The IT Infrastructure and Cabling Design

Your source for everything from the data centre to the desktop—

In this guide, you'll find the latest technologies, tools, tips, and trends to build and upgrade your physical infrastructure for today's networks and to prepare for tomorrow's.

Because the infrastructure is a critical component of your entire network, smart planning and design can have a real effect on your organisation's day-to-day operations and can contribute to its success.

As always, we're here 24/7 to answer your questions and to help you plan your infrastructure. Whether it's finding the right cooling solution for your data centre or some jacks for desktop connections, our Tech Support can help. And also, if you don't see what you need, call us. We can custom-design a solution just for you.

Infrastructure Solutions for Every Industry

Support and solutions to make your infrastructure goals a reality.

Planning a network infrastructure is a daunting task, even for the most seasoned IT professional. What works in one industry might work in another—or might not.

While security may be a top priority for the government or financial institutions, other industries, such as healthcare may need custom-designed cables and cabinets to satisfy regulatory requirements. Education poses entirely different challenges in terms of the proliferation of tablets and mobility in the classroom. And manufacturing and industrial environments must deal with the question of the best way to set up infrastructure in harsh, remote, and extreme environments.

When you need advice, turn to the experts at Black Box. For more than 35 years, our engineers have been helping IT professionals like you achieve their goals with off-the-shelf, custom made, and cutting-edge infrastructure technologies. We're here to help you put the latest trends in network infrastructure to work for you.

Physical network infrastructure

A physical network infrastructure that's smartly designed takes careful planning and can be a daunting project, even for the most experienced IT professional.

The network infrastructure in your office, building, or campus is a critical component of your organisation. Proper planning, design, installation, and maintenance of this infrastructure can have a positive impact on your company's day-to-day operations and can contribute to its success.

The system you plan or upgrade today will be supporting new and different applications for at least 10 years, possibly more. The question is, how do you plan for the future?

In this solutions guide, you'll find everything you need to plan your infrastructure from the data centre to the desktop.

Design considerations

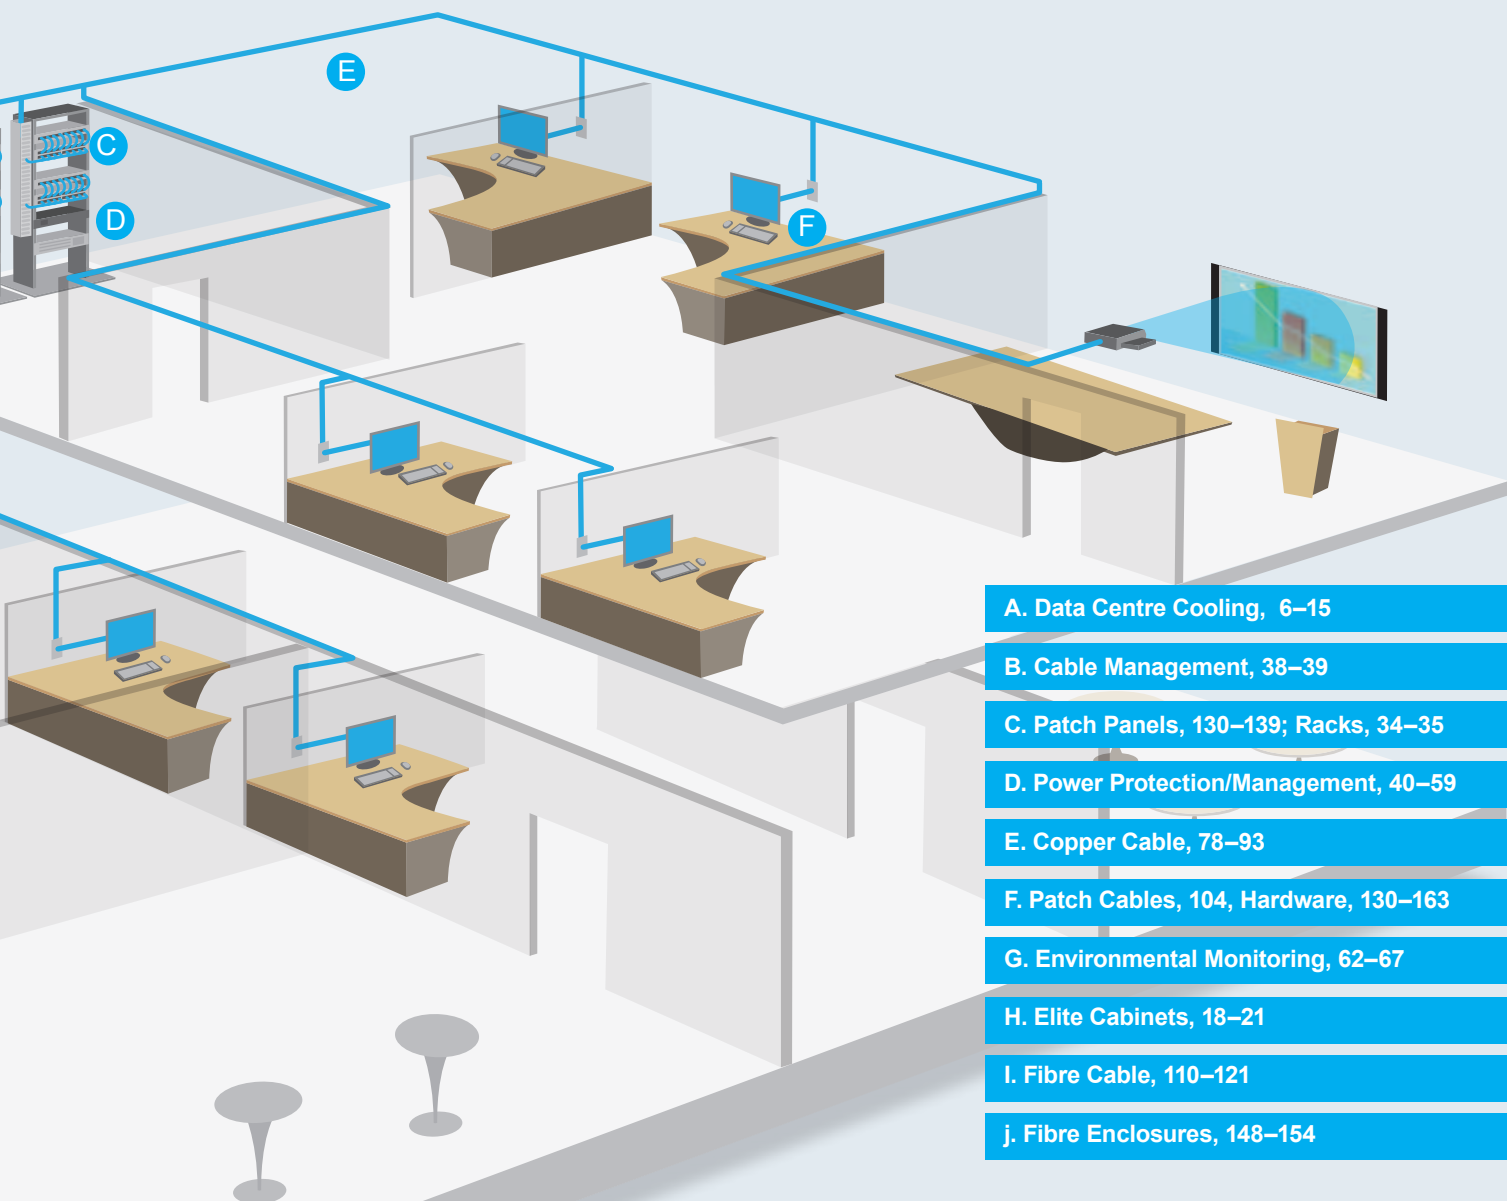

The first step in designing and implementing a new or upgraded network infrastructure is to step back and assess your needs. The more complex your network is now, the more important it is to successfully plan for growth. No matter if your network consists of a two-room office or a multi-building campus, decisions you make now will impact your business's or organisation's success for many years to come.

Plan on using the best cable, hardware, and components your budget can afford. The latest technologies you install today will be old hat by the time you're ready to replace your cabling system in 10, 15, or even 20 years. And, most importantly, plan for more capacity and space than you think you'll need.

Consider these questions during your planning.

- How many servers and workstations do you have now, and how many do you anticipate adding over the next 10 years?
- Where will you locate your data centre?
- How much power do you need in your data centre?
- What cooling methodology and solutions are best for your data centre/server room?
- How much network bandwidth do you need now? How much do you think you'll need in 5 years? 10 years?
- What are your requirements for redundancy and scalability?
- What type of media will you use? Fibre, copper, both?

- Do you need to connect equipment in remote environments?
- Do you plan on using PoE for remote or VoIP phone connections?

Other tips include:

- Plan for complete wireless coverage.
- Future-proof your network by using the best technology and products your budget can afford.
- Leave room for growth in cabinets, racks, conduits, cable trays, etc.
- Label and document your cabling system.

The Language of Cooling

While cooling industry terminology can be like a foreign language when you first encounter it, taking the time to learn the basics can help you understand your data centre or server room's requirements. Listed below are a few of the more common cooling terms. Black Box data centre experts are available to help you to learn the language, too.

Commonly used cooling terms

British Thermal Unit (BTU)—The amount of heat required to raise the temperature of one pound of water by 1° C.

Note: BTU is also an abbreviation for BTU/hr.

Chilled Water System (CW)—A cooling system that uses chilled water to cool the warm return air and discharge the cool air. Typically, the chilled water is cooled by a remote chiller.

Dew Point Temperature (DP)—The temperature at which a sample of air will be 100% saturated with water vapour (100% relative humidity).

Direct Expansion System (DX)—A cooling system that utilises a refrigerant and an evaporator coil to cool the warm return air.

Dry-Bulb Temperature (DB)—The temperature indicated by an ordinary thermometer. It indicates the sensible heat of air and water vapour mixture.

MBTU – Thousands of BTUs.

Relative Humidity (RH)—The ratio of the partial pressure of water vapour in an air-water mixture to the saturated vapour pressure at a certain temperature.

Ton—The amount of heat required to melt a ton of ice in 24 hours at 30° C.

Wet Bulb Temperature (WB)—An air temperature that is used to evaluate the humidity in the air. It is obtained with a wet thermometer bulb to record the evaporation rate with an airstream passing over the bulb to help in evaporation.

Conversions:

- kW to BTU/hr: $\text{kW} \times 3,412 = \text{BTU/hr}$
- kW to Tons: $\text{kW} \times 0.2843 = \text{Tons}$
- BTU/hr to Tons: $\text{BTU/hr} / 12,000 = \text{Tons}$
- BTU/hr to kW: $\text{BTU/hr} / 3,412 = \text{kW}$
- Tons to kW: $\text{Tons} \times 3.513 = \text{kW}$
- Tons to BTU/hr: $\text{Tons} \times 12,000 = \text{BTU/hr}$

Determining the best way to cool your server room or data centre is

Perimeter cooling with hot aisle/cold aisle.

Cabinets are configured back to back and front to front so that aisles of cold air and hot air are created. This is typically done on a raised floor with perforated tiles in the cold aisle to achieve the desired airflow. This arrangement works best for lower equipment densities and power loads less than 5 kW per enclosure. As more equipment is added, the inlet temperature starts to exceed ASHRAE standards putting equipment at risk. Other cooling methodologies need to be considered.

Advantages:

- Already exists in many facilities.
- Familiar technology.

Disadvantages:

- Low cooling capacity (<5 kW per enclosure).
- Inefficient: Need 25–100% more cooling than actual requirement.
- Maintenance costs, service agreements.
- Infrastructure for entire white space must be installed on day one.
- Is not easily scalable.
- Existing cabinets cannot always be easily moved or reconfigured due to existing cabling.

Perimeter cooling with containment.

Cold aisle containment (CAC) adds doors to the ends of the cold aisle and possibly a ceiling to minimise the mixing of the air, thus increasing cooling efficiency. The airflow barrier can range from makeshift arrangements of plastic strips to doors and ceilings made expressly for this purpose.

Because cold aisle containment concentrates cool air at the front of equipment where it's most needed, it's an exceptionally effective cooling method. Cold aisle containment significantly reduces energy usage, lowering power bills as well as reducing a data centre's carbon footprint. In addition, it increases the available cooling capacity.

With hot aisle containment, hot exhaust air from IT equipment is contained so that it doesn't mix with cool air. The front of IT equipment is accessed in the external cold aisle.

This method uses doors and other barriers like cold aisle containment does. However, in this configuration, hot air is captured and directed back to the computer room air conditioning (CRAC) unit. This method also prevents the mixing of hot and cold air, again increasing overall efficiency.

Advantages:

- No fans required.
- Isolation of hot exhaust from cool supply.
- Increases efficiency of computer room air conditioner/heater (CRAC/H).
- Easily deployed in existing data centres.
- More consistent predictable temperatures.
- Can be curtains, metal, plastic ceiling.

Disadvantages:

- May require additional lighting and smoke/fire detection and suppression.
- Still relying on computer room air conditioner/heater (CRAC/H).
- Not conditioning air, just moving it more effectively.
- Curtain solutions sway and are leaky.
- Infrastructure for entire white space must be installed on day one.
- May be difficult or impossible to create a redundant (2N) cooling design.

Hot Aisle / Cold Aisle Configuration

Cold Aisle Containment (CAC)

vital to its reliability and efficiency.

Row cooling, with and without containment.

Designed for scalability, reliability, and seamless integration into new or existing data centres, rack cooling systems are suitable for use in open and contained hot aisle and cold aisle configurations. They're also ideal for hot spot cooling in small- to enterprise-size data centres.

Row systems are available in chilled water or direct expansion (DX) configurations. They capture high-temperature (hot aisle) discharge air from adjacent rack-based IT equipment and reintroduce it as conditioned air through the front of the unit (cold aisle).

Advantages:

- Easily scalable over time as loads and footprint increase.
- Capacity from 17 kW to 30 kW.
- Does not interfere with overhead cable management.
- Cooling near source more efficient than CRAC/H.
- Good for hot spots or supplemental cooling in existing facilities.
- Can use with containment to increase capacity.
- A raised floor is not necessary.
- Can create a redundant 2N cooling design.
- EC fan technology offers significant improvement in efficiency vs. first generation In-Row Cooling cooling.

Disadvantages:

- Need to accommodate condensers required for DX versions.
- Chilled water versions require a chiller or capacity from an existing chiller.

In-Row Cooling Intelligent Rack Cooling

Passive Cooling.

Suitable for new data centres as well as existing ones, passive liquid cooling at the rack level supports increasing IT rack power densities. Resources can be added on an as-needed basis rather than completing a full build-out of an entire space at one time. For existing data centres, this solution also enables upgrades with no disruption to IT operations while achieving a significant cost savings in energy consumption, not to mention the capital expense of constructing a new data centre. Using passive cooling opens options in retrofitting for optimised performance, a comparable initial cost compared with traditional cooling options, and the opportunity to increase cooling capacity without disrupting operations. Long-term, cooling is significantly more cost-effective to data centre operators.

Advantages:

- Highly efficient.
- Very flexible—can install where cooling is needed.
- Lower total cost of ownership (TCO) than other solutions due to passive devices.
- No fans mean no power and reduced operating costs.
- Highly predictable—when close coupled.
- Less costly to pump liquid than to blow air.
- Water cools >3,400x more than air.
- Localised Cooling has been around for more than 45 years (IBM® mainframes, Cray super-computers, military electronics).

Disadvantages

- Need a chiller or capacity from an existing chiller.
- Up-front cost may be large.

Data Centre Design Tips

What are the most important things to consider when designing a data centre?

- ✓ Consider initial and future loads.
- ✓ Lower data centre power consumption and increase cooling efficiency by grouping together equipment with similar heat load densities and temperature requirements. This allows cooling systems to be controlled to the least energy-intensive set points for each location.
- ✓ Reference 2011 ASHRAE Thermal Guidelines for Data Processing Environments to review the standardised operating envelope for the recommended IT operating temperature.
- ✓ Identify the class of your data centre to determine the recommended and allowable environmental envelopes:
 - Recommended: Combines energy-efficient operation with high reliability.
 - Allowable: Outlines boundaries tested by IT equipment manufacturers for functionality.
 - Keep in mind that operating outside the recommended envelope may cause server fans to operate at higher speeds and therefore consume more power.
- ✓ Implement effective air management to minimise or eliminate mixing air between the cold and hot air sections. This includes configuration of equipment's air intake and heat exhaust paths, location of air supply and air return, and the overall airflow patterns of the room. Benefits include reduced operating costs, increased IT density, and reduced heat-related processing interruptions or failures.
- ✓ Under-floor and overhead cable management is important to minimise obstructions within the cooling air pattern.
- ✓ Prevent mixing of hot and cold air by implementing a hot aisle/cold aisle configuration. Create barriers and seal openings to eliminate air recirculation. Supply cold air exclusively to cold aisles and pull hot return air only from hot aisles.
 - Higher return air temperatures extend the operating hours of air economisers.
- ✓ Choose an enclosure configuration that supports your cooling method.
- ✓ If using raised-floor cooling, carefully consider the location of perforated floor tiles to optimise air flow.
- ✓ Managing a uniform static pressure in the raised floor by careful placement of the A/C equipment allows for even air distribution to the IT equipment.

ASHRAE Best Practices

ASHRAE (American Society of Heating, Refrigerating and Air-Conditioning Engineers) TC9.9 contains guidelines for data processing environments. The guidelines are created by a committee that includes representatives from major equipment manufacturers. TC9.9 recommendations are made for "recommended" and "allowable" temperature and humidity ranges for the data centre to maintain high reliability as well as efficient operation. In the most recent update, the guidelines were changed to increase the range of temperature and humidity.

ASHRAE Recommended

- ✓ Server Inlet Air Temperature: 17.7- 27°C DB.
- ✓ Relative Humidity: 5.5°C DP to 60% RH and 15°C DP.

ASHRAE Allowable

- ✓ Server Inlet Air Temperature: 15-32°C DB.
- ✓ Relative Humidity: 20-80% RH up to 16.72°C DP.

How does raising air temperatures impact the data centre?

- ✓ Increases CRAC sensible capacity up to 66%.
- ✓ Same or better sensible capacity with up to 33% less fan power.
- ✓ Allows higher chilled water temperature for more efficient chiller operation.

Hospitality

The Challenge:

A hotel chain was building out a new data centre, in the new corporate headquarters, that would be used to house the IT infrastructure for all of their facilities nationwide.

The Solution:

After learning about the hotel chain's situation and requirements, Black Box recommended a total infrastructure solution for their data centre, including cooling, cabinets and accessories, UPSs, PDUs, and environmental monitoring.

The implemented solution is a cold aisle containment configuration with overhead cable management. It doesn't require a raised floor and provides some redundancy. It can handle heat loads of up to 60 kW within the containment pod with just two In-Row chilled water units and has the UPS capacity to support the load as well. Since it was a new building, the hotel was able to size their new chiller with enough capacity to support the In-Row units.

The solution includes a 10-cabinet package with cold aisle containment, 2N cooling and n+1 power distribution:

- Ten (10) Elite™ Cabinets for housing IT equipment, including air dams, baying hardware, and blanking panels. (Cabinets are 42U, 30" wide, and 42" deep.)
- Two (2) sets of Elite Cabinet containment doors.
- One (1) custom containment ceiling.
- Two (2) In-Row chilled water units (with authorised startup services).
- Complete 60-kW, n+1 metered UPS solution with remote management including (1) cabinet, buss bar, wire-way, power distribution, assembly, and startup services. (Cabinet is 42U, 750 mm wide, and 1000 mm deep.)
- Eighteen (18) metered PDUs—3-phase, 30 A/8.64-kW (24-A), 33-outlet (24) IEC-320-C13, (9) IEC-320-C19], plug type: IEC60309 32A, 0U vertical mounting (2 per cabinet).
- AlertWerks™ ServSensor package with nine (9) temperature/humidity sensors to monitor each cabinet.

A total infrastructure solution was needed that could handle a load of approximately 60 kW.

- KVM tray—1U, 17" LCD display that includes keyboard and touchpad.

No cooling available? One cabinet running hot? No problem. Just use a ClimateCab.

IP 52

NEMA 12

ClimateCab™ Server Cabinet

Save by cooling the cabinet, not the entire room

- IP52 / NEMA 12 rated for protection against falling dirt, circulating dust, lint debris, and splashing liquids in indoor environments.
- Includes 19" rails with M6 square mounting holes.
- Includes castors and levellers.
- 1m depth accommodates most servers.
- Fully welded body and door construction.
- Seamless door gaskets keep out dust and contaminants.
- Gland plate for sealed top or bottom cable entry / exit.
- Three-point locking handles on front and rear doors.
- Removable side panels enable easy attachment and relocation of air conditioning unit.
- **GO GREEN** – save energy and money by cooling only the cabinet rather than the whole room or IT centre.

When you need to install rackmount equipment in less-than-ideal environments or in areas without existing cooling infrastructure, ClimateCab Server Cabinets are your answer. Their self-contained cooling system keeps your equipment housed in ideal conditions in virtually any location.

These units feature excellent access to equipment with removable, reversible doors and sides.

24U ClimateCab

Air-Conditioning

These models are perfect for harsh environments and remote locations without cooling infrastructure. Air-Conditioning units keep equipment cool even with temperatures up to 55°C. A closed-loop cooling system recirculates air in the cabinet and keeps outside air out, while an internal evaporator eliminates condensation.

NOTE: ClimateCab Server Cabinets ship without the air-conditioning mounted. Mounting the AC unit takes a few minutes.

Additional Features

The cabinet includes front and rear rails and a bag of fixings for 19" equipment. Convenient studs are provided on the door and body for bonding and grounding, and earth bonding cables are also included.

The cabinet is finished in satin black with a RAL7035 grey air conditioner outer case. Other colours are available on request. The side panel features a pair of handles and location hooks to make fitting by a single engineer possible.

Front and rear doors feature three point locking. This ensures a tight seal around the entire edge of the door.

In order to eliminate condensation the air conditioner is equipped with a condensate evaporator. This prevents a build-up of condensed water on the condenser. The side location of the air conditioner is another safeguard to condensation away from your valuable servers. The condensed mix is vented to the exterior of the cabinet to keep the interior completely dry.

NOTE: Air conditioner appearance varies depending on voltage range and cooling capacity.

Controls

The air conditioner can be run with no special controls set, however the settings may be modified to accommodate most applications by removing a panel and adjusting three DIP switches

A 5 wire connection block is supplied for wiring to a door open switch or alarm panel.

