

RH850/P1M-E Group

User's Manual: Hardware

Renesas microcontroller
RH850 Family

All information contained in these materials, including products and product specifications, represents information on the product at the time of publication and is subject to change by Renesas Electronics Corp. without notice. Please review the latest information published by Renesas Electronics Corp. through various means, including the Renesas Electronics Corp. website (<http://www.renesas.com>).

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.
Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.
6. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

Notes for CMOS devices

- (1) Voltage application waveform at input pin:** Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between VIL (MAX) and VIH (MIN) due to noise, etc., the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between VIL (MAX) and VIH (MIN).
- (2) Handling of unused input pins:** Unconnected CMOS device inputs can be cause of malfunction. If an input pin is unconnected, it is possible that an internal input level may be generated due to noise, etc., causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using pull-up or pull-down circuitry. Each unused pin should be connected to power supply or GND via a resistor if there is a possibility that it will be an output pin. All handling related to unused pins must be judged separately for each device and according to related specifications governing the device.
- (3) Precaution against ESD:** A strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it when it has occurred. Environmental control must be adequate. When it is dry, a humidifier should be used. It is recommended to avoid using insulators that easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors should be grounded. The operator should be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with mounted semiconductor devices.
- (4) Status before initialization:** Power-on does not necessarily define the initial status of a MOS device. Immediately after the power source is turned ON, devices with reset functions have not yet been initialized. Hence, power-on does not guarantee output pin levels, I/O settings or contents of registers. A device is not initialized until the reset signal is received. A reset operation must be executed immediately after power-on for devices with reset functions.
- (5) Power ON/OFF sequence:** In the case of a device that uses different power supplies for the internal operation and external interface, as a rule, switch on the external power supply after switching on the internal power supply. When switching the power supply off, as a rule, switch off the external power supply and then the internal power supply. Use of the reverse power on/off sequences may result in the application of an overvoltage to the internal elements of the device, causing malfunction and degradation of internal elements due to the passage of an abnormal current. The correct power on/off sequence must be judged separately for each device and according to related specifications governing the device.
- (6) Input of signal during power off state:** Do not input signals or an I/O pull-up power supply while the device is not powered. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Input of signals during the power off state must be judged separately for each device and according to related specifications governing the device.

How to Use This Manual

Readers This manual is intended for users who wish to understand the functions of the RH850/P1M-E and design application systems using the following RH850/P1M-E microcontrollers:

Purpose This manual is intended to give users an understanding of the hardware functions of the RH850/P1M-E shown in the *Organization* below.

Organization This manual is divided into two parts: Hardware (this manual) and Architecture (RH850G3M User's Manual: Software).

| Hardware | Software |
|------------------------------|---------------------------|
| Pin functions | Overview |
| CPU function | Processor Model |
| On-chip peripheral functions | Register Reference |
| Flash memory programming | Exceptions and Interrupts |
| | Memory Management |
| | Instruction Reference |
| | Reset |
| | Appendix |

How to read this manual

It is assumed that the readers of this manual have general knowledge in the fields of electrical engineering, logic circuits, and microcontrollers.

To understand the overall functions of the RH850/P1M-E.

→ Read this manual according to the Contents.

To understand the details of an instruction function

→ See RH850G3M User's Manual: Software (R01US0123E) available separately.

Conventions Data significance: Higher digits on the left and lower digits on the right
Active low representation: xxx (overscore over pin or signal name)
Memory map address: Higher addresses on the top and lower addresses on the bottom
Note: Footnote for item marked with Note in the text
Caution: Information requiring particular attention
Remark: Supplementary information
Numeric representation: Binary ... xxxx or xxxx_B
Decimal ... xxxx
Hexadecimal ... xxxx_H
Prefix indicating power of 2 (address space, memory capacity):
K (kilo): $2^{10} = 1,024$
M (mega): $2^{20} = 1,024^2$
G (giga): $2^{30} = 1,024^3$

Description of Registers

Each register description includes register access, register address, and register value after a reset, a bit chart, illustrating the arrangement of bits, and a table of bits, describing the meaning of the bit settings.

The standard format for bit charts and tables are described below.

Table 14.19 CSIGNCFG0 register contents (1/2)

| Bit Position | Bit Name | Function | | | | | | | | | | | | | | | | | | | | |
|--------------|----------------|---|--|----------|--------------|-----------|---|---|-----------------------|--------------------------|---|---|---------------------------|--|---|---|----------------|-------------------------------|---|---|-----------------|--------------------------------|
| 31, 30 | Reserved | The write value should always be the value after reset. | | | | | | | | | | | | | | | | | | | | |
| 29, 28 | CSIGNPS[1:0] | Specifies parity. <table border="1"> <thead> <tr> <th>CSIGNPS1</th> <th>CSIGNPS0</th> <th>Transmission</th> <th>Reception</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>No parity transmitted</td> <td>No parity is waited for.</td> </tr> <tr> <td>0</td> <td>1</td> <td>Add parity bit fixed at 0</td> <td>Parity bit is waited for but not judged.</td> </tr> <tr> <td>1</td> <td>0</td> <td>Add odd parity</td> <td>Odd parity bit is waited for.</td> </tr> <tr> <td>1</td> <td>1</td> <td>Add even parity</td> <td>Even parity bit is waited for.</td> </tr> </tbody> </table> | CSIGNPS1 | CSIGNPS0 | Transmission | Reception | 0 | 0 | No parity transmitted | No parity is waited for. | 0 | 1 | Add parity bit fixed at 0 | Parity bit is waited for but not judged. | 1 | 0 | Add odd parity | Odd parity bit is waited for. | 1 | 1 | Add even parity | Even parity bit is waited for. |
| CSIGNPS1 | CSIGNPS0 | Transmission | Reception | | | | | | | | | | | | | | | | | | | |
| 0 | 0 | No parity transmitted | No parity is waited for. | | | | | | | | | | | | | | | | | | | |
| 0 | 1 | Add parity bit fixed at 0 | Parity bit is waited for but not judged. | | | | | | | | | | | | | | | | | | | |
| 1 | 0 | Add odd parity | Odd parity bit is waited for. | | | | | | | | | | | | | | | | | | | |
| 1 | 1 | Add even parity | Even parity bit is waited for. | | | | | | | | | | | | | | | | | | | |
| 27 to 24 | CSIGNDLS [3:0] | Specifies data length. 0: Data length is 16 bits 1: Data length is 1 bit 2: Data length is 2 bits ... 15: Data length is 15 bits CAUTION For a data length of less than 7 bits, do not set bits CSIGNCFG0.CSIGNDLS[3:0] for a value 1 to 6 when the extended data length function is disabled with bit CSIGNCTL1.CSIGNEDLE set to 0. It is forbidden to transmit two consecutive data with a data length of less than 7 bits. | | | | | | | | | | | | | | | | | | | | |
| 23 to 19 | Reserved | The write value should always be the value after reset. | | | | | | | | | | | | | | | | | | | | |

(1) Access

The register can be accessed in the bit unit indicated here.

