time.

The count clock can be selected from three clocks: system clock ($f_{\text{sys}}/4$), internal oscillator1 ($f_{\text{IHOSC}1}$), or internal oscillator2 ($f_{\text{IHOSC}2}$).

It also provides the count-clear window function that can clear the count only for the specified period.

Moreover, change of a register can be forbidden by setting to protected mode.(the count-clear function is possible)

5.22. CRC Calculation Circuit (CRC)

The CRC Calculation Circuit has the hardware calculation circuit for CRC32 and CRC16.

It can be used for detecting a memory and communication data error.

5.23. RAM Parity (RAMP)

The RAM parity function generates and (8-bit unit) stores even parity data when writing to RAM, and performs a parity judging when reading from RAM.

An interrupt is generated when it becomes an error by judgment. The Status and Address which the error generated are known.

6. Equivalent Circuit

Basically, the gate symbols written are the same as those used for the standard CMOS logic IC [74HCxx] series. The input protection resistance ranges from several tens of Ω to several hundred Ω . Feedback resistor and Damping resistor are shown with a typical value.

Note: The resistance without the statement of the numerical value in the figure shows input protection resistance.

	V _{IN4}	-0.3 to 6.0	
	I _{OL}	5	
High level output current	I _{OL4}	25	mA
	Σ I _{OL}	50	
Power consumption	I _{OH}	-5	mA
	Σ I _{OH}	-50	
Soldering temperature	PD	(Note3)	mW
Storage temperature	T _{SOLDER}	260	°C
Operational temperature	T _{STG}	-55 to 125	°C
	T _{OPR}	-40 to 105(Note3)	°C
	T _j	-40 to 135	

Note1: Absolute maximum ratings are limiting values of operating and environmental conditions which should not be exceeded under the worst possible conditions. The equipment manufacturer should design so that no Absolute maximum rating value is exceeded with respect to current, voltage, power consumption, temperature, etc. Exposure to conditions beyond those listed above may cause permanent damage to the device or affect device reliability, which could increase potential risks of personal injury due to IC blow up and/or burning.

Note2: DVDD5 is a generic name for DVDD5A, DVDD5B. DVSS is a generic name for DVSSA, DVSSB, DVSSC. Apply the same voltage to DVDD5 and AVDD5.
And refer to following description for turning-on and turning-off a power.

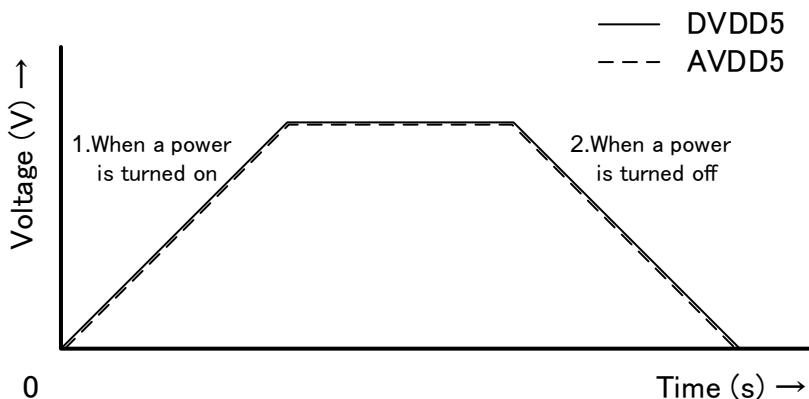

Figure 7.1 Notice When a Power is Turned On and Off

1. When a power is turned on

Note the following:

- A) Even if DVDD5 and AVDD5 are supplied a voltage from a same power supply, the voltage between DVDD5 and AVDD5 may have a different by the capacity of the capacitors which are connected with DVDD5 to DVSS and AVSS5 to AVSS, and by the stray capacitances and inductance of PCB patterns.

2. When a power is turned off

Note the following:

- A) Because capacitors and PCB patterns still have a residual electric charge, the voltage between DVDD5 and AVDD5 may have a different.
- B) A power is re-turned on in above situation.