Door Open

A pair of connections may be used to stop the air conditioner from operating when the door is open. This prevents condensed water from collecting on the cold plates of the air conditioner.

Alarm

A pair of volt free contacts can be used to signal an alarm condition when the temperature exceeds 45, 55 or 60 °C.

Temperature

The internal temperature of the cabinet may be set to 25, 30, 35 or 40 °C by changing the position of the three DIP switches.

Applications

Remote buildings

When the IT for the building will fit into a single cabinet why build a data centre?

Manufacturing plants and Workshops.

Protect control and monitoring equipment from airborne contaminants and temperature excesses. Heaters are available for low temperature applications.

In fact anywhere that needs a data centre environment on a small scale!
e.g. Educational Campuses, Comms closets, Car Parks, Electricity substations.

Consider your requirements to choose the right enclosure for your needs.

By Monty Wilsher, Product Engineer

How to select a cabinet.

The sheer number of available options and variations can make choosing a data or server cabinet a daunting task. But, by considering your requirements one at a time, you can zero in on the enclosure that fits your needs best.

Do you need a cabinet or a rack?

A cabinet is an enclosure with a door (or doors); a rack is an open frame. There are several things you should consider when you're deciding whether you need an enclosed cabinet or a rack.

First, what equipment will you be putting in it? The extra stability of a cabinet might be important if you're installing large, heavy equipment like servers. But if you need frequent access to all sides of the equipment, an open rack might be more convenient.

Second, in what environment will you be installing it? If the environment is open or dusty, for example, you might need the extra protection of an enclosed cabinet. On the other hand, a rack might be perfectly adequate in a well maintained data centre.

Finally, there's security. An enclosed cabinet can be locked. It's a small investment to secure all of your high-cost equipment.

Don't neglect aesthetics.

Will customers or clients see your installation? A cabinet with a door looks much neater than an open rack. When you're trying to create a

professional image, everything counts.

Size.

Before you choose a cabinet size, you need to determine what equipment you need to house. This list can include servers, switches, patch panels, UPSs, and KVM trays. Consider the depth of your equipment—servers require extra depth and may require a cabinet that's at least 1000 mm deep. Bigger is better! Lastly, remember to allow space for cabling and power provisions.

A standard full-sized cabinet is 2 m high (42U). This is the height that makes the most

efficient use of floor space in rooms with standard-height ceilings. For tight spaces, you can choose a smaller cabinet or even a wallmount cabinet, but unless space is limited, it's better to go larger rather than smaller—there always seems to be just one more thing that needs to go into a cabinet, plus extra space is always useful for cable management.

Rails.

A main cabinet component is one or two pairs of vertical rails with mounting holes to which you attach your equipment or shelves. The most common spacing between rails is 19".

A cabinet usually has two pairs of rails—one in front and one in back—so equipment is supported at all four corners. The two pairs of rails may be adjustable front to rear to accommodate different equipment depths. Cabinet rails have holes for mounting equipment. The M6 square hole has become the dominant standard for cabinet rails.

Square M6 holes are adapted for use with screws through the use of snap-in cage nuts, so stripped threads caused by frequent equipment changes are not a problem. M6 holes are also used for tool-less mounting of servers designed to hook onto these holes. Cabinet rails and the equipment that mounts in them are measured in rack units, abbreviated "RU" or "U." One rack unit (1U) is 1.75" of usable vertical space. So, for example, a rackmount device that's 2U high takes up 90 mm of rack space. A rack that's 20U high has 889 mm of usable space. This measurement is usually marked on the rails. The amount of vertical space is what determines how much equipment you can install. Remember that a cabinet's measurement in rack units is smaller than its external height.

serve little use and just get in the way.

If you choose to use cabinet doors, there are mesh, split mesh, solid, fan, split-fan, and plexi. Because ventilation is important, choose mesh doors unless you're using an enclosure blower or other ventilation scheme that moves air from the bottom to the top of the cabinet. In that case, you'll require plexi or solid doors. Doors are also available with fans to help move air through the cabinet. In areas with limited space, choose split doors, which require less clearance to open. If cabinet doors are there for security, be sure you select an appropriate lock. Key locks are standard, but can be problematic because of lost keys and the ease with which keys can be duplicated. Because of the key issue, combination locks are preferable for cabinets that must be accessed frequently yet kept secure.

Side panels.

Like doors, side panels are optional and may be omitted in protected data centres, except where they're needed to control air flow. Without doors or sides, a cabinet starts to look a lot like a four-post rack. The difference is that you could add doors or sides to the cabinet should they become needed, but you cannot add them to a rack. Also, a cabinet usually has adjustable rails whereas a four-post rack typically does not.

Cooling.

Because network equipment generates heat, airflow requirements increase as more equipment is mounted in a cabinet. Data centres generally have special cooling equipment such as CRAC units, In-Row Cooling AC units, or Liquid Cooling to meet their high cooling requirements. But even if your data centre is cool, the inside of a cabinet may overheat if air distribution is inadequate.

The temperature inside a cabinet is affected by many variables, including door type, air flow, and the equipment housed within the cabinet. The most direct way to keep network equipment cool is to ensure adequate airflow. The goal is to ensure that every server, every router, every switch has the necessary amount of air no matter how high or low it is in the cabinet. Most major server manufacturers

recommend that cabinet doors used in hot aisle/cold aisle installations have at least 63% open area for airflow. You can achieve this by either removing cabinet doors altogether or by buying cabinets that have mesh doors. Because most servers and other network devices are equipped with internal fans, open or mesh doors may be the only ventilation you need as long as your CRAC unit has enough capacity to dissipate the heat load. You can increase ventilation even more by installing

fans to actively circulate air through cabinets. The most common cabinet fans are mounted on the roof door. Or you can use a fan or fan panel that mounts inside the cabinet or a specialised high-speed fan that mounts in the bottom of the cabinet to pull cool air from a raised floor across the front of the cabinet where it can be used by equipment. An enclosure blower requires a solid front door with adequate space—usually at least four inches—between the front of your equipment and the cabinet door for air movement. If you're housing components outside of a temperature-controlled area, you may want a cabinet with its own air conditioner. It's also important to monitor components to ensure that they're operating within their approved temperature range. Many network devices come with SNMP or internal temperature sensors to tell you what their internal temperature is.

An IP-addressable environmental monitoring system can also be a valuable addition to your cooling plan, especially if cabinets contain older devices that don't have internal sensors.

Moisture and dust resistance.

When you're housing delicate electronic components outside of a protected data centre—for instance on a factory floor—look for an IP rating.

The **IP Code, Ingress Protection Rating**, sometimes also interpreted as **International Protection Rating**, classifies and rates the degree of protection provided against the intrusion (including body parts such as hands and fingers), dust, accidental contact, and water in *mechanical* casings and with electrical enclosures. It is published by the International Electrotechnical Commission (IEC). Common IP ratings are IP52 and IP66: IP52 covers dripping water at up to 15 degrees from vertical, and dust protection. IP66 ensures an enclosure that resists powerful water jets and is dust tight.

Assembled or not.

Order a preassembled cabinet if you need to set up your installation in a hurry—you can load your equipment as soon as the cabinet arrives. A flat-pack cabinet, on the other hand, requires some time and effort to

assemble, but can be maneuvered through narrow doors and spaces that may not accommodate a full-sized assembled cabinet. Most cabinets are preassembled.

Power provisioning.

Cabinets need provisions for powering enclosed equipment and for managing the cables associated with the equipment. Power distribution units (PDUs) mount either

vertically or horizontally with a wide range of outlet counts, types, and spacing. High-end PDUs may have additional capabilities such as remote management and metering. PDUs may be rackmounted or mount vertically behind the rails—in which case they don't take any rack space. When choosing a vertical PDU, make sure it's compatible with your cabinet for ease of mounting. Uninterruptible power supplies (UPSs) are an important part of power provisioning. If you're planning to use a rackmount UPS, it's important to allot space when planning the cabinet.

UPS units are typically mounted in the bottom of a the cabinet because of their weight. Alternatively, several UPS units may be housed in a separate cabinet in the data centre.

Cable management.

Although most cabinets come with cable management features, you will still need to plan for some additional organisers to keep cables under control. Plotting your connections in advance helps you to decide how to organise the cables. Knowing where the connectors are on your equipment tells you where it's most efficient to run cables.

The important thing is to have a plan—if you let your cables get away from you now, you're sure to pay for it down the road.

Elite Cabinets and data centre cooling.

The Elite™ Cabinet family from Black Box delivers more features and options than any other Black Box cabinet—more door and panel choices, more cable management, and dual universal PDU mounting brackets.

Plus, Elite Cabinets feature heavy-duty, welded steel construction and come with the protection of a lifetime Black Box® warranty. The cabinets arrive fully assembled and ready to populate. Elite Cabinets are specifically designed to be adaptable to your exact

needs. Whether you need a high-airflow cabinet for your data centre or a small, secure cabinet for an office, the Elite Cabinet family has exactly the cabinet for you.

Select a preconfigured cabinet or have one customised to your specifications and shipped in only two business days. Choose from a wide range of sizes to suit all your data and server cabinet needs. Our Black Box pre-sales engineers can help you specify the cabinet you need—FREE of charge.

Elite Cabinet Accessories

More features and options than any other Black Box cabinet.

Add accessories to add function.

After you select the right cabinet configuration, it's time to outfit your cabinet with cooling accessories, cable management, keyboard trays, and all the parts that make your Elite™ Cabinet perfect for your application.

Change your cabinet configuration.

If you already own an Elite Cabinet, it's easy to change top panels and other parts when your requirements change—parts can be changed in a just few minutes with basic tools.

Further improving cooling efficiency.

Add a chimney to an Elite cabinet.

A chimney added to the top of a cabinet directs hot air into the plenum and to the CRAC. This prevents the hot and cold air from mixing as well as shortens the distance the exhaust air has to travel to the cooling unit.

Air distribution is critical.

Even if your data centre is cool, the inside of a cabinet may overheat if air distribution is inadequate. The temperature inside a cabinet is affected by many variables, including door perforations, cabinet size and location, and the types of components housed within the cabinet. The most direct way to cool equipment is to ensure adequate airflow. The goal is to ensure that every server, every router, every switch has the necessary amount of air no matter how high or low it is in the cabinet. Filler panels fill empty space in racks and cabinets to help control airflow, preventing the mixing of hot and cold air and keeping hot exhaust air from being recirculated and affecting cooling efficiency. They also conceal unused spaces, giving a rack or cabinet a more polished look.

Equipment placement.

Don't overload the cabinet by trying to fit in too many servers—75 to 80% of capacity is about right. Maintain at least a 40 mm clearance between equipment and the front and back of the cabinet. And finally, ensure all unused rack space is closed off with filler panels to prevent recirculation of warm air.

Filler Panels and Air Dams keep cool air in the front of the cabinet where it is needed by equipment, and keep warm air from escaping to the front of the cabinet.

Add solid bottom panels to your cabinet to keep cold air from escaping.

Chimneys provide a closed hot air return between the top of a cabinet and a drop ceiling plenum. They can be used with fan trays to increase efficiency.

Air Funnel Kits direct cool air from the raised floor and deliver it to the front of servers or other network components, cooling cabinet hot spots by 8° C, extending the life of servers, and minimising downtime.

Reduce noise, keep equipment cool, increase productivity.

Acoustic Cabinets

Why is noise control so important?

Increased productivity. Increased profits. Research shows that prolonged exposure to noise creates stress and lowers morale. It can also lead to an increase in accidents and errors. A simple 5-dB reduction in noise can actually cut the risk of hearing loss in half. A quiet office is a productive office. These Black Box® Acoust'c Cabinet reduce sound by an amazing 27–28.5 dB—the most you can get today in a soundproof enclosure. And, the cabinets go through independent, third-party testing to ensure it.

So what does that mean?

Noise is measured in decibels. So a 27–28.5-dB noise attenuation (or reduction) means that the cabinet is removing that amount of noise from the sound source.

A single server can generate 50dB of noise- as loud as the conversation making it difficult for people to talk on the phone.

An Acoustic Cabinet can reduce this noise to a whisper.

The cabinet design ensures noise reduction without compromising cooling capacity. To reduce sound, the inside of the cabinet is heavily lined with one of the most effective acoustic materials available.

This heavy-duty, multilayer composite material covers all inside surfaces. Even the six cable routing panels on top and bottom (three each) are covered.

Cabinets are optionally available in Maple, Oak, and Cherry veneers.

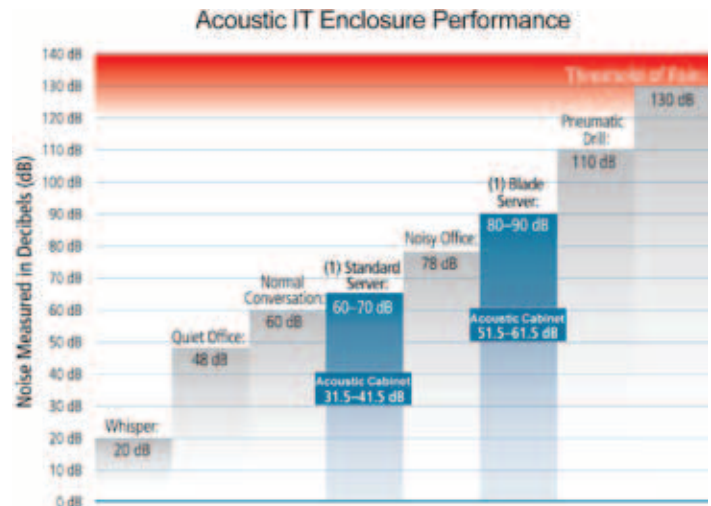

High Cooling Capacity.

Active cabinets have an incredible thermal load capacity of up to 7.2 kW. To cool equipment, Active cabinets feature two variable-speed fans on the rear doors that are controlled by a temperature sensor to ensure maximum energy efficiency.

Quiet Cab

- Put networking equipment where you need it—without the noise, space, or cost concerns.
- Acoustic foam lining reduces audible server and hardware noise by 28.5 dB to a whisper.
- Integrated ventilation fans keep equipment cool in active cabinets.
- Cabinets are optionally available in maple, oak, and cherry veneers.
- Optional chimney.
- Ideal for environments where you need to store network equipment near workers, such as offices, schools, medical offices, retail establishments, and more.
- Includes heavy-duty castors.
- 19" M6 rails are depth adjustable.
- Supplied with foam sealed floor cable entry panel.
- Generous cable management space is built in.
- Accommodates all leading servers, including blade servers.
- Fully assembled—just plug it in!

Acoustic Cabinet (QCE24U)

Very accommodating.

This 19" cabinet is extremely well-designed and built to last. It can hold a very hefty 500Kg of equipment, including all leading servers—even blade servers. To accommodate different types of equipment, the 19" M6 mounting rails are adjustable. Load-bearing castors make it easy to move. Locking front and rear doors secure equipment. The cabinet is also designed with very generous cable management for both horizontal wiring and patch cables.

A good fit in open environments.

Why spend money on a data centre when all you need is an Acoustic cabinet? It's a very economical and smart solution for environments where you need to locate equipment near workers, such as open offices, schools, medical practices, etc. By eliminating equipment noise, you'll reduce stress and improve productivity.

**Inbound Air Flow.**

Air is drawn in through the front doors. A U shaped duct prevents noise from escaping through the air passage. An optional filter is available for dusty environments.

**Passive Air Exhaust.**

The passive cabinet uses the fans in the equipment to draw air in through the front and out through the rear. Warm air from the equipment is vented into the ambient environment to be cooled by the room's air conditioning system. Maximum power consumption in the passive cabinet is 1.75 kW (12U), 2.25 kW (24U), or 2.75 kW (42U).

**Active Air Exhaust.**

Large variable speed fans in the rear doors of the active cabinet draw air from the top of the cabinet and send it upwards through a U section in the rear doors. An optional chimney system may be used to channel the air outside the room, or it may be vented into the room to be cooled by the air conditioning system. Maximum power consumption in the active cabinet is 7.2 kW (all models).

Elite Wallmount Cabinets

- Large openings in the back panel enable you to easily install patch panels or other prewired equipment.
- Accessories that fit the 3U opening in other Elite cabinets also fit into these cabinets' 3U opening.
- Doors can be reversed to open left or right.
- Double hinged for easy access to rear of equipment.

These members of the Elite™ family of cabinets from Black Box have all the quality you've come to expect plus features that set them apart from other wallmount cabinets.

Easily add equipment

Elite Wallmount Cabinets feature large openings on the back panel that enable you to simply slide in a loaded patch panel. This saves time and money—you do not need to reterminate.

Accessorise

If you want to add fans, a Brush Grommet Kit, a Waterfall Radius Bracket, or other accessory, it couldn't be easier. That's because just about any Elite accessory (pages 20–23) that fits into the 3U opening on the top of an Elite cabinet will work with the wallmount cabinet. Add a Brush Grommet Kit (ECBGK3U) to run cable into the cabinet while protecting the interior of the cabinet from dust and debris. Install a Fan (RMT373AE-R2) to increase air circulation and keep equipment cool. Attach a Waterfall Bracket (ECW3U) to maintain bend radius when routing cable into the top of the cabinet. And more!

For even more versatility, optional brackets attach to the back panel of the cabinet and enable you to rackmount patch panels, PDUs, etc., behind the equipment in the cabinet at 45° or 90° angles.

How to pick the correct wallmount cabinet for your application.

By Dave Takach, Tech Support Representative

Know Your Needs

When you want a secure cabinet, but lack floor space, choose a wallmount cabinet. There are several things to consider to ensure you get the right enclosure for your needs.

- Height—How many rackmount units do you need?
- Depth—Will you house extra-deep equipment? Remember to consider total depth, including rear cables.
- Rails—Front vertical rails need to be at least 40 mm from the front door so cables can be plugged into the front of your devices.
- Contents—What equipment and peripherals do you need to

house? What weight capacity does the cabinet need to have?

- IP Rating—Does the cabinet need an IP rating and, if so, which one?
- Cooling—Do you need cooling, either a fan or an air conditioner, or will you rely on passive cooling?
- Access—Do you envision installing patch panels or other prewired equipment? Cabinets that swing out, away from a wall, allow easy access to the rear of equipment.

A good place to start is to talk to one of our Technical Engineers.

Protect and cool equipment in areas without air-conditioning.

Wallmount ClimateCab™

Shown with AC unit installed.

When you need to install rackmount equipment in less-than-ideal environments or in areas without existing cooling infrastructure, ClimateCab IP52/NEMA 12 Wallmount Cabinets are your answer. Their self-contained cooling system keeps your equipment housed in ideal conditions in virtually any location.

On the double-hinged models, the cabinet swings away from either a front or a rear door, enabling access to the rear of your equipment. Single-hinged models in which only the front door opens are also available.

ClimateCab with Air-Conditioning

The AC models (RMW5130ACE, RMW5110ACE, RMW5230ACE, RMW5210ACE) are perfect for harsh environments and remote locations without cooling infrastructure. Air-conditioning units keep equipment cool even with temperatures up to 54.4° C. A closed-loop cooling system recirculates air in the cabinet and keeps outside air out, while an internal evaporator eliminates condensation.

ClimateCab with Fan

Photo shows tapped rails. M6 rails are standard for the European market.

Use the fan models (RMW5120AFE, RMW5100AFE) in areas where you need protection from the elements, but temperature control is not a significant issue. Air filters on the bottom can be easily removed for cleaning without opening the cabinet. A pagoda-style fan top provides protection from falling liquids and debris.

The gland plate closes around cables to keep them in place without damaging them and also helps to keep dust and debris out of the cabinet. Bottom gland plate is standard; top gland plate is optional.

RAK-IT Wall Cabinets

- Fabricated from thick gauge steel with welded sub frames.
- Secure with locking sides and front door.
- 4 vertical mounting angles with front and side cage nut cut-outs and 'U' height marking.
- Passive side ventilation.
- Easy installation with wall hanger device and removable rear panel.
- Generous 325mm x 55mm roof and floor cable entry/ exit points.
- 360° access for ease of configuration
- Earth bonding kit included.

RAK-IT Wall Cabinets are engineered around two welded sub frames that run from front to back. Side panels feature twin latching fasteners for rapid removal and a cam lock for security. Front and rear rails are mounted on slotted horizontal rails that run from the front to the back of the cabinet for complete flexibility. On the roof, and underneath a large rectangular blanking panel may be left in situ or removed to allow cable entry / exit. Four screw holes at the rear of the cabinet enable easy wall mounting. Optional fans may be mounted in the roof of the cabinet for additional heat extraction.

Select Double Hinged Wall Cabinets

Select Double Hinged Wall Mount/Swing Out Enclosures provide 19" mounting (includes two pairs of M6 mounting rails) in an accessible enclosure.

A simple snap latch located inside the cabinet opens the 457mmD centre swing section providing outstanding front and rear access to cables and equipment.

The reversible cabinet mounting design makes left or right-hand swing-out possible. This convenient feature also conserves valuable wall space. 25mm, 50mm, and 76mm knockouts can be found on the rear of the enclosure in addition to horseshoe knockouts found on the top and bottom of the rear section to make wiring, installation, and maintenance of equipment easy. Front and rear sections lock independently for added security.

Server Side Mount Wall Cabinet

- 10U or 8U of usable space.
- Weight capacity of 155kg when secured to three wall studs.
- Unique side mount design—enables you to get more servers in a tighter space by mounting them sideways.
- Mesh front doors ensure optimal airflow to keep hard-working servers cool. Rear door has two Dual Fan mounting locations.
- Internal depth of 860 mm with a maximum rail depth* of 736 mm.
- Flexible cable access features 25 mm, 50 mm, and 75 mm knockouts on the top, bottom, and rear of cabinet.
- Left and right doors, as well as the front panel, can be locked to safeguard your expensive servers and prevent tampering.

Front panel

Left and right doors open for convenient access to server controls and cable connections.

** NOTE: At 750 mm rail spacing, the cabinet provides 50 mm of space in the front and 75 mm in the rear. The 10U of space isn't possible with all equipment configurations. For example, if you mount a 735 mm server in the cabinet, the maximum space is 8 RU because of the necessary rail adjustments.*

What to consider when choosing a rack.

By Dave Takach

If you need frequent access to all sides of the equipment and cabling, an open rack is more convenient than a cabinet. If your equipment needs ventilation, racks offer more air circulation than cabinets. With the open design, racks are a good choice in areas where security isn't a concern, or inside data centres and closets with locked doors.

Types of racks.

If you're installing patch panels, a two-post rack with some cable management is the right choice. But if you have a mix of networking equipment, servers, and patch panels, then a 4-post rack makes more sense because it provides more stable, 4-point mounting for deep equipment.