(2) Address

This is the register address.

For base address, see description of base address in each section.

(3) Value after a reset (in hexadecimal notation)

This is the value of all bits of the register after a reset. Values for bytes are given as numbers in the range from 0 to 9 and letters from A to F or as X where they are undefined.

(4) Bit position

This is the bit number.

The bits are numbered from 31 to 0 for 32-bit registers, 15 to 0 for 16-bit registers, and 7 to 0 for 8-bit registers.

(5) Bit name

Bit name or field name is indicated.

When clearly identifying the digits of a bit field is required, do so by using a form such as CSIGNDLS[3:0] above.

Indicate reserved bits by using a dash (—).

(6) Value after a reset (in binary notation)

This is the bit values after a reset.

0 : The value after a reset is 0.

1 : The value after a reset is 1.

— : The value after a reset is undefined.

(7) R/W

This is the bit attribute of all bits of the register.

R/W : The bit or field is readable and writable.

R : The bit or field is readable.

Note that all reserved bits are indicated as R.

When written, the value specified in the bit chart or the value after a reset should be written.

In case of writing to writable registers that also include non-reserved bits with the R-attribute, writing to the R-attribute bits will be ignored unless otherwise specified.

W : This bit or field is writable. When read, the value is undefined. If a value is indicated in the bit chart, the value is returned.

(8) Function

This is function of the bit.

Section 1 Overview

RH850/P1M-E is a product series of Renesas Electronics' single-chip microcomputer RH850 family. This section describes the overview of RH850/P1M-E.

This product has Security installed. For the specification of Security function, please contact with agent/distributor.

1.1 Outline

This product is a 32-bit single-chip microcomputer with multiple CPUs, Code Flash, Data Flash, RAM modules, DMA controllers, many communication interfaces that are used in the automotive applications, A/D converters, timer units, etc.

The main features are as below.

(1) RH850 CPU

This product contains two RH850G3Ms: one operates as the master CPU for normal operation and another as a checker CPU that monitors the operation of the master CPU. The two CPUs operate in lock step mode.

The architecture of this dual-core CPU unit realizes the compact footprint of the programs by 2-byte basic instructions and high-level language compiler oriented instruction sets. This dual-core CPU unit has very quick interrupt response time so that it can support hard real-time applications.

(2) On-chip Code Flash and Data Flash

This chip has high-speed Code Flash from which the CPU can fetch the instructions and the constant data. Its capacity is up to 2MB. This Code Flash can be reprogrammed in the situation that the chip is mounted in the application systems.

This chip also has Data Flash with EEPROM emulation capability. Its capacity is up to 64KB.

(3) Rich peripheral functionality

The RH850/P1M-E incorporates standard communication controllers such as CAN, LIN, FlexRay, and serial communications in addition to timers and A/D converters best suited for the automobile chassis applications. In addition, the RH850/P1M-E incorporates SENT and PSI5 communication controllers that can be used for sensor interface.

(4) Functional safety support

This chip equips several dedicated functionalities including the Lock-Step Dual Core configuration for the CPU, the memory protection with ECC, the bus protection with ECC, the peripheral module protection, and voltage/clock monitors to support the functional safety standard (ASIL) required in the automotive applications.

1.2 Application Fields

- Automotive field (including chassis control system)

1.3 Specification Overview

Table 1.1 Features in Each Product (1/2)

| Product | | | RH850/P1M-E | | | | |
|---------------|-----------------------|-------------------------|--|---|---------------------|--|--|
| | | | 100-pin | | 144-pin | | |

| | Measurement (Memory Read) | | Yes | |
| Power Supply | Core | | 1.25 (DPS), eVR | |
| | I/O | | 3.3/5.0 | |
| | ADC | | 3.3/5.0 | |

Note 1. Only available in devices with 2-MB flash memory.

Note 2. Only available in devices with 1-MB flash memory.