Note3: The power consumption and the maximum temperature of the ambient temperature (T_{OPR}) should be used within the range not exceeding the junction temperature (T_j). The calculation formula for operating temperature (T_{OPR} (T_a)) is shown below.

$$T_{OPR}(\text{Max}) = T_j(\text{Max}) - PD(\text{Max}) \times \theta_{ja}$$

PD: Power consumption (mW) → Maximum allowable power (PD(Max)) (mW)

θ_{ja} : Thermal resistance of the package ($^{\circ}\text{C}/\text{W}$)

Please refer to Table 7.2.

The calculation formula for maximum allowable power (PD(Max)) is shown below.

$$PD(\text{Max}) = V_{DD} \times I_{DD}(\text{Max}) + \sum (I_{OL} \times V_{OL}) + \sum ((V_{DD} - V_{OH}) \times |I_{OH}|)$$

I_{OL} : "Low" level output current

I_{OH} : "High" level output current

V_{OL} : "Low" level output voltage

V_{OH} : "High" level output voltage

$I_{DD}(\text{Max})$: Consumption current of the MCU excluding I/O.

Please refer to "7.3.DC Electrical Characteristics (2/2)".

7.10. AC Electrical Characteristics

7.10.1. Serial Peripheral Interface (TSPI)

7.10.1.1. Conditions

The AC characteristics are as follows:

- DVDD5=AVDD5= 2.7 to 5.5 V
- Ta = -40 to 105°C
- Output level: High = $0.8 \times \text{DVDD5}$, Low = $0.2 \times \text{DVDD5}$
- Input level: High = $0.75 \times \text{DVDD5}$, Low = $0.25 \times \text{DVDD5}$
- Load capacity: CL = 30pF

Note: DVDD5 is a generic name for DVDD5A, and DVDD5B.

7.10.1.2. AC Electrical Characteristics

"T" indicates an operation clock cycle of the TSPI. This operation clock has the same cycle of the system clock (f_{sysm}). This cycle depends on the clock gear setting.

The number of cycles can be 1 to 16. It is specified with TSPIxSCK. The value of "k1" is specified with *[TSPIxFMTR0]<CSSCKDL[3:0]>*; the value of "k2" is specified with *[TSPIxFMTR0]<SCKCSDL[3:0]>*. These values are 1 to 16.

Note1: On I²C bus standard, the maximum speed of standard mode/fast mode is 100kHz/400 kHz, respectively.

For the frequency setting of the internal SCL clock, refer to the calculation formula in chapter 3.3.2 of "I²C Interface" in reference manual.

Note2: On I²C bus standard, it is described that a data internal hold time should be set at least 300 ns to avoid unstable condition on the falling of the SCL when the SDA is input; however, this precaution is not supported in this MCU. Also, the edge slope control function for the SCL is not available. Therefore, when the customer designs the MCU, make sure to follow the data hold time (input) in the table above. Note that t_r/t_f on the SCL/SDA should be included in the data hold time.

Note3: To keep the time by software.

Note1: DVDD5 is a generic name for DVDD5A, and DVDD5B. DVSS is a generic name for DVSSA, DVSSB, and DVSSC.

Note2: Please contact the oscillator vendor, regarding the matching data of the device and the oscillator.

7.13.3. Oscillation Circuit

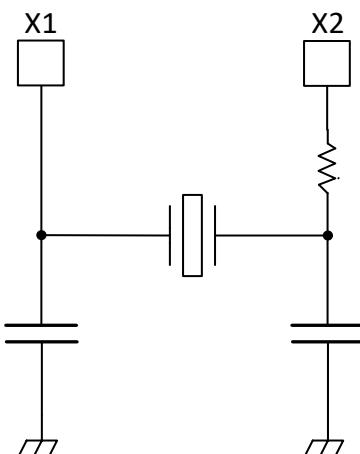

Figure 7.14 Oscillation circuit sample

To obtain a stable oscillation, load capacity and the position of the oscillator must be configured properly. Since these factors are strongly affected by substrate patterns, please evaluate oscillation stability using the substrate you use.