Rack heights.

Height, or rack units, is one of the most important specifications in choosing a rack. One rack unit (1U) is 1.75" of usable space. Most freestanding racks come in a standard 45U height, so they fit rooms with standard ceilings.

Wallmount racks.

Wallmount-style racks save floor space. They're very convenient for installing in cramped wiring closets or narrow hallways. Some even swing out for easy equipment installation and cable connections.

Other low-profile racks enable you to flushmount equipment vertically against a wall to further reduce the amount of space they take up. Wallmount racks typically require a solid or reinforced wall. To determine which wall rack is best for your application, measure the deepest piece of equipment and cable(s) out of the back end to be sure they will fit. Then verify the weight capacity needed.

Cable management.

Many racks have built-in cable management troughs and cable rings for routing cable. If your rack doesn't have these, consider adding managers for neatly routing cable. Vertical managers are great for organising cable runs top to bottom. Horizontal managers are designed to guide cables and hold them precisely at the same level as mounted equipment. You can also add inexpensive hook-and-loop cable ties to hold and bundle cable securely.

The extras.

Consider shelving for your rack. The type you choose depends on the equipment you plan to mount. You can choose from solid or vented shelves, stationary or pull-out shelves. There are shelves built to hold specific pieces of equipment such as servers, monitors, and keyboards. You can place small devices on a cantilevered shelf. Larger, heavier items, such as monitors, should be put on a centre-weight shelf. There are even panels designed to hold flat-screen monitors.

Exceptional stability plus great Black Box quality—all at an economical price.

Power distribution and protection.

Black Box can help you properly plan your power distribution network. From server closets to large data centres, Black Box has the solutions you need—power strips, PDUs, protection devices, and more—to keep your equipment running.

Distributing power throughout your data centre or server room is easy with Black Box PDUs. Standard PDUs are best for applications that require no supervision, scheduling, or metering. Metered PDUs have an LCD display that shows current load in real time. Some have an alarm that sounds if the current draw approaches the maximum current rating, alerting you of a potential problem. Managed PDUs have the most functionality, providing remote management including outlet-level power cycling, scheduling, and reporting. For a PDU comparison chart, see pages 42-43.

Uninterruptible power supplies (UPSs) can protect your systems against power outages, keeping mission-critical equipment running through brief outages and brownouts. In addition, UPSs enable you to shut down computers in an orderly manner in the event of a complete power failure. UPS units come in many sizes and provide run times from minutes to hours in the event of a power loss. They also feature many different outlet types. Give Black Box tech support a call and we will help you choose a UPS that is suited for your application.

Surge protection is more than just buying a surge-protected power strip. A good surge protection system includes the network/communication lines as well. Black Box offers a full range of surge protection devices for every type of communication line, from Gigabit network links to RS-232 serial links. Black Box has the surge protection product to keep your equipment running.

Plugs and receptacles.

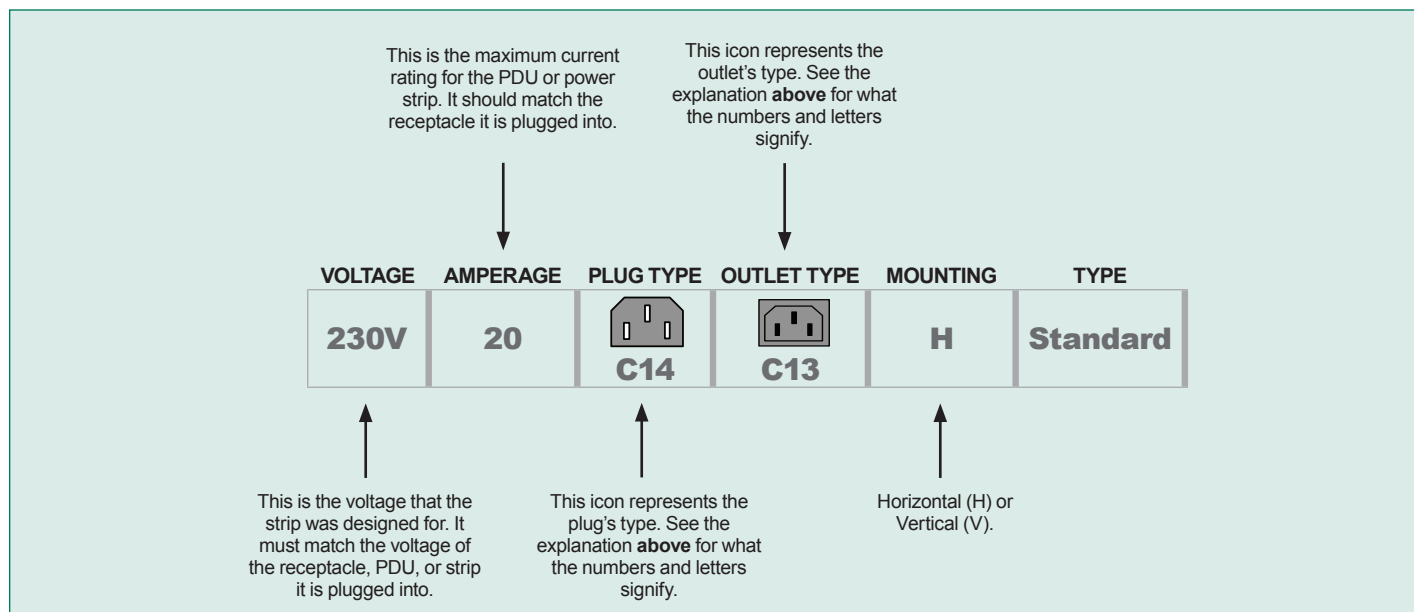

When selecting a power strip or PDU, it's important to choose the correct plug and outlet type. The first thing to consider is what line outlet type is available at the location where the strip or PDU will be installed. You must match the plug type on the power strip or PDU to what you have available. For example, if you have a Schuko available on your wall, you can't plug a C14 into it.

The next step is to identify what type of outlet or outlets you need to plug your equipment into.

Some PDUs offer two or three different outlet types on the same unit but most only have one. Some can even be configured with a custom set of input and output connectors. Outlets commonly available on strips and PDUs include, C13, and C19. If required, locking outlets can be found on click lock PDUs. Locking plugs and receptacles prevent accidental disconnections and are preferred for higher voltage mission-critical devices.

Remotely switch and manage power for one network device or multiple devices.

Outlet managed PDUs

- Get complete power control: remote and timed individual outlet switching, auto on/off/reboot, load shed switching, outlet sequencing, and more.
- Switch power on/off for individual network devices or for groups of equipment.
- Monitor equipment power and automatically notify you of changes in current levels, circuit breaker status, temperature, unauthorised access attempts, ping response, and more.
- Notify you via e mail, text, SNMP, SYSLOG, and audible alarms when user-defined thresholds are exceeded.
- Generate reports with detailed records of current and power consumption.
- **Standard Warranty** — 5 Years
- **Extended Warranty** — Add 1 or 3 Years

Networks today demand 98%+ uptime. When it's your job to make sure your network equipment is up and running, Black Box® Outlet- Managed PDUs can be one of your best friends in the data centre. One of these switched PDUs will keep an eye on your network equipment no matter if you're in the office, across the country, or asleep at home at 3 A.M. You'll know if something is going wrong so you can correct the situation before it turns into a crisis. The PDU will automatically notify you via e mail, text message, SNMP, or SYSLOG when changes in current levels, temperature, circuit breaker status, and other factors exceed threshold values that you set. This gives you the chance to reboot your rackmounted equipment when devices aren't responding; disable outlets to reduce current consumption; or even switch on cooling devices to lower the rack/cabinet temperature. You can reboot equipment over the Internet, via a text message, through an external modem, or a local terminal plugged into the RS-232 port. The PDU also features a 10/100BASE-T port for network connections.

Individual or group play.
One of the best features of these PDUs is the ability to remotely switch one outlet, a group, or a branch, or to switch a whole group of outlets. You can also set the PDU to monitor one outlet, a group, or a branch of outlets.

Sound the alarm.
The PDU boasts a robust selection of monitoring features to help you keep tabs on vital network equipment, avoid costly service calls, and maximise uptime. You can customise the PDU to your network by selecting the alarms and setting individual thresholds.

Use the PDU to alert you when, for example, the temperature gets too high, the power supply has been interrupted, excessive invalid passwords are attempted, and much more.

Power down.
Another great feature of these switched PDUs is that you can set them to respond automatically in case you're not there. Set the parameters for the PDUs to disable outlets to reduce current consumption or to switch on cooling devices. If the current load goes too high, it intelligently sheds load by temporarily shutting down non-essential devices.

Power Switch NG allows remote power management of many devices over Intranet/Internet or locally through RS-232 serial connection. The power switches support the HTTP, DHCP, Syslog and SNMP protocols. Each power outlet or power outlet group can be individually controlled over IP. The serial interface also enables the power outlet management over a terminal connection and to trigger a soft shutdown of a server with shutdown capabilities. A sequential power up/down and a restart delay from 5 to 60 seconds can be set individually for each outlet to avoid the risk of a power inrush that can cause a fuse or circuit breaker to trip in the data centre. The A-xBus on the front panel enables you to connect up to 4 expansion units to increase the number of controlled power outlets and/or to set up remote monitoring of your facilities.

For a security, access to the Switch is protected by name and password. The administrator account allows complete configuration and control of all outlets. The configuration can be performed through a web browser, the provided Windows tool over the LAN or through a terminal connection. To avoid confusion during operation, you can attribute up to 32-character label on each device.

The Power Switch NG can automatically carry out up to 32 rules to trigger scheduled tasks or to take predetermined actions in response to a specific event. This event may be the result of environmental monitoring. A large variety of sensors, detectors and dry contacts can be used directly with this system to secure your facilities and automatically trigger emergency actions.

A Watchdog function lets you monitor 4 IP devices. In the case where the monitored device is locked-up it can be automatically rebooted.

Power Switch Twin 32 Master is a power distribution and control unit that enables power management of 8 devices over a remote TCP/IP or local RS232 terminal connection. The number of controlled power outlets can be extended up to 40 by cascading up to four Power Switch Twin Satellites (PSE538SA) using standard RJ45 CAT5e network cables. Each power outlet can be individually controlled to turn it on, off, or restart the connected equipment. The current consumption of each input can be remotely monitored through the Power Switch Twin 32. The two separate 16A power inputs provide a total power-delivering capability of 7360 VA and can be used to control and measure the current of servers with redundant power supplies. Up to 20 groups of outlets can be created to control with only a single command servers with redundant power supplies. The Watchdog function lets you monitor eight IP devices with specific services or ports. In case of a lock-up of the monitored device, it can be automatically rebooted and alerts can be sent to Syslog or SNMP servers. Event logs can be sent to two Syslog Servers. An internal RTC clock allows to time stamp the events, messages and e-mails and to trigger user-specified actions according to a defined time table.

The Power Switch can automatically carry out up to 32 rules to trigger scheduled tasks or to take predetermined actions in response to a specific event if thresholds are exceeded. The Power Switch Twin 32 feature a xBus at the front that accepts up to four additional xBus peripherals. Use this port to expand your system by connecting Satellite units to it. With the xBus Xtender hub you can add a variety of sensors to secure your facilities and automatically trigger emergency actions. Or connect the Push Button that instantly triggers two emergency actions. The administrator performs configuration and power outlet control through a web browser or through a convenient Windows tool. A power-up delay for each power outlet between 0 and 255 seconds can be set. Furthermore, a delayed restart between 1 and 3600 seconds or an outlet default status after a power failure. For more convenience, a 32-character label can be attributed to each switch and power outlet to avoid confusion during operation. A contextual on line help can be used anytime during the configuration.

Three-phase power

Three-phase power is the most efficient way to distribute power over long distances and allows for large industrial equipment to operate more efficiently. It's characterised by three single-phase waves that are offset in their phase angle by 120 degrees, or one-third of the sine wave period as illustrated in Figure 1. This phase angle is why the power can go long distances.

Three-phase voltage can be measured from each phase to neutral or from one phase to any other. The voltage relation between phase-to-neutral and phase-to-phase is a factor of the square root of 3 (e.g., 230V versus 400V).

Conversely, single-phase power is distributed through common household outlets to power everyday equipment such as laptops, lighting, and televisions. When looking at an oscilloscope image of the voltage coming out of a single-phase outlet as illustrated in Figure 2, there's only a single wave. Single-phase power is obtained by simply using only one phase of a three-phase system. Its root mean square (RMS) voltage is 230V and it oscillates between its peaks of $\pm 322\text{V}$ at 50 Hz (or 50 times a second).

Improve uptime, capacity planning and power use efficiency

- Metering of each outlet and the PDU.
- Remote switching via web browser.
- Secure 256-bit AES encryption.
- Staggered power switching to relieve surges.
- Power consumption monitoring through LCD display.
- GO GREEN — reduce travel and power consumption with intelligent monitoring and remote management.

Intelligent power distribution units give you the ability to manage all your power requirements from the comfort of your desk. These PDUs have an IP browser interface built-in, allowing the user to switch on, switch off or power cycle each socket individually. Featuring both serial access as well as IP access, these PDUs give you the connectivity and control you need. But more than that, these PDUs also feature real time power usage display through both the built-in LCD screen via push buttons, and via the web browser interface. Information on voltage, current drawn etc is available on a per port, and a per PDU basis.

Eco Power Switch Plus

[PSEC04-PLUS](#)

The Black Box Eco Power Switch has an affordable price tag and will help you to reduce your running costs too. Eliminate out of hours journeys to the office to reboot devices and cut your energy bills by scheduling automatic power downs.

The Eco Power Switch has four IEC C13 outlets and dual redundant 10 AMP IEC C14 mains inputs and can be controlled in-band or out-of-band via RS-232 or IP.

Super reliable components achieve a Mean Time Between Failures (MTBF) certification of 200,00 hours+. Independently switched outlets offer increased electrical safety, cutting off the power to each bank of outlets and eliminating most electrical threats from other systems.

The Black Box Eco Power Switch Plus includes all the features of the Eco Power Switch but also additions such as ping functionality, Telnet support and the ability to have multi-level user login authentication. We have also built in a multi-event scheduler and the ability to black list numbers. The Eco Power Switch Plus also presents an auto-ping function, so that the switch can monitor attached devices, and automatically reboot them if they don't respond to a ping within a user defined period of time this makes the switch perfect for small 'lights out' environments.

Fallback Power Switches

A Reliable Power Redundancy Solution for Single-Inlet Security Devices

In this security-conscious age, webcams, motion detectors, and badge scanners have become increasingly common elements in most businesses and public facilities. It doesn't matter if you're checking ID cards, observing activity in a lobby or community space, or monitoring a building during off-hours for suspicious activity; most mission-critical security applications rely on the sort of constant vigilance that can only be supplied by a monitoring device, ID scanner, or electronic sensor.

If your security system or access control application lacks an effective power redundancy solution, fallback power switches

can provide fast, reliable power fallback capabilities, without the need to replace existing single power inlet devices with new, dual-inlet devices. The switches can help to minimise or eliminate downtime for your security system by ensuring that even when your main power source is not available, the security system can automatically switch over to a back-up power source almost instantaneously.

Installation of a fallback power switch is simple. No switch configuration is required; just connect the fallback power switch to your primary and secondary power supplies and then connect your single inlet security devices to the switch's outlets and you're ready to go.

Once installed, the switch will continuously monitor the power source, checking for instability or other trouble signs. If power to the fallback power switch is interrupted, it can quickly switch to the back-up power supply, providing nearly seamless power switching with switchover times less than 16 milliseconds—fast enough that the switchover is generally undetectable by most devices. Later, if the switch determines that the primary power supply has been restored or stabilised, it can also automatically switch from the secondary power supply back to the primary power supply.

Tech Overview: Data Line Surge Protectors

By Monty Wilsher, Product Engineer

Data is transmitted across copper lines using electrical impulses. Unexpected electrical interference on these lines can interrupt the operation of your network, so it is imperative to have a good surge protection system in place.

Where surges come from

Power lines aren't the only way surges can get to your equipment. Any communications line can also be a source of damaging surges. These surges can come in from the outside through telecommunications lines. However, many surges that are assumed to originate in phone or other telecommunications lines actually enter on power lines and find a ground in the phone line.

Data line surges can also originate in your own equipment. This is because most networking devices are connected to both a power line and a data line. If the data ground is "better" than the power ground—for instance if it's plugged into an ungrounded outlet—then any electrical system surge will go through the equipment circuitry and out the data ground, often traveling across data lines into other equipment to do so. Data line surges often damage equipment that was thought to have been already protected because it had surge protectors on the power lines.

EMI/RFI

Electromagnetic interference (EMI) and radio-frequency interference (RFI) can interfere with data transmission over copper wires, slowing communication and causing errors. Although EMI/RFI often comes in over your equipment's power lines, it can also affect data lines directly when your network cabling is installed near sources of interference, such as fluorescent lights or elevator motors.

Ground loops

An electrical problem not often thought about or understood is that of ground loops, which are often encountered when running copper data lines between two buildings, although they can occur within the same building as well.

When a copper cable links devices that draw power from separate electrical sources with different grounding systems, ground loops can happen. Although each device references its own grounding system as zero volts, differences in the earth's composition at the separate grounding sites may actually yield a voltage difference higher or lower than zero when the systems are compared to one another. If there is a difference, a ground loop is created when the two devices are connected and the excess energy causes the data line voltage to fluctuate as information is transmitted in both directions.

Unlike electrical surges, which are fast-rising voltage spikes that last a very short time, a ground loop is a constant electrical state that can, over time, cause equipment malfunctions or even severe damage. It's tough to diagnose ground loops, but unexplained system damage such as strange outages and failing components are all common symptoms of the problem. Fortunately, ground loops can be easily prevented.

Static electricity

We've all felt the subtle sting of a static electric shock—that tiny spark that arcs from your fingertips to a metal doorknob after you've walked across a carpeted surface. But did you know that a single electrostatic discharge packs enough energy to damage electronic equipment?

Static electricity is a charge that builds up when two dissimilar objects rub against one another—like fabric in a clothes dryer or shoes on a carpet. Under normal conditions, this charge dissipates gradually through conduction with the moisture in the air around us. But when the air is

particularly dry, there's less humidity so the air becomes much less conductive. This provides an opportunity for electrostatic charges to accumulate quite a large potential, which, if discharged by touching sensitive electronic devices, may be destructive.

You can take precautions to avoid the threat of static discharges by using special static-free floor mats in your work area and by humidifying the air in your building.

Types of surge protectors

There are many different kinds of surge protectors. Surge protectors installed on power lines don't absorb or otherwise diminish damaging power surges. Their primary function is to divert these destructive forces away from your sensitive circuitry.

There are four basic kinds of surge protectors: metal oxide varistors (MOVs), avalanche diodes, filters, and gas tubes.

Metal oxide varistors (MOVs) are a common choice. The word varistor is a combination of two words: variable resistor. As these words imply, an MOV is a highly resistive device that triggers during an AC power surge and diverts the excess voltage, preventing it from reaching your expensive computer equipment.

MOVs are designed to accommodate surge levels up to a specified breakdown voltage. When this limit is exceeded, the MOV varies from a highly resistive state to a state of low resistance. The excess energy is "clipped" from the power line and sent to ground.

Surges occurring at the peak of a sine wave are clipped by the MOV, but high-voltage spikes may still occur (though they'll eventually be clipped), and the MOV response times can range up to 500 picoseconds. This is the primary weakness of an MOV, but it's usually overcome by the inclusion of some other suppression technique within the surge protector.

Avalanche diodes, also known as Zener diodes, are semiconductor devices similar to MOVs, but they feature much faster response times (usually less than one picosecond). Avalanche diodes are available in a wide range of sizes to provide accurate and repeatable voltage clamping. However, they have a limited ability to withstand large surges, which means they should be combined with other devices to make them useful for lightning surge protection.

Filters are also usually built into surge protectors, along with other suppression devices, to offer enhanced levels of protection. They're made up of discrete coils, called chokes, and capacitors that are designed to filter noise occurring within specific frequency ranges on AC power lines.

Gas discharge tubes are specialty devices usually installed near a building's main service entrance or transformer to divert particularly devastating surges well before they enter your building. Intense voltage levels striking the tube ionise the gas, turning it into a conductive path to ground. Gas discharge tubes generate their own disruptive high-frequency levels during this grounding process, so they should never be

installed near any electronic equipment that might be damaged as a result.

Gas tubes can absorb huge voltages, so they're often used to protect against lightning strikes. However, they take a certain amount of time to activate—just enough time to let in a surge that can damage electronic equipment. For this reason, they're best used with other forms of surge protection.

Because all the common surge protection methods have inherent advantages and disadvantages, the best systems use more than one type achieve the best performance. The most common combinations incorporate a high-current but relatively slow-acting component with a faster-acting but lower-power-rated component.

Choosing surge protectors

A good surge-protection system involves more than one type of protection—silicon avalanche diodes for quick response, for example, with gas tubes to take the main hit. When evaluating surge protectors, you should also look at the clamping voltage, and the maximum surge current.

Clamping voltage is a measure of the actual voltage level that the protective device will allow through to your equipment. Often called the let-through voltage, this measure is the best performance indicator to consider when choosing surge protection equipment. The lower the number, the better the degree of protection.

Maximum surge current is a measure of overall capacity for diverting surges or the highest voltage a surge protector will take before sacrificing itself. In the face of an extremely large surge, a surge protector will break the link to your hardware and sacrifice itself.

Solutions for data line electrical problems

Fibre optic cable

Fibre optic cable is the ideal choice for installations between buildings because it doesn't carry electrical surges caused by nearby lightning strikes or cause ground loops. All your data line surge, interference, and ground loop problems can be solved simply by installing fibre optic rather than copper cable. Common copper cable works by carrying electrical impulses. The problem is that any other kind of electrical impulse can also travel along the copper cable, too. On the other hand, fibre optic cable is completely immune to interference. The fibre is made of glass, which is an insulator, so no electric current can flow through.

There are other reasons to choose fibre optic cable as well: Fibre offers greater bandwidth than copper and can operate over longer distances. With all these benefits and with the cost of fibre installation dropping,

fibre optic cable is rapidly becoming a top choice for new cable installations.

If you have existing copper cabling, fibre optic cable can be used to create surge-proof "firewalls" within your network.

Copper cable solutions

One basic precaution for copper cable is to avoid running it in electrically noisy areas such as near heavy machinery. If you must run copper cable through an electrically noisy area, choose a shielded cable. Foil is the most basic cable shield; a copper-braid shield provides even more protection.

There are two primary options to protect data lines from surges: grounded surge protectors and opto-isolation.