1.4 Block Configuration

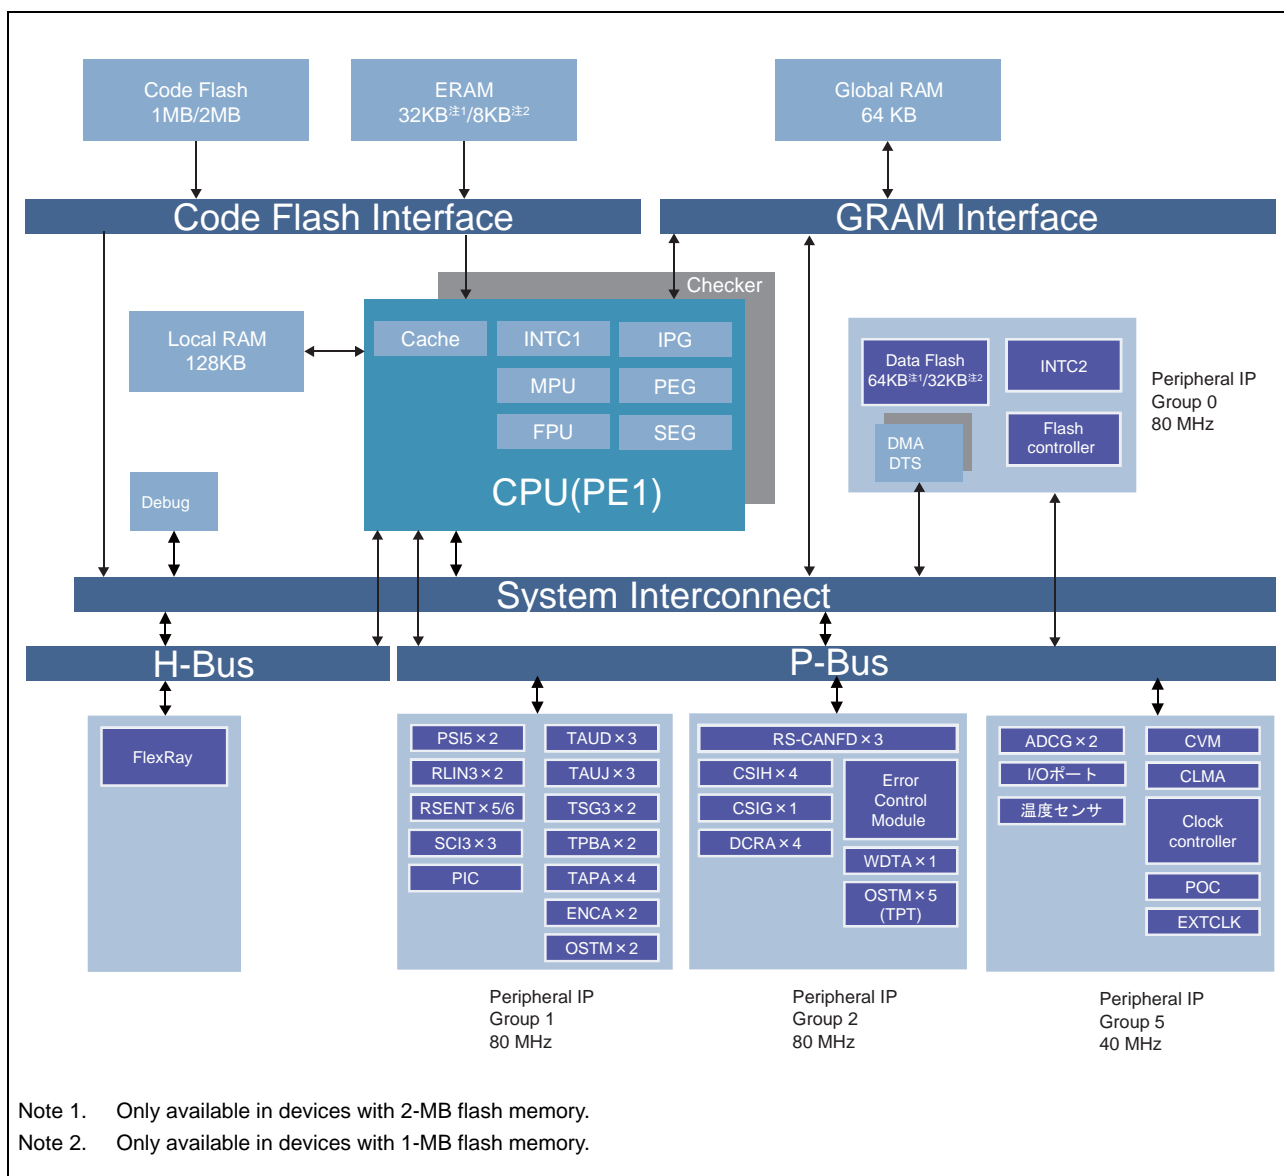

Figure 1.1 Internal Block Diagram

Section 2 Pin Functions

2.1 Pin Connection Diagrams

Figure 2.1 Pin Connection Diagram (100 pins)

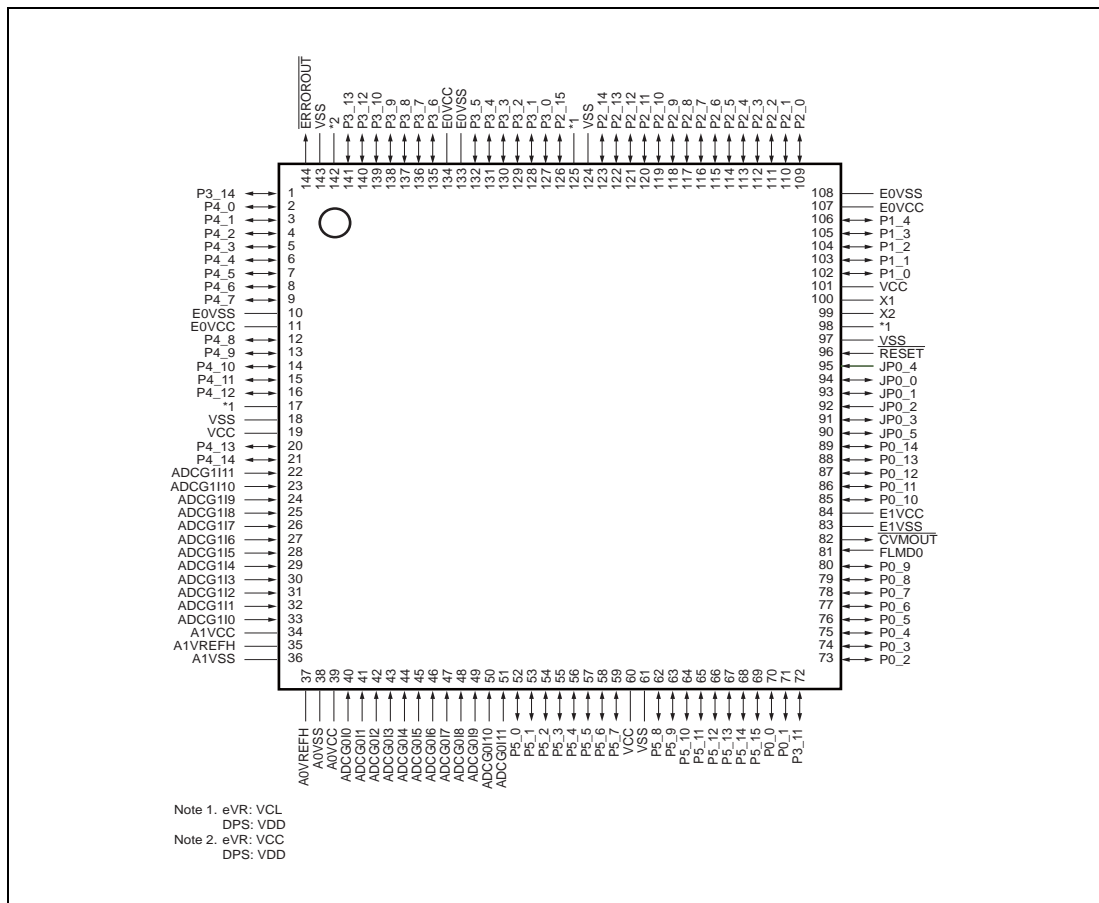

Figure 2.2 Pin Connection Diagram (144 pins)

Table 2.1 shows the pin assignment.