This product has been evaluated by the oscillator vendor below. Please refer this information when selecting external parts.

7.13.4. Ceramic resonator

This product has been evaluated by the ceramic resonator by Murata Manufacturing Co., Ltd.
Please refer to the company's website for details.

7.13.5. Crystal unit

This product has been evaluated by the crystal unit by KYOCERA Corporation and MURATA MANUFACTURING Corporation.

Please refer to each company's website for details.

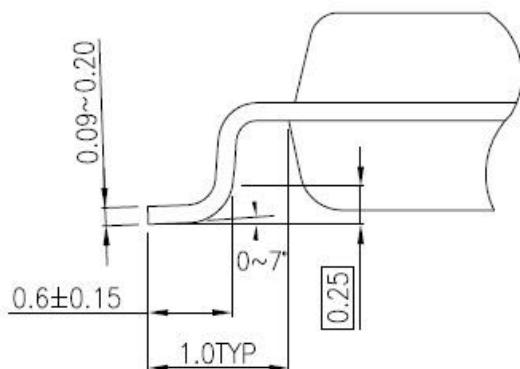

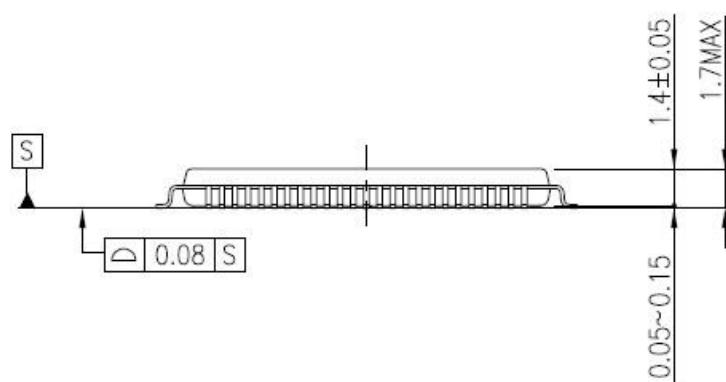

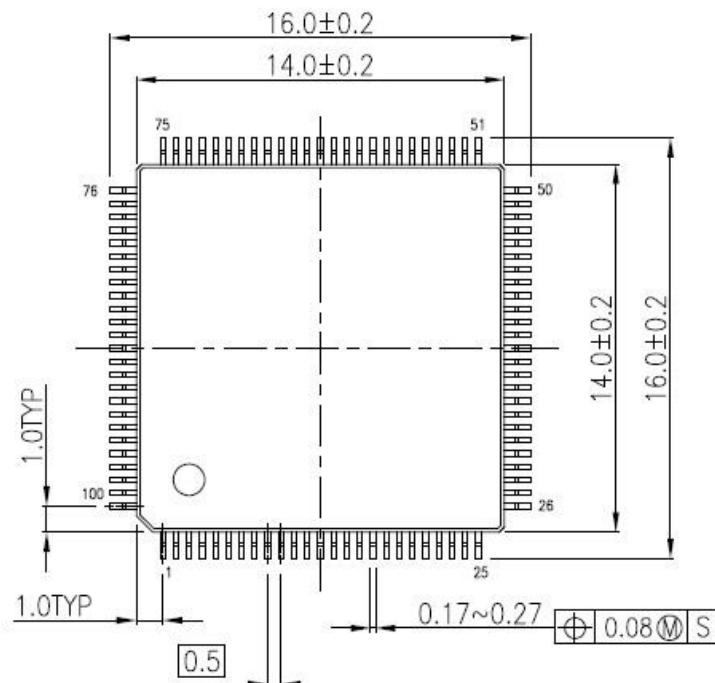

7.13.6. Precautions for designing printed circuit board

Be sure to design printed circuit board patterns that connect a crystal unit with other oscillation elements so that the length of such patterns become shortest possible to prevent deterioration of characteristics due to stray capacitances and wiring inductance. For multilayer circuit boards, it is important not to wire the ground and other signal patterns right beneath the oscillation circuit. For more information, please refer to the URL of the crystal unit vendor.