Grounded surge protectors—usually with avalanche-diode technology—divert excess energy to an earth ground. They're simple to install: Just connect them between ports and data lines, then connect the ground. That little pigtail of a ground wire hanging off the surge protector is very important. It needs to be connected to ground for the surge protector to work. If you install the surge protector but don't connect the ground, you might as well not install a surge protector.

Opto-isolators use fibre optic technology to effectively break the pathway over which potentially damaging ground loops can travel between separate electrical systems. These devices contain photoelectric transistors that introduce a physical gap in the circuit. The transistors convert digital electrical signals from copper wires into light pulses that are transmitted optically across this air gap, interrupting the copper-wire connection.

This enables you to use your existing copper wire without worrying about ground loops.

There are a variety of opto-isolators to choose from, so select one that's appropriate for your system. Just one standalone unit can provide protection for an entire between-building network. Many surge protectors feature built-in opto-isolators, but if you use these in a building-to-building network, you need to install one at each site. That's because even though one opto-isolator is all it takes to prevent ground loops, you still need dedicated surge protection at each end of the circuit to prevent damaging surges and spikes from entreing either building over the outdoor cable.

If you've already installed copper cable between buildings and decided that replacing it with fibre optic cable is cost prohibitive, opto-isolation is an inexpensive cure for ground loops.

Key Factors to Consider When Rating Surge Protectors

Clamping Voltage

This is a measure of the actual voltage level that the protective device will allow through to your computing equipment. Often called the let-through voltage, this measure is the best performance indicator to consider when choosing surge protection equipment. The lower the number, the better the degree of protection.

Maximum Surge Current

This is a measure of overall capacity for diverting surges. Protective devices are designed to keep surges from your computer. In the event of an extremely large surge, they'll do this by breaking the link to your hardware and sacrificing themselves. Ultimately, they're designed to fail. This rating provides a measure of their performance ability in extreme cases.

Stop ground loops of up to 2500 volts from wreaking havoc on your system.

Grounding & Bonding

All metal components in data centre infrastructure (cabinets, racks, basket tray) should be bound to the grounding system to protect the equipment from electrical surges.

A grounding system with a poor ground is the same as having no ground at all. Recommended grounds are the utility company ground, a ground rod, well casings, and metal cold water pipes. (Caution: Metal cold water pipes can be repaired and/or extended using PVC, which renders the cold water pipe unusable as a proper ground. Other unacceptable grounds include sprinkler pipes, PVC pipe, conduit, buried wire, and any ground that cannot be verified.)

Bonding ensures the most effective ground for all equipment. It ties all of the grounds in the building together electrically. If there is a rise in ground potential and all of the grounds are bonded, no damage will occur since it is differential voltage that causes problems.

The ground used for AC power **MUST** be the same as the ground used for surge protectors. A common ground reference must be achieved for all equipment. In addition, all ground wires must be as short and straight as possible and not be coiled or looped. The larger the diameter of the ground wire, the better, as this results in better electrical conductivity. Finally, the earth ground resistance must be less than 5 ohms.

A properly designed grounding system has to be verifiable, sized to handle expected currents safely, and able to direct damaging currents away from sensitive equipment.

Lines that need protection include incoming telco lines, lines to off-premise sites, LANs, and cable runs between multiple buildings in campus environments. All lines entering or exiting a building need protection at both ends!

Mining

The Challenge:

A mining company discovered that communication had been cut to several of their remote sites after a severe thunderstorm moved through the area. Upon inspection, the company realised that, while the equipment at the remote sites was protected from power surges by UPS units, the communications lines were not. As a result, several thousand Pounds worth of communication equipment had to be replaced.

The Solution:

When the new equipment was installed, the mining company contacted Black Box, who recommended that surge protectors be installed at each end of the connections, thus protecting both sides of the link and preventing any future equipment damage.

Guard your mission-critical IT equipment against physical threats—

By Melissa Rohm

Beyond virus protection.

It has become almost automatic to protect your data centre by backing up your servers, installing firewalls and virus protection, and keeping the protection up-to-date.

But what about more tangible threats? Do you have hot spots in your racks? If the cooling system shuts down, how will you know when temperatures climb out of control? Are you alerted to humidity changes or water leaks that threaten your equipment?

Planning for the unexpected is a critical task because there are more systems performing mission-critical functions than ever before. These systems are often deployed without the proper environmental infrastructure to support them. Equipment density is increasing constantly, which is creating more stress on ventilation and power. That's where Black Box's environmental monitoring systems enter the picture.

The top three IT risks:

1. Environmental disruption.

The number one cause of downtime for remote locations, environmental problems go beyond fires and floods and affect as much as 30% of a company's mission-critical infrastructure. Cooling and power are key points of exposure and increase as equipment density does.

2. Unnecessary risk.

When systems are housed in less-than-optimal settings, or are in remote and unsupervised locations, any error causes downtime. Yet, it's not practical to have someone babysitting the servers. We offer more effective ways to keep track of your equipment.

3. Sabotage.

Regardless of the probability, terrorism is now something each of us must plan for. Your systems can also be brought down from within if the proper security safeguards are not in place.

What's an environmental monitoring system?

Environmental monitoring products enable you to actively monitor the conditions in your rack, server room, data centre, or anywhere else you need to protect critical assets. Conditions monitored include extreme temperatures, humidity, power spikes and surges, water leaks, smoke, and chemical materials. With proper environmental monitoring, you're alerted to any conditions that could have an adverse effect on your mission-critical equipment. These products can also alert you to potential damage from human error, hacking, or prying fingers.

Environmental monitors consist of three main elements: a base unit, probes or sensors, and network connectivity and integration.

The base units may contain one or more built-in sensors, as well as ports for hooking up external probes. Additionally, they include an Ethernet port and have software for remote configuration and graphing. This software may also work with existing network management software, such as SNMP systems.

Features:

Measurement (see chart below).

The environmental monitoring appliance displays the values measured by the attached probes, e.g. temperature, humidity, airflow, status of dry contact, door, motion detector, and other sensors.

Data collecting and graphing (see chart below).

The measurements are periodically stored in the internal memory or external storage media and displayed as graphs.

Alerting (see chart on facing page).

When the measured value exceeds the predefined threshold, it triggers an alert: a blinking LED on the front panel, an audible alarm, SNMP trap, e mail, etc.

The environmental monitoring appliance can also activate an external alarm system like a siren or strobe light.

Benefits of environmental monitoring:

- Reduced downtime—When things go wrong, you're the first to know. Minimise downtime by being alerted about conditions that cause damage to servers and other network devices.
- Increased profits—Black Box environmental monitoring systems are easy to implement. Also, they help you cut replacement equipment costs and redistribute your workforce more effectively.
- Increased employee satisfaction — With built-in notification features like email, SMS, and SNMP traps, a remote monitoring system enables employees to better manage their work.

Applications:

The Black Box AlertWerks™ System consists of SNMP-enabled, Web-based monitors that alert the user to any abnormal conditions. AlertWerks monitors multiple environmental conditions, including temperature, humidity, airflow, smoke, security, and voltage. Black Box has complete solutions for a variety of applications, including:

- Data centre monitoring
- Server room monitoring
- Rackmount industrial equipment
- Telecommunications
- UPS/battery backup
- Educational institutions
- Food and beverage applications
- Buildings/warehouses
- Air conditioner/refrigerants/freezer monitoring
- Greenhouses
- Oil and gas

from temperature extremes to water damage.

Data Centre

The Challenge:

eASP.Net was launched in 2000 by Nortel Networks in Taiwan with a goal to be the premier carrier-neutral data centre and “Application Service Provider” (cloud computing) in Asia. Today, eASP.Net is still the top data centre not owned or established by any local carrier in Asia. They are proud to be the Tier 1 Internet/Submarine Cable landing hub of Taiwan and were selected by the world-renowned carriers as the Asia POP.

eASP.Net's data centre is on four floors in one building, with equipment located on multiple floors. They had an old environmental monitoring system which was using PLC (programmable Logic Control) technology. By using a PLC system, their management team could only get environmental status reports via alarm notifications. The team was aware when something happened but did not know the details. So they had to send somebody to every floor to see what was going on and to fix the problem—a very ineffective, time-consuming process. For these reasons, eASP.Net wanted a brand new environmental monitoring system that could be monitored remotely. They also needed it to provide details on conditions, locations, and events. The new system had to provide integration capabilities with their existing network management software. Finally, they needed an environmental monitoring system that could provide remote monitoring via IP and also support SNMP.

The Solution:

Black Box installed one AlertWerks™ ServSensor V4E Hub (EME134A-60) and multiple expansion units. eASP.Net uses network management software in their control centre to monitor all the sensors and dry contact status. The AlertWerks solution for eASP.Net provides them e mail notifications, a different audible alarm for each kind of notification through broadcasting speakers, and SNMP TRAP. They can maintain the entire system by themselves.

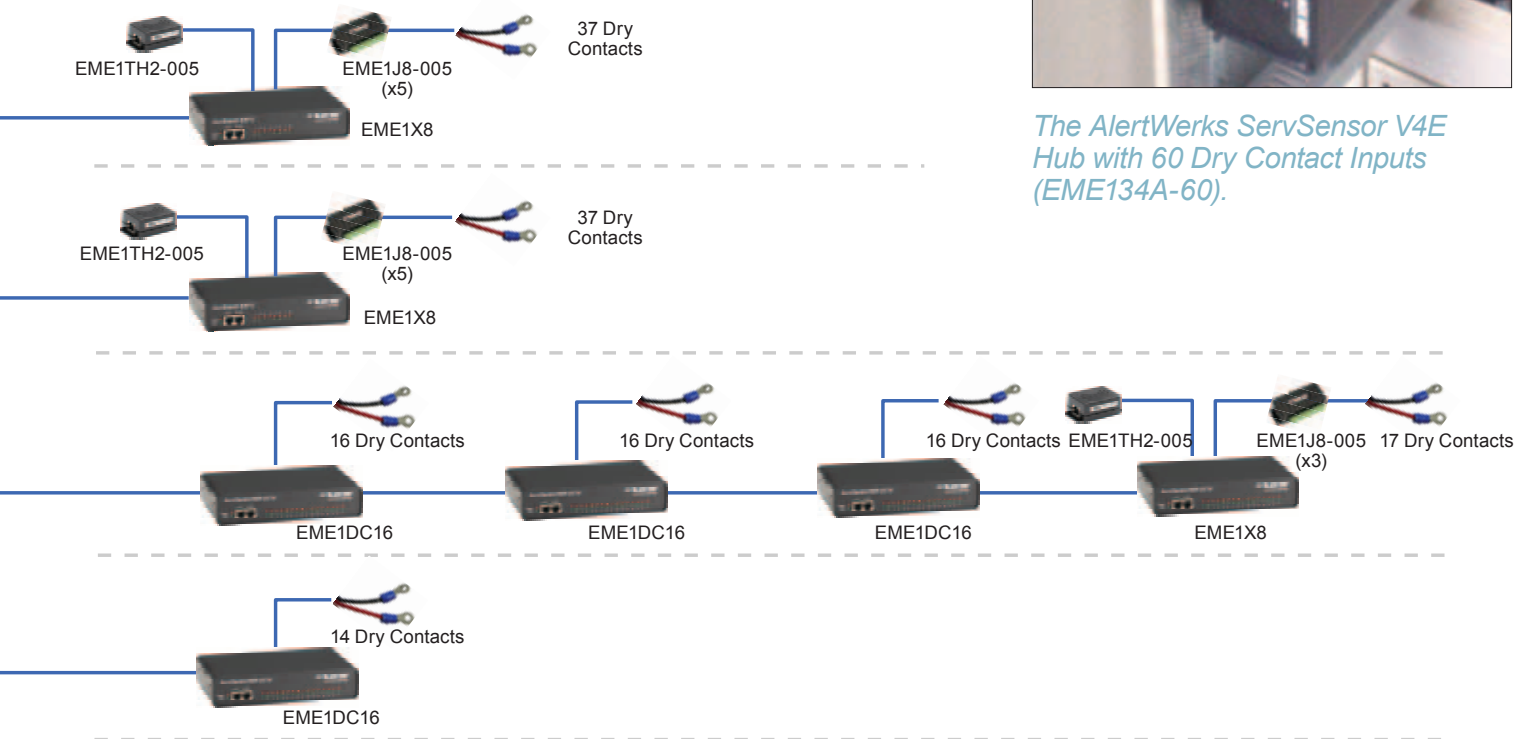

The solution includes:

- ServSensor V4E Hub, 60 Dry Contact Inputs (EME134A-60)
- ServSensor Expansion Unit, 8-Port Sensor Hub (EME1X8)
- Serv Sensor Expansion Unit, 16-Port Dry Contact Hub (EME1DC16)

A. AlertWerks ServSensor V4E Hub, V4EL Hubs

- Support up to eight plug-and-play Intelligent Sensors (pages 66-67).
- Can be daisychained to expansion hubs, increasing the total sensor count up to 500.
- V4E model also supports up to four surveillance cameras (see page 67 for the AlertWerks cameras).
- Notify you of alarms in a variety of ways, including e mail, SNMP, and text messages.
- Can also monitor up to 80 SNMP devices.
- Monitors external devices via SNMP or IP "ping."
- Manageable through an easy-to-use Web interface.
- Full SNMP v1, v2, and v3 compliance.
- Include a combination temperature/humidity sensor.

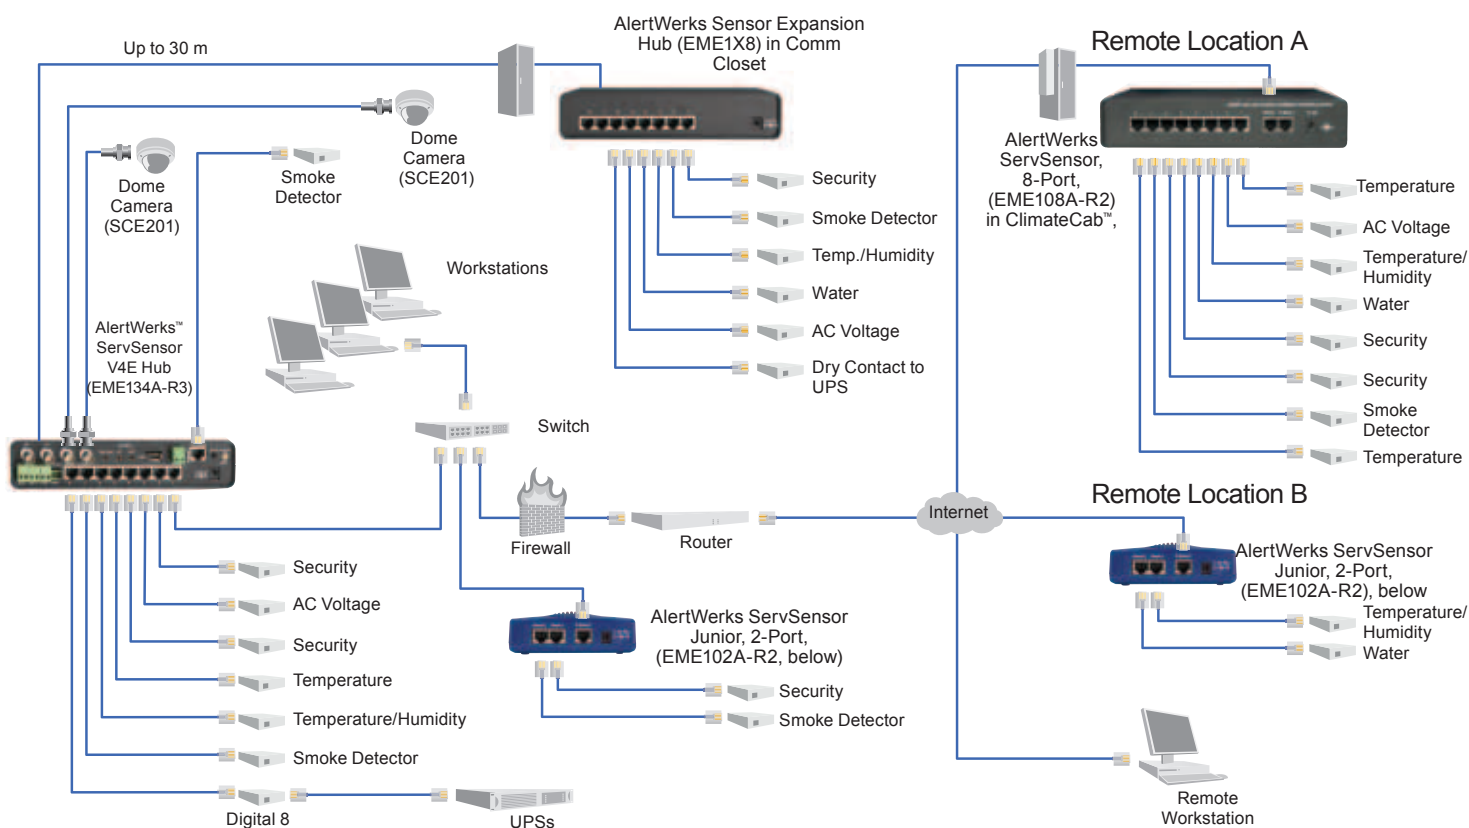

The AlertWerks ServSensor V4E family enables you to integrate environmental sensors and surveillance cameras into one seamless remote monitoring system that watches over your premises. Each ServSensor supports up to eight AlertWerks Intelligent Sensors (pages 66-67). Sensors automatically configure and go on-line, ready to report any status change. Choose from a wide variety of sensors, including temperature, humidity, water, airflow, motion, and voltage.

B. AlertWerks ServSensor Hubs

- Function as a central hub for your AlertWerks Intelligent Sensors.
- Use them for remote monitoring of a wide range of areas from server rooms to factory floors.
- Feature four or eight RJ-45 ports; AlertWerks Intelligent Sensors sold separately.
- Work with a wide range of sensors: temperature, humidity, water, airflow, smoke, motion, security, dry contact, and AC and DC voltages.
- Use sensors in any combination.
- Easy to set up, easy to use.
- Integrate hubs into your SNMP managed network or use as an independent monitoring system.

Black Box ETL Verified Channel Solutions: Guaranteed for Life,

For proven performance in your mission-critical networks, choose Black Box channel solutions.

Guaranteed for life.

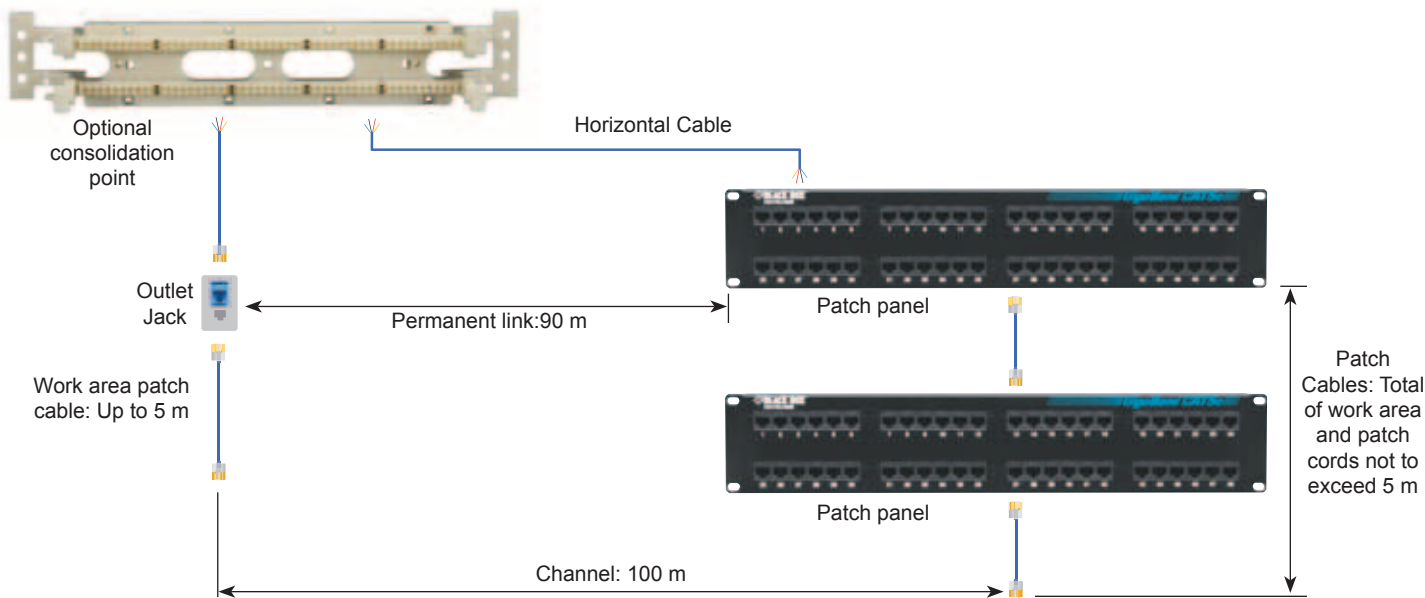

For performance designed to last the lifetime of your structured cabling system, choose Black Box channel solutions. These structured cabling systems are designed to work together so you get the absolute best channel performance.

To fully back our claims of quality and performance, we guarantee—for life—every component in our channel solutions. If it fails, we'll replace it. Black Box's unbeatable Double Diamond™ Warranty covers everything from manufacturing defects to accidental damage—including water and surge damage.

Plus, all Black Box® brand copper cables, most fibre cables, and infrastructure components are also guaranteed for life.

Independent testing

To back up our performance claims, Black Box puts our channel solutions to the test.

Black Box engages independent third-party testing. Intertek Testing Services—ETL Semko, Inc. conducts ETL® Verification tests of our PVC, CAT6A, CAT6, and CAT5e channels.

Four times a year, an ETL inspector visits Black Box and randomly selects cable and cabling products from our warehouse for ongoing performance testing. The result time and time again: Black Box channels exceed all key measurements for their respective categories.

In addition, Black Box's GigaTrue® CAT6A, GigaTrue CAT6, and GigaBase® CAT5e bulk PVC cables are all component-level tested.

Passive testing

In passive testing, the channel solution is tested against the appropriate specifications. The results indicate how much headroom the products provide above the specification. These are important numbers to consider because you want your system to have enough headroom to accommodate future growth.

For test results, contact Tech Support on 0811-5541 112.

Black Box bulk LSZH cables are 3rd party tested to ensure compliance with:

- ISO/IEC 11801, also CENELEC and ANSI/TIA standards.
- Bulk cables also comply with the Low Voltage Directive.
- They are also fire tested according to IEC60332.