CAUTION

There are restrictions on the combinations of the CSIG, CSIH, SCI3, RLIN3, RSCAN, FlexRay, and RSENT pins that can be used. For details, see the Combinations of Pins and Ports table in each section.

Table 2.1 Pin Assignment (1/5)

| Pin Name | Pin Number | | | | Power Area |
|---|---------------|---------------|---------------|---------------|------------|
| | Pkg 100 (eVR) | Pkg 100 (DPS) | Pkg 144 (eVR) | Pkg 144 (DPS) | |

Note 1. Only in 144-pin products.

2.2 Pin Expansion

2.2.1 Overview

This subsection describes pin functions, external pin lists, and external pin states at a reset and in each operating status.

2.2.2 List of Pin Functions

Table 2.2 lists functions of each pin. “Port number” in the table indicates that the function is supported, while “—” indicates that the function is not supported. Do not use the pin function that is not supported.

Table 2.2 Pin Function (1/16)

| Category | Pin name | IO | Function | Alternative Port | | | |
|----------|----------|----|---------------------------------------|--|--|--|--|
| | | | | 100-pin | | 144-pin | |
| | | | | eVR | DPS | eVR | DPS |
| NMI | NMI | I | External non-maskable interrupt input | P3_14 | P3_14 | P3_14 | P3_14 |

| P5_15 | I/O | Port | — | — | P5_15 | P5_15 | |

Note 1. This is a dedicated pin. Do not use it as a port pin.

2.3 Port Functions

2.3.1 Features

Port Group

This product has the following numbers of port groups:

Table 2.3 RH850/P1M-E Port Group

| Product | Number of Group | Name of Group |
|-------------|-----------------|---------------|
| RH850/P1M-E | 7 | P0 to P5, JP0 |

Port Group Index n

Each port group is identified by its own index “n” (n = 0 to 5) throughout this section; e.g. PMCn for the port mode control register of the Pn pin.

Register Address

All port addresses are given as an offset from the individual base addresses, <JPOR0_base> and <PORT_base>.

Table 2.4 shows the base addresses, <JPOR0_base> and <PORT_base>.

Table 2.4 Port Base Address

| Base address | Address |
|--------------|------------------------|
| <PORT_base> | FFC1 0000 _H |
| <JPOR0_base> | FFC2 0000 _H |

2.3.2 Overview

This product has various pins for input/output (I/O) functions, known as ports. The ports are organized in port groups.

This product also has several control registers to allocate the functions other than general I/O purpose to the corresponding pins.

For definitions of pin, port, and port group, see **Section 2.3.2.1, Terms**.

2.3.2.1 Terms

The terms described in this section are defined as follows.

- **Pin:**
Denotes a physical pin. Every pin is denoted by a unique pin number. Most pins can be used in multiple modes. Thus the pin name indicating its own function is assigned to each pin depending on the selected mode.
- **Port group:**
Denotes a group of ports.
- **Port mode / Port:**
A pin in port mode functions as a general purpose I/O pin. It is then called port.
The corresponding name is Pn_m. For example, P0_7 denotes the port 7 of port group 0 and it is referred to as port P0_7.
- **Alternative mode:**
In alternative mode, a pin can be used for non-general purpose I/O functions as well; e.g. as the I/O pin of on-chip peripherals. Therefore, the corresponding pin name depends on the selected function. For example, the INTPO pin denotes the pin for one of the external interrupt inputs.
Note that two or more different names can refer to the same physical pin, e.g. for P0_2 and INTPO. Those different names indicate the function in which the pin is being operated.
- **Port type:**
The control circuit is selected based on a register setting, and the port type is determined based on the type of the control circuit.

(1) JTAG Ports

The JTAG port groups are used for connecting a debugger for on-chip debugging. These are special port groups provided because the microcontroller cannot be used for the user's application while on-chip debugging is being executed. When a debugger is not connected and the microcontroller is operating normally, these port groups can be used in the same way as the other port groups.

JTAG port group registers and bit names are prefixed by a "J". For example, JP0 denotes JTAG port group 0, and JPM0.JPM0_m denotes the JPM0_m port mode bit of the JPM0 port mode register.

NOTE

In this section, the descriptions about all ports and their registers other than PFCn, PFCAEn, PIPCn, PINVn, and PODCEn apply to the JTAG port unless otherwise specified.

2.3.2.2 Overview of Pin Functions

The pin can operate in the following three different modes:

- Port mode (PMn.PMCn_m = 0)
The pin operates as a general purpose I/O port in port mode.
PMn.PMn_m selects input or output.
- S/W I/O control alternative mode (PMn.PMCn_m = 1, PIPn.PIPCn_m = 0)
The pin is operated by an alternative function in S/W I/O control alternative mode.
The selection between input and output is made by S/W via the PMn.PMn_m control bits.
- Direct I/O control alternative mode (PMn.PMCn_m = 1, PIPn.PIPCn_m = 1)
The pin is operated by an alternative function in direct I/O control alternative mode.
In contrast to S/W I/O control alternative mode, input/output is directly controlled by the alternative function in this mode.

Table 2.5 shows the outline of the register settings.

Table 2.5 Pin Function Configuration (Outline)

| Mode | Bit | | | | I/O |
|-------------------------------------|-------|-------|--------|---------|--|
| | PMn_m | PMn_m | PIPn_m | PIBCn_m | |
| Port mode | 0 | 0 | X | X | O |
| | | 1 | | 1 | I |
| S/W I/O control alternative mode | 1 | 0 | 0 | X | O |
| | | 1 | 0 | 0 | I |
| Direct I/O control alternative mode | | X | 1 | X | Controlled by the alternative function |

- S/W I/O control alternative modes (PIPn.PIPCn_m = 0):
 - Outputs (PMn_m = 0): Alternative output mode 1 to 6
 - Inputs (PMn_m = 1): Alternative input mode 1 to 6
- Direct I/O control alternative modes (PIPn.PIPCn_m = 1):
 - Input/Output of alternative output mode 1 to 6 and alternative input mode 1 to 6 are directly selected by the alternative function.