9. Precautions

This Page explains general precautions on the use of our MCUs.

Note that if there is a difference between the general precautions and the description in the body of the document, the description in the body of the document has higher priority.

(1) The MCUs' operation at power on

At power on, internal state of the MCUs is unstable. Therefore, state of the pins is undefined until reset operation is completed.

When a reset is performed by an external reset pin, pins of the MCUs that use the reset pin are undefined until reset operation by the external pin is completed.

Also, when a reset is performed by the internal power on reset, pins of the MCUs that use the internal power on reset are undefined until power supply voltage reaches the voltage at which power on reset is valid.

(2) Unused pins

Unused input/output ports of the MCUs are prohibited to use. The pins are high-impedance.

Generally, if MCUs operate while the high-impedance pins left open, electrostatic damage or latch-up may occur in the internal LSI due to induced voltage influenced from external noise.

We recommend that each unused pin should be connected to the power supply pins or GND pins via resistors.

(3) Clock oscillation stability

A reset state must be released after the clock oscillation becomes stable. If the clock is changed to another clock while the program is in progress, wait until the clock is stable.

RESTRICTIONS ON PRODUCT USE

Toshiba Corporation and its subsidiaries and affiliates are collectively referred to as "TOSHIBA".

Hardware, software and systems described in this document are collectively referred to as "Product".

- TOSHIBA reserves the right to make changes to the information in this document and related Product without notice.
- This document and any information herein may not be reproduced without prior written permission from TOSHIBA. Even with TOSHIBA's written permission, reproduction is permissible only if reproduction is without alteration/omission.
- Though TOSHIBA works continually to improve Product's quality and reliability, Product can malfunction or fail. Customers are responsible for complying with safety standards and for providing adequate designs and safeguards for their hardware, software and systems which minimize risk and avoid situations in which a malfunction or failure of Product could cause loss of human life, bodily injury or damage to property, including data loss or corruption. Before customers use the Product, create designs including the Product, or incorporate the Product into their own applications, customers must also refer to and comply with (a) the latest versions of all relevant TOSHIBA information, including without limitation, this document, the specifications, the data sheets and application notes for Product and the precautions and conditions set forth in the "TOSHIBA Semiconductor Reliability Handbook" and (b) the instructions for the application with which the Product will be used with or for. Customers are solely responsible for all aspects of their own product design or applications, including but not limited to (a) determining the appropriateness of the use of this Product in such design or applications; (b) evaluating and determining the applicability of any information contained in this document, or in charts, diagrams, programs, algorithms, sample application circuits, or any other referenced documents; and (c) validating all operating parameters for such designs and applications. **TOSHIBA ASSUMES NO LIABILITY FOR CUSTOMERS' PRODUCT DESIGN OR APPLICATIONS.**
- **PRODUCT IS NEITHER INTENDED NOR WARRANTED FOR USE IN EQUIPMENTS OR SYSTEMS THAT REQUIRE EXTRAORDINARILY HIGH LEVELS OF QUALITY AND/OR RELIABILITY, AND/OR A MALFUNCTION OR FAILURE OF WHICH MAY CAUSE LOSS OF HUMAN LIFE, BODILY INJURY, SERIOUS PROPERTY DAMAGE AND/OR SERIOUS PUBLIC IMPACT ("UNINTENDED USE").** Except for specific applications as expressly stated in this document, Unintended Use includes, without limitation, equipment used in nuclear facilities, equipment used in the aerospace industry, lifesaving and/or life supporting medical equipment, equipment used for automobiles, trains, ships and other transportation, traffic signaling equipment, equipment used to control combustions or explosions, safety devices, elevators and escalators, and devices related to power plant. **IF YOU USE PRODUCT FOR UNINTENDED USE, TOSHIBA ASSUMES NO LIABILITY FOR PRODUCT.** For details, please contact your TOSHIBA sales representative or contact us via our website.
- Do not disassemble, analyze, reverse-engineer, alter, modify, translate or copy Product, whether in whole or in part.
- Product shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable laws or regulations.