Secure network ports—only when you need to.

These one-of-a-kind cables give you the ability to lock down critical network ports—when you need to—without buying new patch cords.

Use these high-performance cables for your everyday network connections. Then when you need to secure network ports, you can—in seconds. Just slip an optional Locking Pin under the locking tab on the patented, slimline boot. Now no one can come along and unplug your cable. It stays locked until you decide to release it. To unplug the cable, release the Pin with the Removal Key (sold separately).

Prevent unauthorised access and disconnects.

These 3-Series cables are ideal for protecting mission-critical network ports from unauthorised access and removal. They're also ideal for preventing accidental disconnects, particularly in industrial and manufacturing applications.

Premium performance.

You won't sacrifice performance for security. These high-performance cables are tested to 650 MHz (CAT6A), 550 MHz (CAT6), or 350 MHz (CAT5e) and are guaranteed for life. Our CAT6A cables are also component-level rated.

Rugged, patented, slimline boot.

No one is going to break this boot or pull out your cable!

The extremely rugged, hard-polymer plug and boot are integrated to protect the cable and to prevent tampering. The hard shell also protects the strain-relief and prevents excessive bending and flexing. The snag-free, slimline form fits all standard RJ-45 openings.

The boot's slimline design makes it ideal for high-density applications. It fits all RJ-45 openings.

The hard-polymer boot and plug are integrated for better strength and strain-relief and to prevent tampering.

To secure network ports, slip the Locking Pin under the built-in locking tab on the patented boot. Once inserted, it can only be released with the Removal Key.

Reduce cabling space, management, and costs.

Retrofitting a cabinet?

Installing newer, deeper equipment?

Upgrading your data centre?

Today, as more and more IT managers move to high-density configurations, space in the data centre is becoming more and more valuable. Keeping your data centre a showplace takes time and effort. When making changes, it's easy to say, "I'll add that cable management tomorrow." Before you know it, you end up with data centre cable spaghetti.

Tame cable chaos and gain space with SpaceGAIN™, a family of patch cables and panels designed to help you create space instead of taking up space. Found only at Black Box, they turn tight spaces into right spaces. Gain space for cabling in the closet and reduce cable management, installation time, and costs.

The SpaceGAIN family consists of:

- 90° Right-Angle Patch Cables, Unshielded and Shielded, a Black Box Exclusive.
- 6" Reduced-Length Patch Cables
- 45° Angled-Port Patch Panels

Cables flow downward—not out—saving even more space with our award-winning SpaceGAIN 45° Angled-Port Patch Panels.

Save space in crowded cabinets.

SpaceGAIN cables give you an ingenious new way to save space in high-density configurations. Streamline panel and switch connections and gain up to four inches of valuable space in crowded cabinets. You'll never have to worry about closing cabinet doors again.

Make neat patches.

Follow data centre cabling best practices and use the right length cable. You'll avoid cable spaghetti and eliminate the use of cable management.

More space-saving panels.

Eliminate the need for horizontal cable managers with the SpaceGAIN Angled Patch Panels, page 139. Tight quarters in your rack? Free up space with the 1/2U SpaceGAIN Patch Pane.

Save even more space with this exclusive SpaceGAIN combo!

The high-density SpaceGAIN solution. Use our 90° Down Patch Cables and High-Density Feed-Through Patch Panels.

Retrofitting a cabinet? Installing newer, deeper equipment? Want to make sure your cabinet door closes?

In high-density configurations, cabinet space is becoming an increasingly scarce commodity. Gain space in your cabinets (and ensure the door will close) by using our exclusive SpaceGAIN 90° Right-Angle Patch Cables with our 48-Port, 1U, High-Density Feed-Through Patch Panel.

To fit 48 ports in only 1U, the patch panel connectors face up on the top row and down on the bottom row as indicated by the tab area. To achieve the tight, neat configuration as shown above, use 90° Down Cables for both rows.

Put technology wherever you need it—without running power.

What is PoE?

Power over Ethernet (PoE) is a standard for sending data and power over your Ethernet cable to low-wattage devices, such as cameras, wireless access points, VoIP phones, and more. The greatest benefit PoE gives you is the ability to power devices in remote, hard-to-reach, and non-powered locations—without worrying about the cost or hassle of running new AC power lines. And it's a lot easier to install an Ethernet line than electrical wiring.

PoE technology has matured and gone from a being a hodgepodge of home-brew and proprietary methods to the safe, reliable standard it is today.

Electrical power has a frequency of 60 Hz or less.

Data signals travel at 10–100 MHz.

How does PoE work?

The way it works is simple: Ethernet cable that meets CAT5 (or better) standards consists of four twisted pairs of cable, and PoE sends power over those pairs to PoE-enabled devices. In one method, two pairs are used to transmit data, and the remaining two pairs are used for power. In the other method, power and data are sent over all four pairs.

When the same pairs are used for both power and data, the power and data transmissions don't interfere with each other. Because electricity and data function at opposite ends of the frequency spectrum, they can travel over the same cable. Electricity has a low frequency of 60 Hz or less, and data transmissions have frequencies that can range from 10 MHz to 100 MHz.

There are two types of devices involved in PoE configurations: Power Sourcing Equipment (PSE) and Powered Devices (PD). PSEs, which can include end-span and mid-span devices, provide power to PDs over the Ethernet cable. PDs are devices such as surveillance cameras, sensors, wireless access points, etc., that receive power via the Ethernet line.

PoE standards.

The original PoE standard is IEEE 802.3af or simply Power over Ethernet. It was ratified by the Institute of Electrical and Electronic Engineers (IEEE) in June 2000 as the 802.3af-2003 standard. It defines the specifications for low-level power delivery—15.4 watts at 48 VDC—over twisted pair Ethernet cable to PoE-enabled devices such as VoIP phones, wireless access points, Web cameras, and audio speakers.

In 2009, this standard was joined by the IEEE 802.3at standard, PoE Plus. This standard provides at least 25.5 watts to more power-hungry devices such as pan/tilt/zoom cameras. This standard specifies using only two of the four twisted pairs for power rather than all four pairs. 802.3at is backwards compatible with 802.3af.

Newer, proprietary higher-powered PoE methods capable of outputting at least 60 watts or more are also available.

In addition to standards-based PoE, there are other methods for delivering power over data lines, including legacy PoE, high-wattage PoE, and passive PoE. Different kinds of PoE are not interchangeable, and you may damage a device by connecting it to the wrong kind of power sourcing equipment.

PoE applications and benefits: Save money and time.

PoE enables you to easily move equipment from room to room without costly, time-consuming rewiring. Additionally, if your LAN is protected from power failure by a UPS, the PoE devices connected to your LAN are also protected from power failure.

Using PoE can save hundreds of dollars per Wi-Fi access point (AP) location compared to a non-PoE solution.

In a non-PoE installation, in addition to the Ethernet link, power must be wired to the access point. Depending on factors such as AP location, distance from the AC circuit, and local safety codes, the savings from using a PoE solution can be \$200-\$400 per AP. In harsh, outdoor, or industrial environments, you can save \$600-\$1200 per AP by using PoE. PoE is also the answer if you're doing a VoIP phone conversion. There's a much lower installation cost—all you need to do is provide the Ethernet connection.

Plus, using PoE can improve VoIP phone system availability. PoE PSE gear can be located in data centres with uninterruptible power supplies and battery backup. This arrangement means that your PD VoIP phones will remain working if there's a power failure. On the other hand, wall-outlet powered phones will stop working when the power goes out.

Common myths about PoE.

Myth #1: PoE requires special wiring.

If you're using CAT5 or greater cable, there's no need to modify or upgrade your existing cabling to use PoE. It operates over regular, 4-pair Ethernet cable. You can use CAT5 and up, and it can be shielded or unshielded.

Myth #2: PoE requires electrical expertise.

It's easy to add PoE equipment to your network and you don't have to be an electrician. While early PoE required electrical expertise and a lot of calculating, today's 802.3 af/at standards-based PoE requires no special electrical expertise.

Because most of the equipment is plug and play, you don't have to worry if a PD is getting the wrong amount of power, or worse, getting power when it shouldn't. This is because the PSE communicates with the PD to determine power requirements. This keeps power from accidentally going to devices that don't support PoE.

Myth #3: PoE requires expensive new equipment.

Actually, you can add PoE devices to your network quite economically.

PoE powered devices, such as cameras and wireless access points, are relatively inexpensive. You can buy PoE switches as PSEs, but it could be much more economical to use mid-span power sourcing equipment, such as injectors or splitters. They go in between your regular network switch and the network and don't require you to replace any existing infrastructure.

That pretty much covers the basics of PoE. It can be an easy, economical way to add equipment to remote, hard-to-reach, and unpowered areas of your enterprise.

Can't find what you need? Tell us what you want to accomplish and we'll design a custom solution for you. Depending on your application, we can modify existing cables, adaptors, and other products to your specs- or we can build them from scratch. Best of all, all the engineering support and custom design service is **absolutely free**.

Custom capabilities:

- Cables: UTP, fibre, A/V, RS-232 and more.
- Bundled cables.
- Y and octopus cables.
- Nurse all cables.
- Special connectors and adaptors.
- Special pinning.
- Faceplates.
- Pinning, striping, and colouring.
- Kitting, labelling, and bundling.
- Packaging and shipping.

Special requirements are no problem. Every day, experienced technicians in our manufacturing facility in Lawrence, PA, build custom cable assemblies, wallplates, switches, and more.

Custom capabilities can include:

Custom copper cables

We can customise any kind of copper cable: twisted pair, AV, coax, RS-232, and more. Need special snap-on/off connectors for security reasons? You've got it. We can also build custom Y and large octopus cables with extremely unusual connector combinations. Tell us what you want, and we'll make it.

Bundled CAT5e and CAT6 Bulk Cable

Black Box saves you time by delivering bundled cables with the exact number of cables of the type and length you need. You can even specify colour. Pull cable once and you're done. Ask about our bundled fibre cables, too.

Dyed, striped, UV, and more

Camouflage? Company colours? Red, white, and blue? Show your colours with Black Box Custom Cable. We provide you with the jacket solution you need, whether it's special colour or striping for easy identification, or even cable that can stand up to the sun's UV rays.

Custom fibre colours and lengths.

Colour-code your network with fibre optic cable in different colours and different lengths. For details, call us on 0811-5541 112

Adaptors

Tell us the specific pairing, jumpers, and drains you need. Not sure? Describe your application, and our Tech Support experts will help you. We even do quick connect/disconnect adaptors for industrial applications. Have legacy equipment and can't find adaptors? We'll make them for you.

Feed-through faceplates

Need custom faceplates for conference rooms, classrooms, digital signage displays, or even healthcare facilities? We can create your installation with the connectors of your choice: CAT5e, CAT6, fibre optic, VGA, audio, S-Video, HDMI, and more.

Copper Structured Cabling

Solutions for every network and industry.

No matter what type of structured cabling system you're planning, Black Box can help. Whether you want a premium, guaranteed-for-life channel that will last for years, or an inexpensive solution for a temporary network, you'll find it right here. Black Box can take your structured cabling system from the data centre to the desktop and beyond. Count on Black Box for:

- ETL Verified CAT6A/6/5e channel solutions.
- Guaranteed-for-life cable and components.
- Lockable patch cables for security and reliability.
- Value Line channels (www.black-box.de).
- ISO/TIA/CENELEC compliant bulk cable.
- 3rd party tested cable.

Copper Cabling

By Roberta Bowen Szyper

Cabling lifespan

Cabling is one of the most important components of your network. Choosing the right cabling can be a daunting proposition as we move forward to 10-/40-/100-Gbps, even 1 TB networks. You have to consider many factors including cost, mobility, convergence, and even applications that haven't been developed yet. In a July 2012 report, the IEEE estimated that industry bandwidth requirements in 2015 would be 10 times the traffic of 2010, and in 2020, 100 times more than 2010.

Cabling is the most long-lived component of your network, with an expected life span of at least 10 years to as long as 15–20 years. You'll most likely replace your network equipment three to four times over the life of the cabling system. Plan on cabling to be about 3–5% of your total network cost. An investment in high-quality cabling is easily justified in reduced downtime, reduced maintenance, and better network performance.

If you're planning a structured cabling infrastructure today, you'll most likely specify cabling that, at minimum, supports 10-Gigabit Ethernet now with an upgrade to a 40-/100-Gigabit network in 5–10 years.

Copper cable

One of the most obvious advantages copper offers is that it is less expensive than fibre optic cable and much easier to terminate in the field. Twisted pair cable consists of four pairs of 22–28 AWG copper wires, each covered by insulators and twisted together. There are two types of twisted pair cable, unshielded and shielded.

Unshielded twisted pair

This is the most widely used cable. Known as balanced twisted pair, UTP consists of twisted pairs (usually four) in a PVC or LSZH jacket. When installing UTP cable, make sure you use trained technicians. Field terminations, bend radius, pulling tension, and cinching can all loosen pair twists and degrade performance. Also take note of any sources of EMI. Choose UTP for electrically quiet environments.

Shielded twisted pair

Over the past twenty years, the need for speed in networking has driven new cabling specifications and technologies at an ever-accelerating rate. Alongside the development of each generation of Ethernet are corresponding developments in cabling technologies. Part of that development is the increased use of shielded cable. It's becoming more common in high-speed networks, especially when it comes to minimising ANEXT in 10-GbE runs.

Shielded cable was traditionally used to extend distances and to minimise EMI. It still is. Sources of EMI, commonly referred to as noise, include elevator motors, fluorescent lights, generators, air conditioners, and printers.

Shielded cable can be less balanced than UTP cable because of the shield. The metal sheaths in the cable need to be grounded to cancel the effect of EMI on the conductors. Shielded cable is also more expensive, less flexible, and can be more difficult to install than UTP cable because of the grounding and bonding.

Most shielded cable is thicker than UTP, so it fills conduits quicker. Keep that in mind as you plan your cable pathways.

Types of shields. There are a number of different types of shielded twisted pair cable and the terminology has evolved over the years. There are two common shields: foil sheaths and copper/metal braids. Foil gives a 100% shield while a copper braid provides 85% to 95% coverage because of the holes in the braid. But, a braided shield offers better overall protection because it's denser than foil and absorbs more EMI. A braided shield also performs better at lower frequencies. Foil, being thinner, rejects less interference, but provides better protection over a wider range of frequencies. For these reasons, combination foil and braid shields are sometimes used for the best protection. Shields can surround all the twisted pairs and/or the individual twisted pairs.

Twisted Pair Cable Shielding

Old name	New name	Outer shield	Inner, pair shields
UTP	U/UTP	—	—
STP	U/FTP	—	Foil
FTP	F/UTP	Foil	—
S-STP	Sc/FTP	Braiding (or screening)	Foil
S-FTP	SF/UTP	Foil and braiding	—

U = Unshielded
Sc = Braiding or Screening

TP = Twisted Pair
F = Foil

Shielding acronyms

Shielding acronyms have evolved over the years after confusion as to what FTP is versus STP and S/FTP. Now, the letter for the outer shield (under the cable jacket) is noted first.

The letter after the slash denotes any shield on the individual twisted pairs.

U/FTP (Unshielded/Foiled Twisted Pair). This cable does not have an overall outer shield. It does have foil shields on each of the four pairs. Formerly called FTP.

F/UTP (Foiled/Unshielded Twisted Pair). This cable has an overall foil shield surrounding all the pairs. Formerly called FTP.

Sc/FTP (Screened/Foiled Twisted Pair). This cable features an overall braided or screened shield underneath the cable jacket. It has individual foil shields on each twisted pair. Formerly called S/FTP.

F/FTP (Foiled/Foiled Twisted Pair). This cable features an overall foil shield underneath the cable jacket. It has individual foil shields on each twisted pair. Formerly called S/FTP.

Sc/FTP and F/FTP cables offer the best protection from external noise and ANEXT.

Solid vs. stranded conductors

Copper cable conductors can be solid or stranded.

Solid-conductor. A solid conductor is a single, solid-copper wire. Solid-conductor cable has better electrical characteristics and lower attenuation than stranded-conductor cable. But, solid-conductor cable is less flexible and shouldn't be bent, flexed, or twisted. Solid-conductor cable is usually used for backbone and horizontal cables runs, such as between equipment rooms or from the telecommunications room to the wallplate.

Stranded-conductor. In stranded cable, each individual conductor is made up of a bundle of smaller-gauge wire strands bundled or wrapped around a centre strand to form a single conductor. This conductor has a diameter similar to a solid-conductor but with less conducting area. The stranding gives the cable more flexibility. Stranded cable is better for short runs, such as between the outlet and desktop, and in patching applications where it will be repeatedly bent, plugged, and unplugged. Stranded cable does have a higher attenuation, so the total length in your channel should be kept to 10 metre or less to reduce signal degradation.

PVC, LS0H

PVC cable features an outer polyvinyl chloride jacket that gives off smoke and toxic fumes when it burns. It's most commonly used between the wallplate and workstation. It can be used for horizontal and vertical runs, but only if the building features a contained ventilation system. PVC cable is designated CM or CMR.

Low Smoke, Zero Halogen (LS0H, LSZH) is a type of fire rated cable with a thermoplastic or thermoset compound in the jacket. It limits the emission of smoke and corrosive gases and permits no halogens to be released when exposed to high heat or flames. Halogen in cable jackets is considered to be a good flame retardant, but it emits toxic fumes and smoke when exposed to flame and it can create acid when exposed to moisture. LS0H cables are ideal for use in areas with poor ventilation, such as aircraft and rail cars. They are commonly used in Europe. LS0H cables are also less flexible than PVC cable.

Types of twisted-pair cables

Hey, so what does AWG mean?

AWG (American Wire Gauge) is a classification system for the diameter of the conducting wire. The more a wire is drawn or sized, the smaller the diameter. For example, a 24-gauge wire is smaller than an 18-gauge wire.

The importance of standards

Standards are the platform of all telecommunications networks. They establish guidelines and recommend best practices for every aspect of telecommunications cabling systems from network design and installation to cable performance and verification. Standards establish technical criteria and ensure uniformity and compatibility in and between networks.

In communications cabling, standards define cabling types, distances, connections, cabling architectures, performance parameters, testing requirements, and more. And because they provide recommended best practices, standards can reduce downtime and installation expenses. They also simplify moves, adds, and changes.

Standards enable you to build structured cabling systems that can easily accommodate existing technologies, equipment, and users, as well as future ones.

Standards organisations

Today, there are a few primary organisations involved in the development of structured cabling standards.

Globally, the organisations that issue standards are the International Organisation for Standardization (ISO) and the International Electrotechnical Commission (IEC). Standards are often listed as ISO/IEC. These standards focus on networking. The IEEE (Institute of Electrical and Electronics Engineers) standards focus on local and metropolitan area networks.

In North America, standards are issued by the Telecommunications Industry Association (TIA), which is accredited by the American National Standards Institute (ANSI). That's why its standards are commonly known as ANSI/TIA. The TIA creates standards for telecommunications cabling infrastructure in user-owned buildings, such as commercial buildings.

Other organisations include the Canadian Standards Association (CSA), CENELEC (European Committee for Electrotechnical Standardizations), and the Japanese Standards Association (JSA/JSI).

The committees of all these organisations work together and the performance requirements of the standards are very similar. But there is some confusion in terminology.

The TIA cabling components (cables, connecting hardware, and patch cords) are labeled as a "category." These components together form a permanent link or channel that is also called a "category." The ISO /IEC defines the link and channel requirements with a "class" designation. But the components are called a "category."

*Under development.

The standards

Category 5 (CAT5), was ratified in 1991. It is no longer recognised for use in networking.

Category 5e (CAT5e)–ISO/IEC 11801 Class D, ratified in 1999, is designed to support full-duplex, 4-pair transmission in 100 MHz applications. The CAT5e standard introduced the measurement for PS-NEXT, EL-FEXT, and PS-ELFEXT. CAT5e is no longer recognised for new installations. It is commonly used for 1-GbE installations.

CAT6 vs. CAT6A

CAT6
OD: 5.3–6.1 mm

CAT6A UTP
OD: 7.3–8.9 mm

Category 6 (CAT6)–Class E has a specified frequency of 250 MHz, significantly improved bandwidth capacity over CAT5e, and easily handles Gigabit Ethernet transmissions. CAT6 supports 1000BASE-T and, depending on the installation, 10GBASE-T (10-GbE).

10-GbE over CAT6 introduces Alien Crosstalk (ANEXT), the unwanted coupling of signals between adjacent pairs and cables. Because ANEXT in CAT6 10-GbE networks is so dependent on installation practices, TIA TSB-155-A and ISO/IEC 24750 qualifies 10-GbE over CAT6 over channels of 37 to 55 metres and requires it to be 100% tested, which is extremely time consuming. To mitigate ANEXT in CAT6, it is recommended that the cables be unbundled, that the space between cables be increased, and that non-adjacent patch panel ports be used. If CAT6 F/UTP cable is used, mitigation is not necessary and the length limits do not apply. CAT6 is not recommended for new 10-GbE installations.

Augmented Category 6 (CAT6A)–Class Ea was ratified in February 2008. This standard calls for 10-Gigabit Ethernet data transmission over a 4-pair copper cabling system up to 100 metres. CAT6A extends CAT6 electrical specifications from 250 MHz to 500 MHz. It introduces the ANEXT requirement. It also replaces the term Equal Level Far-End Crosstalk (ELFEXT) with Attenuation to Crosstalk Ratio, Far-End (ACRF) to mesh with ISO terminology. CAT6A provides improved insertion loss over CAT6.

It is a good choice for noisy environments with lots of EMI. CAT6A is also well-suited for use with PoE+.

CAT6A UTP cable is significantly larger than CAT6 cable. It features larger conductors, usually 23 AWG, and is designed with more space between the pairs to minimise ANEXT. The outside diameter of CAT6A cable averages 7.3–8.9 mm compared to 5.3–6.1 mm for CAT6 cable. This reduces number of cables you can fit in a conduit. At a 40% fill ratio, you can run three CAT6A cables in a 20 mm conduit vs. five CAT6 cables.

CAT6A UTP vs. CAT6A F/UTP

CAT6A UTP
OD: 9 mm

CAT6A F/UTP
OD: 7.4 mm

CAT6A UTP vs. F/UTP. Although shielded cable has the reputation of being bigger, bulkier, and more difficult to handle and install than unshielded cable, this is not the case with CAT6A F/UTP cable. It is actually easier to handle, requires less space to maintain proper bend radius, and uses smaller conduits, cable trays, and pathways. CAT6A UTP has a larger outside diameter than CAT6A F/UTP cable. This creates a great difference in the fill rate of cabling pathways. An increase in the outside diameter of 2 mm, from 7 mm to 9 mm for example, represents a 21% increase in fill volume.