Table 2.6 Outline of Alternative Mode Selection (PMCn.PMCn_m = 1)

| Function | Register | | | | I/O |
|--------------------------------------|----------|------|-----|------|-----|
| | PFCAE | PFCE | PFC | PM*1 | |
| Alternative output mode 1 (ALT-OUT1) | 0 | 0 | 0 | 0 | O |
| Alternative input mode 1 (ALT-IN1) | 0 | 0 | 0 | 1 | I |
| Alternative output mode 2 (ALT-OUT2) | 0 | 0 | 1 | 0 | O |
| Alternative input mode 2 (ALT-IN2) | 0 | 0 | 1 | 1 | I |
| Alternative output mode 3 (ALT-OUT3) | 0 | 1 | 0 | 0 | O |
| Alternative input mode 3 (ALT-IN3) | 0 | 1 | 0 | 1 | I |
| Alternative output mode 4 (ALT-OUT4) | 0 | 1 | 1 | 0 | O |
| Alternative input mode 4 (ALT-IN4) | 0 | 1 | 1 | 1 | I |
| Alternative output mode 5 (ALT-OUT5) | 1 | 0 | 0 | 0 | O |
| Alternative input mode 5 (ALT-IN5) | 1 | 0 | 0 | 1 | I |
| Alternative output mode 6 (ALT-OUT6) | 1 | 0 | 1 | 0 | O |
| Alternative input mode 6 (ALT-IN6) | 1 | 0 | 1 | 1 | I |

Note 1. When PIPCn.PIPCn_m = 1, the I/O direction is directly controlled by the peripheral (alternative) function and PM is ignored.

When a pin is operated in alternative mode (PMCn.PMCn_m = 1), one of several alternative functions can be selected by the PFCn, PFCEn, and PFCAEn registers.

2.3.2.3 Pin Data Input/Output

The registers used for data input and output are described below.

The source of the data to be read via the PPRn register depends on pin mode.

Output data

In port mode (PMn.PMCn_m = 0), the value of Pn.Pn_m is output from the Pn_m pin.

Input data

A read operation of the PPRn register returns either the value of the Pn_m pin, the associated bit of the port register Pn.Pn_m, or the data output by an alternative function.

The source of the data read via PPRn depends on pin mode and setting of several control bits.

Table 2.7 summarizes the differences of PPRn read modes.

Table 2.7 PPRn_m Read Values

| PMc n_m | PM n_m | PIBC n_m | PIPC n_m | PODCE n_m | PODC n_m | Mode | PPRn_m read value |
|------------|-----------|-------------|-------------|--------------|-------------|--|--|
| 0 | 1 | 0 | X | X | X | Port input, input buffer disabled | Pn.Pn_m bit |
| | | 1 | | X | X | Port input, input buffer enabled | Pn_m pin |
| | 0 | X | | 0 | 0 | Port push-pull output | Pn.Pn_m bit* ¹ |
| | | | | 0 | 1 | Port N-ch open-drain output | |
| | | | | 1 | 0 | Port push-pull output | |
| | | | | 1 | 1 | Port P-ch open-drain output | |
| 1 | 1 | 0 | 0 | X | X | S/W I/O control alternative input | Pn_m pin |
| | | 1 | | | | Setting prohibited | |
| | 0 | X | 0 | 0 | 0 | S/W I/O control alternative push-pull output | Alternative function internal output signal* ¹ |
| | | | | 0 | 1 | S/W I/O control alternative N-ch open-drain output | |
| | | | | 1 | 0 | S/W I/O control alternative push-pull output | |
| | | | | 1 | 1 | S/W I/O control alternative P-ch open-drain output | |
| | X | 1 | 1 | 0 | 0 | Direct I/O control alternative input or push-pull output | I/O port in alternative function mode: • Input: Pn_m pin • Output: Alternative function internal output signal* ¹ |
| | | | | 0 | 1 | Direct I/O control alternative input or N-ch open-drain output | |
| | | | | 1 | 0 | Direct I/O control alternative input or push-pull output | |
| | | | | 1 | 1 | Direct I/O control alternative input or P-ch open-drain output | |

Note 1. When PBDCn_m = 1, Pn_m pin level is read via PPRn_m.

The control registers in **Table 2.7** have the following effects:

- **PMn.PMCn_m**
This bit selects either port mode ($PMn_m = 0$) or alternative function mode ($PMn_m = 1$).
- **PMn.PMn_m**
This bit selects input ($PMn_m = 1$) or output ($PMn_m = 0$) in port mode ($PMn_m = 0$) and S/W I/O control alternative mode ($PMn_m = 1, PIPCn_m = 0$).
- **PIBCn.PIBCn_m**
This bit disables ($PIBCn_m = 0$) or enables ($PIBCn_m = 1$) the input buffer in input port mode ($PMn_m = 0$ and $PMn_m = 1$). When the input buffer is disabled, $PPRn_m$ reads the $Pn.Pn_m$ bit, otherwise the Pn_m pin level is returned.
- **PIPCn.PIPCn_m**
This bit selects either the S/W or direct I/O control alternative mode.
- **PBDCn.PBDCn_m**
Setting this bit to 1 forces to read the Pn_m pin level via $PPRn_m$. Thus this enables a bidirectional mode, where the level of pin Pn_m can also be read back when the port is operated in an output mode.
- **PODCn.PODCn_m and PODCEn.PODCEn_m bits**
These bits select push-pull output ($PODCn_m$ bit = 0), N-ch open-drain output ($PODCn_m$ bit = 1 and $PODCEn_m$ bit = 0), or P-ch open-drain output ($PODCn_m$ bit = 1 and $PODCEn_m$ bit = 1).

Write to the Pn Register

The data to be output via port Pn_m in port mode ($PMn.PMCn_m = 0$) is held in the port register Pn .

The Pn data can be rewritten in the following two different ways:

- Direct write to the Pn register
New data can be directly written to the Pn register.
- Indirect operation to the Pn bit (set/reset/not)
The indirect Pn operation is possible using the following two registers:
 - Port set/reset register: $PSRn$
When the bit $PSRn.PSRn_{(m+16)} = 1$, the value of bit $PSRn.PSRn_m$ determines the value of $Pn.Pn_m$.
Thus Pn_m can be set/reset without a direct write to Pn .
 - Port NOT register: $PNOTn$
Setting $PNOTn.PNOTn_m = 1$ inverts the bit $Pn.Pn_m$ without a direct write to Pn_m .
Additionally, reading the level of the output pin can read the inverted value of the value that was initially set.

The indirect Pn set/reset/not operation provides access to single bits (not limited to one bit) of the Pn register while leaving all other Pn bits untouched.

2.3.3 Port Type

Figure 2.3 shows the overall configuration of the pins. For the details of port blocks, see Figure 2.4.

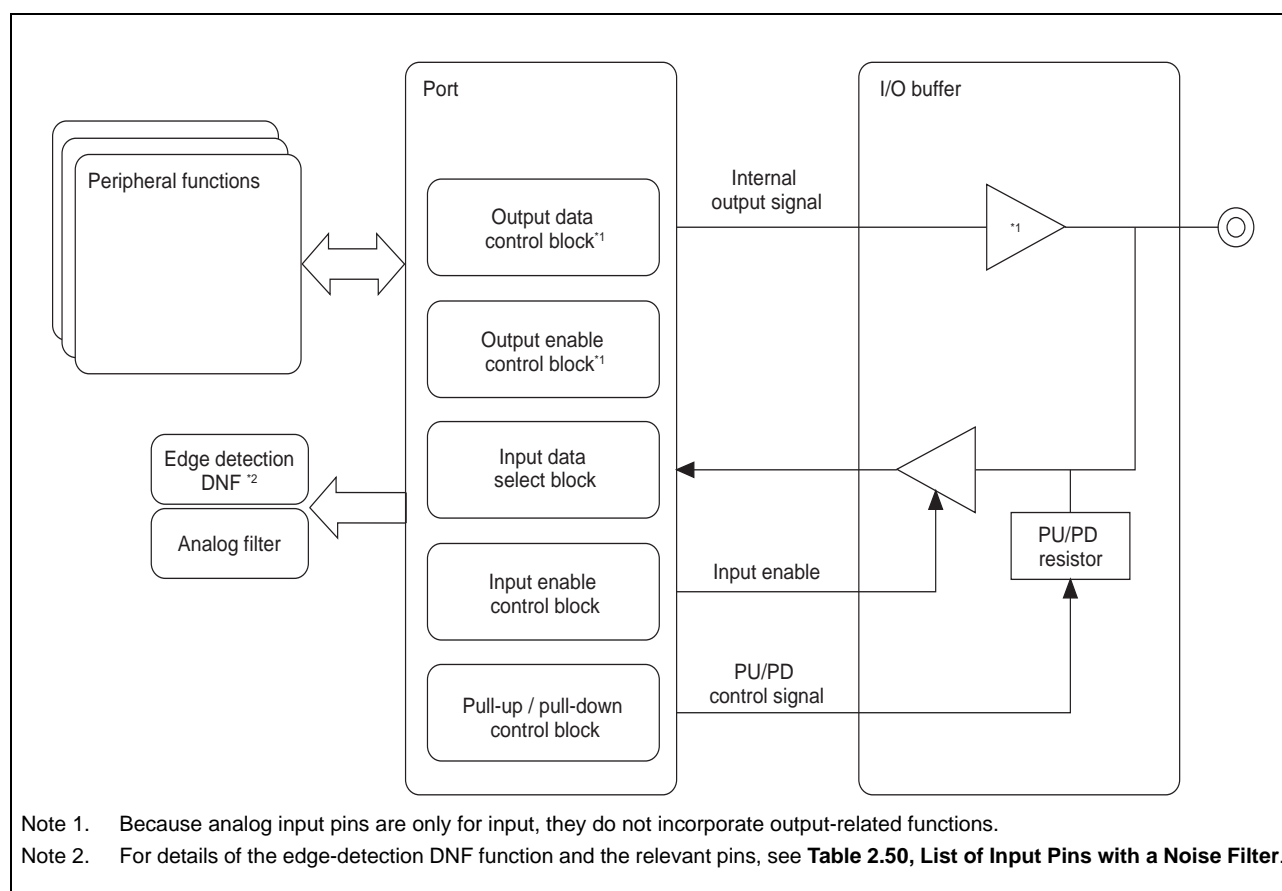

Figure 2.3 Block Diagram of Pin Configuration

Figure 2.4 shows the logical circuitry of the port control functions. The diagram is only a logical reference and does not show the real circuitry.