In general CAT6A F/UTP provides a minimum of 35% more fill capacity than CAT6A UTP. In addition, innovations in connector technology have made terminating CAT6A F/UTP actually easier than terminating bulkier CAT6A UTP.

Category 7 (CAT7)–Class F was published in 2002 by the ISO/IEC. It is not a TIA recognised standard and TIA plans to skip over it.

Category 7 specifies minimum performance standards for fully shielded cable (individually shielded pairs surrounded by an overall shield) transmitting data at rates up to 600 MHz. It comes with one of two connector styles: the standard RJ plug and a non-RJ-style plug and socket interface specified in IEC 61076-2-104.2.

Category 7a (CAT7a)–Class Fa (Amendment 1 and 2 to ISO/IEC 11801, 2nd Ed.) is a fully shielded cable that extends frequency from 600 MHz to 1000 MHz.

Category 8 – The TIA decided to skip Category 7 and 7A and go to Category 8. The TR-42.7 subcommittee is establishing specs for a 40-Gbps twisted-pair solution with a 2-GHz frequency. The proposed standard is for use in a 2-point channel in a data centre at 30 meter. It is expected to be ratified in February 2016. The TR-42.7 subcommittee is also incorporating ISO/IEC Class II cabling performance criteria into the standard. It is expected to be called TIA-568-C.2-1. The difference between Class I and Class II is that Class II allows for three different styles of connectors that are not compatible with one another or with the RJ-45 connector. Class I uses an RJ-45 connector and is backward compatible with components up to Category 6A.

Recommended channel and permanent link

Channel and Permanent Link

The horizontal cabling channel encompasses everything between the communications room cross-connects to the outlets in the work area. It's specified in TIA-568-C.2.

Channel performance is when all the parts of the channel are tested together and meet the applicable industry standards.

Component-level compliance is when one part of the channel, say the horizontal cabling, is tested and meets or exceeds category performance requirements. Meeting component-level performance does not guarantee the channel will meet specification as some parts may have better or worse performance or may come from different manufacturers.

Fill Capacity (Number of Cables)

Conduit Size	Fill*	CAT6A UTP 9.00 mm O.D.	CAT6A F/UTP 7.4 mm O.D.

Cable installation guidelines

You can invest in the best cable and hardware, but if they're not installed properly, they won't work, or at least they won't work well. Protect your investment and follow these installation guidelines.

Cable pair twists. This is the most important guideline you can follow for twisted-pair cable. The pair twists are responsible for much of cable's performance. If you lose the twists, you lose performance.

When terminating CAT5e or higher, maintain pair twists to within 13 mm from the point of termination. And remove as little of the sheath as possible.

When terminating cable, only strip back the cable sheath 25 mm. Keep pair untwists to a maximum of 13 mm.

Bend radius. If you bend twisted-pair cable too much, you loosen the twists, and yes, lose performance. The following bend radii are under no-load conditions:

UTP horizontal: 4 times the cable diameter.

Sc/UTP horizontal: 8 times the cable diameter.

Multipair backbone: 10 times the cable diameter.

Tension. To avoid stretching, pulling tension should not exceed 110 N. Pulling too hard untwists the pairs, which can cause transmission problems, and can affect cable certification. Use supports and trays in cable runs to minimise sagging, which pulls on the pairs and degrades performance.

Cinching. Take care not to cinch cable bundles tightly, which causes stress and degrades performance. Tie cable bundles loosely. And never staple cables.

Connecting hardware. Use connecting hardware of the same category or higher. The transmission of your components will always be the lowest category in the link. So, if you're using CAT6 cable, use CAT6 connectors.

Miscellaneous considerations. Visually inspect the cable for proper terminations, bend radius, tension, nicks, etc. Don't uncoil UTP cable on a spool. It can cause kinks. Rotate the spool instead. Plan for 30 mm of slack cable behind wall outlets for possible future reterminations.

Keep jacket removal and untwists to a minimum.

*UTP bend radius = 4X cable diameter.
Sc/UTP bend radius = 8X cable diameter.*

Keep cable wraps snug, but don't pull or crush cables. Wrap CAT6A cables loosely.

T568A, T568B, and USOC wiring

Pair 1 ——— Pair 3 ———
Pair 2 ——— Pair 4 ———

There are two approved pinning methods in the TIA-568-C standard for terminating network cable to 8-position RJ-45 jacks and connectors: T568A and T568B. The difference between the two is the pin position of the orange and green pairs.

The T568B wiring scheme is the de facto standard for communications networking in the U.S. It is the same as AT&T's old 258A colour scheme. T568B offers backward compatibility with USOC through one pair.

T568A

is backward compatible with both one- and two-pair USOC connections.

Whichever pinning scheme you choose to use, stick with it. T568A and T568B pinning schemes are not interchangeable. Mixing the two can cause crossed pairs, which just don't work.

Straight-pinned and crossover cable

Straight-pinned cable has the most common type of pinning. The send and receive pairs are wired straight through on either end of the cable. Crossover cable is generally used for peer-to-peer connections. The send and receive pairs are crossed between Connector A to Connector B on either end of the cable.

CAT6 and CAT6A Cable Diameters

by Roberta Bowen Szyper

What you need to know.

Although shielded cable has the reputation of being bigger, bulkier, and more difficult to handle and install than unshielded cable, this is not the case with CAT6A F/UTP cable. It is actually easier to handle than CAT6A UTP; requires less space to maintain proper bend radius; and uses smaller conduits, cable trays, and pathways.

CAT6A UTP is significantly larger than CAT6 and CAT6A F/UTP cable because it is designed with more interior space between the pairs to minimize ANEXT. The outside diameter of CAT6A UTP can be as large as 9 mm compared to 6.7 mm – 7.6 mm for CAT6A F/UTP, and 5.3 mm – 6.1 mm for CAT6.

CAT6A UTP cable design differs among manufacturers. It may have double interior pair separators and/or a rigid jacket with a gear-shaped interior wall to create interior air space and decrease crosstalk.

CAT6A UTP is constructed with larger conductors, usually 23 AWG, and tighter twists than are used in CAT6 and CAT5e cable. The heavier conductors and heavier, larger, rigid jacket combine to make CAT6A

UTP more difficult to install. It also requires a bend radius of 4x O.D., which is significantly larger than CAT6 and CAT6A F/UTP.

The CAT6A UTP outside diameter creates a greater difference in the fill rate of cabling pathways.

TIA-569 recommends a maximum conduit fill ratio of 40% to accommodate bend radius requirements and to allow for future expansion. An increase in the outside diameter (O.D.) of 2.5 mm, from 6.5 mm to 8.9 mm, represents a 21% increase in fill volume.

In general, CAT6A F/UTP cable provides a minimum of 35% more fill capacity than CAT6A UTP cable. For example, at a 40% fill ratio, you can run (3) CAT6A UTP cables in a 18 mm conduit vs. (5) CAT6 cables, and (3) CAT6A F/UTP cables.

In addition, innovations in connector technology have made terminating CAT6A F/UTP cable actually easier than terminating bulkier CAT6A UTP cable.

CAT6A: What you need to know.

by Roberta Bowen Szyper

UTP vs. F/UTP

CAT6A is specified in ANSI/TIA-568-C.2 (Balanced Twisted-Pair Communications Cabling and Components Standard), published in August 2009. It defines 10-Gigabit data transmission for a distance of 100 metres. It extends electrical specifications to 500 MHz up from 250 MHz for CAT6. CAT6A supports bundled cable installations up to 100 metres and PoE+ low-power implementations. The standard adds the performance parameter, Alien Crosstalk (ANEXT), which wasn't a concern with previous cabling categories.

ANEXT

Alien Crosstalk (ANEXT) is a critical and unique measurement in 10-GbE networks. It's the measurement of the unwanted signal coupling between wire pairs in different and adjacent cables or from one balanced twisted-pair component, channel, or permanent link to another.

The amount of ANEXT depends on a number of factors, including the type of cable, cable jacket, cable length, cable twist density, proximity of adjacent cables and connectors, and EMI. Patch panels and connecting hardware are also affected by ANEXT.

Typically in a laboratory, measuring alien crosstalk is based on cables in a "six-around-one" configuration. The central or affected cable is called the victim cable and the surrounding, adjacent cables are the disturber cables. This test configuration bundle presents a worst-case scenario, and the centre cable would be adversely affected by ANEXT. A total of seven equal length links are connected to each other at previously defined distances. Every pair is measured against the other so there are 96 individual measurements.

10-GbE

CAT6A is currently the cable of choice for 10-GbE installations. You will typically replace your electronic equipment three to five times during the lifespan of one cabling system, which can be as long as 15–20 years. That's why you should consider getting the best cabling you can—CAT6A minimum. It has been extensively tested and has been proven to support 10-GbE systems with plenty of headroom.

CAT6A UTP
OD: 9.0 mm

CAT6A F/UTP
OD: 7.4 mm

CAT6A UTP

CAT6A UTP cable is larger than CAT6A F/UTP and can have a diameter up to 9 mm. It's constructed to minimise crosstalk and ANEXT with larger conductors (23 AWG minimum), tighter twists, extra internal airspace, an internal separator between the pairs, and a thicker outer jacket. Despite this, CAT6A UTP is still affected by ANEXT.

ANEXT can be improved by laying CAT6A UTP cable loosely in pathways and raceways with space between the cables, as opposed to tight bundles of cable. CAT6A UTP also needs to be tested for ANEXT. This is a complex and time-consuming process where all possible wire-pair combinations need to be tested for ANEXT and far-end ANEXT. It can take up to 50 minutes to test one link in a bundle of 24 CAT6A UTP cables.

CAT6A F/UTP

ANEXT and the time needed to test for it can be greatly reduced, if not eliminated completely, by using shielded cables and equipment to isolate adjacent cables from each other. Studies have shown that CAT6A F/UTP cable does a much better job of eliminating ANEXT than CAT6A UTP and provides significantly more headroom (as much as 20 dB) for 10-GbE over copper. The foil shield acts as a barrier preventing EMI/RFI from coupling onto the twisted pairs from other adjacent cables. In effect, it reflects the noise from machinery, lights, motors, and other sources of EMI, as well as RFI from cell phones, wireless access points, and radios. In addition, the foil shield prevents data signals from leaking out of the cable, making the cable more difficult to tap and better for secure installations.

Custom-Length Patch and Power Cables

Get *exactly* the length you need, *when* you need it.

Why compromise your work by using the wrong length cable? Don't settle for whatever's lying around in the back room, especially if it's way too long.

Why use 3 m cables when you really need 2.5 m cables? Plus you risk jeopardising your network organisation and performance. Keep your telecomm rooms and data centres well-organised, good-looking showpieces by using the right length cable. You'll save money, too, by buying exactly what you need and no more.

Take the risk out of custom-length cables.

Black Box eliminates long lead times for custom cables.

Guidelines for choosing fibre optic cable.

By Roberta Bowen Szyper

The advantages of fibre optic cable.

Greater bandwidth

Fibre provides far greater bandwidth than copper. Fibre also gives network designers future-proofing insurance with speeds of 1000 Mbps or 10-Gbps now and the ability to upgrade to 40- or 100-Gbps later. Fibre speeds and distances are dependent on the type of cable used. Single mode cable offers far greater distance than either 62.5- OM1 or 50 micron OM2 multimode cable. Laser-optimised OM3 and OM4 50 micron multimode cables offer more distance and bandwidth than OM1 and OM2 cable and are less expensive than singlemode cable. In addition, fibre optic cable can carry more information with greater fidelity than copper wire. That's why phone and cable companies use fibre.

Low attenuation and greater distance

Because the fibre optic signal is made of light, very little signal loss occurs during transmission, and data can move at higher speeds and greater distances. Fibre does not have the 100 metre distance limitation of unshielded twisted-pair copper. Fibre distances can range from 100 metres to 40 kilometres, depending on the style of cable, wavelength, and network. (Fibre distances are typically measured in metric units.)

Security

Your data is safe with fibre cable. It doesn't radiate signals and is extremely difficult to tap. If the cable is tapped, it's very easy to monitor because the cable leaks light, causing system failures. If an attempt is made to break the physical security of your fibre system, you'll know it. Fibre networks also enable you to put all your electronics and hardware in one central location, instead of having wiring closets with equipment throughout the building.

Immunity and reliability

Fibre provides extremely reliable data transmission. It's completely immune to many environmental factors that affect copper cable. The core is made of glass, which is an insulator, so no electric current can flow through. It's immune to electromagnetic interference and radio-frequency interference (EMI/RFI), crosstalk, impedance problems, and

more. You can run fibre cable next to industrial equipment without worry. Fibre is also less susceptible to temperature fluctuations than copper and can be submerged in water.

Design

Fibre is lightweight, thin, and more durable than copper cable. Plus, fibre cable has pulling specifications that

are up to 10 times greater than copper cable's. Its small size makes it easier to handle, and it takes up much less space in cabling ducts. Although fibre is still more difficult to terminate than copper, advancements in connectors are making termination easier. Fibre is actually easier to test than copper cable because only insertion loss and return loss are measured. Copper has many more electrical measurements.

Migration

The proliferation and lower costs of media converters are making copper to fibre migration, especially fibre to the desktop much easier.

The converters provide seamless links and enable the use of existing hardware. Fibre can be incorporated into networks in planned upgrades.

Standards

The use of fibre in networks is covered in TIA-568-C.3.

Costs

The cost for fibre cable, components, and hardware is steadily decreasing. Installation costs for fibre are higher than copper because of the skill needed for terminations. Overall, fibre is more expensive than copper in the short run, but it may actually be less expensive in the long run. Fibre typically costs less to maintain, has less downtime, and requires less networking hardware.

Fibre optic cable construction

Core—This is the physical medium that transports optical data signals from an attached light source to a receiving device. The core is a single continuous strand of extruded silica glass or plastic that's measured in microns (μm) by the size of its outer diameter. The larger the core, the more light the cable can carry.

All fibre optic cable is sized according to its core's outer diameter. The two most common multimode sizes are 50 and 62.5 microns. Single mode cores are 8.5–9 microns.

The cores of OM1 and OM2 multimode cable are made differently than the cores of laser-optimised OM3 and OM4 cable. OM1 and OM2 have a small defect in the core called an index depression. This enables them to

be used with LED light sources. OM3 and OM4 are manufactured without the centre defect to enable them to be used directly with VCSELS for greater speeds and distance.

Cladding—This is the thin layer that surrounds the fibre core and serves as a boundary that contains the light waves and causes the refraction, enabling light to travel the length of the fibre segment.

Coating—This is a layer of plastic that surrounds the core and cladding to reinforce and protect the fibre core. Coatings are measured in

microns and can range from 250 to 900 microns.

Strengthening fibres—These components help protect the core against crushing forces and excessive tension during installation. The materials can range from aramid yarn (Kevlar®) to wire strands to gel-filled sleeves.

Cable jacket—This is usually constructed of extruded PVC or LSZH (Low Smoke Zero Halogen). It protects the fibre and enables easy handling.

Multimode vs. single mode.

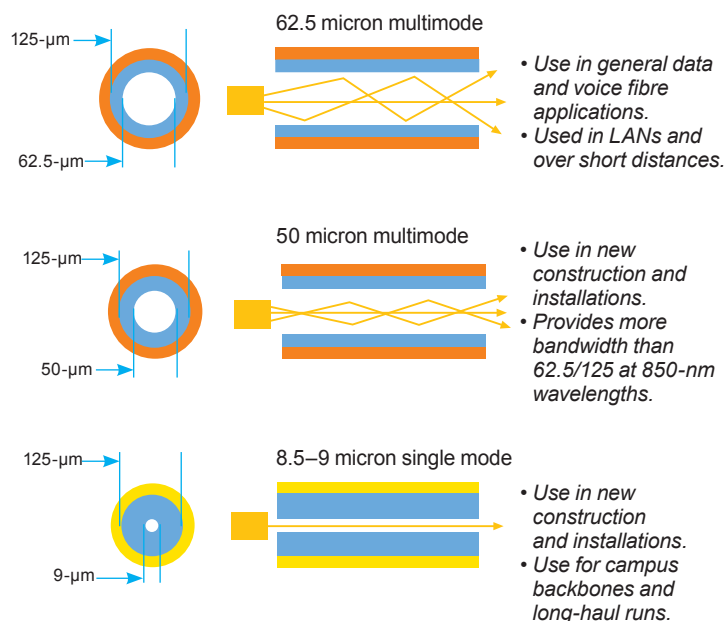

Multimode cable has a large-diameter core and multiple pathways of light. It can be used for most general data and voice applications, such as adding segments to an existing network.

Multimode comes in two core sizes and four varieties: 62.5 micron OM1, 50 micron OM2, 50 micron OM3, and 50 micron OM4. (OM stands for optical mode.) All have the same cladding diameter of 125 microns, but 50 micron fibre cable has a smaller core (the light-carrying portion of the fibre). Although all can be used in the same way, 50 micron cable, particularly laser-optimised OM3 and OM4 50 micron cable, provides longer link lengths and/or higher speeds and is recommended for premise applications (backbone, horizontal, and intrabuilding links) and should be considered for new installations. OM3 and OM4 can also be used with LED and laser light sources. For more information on OM3 and OM4 cable, see page 114-115.

Single mode cable (OS1, OS2) has a small (8–10 micron) glass core and only one pathway of light. (OS stands for optical single mode.) With only a single wavelength of light passing through its core, single mode realigns the light toward the core centre instead of simply bouncing it off the edge of the core as multimode does. OS1 is applied to inside-plant tight-buffered cable. OS2 is applied to loose-tube cables.

Single mode provides far greater distances than multimode cable and can go as far as 40 km (see the chart on page 111), so it's typically used in long-haul network links spread out over extended areas, including CATV and campus backbone applications. Single mode cable also provides higher bandwidth than multimode fibre.

UPC vs. APC connectors

UPC stands for Ultra Physical Contact. APC stands for Angled Physical Contact. Both describe the polish style of the connector endface. The UPC endface is polished at a 0° angle. The APC endface is polished at an 8° angle preventing light from reflecting and traveling back up the interface. Single mode UPC connector bodies are blue, while single mode APC connector bodies are green. Never mix the two.

Guidelines for choosing fibre optic cable. (continued)

The basics of fibre optic cable.

Simplex vs. duplex patch cables

Multimode and single mode patch cables can be simplex or duplex. Simplex cable has one fibre, while duplex (zipcord) cable has two fibres joined with a thin web. Simplex (also known as single strand) and duplex zipcord cables are tight-buffered and jacketed, with Kevlar strength members.

Because simplex fibre optic cable consists of only one fibre link, you should use it for applications that only require one-way data transfer. For instance, an interstate trucking scale that sends the weight of the truck to a monitoring station or an oil line monitor that sends data about oil flow to a central location.

Use duplex multimode or single mode fibre optic cable for applications that require simultaneous, bidirectional data transfer. Workstations, fibre switches and servers, Ethernet switches, backbone ports, and similar hardware require duplex cable.

Indoor/outdoor cable

Indoor/outdoor cable uses dry-block technology to seal ruptures against moisture seepage and gel-filled buffer tubes to halt moisture migration. Comprised of a ripcord, core binder, a flame-retardant layer, overcoat, aramid yarn, and an outer jacket, indoor/outdoor cable is designed for aerial, duct, tray, and riser applications.

Interlocking armoured cable is jacketed in aluminium interlocking armor so it can be run just about anywhere in a building. Ideal for harsh environments, it is rugged and rodent resistant. No conduit is needed, so it's a labour- and money-saving alternative to using innerducts for fibre cable runs.

Outside-plant cable is used in direct burials. It delivers optimum performance in extreme conditions and is terminated within 15 meters of a building entrance. It blocks water with dry blocking, absorbent tape, or powder. If it is armoured, it will require grounding. Outside-plant cables are also rodent resistant. If they are to be used in aerial applications, they will have a messenger strength member.

Distribution-style vs. breakout-style

Distribution-style cables have several tight-buffered fibres bundled under the same jacket with Kevlar® or fibreglass rod reinforcement. These cables are small in size and are used for short, dry conduit runs in either riser or plenum applications. The fibres can be directly terminated, but because the fibres are not individually reinforced, these cables need to be broken out with a "breakout box" or terminated inside a patch panel or junction box.

Breakout-style cables are made of several simplex cables bundled together, making a strong design that is larger than distribution cables. Breakout cables are suitable for conduit runs and riser and plenum applications.

Loose-tube vs. tight-buffered

There are two types of fibre optic cable construction: loose-tube and tight-buffered. Both contain some type of strengthening member, such as aramid yarn, stainless steel wire strands, or even gel-filled sleeves. But each is designed for different environments.

Loose-tube cable is specifically designed for harsh outdoor environments. It protects the fibre core, cladding, and coating by enclosing everything within semi-rigid protective sleeves or tubes. Many loose-tube cables also have a water-resistant gel that surrounds the fibres. This gel helps protect the fibres from moisture, which makes loose-tube cable great for harsh, high-humidity environments where water or condensation can be a problem. The gel-filled tubes can also expand and contract with temperature changes.

But gel-filled loose-tube cable is not the best choice when cable needs to be routed around multiple bends, which is often true in indoor applications. Excess cable strain can force fibres to emerge from the gel.

Tight-buffered cable is optimised for indoor applications. Because it's sturdier than loose-tube cable, it's best suited for moderate-length LAN/WAN connections or long indoor runs. It's easier to install because there's no messy gel to clean up and it doesn't require a fan-out kit for splicing or termination. You can install connectors directly to each fibre.

When making the transition from outdoor cable to indoor, the loose-tube will be connected to a box in the entrance point. Then, the run will be connected to tight-buffered cable for indoor use.

† The ISO/IEC 11801 standard stipulates maximum cable attenuation. The IEC and TIA fibre standards call for lower (and varied) bare fibre attenuation.

Laser-optimised cable

Laser-optimised multimode fibre cable differs from standard multimode cable because it has graded refractive index profile fibre optic cable in each assembly. This means that the refractive index of the core glass decreases toward the outer cladding, so the paths of light towards the outer edge of the fibre travel more quickly than the other paths. This increase in speed equalises the travel time for both short and long light paths, ensuring accurate information transmission and receipt over much greater distances, up to 300 metres at 10 Gbps. Laser-optimised cable is aqua coloured.

OM3/OM4

By Roberta Bowen Szyper

The demand for increased network bandwidth is driving the migration towards 40- and 100-GbE networks.

When planning your 40-/100-GbE migration, consider your cabling infrastructure and how it will meet your current and future data requirements. What you install today needs to give you the scalability for the next 15 to 20 years.