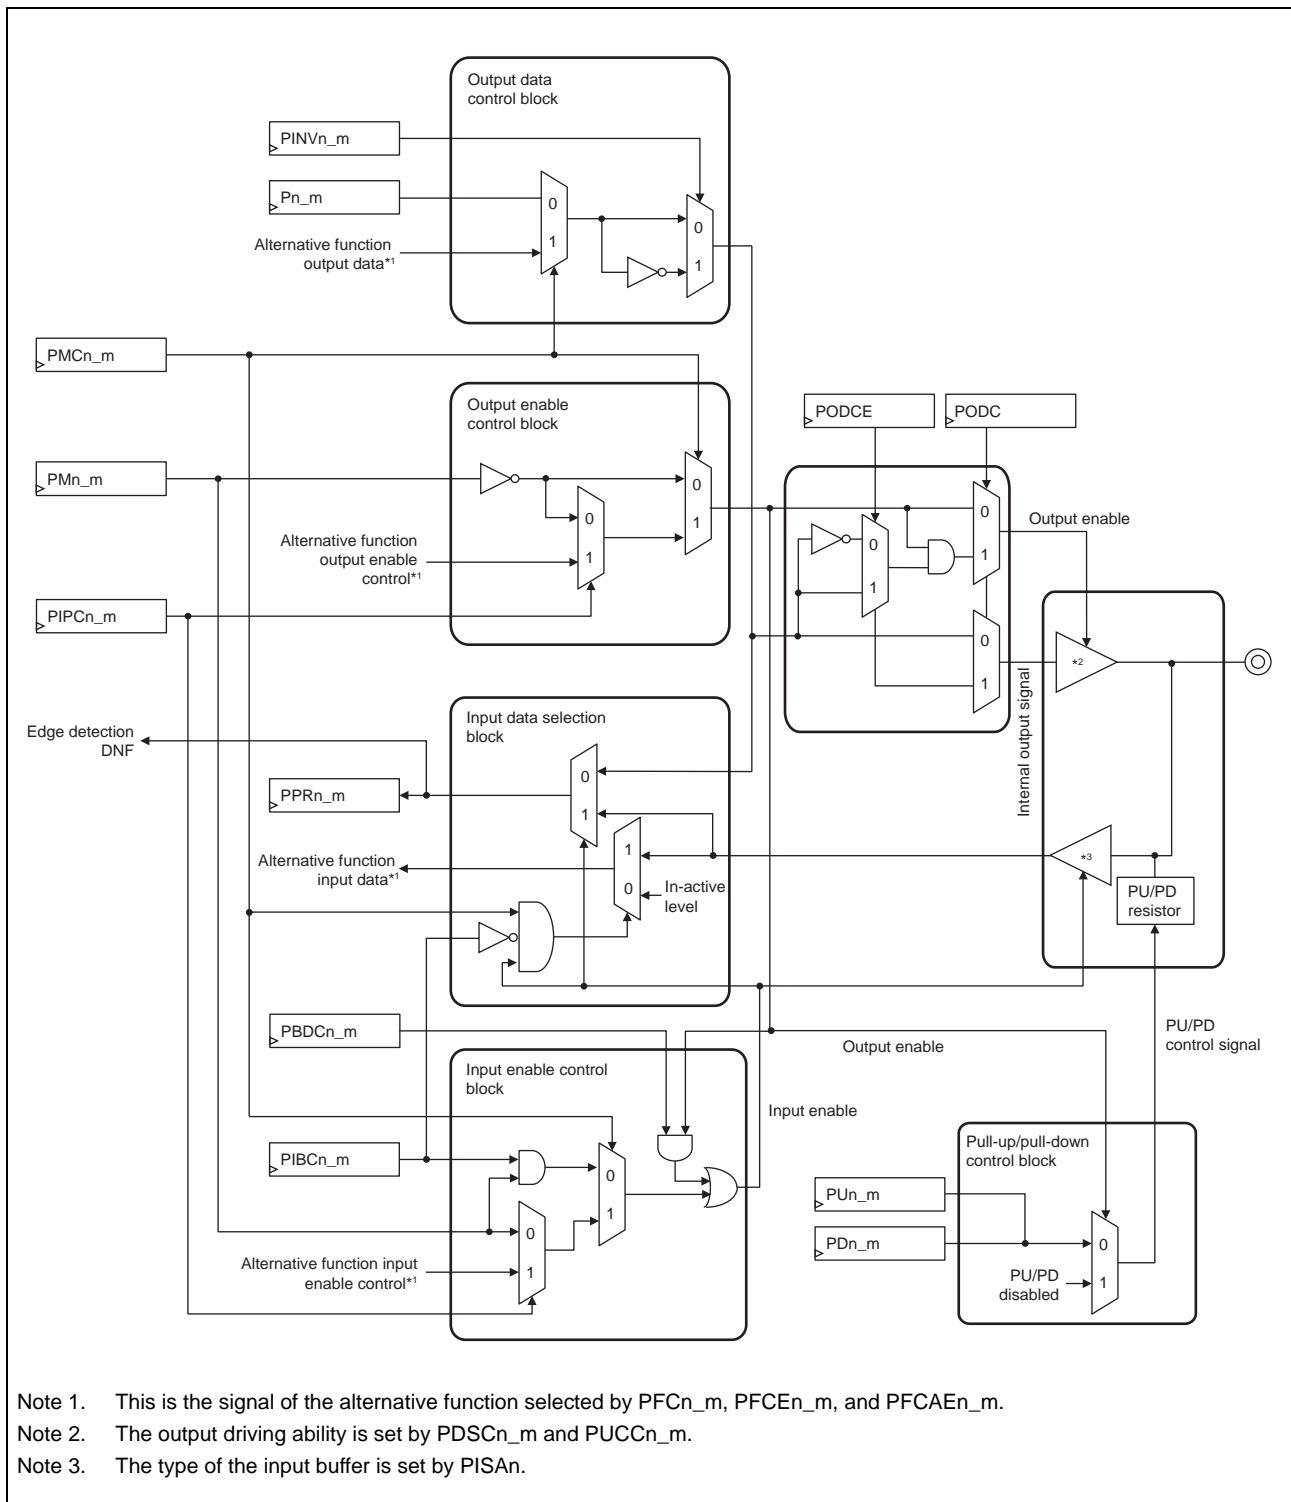

Figure 2.4 Port Control Logic Diagram

2.3.4 Port Group Configuration Register

This section starts with an overview of all configuration registers and then presents all registers in detail. The configuration registers are classified as follows:

- **2.3.4.2 Pin Function Configuration**
- **2.3.4.3 Pin Data Input/Output**
- **2.3.4.4 Configuration of Electrical Characteristics**

2.3.4.1 Outline

The following registers are used for the configuration of the individual pins of the port groups:

Table 2.8 Registers for Port Group Configuration (1/2)

| Register Name | Symbol | Address |
|---|--------------------|--|
| Pin function setting | | |
| Port control register | PCRN _m | <PORT_base> + 2000 _H + n × 40 _H + 4 _H × m |
| | JPCR0 _m | <JPORT0_base> + 2000 _H + 4 _H × m |
| Port mode control register | PMCN | <PORT_base> + 0014 _H + n × 40 _H |
| | JPMC0 | <JPORT0_base> + 0014 _H |
| Port mode control set/reset register | PMCSRn | <PORT_base> + 0024 _H + n × 40 _H |
| | JPMCSR0 | <JPORT0_base> + 0024 _H |
| Port IP control register | PIPCn | <PORT_base> + 4008 _H + n × 40 _H |
| Port mode register | PMn | <PORT_base> + 0010 _H + n × 40 _H |
| | JPM0 | <JPORT0_base> + 0010 _H |
| Port mode set/reset register | PMSRn | <PORT_base> + 0020 _H + n × 40 _H |
| | JPMSR0 | <JPORT0_base> + 0020 _H |
| Port input buffer control register | PIBCn | <PORT_base> + 4000 _H + n × 40 _H |
| | JPIBC0 | <JPORT0_base> + 4000 _H |
| Port function control register | PFCn | <PORT_base> + 0018 _H + n × 40 _H |
| Port function control expansion register | PFCEn | <PORT_base> + 001C _H + n × 40 _H |
| | JPFCE0 | <JPORT0_base> + 001C _H |
| Port function control addition expansion register | PFCAEn | <PORT_base> + 0028 _H + n × 40 _H |
| Pin data input/output | | |
| Port bi-direction control register | PBDCn | <PORT_base> + 4004 _H + n × 40 _H |
| | JPBDC0 | <JPORT0_base> + 4004 _H |
| Port pin read register | PPRn | <PORT_base> + 000C _H + n × 40 _H |
| | JPPR0 | <JPORT0_base> + 000C _H |
| Port register | Pn | <PORT_base> + 0000 _H + n × 40 _H |
| | JP0 | <JPORT0_base> + 0000 _H |
| Port NOT register | PNOTn | <PORT_base> + 0008 _H + n × 40 _H |
| | JPNOT0 | <JPORT0_base> + 0008 _H |
| Port set/reset register | PSRn | <PORT_base> + 0004 _H + n × 40 _H |
| | JPSR0 | <JPORT0_base> + 0004 _H |
| Port output level inversion register | PINVn | <PORT_base> + 0030 _H + n × 40 _H |