The cables of choice for data centre connectivity and what is recommended by the TIA are OM3 and OM4 laser-optimised multimode fibre.

OM3 and OM4

OM3 is specified in ISO 11801. OM3 was ratified by the TIA in August 2009 (TIA/EIA 492-AAAD). The IEEE ratified OM4 (802.3ba 40G/100G Ethernet) in June 2010.

It was amended in 2012 to IEEE 802.3-2012. The 802.3-bm Task Force is currently working on updates. The standard provides detailed guidelines for 40-/100-GbE transmission over OM3 and OM4 multimode cable and single mode fibre optic cable.

OM3 and OM4 are both laser-optimised 50 micron multimode fibre (LOMMF) and were developed to accommodate faster networks such as 10-, 40-, and 100-GbE. They also support existing networks. Both OM3 and OM4 are designed for use with 850-nm vertical-cavity surface-emitting lasers (VCSELs) and have aqua sheaths.

OM3 specifies an 850-nm laser-optimised 50 micron cable with an effective modal bandwidth (EMB) of 2000 MHz/km. It can support 100-Gbps link distances up to 100 metre.

OM4 specifies a high-bandwidth 850-nm laser-optimised 50 micron cable with an EMB of 4700 MHz/km.

It can support 100-Gbps link distances of 150 metre. OM3 allows for 1.5 dB of connector loss at 100 metre at all speeds; OM4 allows for 1.0 dB of loss at 150 metre for 40-100-GbE. Both OM3 and OM4 rival single mode fibre in performance while being significantly less expensive to implement. In addition, single mode electronics are also expensive. OM3 and OM4 cable are made with a different process than OM1 and OM2, which are made with a small defect in the core called an index depression.

Manufacturing process

Laser-optimised OM3 and OM4 are manufactured without the centre defect. As networks migrated to higher speeds, VCSELs became more commonly used rather than LEDs, which have a maximum

modulation rate of 622 Mbps and can't be turned on and off fast enough to support higher-speed applications. Thus manufacturers changed the production process to eliminate the centre defect and enable OM3 and OM4 cables to be used directly with the VCSELs.

Parallel transmission

40- and 100-GbE over OM3 and OM4 uses parallel optics where data is simultaneously transmitted and received over multiple fibres. 40-GbE consists of (4) 10-Gbps fibre channels each way, for a total of 8 fibres. 100-GbE consists of 10 fibre channels each way, for a total of 20 fibres. The signals are then aggregated at each end in an arrayed transceiver (connector) containing 4 or 10 VCSELs and detectors. For multimode fibre, the Media Dependent Interface (MDI) is the MPO adaptor (IEC 61754-7).

Black Box Explains... OS1 and OS2

OS1 is based on a specification from ISO/IEC 118.1: 1995 supporting 1310 and 1550 nm. OS2 was introduced in 2006 supporting transmissions at 1310, 1550, and additionally 1383 nm (i.e. a low water peak suitable for CWDM).

OS2 offers a lower maximum attenuation is only achieved in loose-tube outdoor and not tight-buffered indoor constructions.

Get more bandwidth and distance than OM1 with 50 micron cable.

OM2 50 micron Multimode, Duplex Fibre Optic Patch Cable

Ultra-low

- This 50 micron fibre cable provides three times the bandwidth of standard 62.5 micron cable.
- Boasts an ultra-low insertion loss of less than 3 dB.
- Features two 900-µm buffered fibres surrounded by aramid yarn strength members.
- Ceramic connectors provide low signal loss, high reliability, and long life.
- **Standard Warranty** — Lifetime

- Available with PVC or LSZH (Low Smoke Zero Halogen) jacket.
- Features tight-buffered fibre with an acrylate fibre coating and aramid yard strength members.
- Use with either LED or laser light sources. With a laser light source, bandwidth increases to 2000 MHz/km.
- Meets Optical Multimode 3 (OM3) standard for high-bandwidth communications. Rivals single mode fibre in performance while being significantly less expensive to implement.
- **Standard Warranty** — Lifetime

Transmit at higher rates than with Single Mode fibre—and choose from OS1/2 Single Mode, 9 micron, Duplex Fibre Optic Cable

- Get long-distance transmission—50 times farther than multimode.
- PVC cable is certified OFNR for use as riser cable.
- LSZH Cable is tested to IEC60332-1.

ST and SC Connectors

- Ideal for patching single-mode backbones to high-speed network devices, such as Gigabit Ethernet switches.

MT-RJ Connectors

- Small, snag-proof RJ-style connectors enable you to fit more terminations in a limited area than with SC connectors.

LC Connectors

- Almost half the size of standard ST and SC terminations.
- Ideal for high-density applications.

MU Connectors

- This small-form connector resembles the larger SC connector and also features a simple push-pull latching connection.
- Ideal for high-density applications, CATV, video, and more.
- Standard Warranty — Lifetime

DisplayPort

DisplayPort is a digital video interface that was designed by the Video Electronics Standards Association (VESA) in 2006 and has been produced since 2008. It competes directly with HDMI®. Unlike HDMI, however, DisplayPort is an open standard with no royalties.

DisplayPort is incredibly versatile, with the capability to deliver digital video, audio, bidirectional communications, and accessory power over a single connector. It's targeted at the computer world rather than at consumer electronics. It is used to connect computers, monitors, projectors, etc. DisplayPort connectors are found on newer computers and displays. The Mini DisplayPort connector is also found on Apple® products.

DisplayPort v1.1 supports a maximum of 10.8 Gbps over a 2 meter cable; v1.2 supports up to 21.6 Gbps. DisplayPort v1.2 enables you to daisychain up to four monitors with only a single output cable.

It also offers the future promise of DisplayPort Hubs that would operate much like a USB hub.

The standard DisplayPort connector is very compact and features latches that don't add to the connector's size—a quick squeeze of the connector releases the latch.

DisplayPort supports cable lengths of up to 15 metres with maximum resolutions at cable lengths up to 3 metres. Bidirectional signaling enables DisplayPort to both send and receive data from an attached device.

With the proper adaptors, DisplayPort cable can carry DVI and HDMI signals, although this doesn't work the other way around—DVI and HDMI cable can't carry DisplayPort. Because DisplayPort can provide power to attached devices, DisplayPort to HDMI or DVI adaptors doesn't need a separate power supply.

Transmit your digital video and digital audio signals over one cable.

HDMI Cables and Adaptors

- Transmit compressed video, multichannel digital audio, and intelligent format and command data.
- Connect HDTV set-top boxes, digital TVs, DVDs, and other equipment with HDMI interfaces.
- Premium High-Speed HDMI Cables with Ethernet also transmit network data.
- HDMI-to-DVI cables and adaptors enable you to connect mismatched interfaces.
- **Standard Warranty** — Lifetime

To transmit network data over the same cable, and for high-resolution 1080p displays, as well as 4K, 3D, and Deep Colour order Premium High-Speed HDMI cable.
Order Standard HDMI to HDMI Cable for most HDTV connections with resolutions up to 1080i or 720p video from cable, satellite, or Blu-ray players.

To connect HDMI to DVI or vice versa, use the HDMI to DVI Swivel

Adaptor. Swivelling connectors rotate 90° up and down and are ideal for rear equipment connections in tight areas.

Use an HDMI Micro Cable to connect a smartphone, digital camera, tablet, and other devices to a TV or HDMI display. The connector features all 19 pins, but is approximately a quarter the size of the HDMI connector. It supports full HDMI specs and delivers high-resolution 1080p video.

HDMI Connections

High-Definition Multimedia Interface® (HDMI) was the first digital interface to combine uncompressed high-definition video, up to eight channels of uncompressed digital audio, and intelligent format and command data in a single cable.

HDMI offers significant benefits over older analog A/V connections. It provides superior video and audio clarity because there's no signal loss from digital-to-analog conversions.

HDMI is the de facto standard for consumer electronics. It is backward compatible with DVI equipment such as PCs, TVs, and other electronic devices using the DVI standard (the DVI device simply ignores the extra data).

Recently, classic Standard HDMI has been joined by High-Speed HDMI. Standard HDMI cable is designed for use with digital broadcast

TV, cable TV, satellite TV, Blu-ray and upscale DVD players to reliably transmit up to 1080i or 720p video.

High-Speed HDMI reliably transmits video resolutions of 1080p and beyond, including advanced display technologies such as 4K, 3D, and Deep Colour. High-Speed HDMI is the recommended cable for 1080p video.

Buy only tested cables with the HDMI logo. This guarantees the cable will perform to specification, especially because there is no maximum length specified in the HDMI standard. And because longer lengths require a larger cable, HDMI cables usually have 24–28 AWG copper conductors.

DVI

The DVI (Digital Video Interface) technology is the standard digital transfer medium for computers, while the HDMI interface is more commonly found on HDTVs and other high-end displays. These high-speed cables have the bandwidth necessary for high-definition video. There are several types of DVI connectors.

DVI-D (digital) is a digital-only connector for use between a digital video source and monitors. DVI-D eliminates analog conversion and improves the display. It can be used when one or both connections are DVI-D.

DVI-I (integrated) supports both digital and analog RGB connections. It can transmit either a digital-to-digital signal or an analog-to-analog signal. It is used by some manufacturers on products instead of separate analog and digital connectors. If both connectors are DVI-I, you can use any DVI cable, but DVI-I is recommended.

DVI-A (analog) is used to carry a DVI signal from a computer to an analog VGA device, such as a display. If one connection is DVI and the other is VGA HD15, you need a cable or adaptor with both connectors.

DFP (Digital Flat Panel) was an early digital-only connector used on some displays. EVC (also known as P&D, for Plug & Display), another older connector, handles digital and analog connections.

DVI-I, Single-Link

DVI-A

DVI-I, Dual Link

DFP

DVI-D, Dual Link

DVI-D, Single-Link

There are two DVI formats: Single-Link and Dual-Link. Single-link cables use one TMDS-165 MHz transmitter and dual-link cables use two. Dual-link cables double the power of the transmission. A single-link cable can transmit a resolution of 1920 x 1200 vs. 2560 x 1600 for a dual-link cable.

VGA

The VGA (Video Graphics Array) interface was developed to support traditional CRT monitors. VGA cables transmit analog component RGBHV signals and VESA Display Data Channel data. VGA cables can support resolutions ranging from 640 x 500 up to 2048 x 1536. They can contain both 28 AWG mini coax and 24 AWG tinned-copper VGA conductors to provide support for all control leads, including Pins 9 and 15 for DDC compliance.

This cable transmits analog video signals. It does not support audio.

A brief overview of USB

The Universal Serial Bus (USB) hardware standard makes connecting peripherals to your computer easy. USB 1.1, introduced in 1995, is the original USB standard. It has two data rates: 12 Mbps and 1.5 Mbps. USB 2.0, or Hi-Speed USB 2.0, was released in 2000. It increased the peripheral-to-PC speed from 12 Mbps to 480 Mbps, or 40 times faster than USB 1.1. This increase in bandwidth enabled the use of peripherals requiring higher throughput, such as CD/DVD burners, scanners, digital cameras, and video equipment. It is backward-compatible with USB 1.1. USB 3.0, introduced in 2008, provides vast improvements over USB 2.0. It promises speeds up to 5 Gbps, nearly ten times that of USB 2.0. USB 3.0 has the flat USB Type A plug, but inside there is an extra set of connectors and the edge of the plug is blue instead of white. The Type B plug looks different with an extra set of connectors. USB 3.0 adds a physical bus running in parallel with the existing 2.0 bus.

USB 3.0 cable contains nine wires—four wire pairs plus a ground. It has two more data pairs than USB 2.0, which has one pair for data and one pair for power. The extra pairs enable USB 3.0 to support bidirectional async, full-duplex data transfer instead of USB 2.0's half-duplex polling method. USB 3.0 provides 50% more power than USB 2.0 (150 mA vs. 100 mA) to unconfigured devices and up to 80% more power (900 mA vs. 500 mA) to configured devices. Also, USB 3.0 conserves more power when compared to USB 2.0, which uses power when the cable isn't being used.

Augmented CAT6A over F/UTP

CAT6A is a 10-Gigabit Ethernet (10-GbE) over copper standard. Its requirements are covered in ANSI/TIA-568-C.2 (Balanced Twisted-Pair Telecommunications Cabling and Components Standard) published in August 2009. The standard defines 10-Gigabit data transmission over a 4-conductor twisted-pair copper cable for a distance of 100 metres on CAT6A copper cabling. This ensures that the system is ready to support IEEE 802.3an, the IEEE standard for 10GBASE-T, which specifies using Class E-augmented cable.

CAT6A extends electrical specifications from 250 MHz to 500 MHz. It also features Power-Sum Alien Crosstalk (PS-ANEXT) to 500 MHz. Alien Crosstalk (ANEXT) is a coupled signal in a disturbed pair arising from a signal in a neighbouring cable.

To virtually eliminate the problem of ANEXT, use CAT6A F/UTP cable. The F indicates an overall foil shield that eliminates PS-ANEXT. In addition, CAT6A F/UTP cable works well in noisy environments with a lot of EMI.

Get component-level CAT6A performance beyond 625 MHz.

Save space and time in the data centre with these 45° Angled-Port Patch Panels. The connectors tilt either down or up at a 45° angle, making patching easier.

24-port panels have one row of ports and are 1U. 48-port panels have two rows of ports and are 2U. All ports in the Down panels tilt down, and all ports in the Up panels tilt up. In the Down/Up panel, the bottom row tilts down and the top row tilts up.

Black Box® High-Density Multimedia Patch Panels have the flexibility, modularity, and connection density you need. They support many media types, including jacks and adaptors for copper UTP and STP, S-Video, and fibre.

The patch panels' maximum-density design makes the most of your rack space—they hold from 16 to 48 or 96 connectors in just one or two rack units of space! The industry-standard keystone openings enable flush fitting of jacks, which makes connections look neat.

How to terminate your own patch cable.

Start with the right equipment.

Terminating twisted-pair cable with RJ modular connectors. Of all the components in your network, none is arguably more underrated than the RJ-45 connector. Simplicity incarnate, this transparent marvel literally defines plug-and-play connectivity—from the desktop to the data centre. Yet it defies the obvious: How'd they get those wires in there? Who puts these things together? Where are the seams? So, in the spirit of demystifying one more aspect of modern-day communications, we give you this behind-the-scenes look at terminating twisted-pair cable using RJ connectors.

The challenge: Do it right the first time.

That means you must take time to install each connector carefully, according to the specifications of the wiring system you're installing. Then test each cable to certify that it supports the specified performance levels—in this case, the TIA specs for CATx cabling. The wiring standards illustration (right) indicates proper T568A, T568B, and USOC pairing and pinning for twisted pair cable. T568B wiring is most commonly used in North America for networking.

Follow these step-by-step instructions.

First, start with a wire stripping tool, such as the Multi-Strip (FT231A). Next, put the tool around the cable, squeeze, and carefully remove the jacketing from the cable. You'll want to expose about one inch of the insulated wire conductors.

Do not remove any insulation from the conductors.

When you crimp the RJ-45 connector, the contacts inside will pierce the conductor insulation to make contact, so there's no need to do it here.

Untwist each pair of conductors to within 3 mm of the jacket with a stripping tool. Do not untwist the conductors more than 12 mm. Arrange the wires according to the cable spec you're using (T568B in this case). Check the wiring standards above if you're not sure. Flatten and align the wires. Use your wire cutters and make one straight cut across all the conductors. Trim the ends to ensure they're all of equal length. Once you cut the cable, make sure you flatten out the wires.

Orient the wires so the cable's Pin 1 connector aligns correctly with the RJ-45 connector's Pin 1, and do the same for all pins. (To maintain the correct alignment, see "Rule of Thumb".) While carefully maintaining the proper position of each conductor, slide the wires into an RJ-45 connector.

All connectors must extend all the way into the conductor so they're flush against the back and aligned underneath the contacts within the plastic connector housing. The cable jacket should also extend into the connector about 6 mm for strain relief.

The prep work.

The majority of RJ-45 cables are terminated by machine. But field technicians and professional cable installers crimp on modular connectors every day. You can terminate cables, too. Once you do, you'll gain a new appreciation for the skill it takes to successfully terminate these cables inside a connector the size of a jelly bean.

First, gather your materials. You'll need bulk cable, such as the GigaTrue® CAT6 550 MHz Stranded Bulk Cable (page 89), a cable cutter and stripper, a connector, a pre-plug (optional), a crimp tool, and a continuity tester. All these items—except the cable and the pre-plugs—are in our CAT6 and CAT5e Termination Kit. Don't forget—Black Box can make terminated cables for you. Just call our FREE Tech Support at 0811-5541 112.

Insert the connector into an RJ-45 crimp tool. Make sure you're using the proper die for the type of connector you're using. For instance, connectors that use a load bar require a different crimp die than connectors that don't feature a load bar. If you don't use the right die, you'll damage the connector when you try to crimp it.

Firmly squeeze the crimp tool handles together. They'll lock in a ratcheting action as you crimp the connector. A final click indicates the connector is firmly latched, and you can release the handles.

Check your work using a continuity tester or cable certifier rated for the cable standard you're installing. Your tester should be able to check for shorts, opens, or miswires. For network certification, more expensive testers can even store and download test results based on standardised minimum performance levels. For questions or to learn more about building and testing a patch cable, call our FREE Tech Support at 0811-5541 112.

Rule of Thumb

Many people miswire RJ-45 connectors because they're careless about proper conductor alignment. Before terminating connectors, be sure they're oriented properly so connector Pin 1 aligns with cable Pin 1, etc.

To determine which RJ-45 contact is Pin 1 in CATx applications, hold the connector in front of your face as if you were going to plug it onto the tip of your nose. With the locking thumb tab up, connector Pin 1 is on the far left.

Make faster terminations and reduce waste.

CAT5e and CAT6 EZ-RJ45 Modular Plugs and Boots

- Simple one-piece design eliminates loading bar and liners.
- Insert wires right through the connector.
- Trim the wires and crimp the connector in one step.
- Use with solid or stranded cable.
- Boots maintain proper bend radius.
- Once crimped, the strain-relief boot becomes an integral part of the connector and will not pull off.

Fibre Optic Wall Box and Adaptor Panel

Secure termination box.

- Cable management kit included.
- Interchangeable modular adaptor panels.
- Pre-loaded with an adaptor panel.
- Accepts one fibre adaptor panel (supplied).
- Fitted with security screws.
- Extended lid protects patch cords from being accidentally disconnected.
- Strength member tie position.
- Suitable for pre-terminated cable or splicing.
- IP20 rated.

The easy way to mate fibre connectors.

Fibre Optic Couplings and Adaptors

- Use the couplings to mate two fibre cables.
- Convert ST, SC, and FC connectors with the Adaptors.
- All feature a panel mount design.
- The bronze sleeves are better for multimode fibre applications where alignment is not crucial.
- The ceramic sleeves offer precise alignment and are better for single mode applications.
- Ceramic sleeves are more durable and provide better alignment than bronze sleeves.

NOTE: For indoor use only.

The Black Box® Fan-Out Kit is specifically designed to enable you to terminate fibre loose-tube cables. Loose-tube distribution cable protects each strand of fibre in its own buffer sheath. Although the buffers are ideal for protecting each strand of fibre in multifibre cables, they're too narrow to terminate with standard fibre optic connectors. The Fan-Out Kit solves that problem. Just strip the buffer sheath off the cable and thread

each strand through the fan-out assembly. You don't need any more space than you would for any other cable termination or any additional hardware. And because the fan-out assembly snaps together, you don't even need epoxy! The fan-out is colour-coded to match your fibre cable's colour scheme and it's available in lengths of 63.5 or 91.4 cm for 6- or 12-fibre cables.

Make 6 or 12 connections in no time at all.

The practical accessories for your fibre enclosures.

Splice Trays

Splice Trays

- Make splices on up to 12 or 24 strands of single mode or multimode fibre optic cable.
- The Splice Trays mount inside fibre enclosures and come with a lid to protect your splices.
- The JPM440A works with the following fibre enclosures:

JPM401A-R2	JPM407A-R2
JPM402A-R2	JPM418A
JPM403A-R2	JPM4000A-R2
JPM406A-R2	
- The JPM441A works with all of the above enclosures, plus the JPM4001A.

Mechanical Splice and Tray

- Use the FO030 for fast, twist-action multi mode or single mode splices on up to six cables.
- Insert a stripped and cleaved fibre cable into each end of the splice and twist. A cam locks the fibres into position for accurate alignment.
- Make quick, clean, no-adhesive splices.
- Works with 250- or 900-µm cladding.
- Use the WP602 to protect and organise up to six splices.

- **Standard Warranty** — All: Lifetime

Testers & Tools

Solutions for every application.

Whether you need to maintain a small office or a large enterprise, Black Box has the professional testing solutions for you. With the latest products, a great selection, and free, 24/7 tech support, we're your go-to source.

We can customise a tool kit to fit your needs, help you choose the right tester for your application, and then help you use it most effectively.

Plus, the Resources section at www.black-box.de has videos, data sheets, and white papers so you can get the most from your testers and tools.

And when you're out in the field, no need to muddle through a manual—just call us!

Working with Fibre

Fibre's ability to carry light signals, with very low losses, is based on some fundamental physics associated with the refraction and reflection of light. Whenever a ray of light passes from one transparent medium to another, the light is affected by the interface between the two materials. This occurs because of the difference in speeds that the light can travel through different materials. Each material can be described in terms of its refractive index, which is the ratio of the speed of light in the material to its speed in free space. The relationship between these two refractive indices determines the critical angle of the interface between the two materials.

Three things can happen when a ray of light hits an interface. Each depends on the angle of incidence of the ray of light with the interface. If the angle of incidence is less than the critical angle, the light ray will refract, bending toward the material with the higher refractive index. If the angle of incidence is exactly equal to the critical angles, the ray of light will travel along the surface of the interface. If the angle of incidence is greater than the critical angle, the ray of light will reflect.

The refractive index of a vacuum is considered to be 1. Often, we consider the refractive index of air also to be 1 (although it is actually slightly higher). The refractive index of water is typically about 1.33. Glass, which is used in fibre cabling, has a refractive index in the range of 1.5, a value that can be manipulated by controlling the composition of the glass itself.

Fibre Optic Characteristics

Optical fibre allow data signals to propagate through them by ensuring that the light signal enters the fibre at an angle greater than the critical angle of the interface between two types of glass. The centre core is composed of very pure glass with a refractive index of 1.5. Core dimensions are usually in the range of 8 to 62.5 μm . The surrounding glass, called cladding, is a slightly less pure glass with a refractive index of 1.45. The diameter of the core and cladding together is in the range of 125 to 440 μm . Surrounding the cladding is a coating, strengthening fibres and a jacket.

When light is introduced into the end of an optical fibre any ray of light that hits the end of the fibre at an angle greater than the critical angle will propagate through the fibre. Each time it hits the interface between the core and the cladding it is reflected back into the fibre. The angle of acceptance for the fibre is determined by the critical angle of the interface. If this angle is rotated, a cone is generated. Any light falling on the end of the fibre within this cone of acceptance will travel through the fibre. Once the light is inside the fibre it "bounces" through the core, reflecting inward each time it hits the interface.

The illustration below depicts how light rays travel through the fibre reflecting off the interface. If the physical dimensions of the core are relatively large, individual rays of light will enter at slightly different angles and will reflect at different angles. Because they travel different paths

through the fibre the distance they travel also varies. As a result, they arrive at the receiver at different times. A pulse signal sent through the fibre will emerge wider than it was sent, deteriorating the quality of the signal. This is called modal dispersion.

Another effect that causes deterioration of the signal is chromatic dispersion. Chromatic dispersion is caused by light rays of different wavelengths travelling at different speeds through the fibre. When a series of pulses is sent through the fibre modal and chromatic dispersion can eventually cause the pulse to merge into one long pulse and the data signal is lost.

Another characteristic of optical fibre is attenuation. Although the glass used in the core of optical fibre is extremely pure, it is not perfect. As a result, light can be absorbed within the cable. Other signal losses include bending and scattering losses as well as losses from poor connections. Connection losses can be caused by misalignment of the ends of the fibre or end surfaces that are not properly polished.

The Ferrules: Ceramic or Composite?

As a general rule, use ceramic ferrules for critical network connections such as backbone cables or for connections that will be moved frequently, like those in wiring closets. Ceramic ferrules are more precisely moulded and fit closer to the fibre, which gives the fibre optic cables a lower optical loss.

Use composite ferrules for connections that are less critical to the network's overall operation and less frequently moved. Like their ceramic counterparts, composite ferrules are characterised by low loss, good quality, and a long life. However, they are not as precisely moulded and slightly easier to damage, so they aren't as well-suited for critical connections.

Signal Sources and Detectors

To use fibre optic cables for communications, electrical signals must be converted to light, transmitted, received, and converted back from light to electrical signals. This requires optical sources and detectors that can operate at the data rates of the communications system.

There are two main categories of optical signal sources—light emitting diodes and infrared laser diodes.

Light emitting diodes (LEDs) are the lower-cost, lower-performance source. They're used in applications where lower data rates and/or shorter distances are acceptable. Infrared laser diodes operate at much higher speeds, dissipate higher power levels, and require temperature compensation or control to maintain specified performance levels. They are also more costly.

Signal detectors also fall into two main categories—PIN photodiodes and avalanche photodiodes.

Similar to sources, the two types provide much different cost/performance ratios. PIN photodiodes are more commonly used, especially in less stringent applications. Avalanche photodiodes, on the other hand, are very sensitive and can be used where longer distances and higher data rates are involved.

Slicing and Terminating Optical Fibres

In practical situations, fibre optic cables exhibit signal power losses based on both the fibre and connections from the fibre to sensors or other fibre segments. Typically fibre losses run at about 10 decibels (dB) per kilometer.

Whenever a fibre must be terminated, the goal is to produce a perfectly transparent end to the fibre. The end-face should be square, clear, and physically mated to the receiving optical device. In some cases, cables are permanently joined by splicing or gluing the ends of the fibre together. Others mechanically align the fibres and use a transparent gel to couple the ends of the fibre together.

Early fibre optic connections involved cutting the fibre, epoxying a special connector, and polishing the end of the fibre. This operation required special tools and testing equipment to ensure a good connection. While this technique is still used, devices used to cleave, align, and join fibres have been improved and simplified. Connection losses vary, depending on the type of connection, but typically range from 0.2 to 1 dB.

Planning a Fibre Optic Link

The most important consideration in planning a fibre optic link is the power budget specification of the devices being connected. This value tells you the amount of loss in dB that can be present in the link between the two devices before the units fail to perform properly. This value will include inline attenuation as well as connector loss.

Fibre attenuators are used with single mode fibre optic devices and cable to filter the strength of the fibre optic signal. Depending on the type of attenuator attached to the devices at each end of the fibre optic cable, you can diminish the strength of the light signal a variable amount, measured in decibels (dB). Why would you want to filter the strength of the fibre optic signal?

Single mode fibre is designed to carry a fibre optic signal long distances—as much as 70 kilometres. Fibre devices send this signal with great force to ensure that the signal, and your data, arrive at the other end intact.

But when two fibre devices connected with single mode fibre cable are close to each other, the signal may be too strong. As a result, the light signal reflect back down the fibre cable. Data can be corrupted and transmissions can be faulty. A signal that is too strong can even damage the attached equipment.

Because it's probably not feasible to move your fibre equipment farther apart, the easiest solution is to attach an attenuator to each fibre device. Just as sunglasses filter the strength of sunlight, attenuators filter the strength of the light signal transmitted along single mode fibre cable. Within the attenuator, there's doping that reduces the strength of the signal passing through the fibre connection and minute air gaps where the two fibre meet. Fibre grooves may also be intentionally misaligned by several microns—but only enough to slow the fibre optic signal to an acceptable rate as it travels down the cable.

Before selecting an attenuator, you need to check the type of adaptor on your fibre devices. Attenuators typically fit into any patch panel equipped with FC, SC, or LC adaptors that contain either PC or APC contacts.

In addition to the type of adaptor, you also need to determine the necessary attenuation value, such as 5 or 10 dB. This value varies, depending on the strength of fibre optic signal desired.

Testing and Certifying

If you're accustomed to certifying copper cable, you'll be pleasantly surprised at how easy it is to certify fibre optic cable because it's immune to electrical interference. You only need to check a few measurements.

Attenuation (or decibel loss)—Measured in decibels/kilometre (dB/km), this is the decrease of signal strength as it travels through the fibre cable.

Generally, attenuation problems are more common on multimode fibre optic cables.

Return loss—This is the amount of light reflected from the far end of the cable back to the source. The lower the number, the better. For example, a reading of -60 decibels is better than -20 decibels. Like attenuation, return loss is usually greater with multimode cable.

Graded refractive index—This measures how the light is sent down the fibre. This is commonly measured at wavelengths of 850 and 1300 nanometre. Compared to other operating frequencies, these two ranges yield the lowest intrinsic power loss. (NOTE: This is valid for multimode fibre only.)

Propagation delay—This is the time it takes a signal to travel from one point to another over a transmission channel.

Optical time-domain reflectometry (OTDR)—This enables you to isolate cable faults by transmitting high-frequency pulses onto a cable and examining their reflections along the cable. With OTDR, you can also determine the length of a fibre optic cable because the OTDR value includes the distance the optic signal travels.

There are many fibre optic testers on the market today. Basic fibre optic testers function by shining a light down one end of the cable. At the other end, there's a receiver calibrated to the strength of the light source. With this test, you can measure how much light is going to the other end of the cable. Generally these testers give you the results in dB lost, which you then compare to the loss budget. If the measured loss is less than the number calculated by your loss budget, your installation is good.

Newer fibre optic testers have a broader range of capabilities. They can test both 850- and 1300-nanometer signals at the same time and can check your cable for compliance with specific standards.

Precautions to Take When Using Fibre

A few properties particular to fibre optic cable can cause problems if you aren't careful during installation:

Intrinsic power loss—As the optic signal travels through the fibre core, the signal inevitably loses some speed through absorption, reflection, and scattering. This problem is easy to manage by making sure your splices are good and your connections are clean.

Microbending—Microbends are minute deviations in fibre caused by excessive bends, pinches, and kinks. Using cable with reinforcing fibres and other special manufacturing techniques minimises this problem.

Connector loss—Connector loss occurs when two fibre segments are misaligned. This problem is commonly caused by poor splicing. Scratches and dirt introduced during the splicing process can also cause connector loss.

Coupling loss—Similar to connector loss, coupling loss results in reduced signal power and is from poorly terminated connector couplings. Remember to be careful and use common sense when installing fibre cable. Use clean components. Keep dirt and dust to a minimum. Don't pull the cable excessively or bend it too sharply around corners.

Confirm correct installation of your copper and fibre cabling supporting voice, video, data and CCTV applications.

SignalTEK II

- Tests copper and fibre optic networks.
- Supports voice, video, data and CCTV applications over 10/100/1000M Ethernet.
- Excellent wire mapping by pin and pair with distance to fault.
- IPv6 and IPv4 compatible.
- Full Gigabit bi-directional load cable tests.
- Detects and runs load test on Power over Ethernet.
- Simplified network load testing through hubs and switches.
- Document the network connectivity and generate detailed reports.
- **Standard Warranty — 1 Year**

SignalTEK II is a handheld cable and network qualifier designed to confirm correct installation of copper and fibre cabling capable of supporting voice, video, data and CCTV applications up to Gigabit Ethernet. SignalTEK II is a cost-effective way to test network links to performance standards including IEEE 802.3ab. With multiple network troubleshooting features including wiremap by pin with distance to fault, cable tracing and verifying Ethernet connectivity, SignalTEK II is a highly versatile and cost effective tool. The tester design is perfect for the cabling installer whose workplace requires a rugged and robust tool. When working in poorly lit areas the bright, backlit colour screen displays test results clearly. User-exchangeable RJ45 inserts and intuitive screen icons ensure the installer maximises productivity. Capable of multiple performance testing, the administrator operates, with confidence in the accuracy of

the results, both rapidly and with minimal user training. Completed jobs can be reported upon, using the internal memory and USB interface to export results. SignalTEK II performs active network testing through hubs and switches all the way to the server. Not only does it detect and run load testing on PoE and PoE+, the tester is specifically capable of running full bi-directional Gigabit tests, providing time savings and assurance of network performance. Incorporating IPv6 compatibility, SignalTEK II provides a future-proof investment for all who need a cable qualifier. Simplify customer reporting and create accurate documentation on jobs undertaken using SignalTEK II to generate and store test results in standards compliant XML format. Additionally, view and export results to enable report printing.

Best Practices: Copper

Cable in an ideal world

Ideally, every cable ever installed would be a solid conductor cable and it would have the proper category rating for the communication speeds required. The installation would have cable paths with smooth radius bends. The cable would be installed without nicks in the jackets. AC wiring or voltage sources would be far away from the communication cable. Fire code jackets would be used when required. Twist rates would be maintained all the way to the jacks or plugs.

When the punchdowns were done, the cable channel would be tested with a tester capable of all the certification tests and the channel

would be documented to meeting the category certification requirements.

The ideal world is what everyone wants, and what everyone demands, thus driving the industry to create expensive test equipment used by qualified professional personnel.

This is the best practice for new installations.

When the network is signed over from professionals with certified credentials to the customer after installation, the customer typically has but one goal: To use the network.

Best practice in cable installation is a professional with the proper tools and certifications to ensure the proper installation of the network cabling. Many businesses aren't willing to pay for this level of service.

Often it falls on the IT department to install or supervise moves, adds, and changes to the network by unqualified personnel.

The trade-off in time and possible lost production is a business judgment exercised by management and is a reality of every network.

Still, quality testing and following a few simple rules will result in a network link or repair that can provide years of high-speed network performance.

Best practices

First, know your job. Is this a repair of a failed network link or a whole new cable run? Where is the cable going? Is it just a short hop up and over the equipment rack to the next one? Or is it a couple of hundred feet up a riser and

across the ceiling to a medical room? Careful here—there are no Etherpolice, but there is a fire marshal who doesn't care anything about how much work it was to install a cable—it's better have the right fire rating on the jacket. It is expensive and time consuming to remove thousands of metres of cable because a non-smoke-/flame-resistant cable was used.

The cable must have the proper jacket material for the job. There are many types of jacket materials: LSZH, PVC, UV-resistant, mould-resistant, low temperature, to name a few.

Use the proper jacket for the job at hand. Learn about LSZH versus PVC jackets.

The cable will have to be cut to length, the ends stripped off of the outer jacket material, and the connectors attached. The cable may very likely be pulled directly off the reel or spool into position through conduit, onto a cable tray or basket.

All cable should be laid in as smoothly as possible, without damage to the jacket. When going around corners, a smooth radius should be maintained in accordance with the cable manufacturers' specification. Remember that an Ethernet copper cable holds four twisted pairs of wire. A kink or sharp bend will affect the relationship of the twisted pairs, allowing electrical noise or crosstalk into the communication signals.

Route your network cables away from power lines, fluorescent lights, and industrial equipment, as electrical coupling increases with proximity and voltage. There is raceway designed to combine power cables and data cables in the same raceway; it will have a divider to keep the two separate. If you must lay a data cable across a cable carrying AC power, do it at a right angle. Power AC wiring and low voltage data cable don't mix well; this is where fibre optic cables really shine.

You will have to strip the outer jacket off of the ends of the cable. Be careful not to nick the individual data conductors when doing so. There are many stripping tools designed for doing this properly. The standards require that no more than a half-inch of the individual twisted pairs be untwisted at the connectors, and the cable jacket really should reach all the way up to the connectors or punch blocks.

Add jacks or connectors

So you have your cables installed, and you've avoided AC wiring and other sources of electrical noise along the run. The cable has no kinks or sharp bends.

If only one cable has been run, then your next step is to add jacks or connectors as the job requires. With a bundle, it is a bit more difficult. If the cables were labelled on both ends before pulling, and the labels are still intact, then cable identification is simplified. But this often isn't practical, or is overlooked until after the cable is in place. In this case a tone probe comes in really handy. It sends a

signal down the wire that a probe can convert to an audio signal for identification.

There are two approved pinning methods in the TIA-568-C.2 standard for terminating network cable to 8-position RJ-45 jacks and connectors: T568A and T568B. The difference between the two is the pin position of the orange and green pairs.

The T568B wiring scheme is the de facto standard for communications networking. It is the same as AT&T's old 258A colour scheme. T568B offers backward compatibility with USOC through one pair. T568A is backward compatible with both one- and two-pair USOC connections.

Whichever pinning scheme you choose to use, stick with it. T568A and T568B pinnings are not interchangeable. Mixing the two can cause crossed pairs, which just don't work. Strip the jacket back and punch down the wires according to the colour code on the jack and patch panel (T568A or B).

Use connecting hardware of the same category or higher. The transmission of your components will always be the lowest category in the link. So, if you're using CAT6 cable, use CAT6 connectors.

Visually inspect the cable for proper terminations, bend radius, tension, nicks, etc. Don't uncoil UTP cable on a spool. It can cause kinks. Rotate the spool instead. Plan for 30 cm of slack cable behind wall outlets for possible future reterminations.

Time to test

It would now be a good idea to check the cable. Ideally, a good cable tester that is certified for your cable type should be used. They are expensive for the casual user, but a tester checking for continuity and split pairs is reasonably priced and highly recommended. They are simple to use, and often offer go/no-go testing or simple readouts showing which wire conductors are connected properly or not.

Some use lights, as simple as green is good and red is not, or they step through each pair giving a go/no-go result. Others have LCD screens with the conductor number of both ends of the cable reflecting the connections.

Testing is important; it prevents possible damage to equipment due to wiring faults. In the 10BASE-T world, only two pairs were actually in use. Gigabit requires all four pairs, as does PoE.

Newer Power-over-Ethernet equipment uses voltages over the twisted pairs to power remote equipment. It can damage equipment to put even these low AC voltages on equipment not designed for it. A simple test can save the embarrassment and expense of damaged equipment.

Industry Requirements

The industry requirements for certification require testing of the following signals on the cable under test:

- Wiremap
- Propagation Delay
- Delay Skew
- Cable Length
- Insertion Loss (IL)
- Return Loss (RL)
- Near-End Crosstalk (NEXT)
- Power Sum NEXT (PSNEXT)
- Equal-Level Far-End Crosstalk (ELFEXT)
- Power Sum ELFEXT (PSELFEXT)

All of these tests pass or fail based on the manner in which the cable is installed and the quality of workmanship of the installer. Failing to pass these tests will result in failed links or slow connections. Very often, 100BASE-T is better than NO BASE-T, and the work continues another day when it can be scheduled instead of scrambling around when the network completely fails, stopping production at a critical time.

The average in-house repair of network cable is done with a simplified tester that only does a continuity check by tone or LED. Following best practices and a good work ethic for the installation of the cable is required no matter the test. The industry has done a good job of simplifying cable installation. By following a few simple rules and using a low-cost tester, most people can install an Ethernet cable.

Comprehensive and user friendly in-line end-point tester for Ethernet connectivity and cabling issues including copper, fibre and Wi-Fi.

LanXPLOER

- Intuitive operation via a full-colour 3 1/2" touchscreen display.
- A single tester for network tests over copper, MM/SM fibre or Wi-Fi.
- Support of 10/100/1000 Ethernet.
- Inline tests and PC diagnostics through dual RJ-45 copper ports (top talker, protocol, packet size distribution etc.).
- Wire mapping by pin and pair with distance to fault.
- Scan the network for Wi-Fi access points and pinpoint issues incl. rogue devices.
- PoE/PoE+ testing.
- Monitor calls and quality of VoIP, including RTP jitter.
- Full bandwidth Layer 1, 2 and 3 Loopback device.
- DHCP client, Ping and Traceroute tests with VLAN support.
- Identify active devices on the network and compare with historical data.
- Detailed network statistics and device mapping that can be stored and exported.
- **Standard Warranty — 1 Year**

LanXPLOER is a versatile handheld network maintenance and troubleshooting tool capable of testing active and passive LAN connections over both copper and fibre. Most tests can also be performed through a Wi-Fi connection liberating the user from having to make a physical connection to the network. LAN management professionals will benefit greatly from the sizeable time-saving potential and multifunction capabilities of LanXPLOER. Highly valuable in multimedia environment, the network tester provides active and passive troubleshooting capabilities for cabling issues and Ethernet connectivity. Systems integrators particularly would benefit from the in-line test capabilities to measure voice Quality of Service (QoS) between VoIP phones and the network. Or use LanXPLOER as an essential tool to diagnose low level Ethernet issues by connecting in-line between devices, and identify errors that cannot be detected by Windows applications or managed switches. Applications that require increased network bandwidth are becoming more prevalent. IT consultants are needed to troubleshoot network access problems, bad quality of VoIP calls and other network bandwidth issues. LanXPLOER determines whether the issue lies within the network or attached devices. For facility maintenance and Industrial Ethernet, LanXPLOER documents network mapping and Ethernet statistics.

Improve productivity over the large back-lighted colour screen with easy navigation.

Clearly see cable faults, know where they are and validate repairs.

Test and validate any network, and PoE resources.

In loopback mode it can partner transmission testers to measure Ethernet throughput up to 1 Gbps.

For IT professional carrying out Moves, Adds or Changes to their existing network, LanXPLOER is the perfect single device companion to test copper, fibre and Wi-Fi. As a fully-featured tester, LanXPLOER is a future-proofed investment to deliver against IPv6 internet addresses, plus PoE+ detection and PoE+ current tests including load and in-line. Thanks to its Autotest functions, a virtual keyboard and intuitive screen icons, the tester is an essential portable troubleshooting device that is easy to use and understand.

- Maintain active and passive networks across copper and fibre.
- Pinpoint and solve networking issues quickly and efficiently.
- Test Power over Ethernet and LAN/Internet connectivity when installing new devices.
- Detect cable issues and split pairs with wire mapping by pin as well as pair including the distance to fault.
- VLAN support (PLUS, PRO only).
- Generate, store and export test results in standard compliant XML formats (PLUS, PRO only).
- Log onto 802.1x secured networks (PRO only).
- Future-proof investment with support of IPv4 and IPv6 addresses as well as user replaceable RJ-45 jacks.
- Intuitive and easy to use with large backlit colour screen.
- **Standard Warranty — 1 Year**

NaviTEK II is a highly cost efficient solution, comprising multiple advanced test capabilities in just one robust, handheld tester. The tester is the perfect companion for IT Professionals who maintain and troubleshoot issues on copper and fibre networks. It's network scanning and auto-test functions quickly verify the connectivity after carrying out moves, adds or changes.

With wire mapping by pin and pair including the distance to fault, PoE capabilities, and support for VLAN and 802.1x secured networks, the tester pinpoints Ethernet and PoE issues completely to enable rapid fault finding and highly productive verifications.

- Tests PoE and PoE+.
- Single and Dual Port models available.

Standard Warranty — 1 Year

The UniPRO Tester is a handheld Carrier Gigabit Ethernet tester and an intelligent loopback device for access and metro networks that allows you to get to the heart of "slow network" issues.

The UniPro tester is designed for full Ethernet testing of carrier service turn-up, mobile backhaul link, microwave and wireless link and for enterprise users to monitor carriers' SLA performance.

Use the UniPro if your service provider doesn't meet the SLA or you have a high WAN utilization where issues appear only at peak times when provider reduces bandwidth to committed information rate.

Capabilities

This low-cost tester combines the functions of seven test sets:

- A switch/PC verifier
- A LAN speedometer to verify link speed
- A straight-through/crossover cable simulator
- An on-line network activity monitor
- A tone probe/tone generator
- A cable pairs tester
- A cable termination tester

It helps you answer these device questions:

- Is my hub or PC operational?
- Does it appear as a hub or a PC?
- Does it use 2- or 4-pair cable?
- Which hub port is my PC using?
- Is my LAN speed 10, 100, or 1000 Mbps?

It also helps answer these cabling questions:

- What pairs are terminated in the wiring?
- Where is my cable in the wiring closet?
- Is my cable straight through or crossover?
- Does my cable have inverted pairs?

What's included

- Main tester unit
- Remote probe unit
- (2) 9-V to RJ-45 jumper cables
- (2) 9-V batteries
- Protective felt carrying case
- User manual

Locate cable runs and test for continuity and voltage.

Net Tone

- Place the tone generator on one end of the cable and use the tone probe to find the other.
- Make connections to RJ-11 and RJ-45 jacks and to any wire pair using alligator clips.
- Works on both Ethernet and telco cabling.
- Switch-selectable tone and large LED display.
- Tone Probe has ultrabright LED tip for visibility in dark spaces, filtered circuitry for elimination of fluorescent hum, and safety LED.
- Tone Probe also has volume control and insulated tip to stop accidental shorts when probing punchdown blocks.
- **Standard Warranty** — 1 Year
- **Extended Warranty** — Add 1 or 3 Years

What's included

- Tone generator
- Probe
- Carrying pouch
- (2) 9-V batteries