Table 2.8 Registers for Port Group Configuration (2/2)

| Register Name | Symbol | Address |
|--|--------|---|
| Specifying electrical characteristics | | |
| Pull-up option register | PUn | <PORT_base> + 400C _H + n × 40 _H |
| | JPU0 | <JPORT0_base> + 400C _H |
| Pull-down option register | PDn | <PORT_base> + 4010 _H + n × 40 _H |
| | JPD0 | <JPORT0_base> + 4010 _H |
| Port drive strength control register | PDSCn | <PORT_base> + 4018 _H + n × 40 _H |
| | JPDSC0 | <JPORT0_base> + 4018 _H |
| Port open-drain control register | PODCn | <PORT_base> + 4014 _H + n × 40 _H |
| | JPODC0 | <JPORT0_base> + 4014 _H |
| Port open-drain control expansion register | PODCEn | <PORT_base> + 403C _H + n × 40 _H |
| Port universal control register | PUCCn | <PORT_base> + 4028 _H + n × 40 _H |
| | JPUCC0 | <JPORT0_base> + 4028 _H |
| Port input buffer selection register | PISAn | <PORT_base> + 402C _H + n × 40 _H |
| | JPISA0 | <JPORT0_base> + 402C _H |

Note: n: Port group number
m: Bit number in a port group

Base address

The PORTn base addresses, <PORT_Base> and <JPORT0_Base> are defined in **Register Address, Section 2.3.1, Features**.

Value after a reset

The value after a reset depends on the port, and are not described in the following register descriptions, but are given in **Section 2.4.1.1, List of Port Registers**.

2.3.4.2 Pin Function Configuration

(1) PMCn/JPMC0 — Port Mode Control Register

This register specifies whether the individual pins of port group n are in port mode or in alternative mode.

Access: PMCn: This register can be read/written in 16-bit units.
JPMC0: This register can be read/written in 8-bit units.

Address: PMCn: <PORT_base> + 0014_H + n × 40_H
JPMC0: <JPORT0_base> + 0014_H*1

Value after reset: PMCn: 0000_H
JPMC0: 00_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (Table 2.36, List of Registers in Port Group 0, Table 2.37, List of Registers in Port Group 1, Table 2.38, List of Registers in Port Group 2, Table 2.39, List of Registers in Port Group 3, Table 2.40, List of Registers in Port Group 4, Table 2.41, List of Registers in Port Group 5, Table 2.42, List of Registers in Port Group JP0) in Section 2.4.1.1, List of Port Registers.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|---------|---------|---------|---------|---------|---------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| | PMCn_15 | PMCn_14 | PMCn_13 | PMCn_12 | PMCn_11 | PMCn_10 | PMCn_9 | PMCn_8 | PMCn_7 | PMCn_6 | PMCn_5 | PMCn_4 | PMCn_3 | PMCn_2 | PMCn_1 | PMCn_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 2.9 PMCn Register Contents

| Bit Position | Bit Name | Function |
|--------------|-------------|---|
| 15 to 0 | PMCn_[15:0] | Specifies the operation mode of the corresponding pin. 0: Port mode 1: Alternative mode |

CAUTIONS

- The I/O control is not performed by just setting alternative mode (PMCn.PMCn_m). When the alternative function performs direct I/O control, set also the PIPcn.PIPcn_m bit to 1.
- When a port is used as an input pin in alternative mode, there is a pin that passes a noise filter. Such a pin might need FCLA0CTLm.DFNAnCTL and the DFNAnEN register to be set. For details, see **Section 2.6, Noise Filter and Edge Level Detection Circuit**.

NOTES

- The control bits of the JTAG port mode control register (JPMC0) are JPMC0_[7:0].
- For details about the relevant port groups and bits, see **Section 2.4.1.1, List of Port Registers**.

(2) PMCSRn/JPMCSR0 — Port Mode Control Set/Reset Register

This register provides an alternative method to write data to a bit in the PMCN register.

The upper 16 bits of PMCSRn specify whether the data of the corresponding lower 16 bits of PMCSRn is written to the PMCN.PMCn_m bit.

Access: This register can be read/written in 32-bit units.

PMCSRn: Bits 31 to 16 are always read as 0000_H. Reading bits 15 to 0 returns the value of the PMCN register.

JPMCSR: Bits 31 to 8 are always read as 0000 00_H. Reading bits 7 to 0 returns the value of the JPMCN register.

Address: PMCSRn: <PORT_base> + 0024_H + n × 40_H
JPMCSR0: <JPORT0_base> + 0024_H*1

Value after reset: 0000 0000_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (Table 2.36, List of Registers in Port Group 0, Table 2.37, List of Registers in Port Group 1, Table 2.38, List of Registers in Port Group 2, Table 2.39, List of Registers in Port Group 3, Table 2.40, List of Registers in Port Group 4, Table 2.41, List of Registers in Port Group 5, Table 2.42, List of Registers in Port Group JP0) in Section 2.4.1.1, List of Port Registers.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|
| | PMCSR n_31 | PMCSR n_30 | PMCSR n_29 | PMCSR n_28 | PMCSR n_27 | PMCSR n_26 | PMCSR n_25 | PMCSR n_24 | PMCSR n_23 | PMCSR n_22 | PMCSR n_21 | PMCSR n_20 | PMCSR n_19 | PMCSR n_18 | PMCSR n_17 | PMCSR n_16 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | PMCSR n_15 | PMCSR n_14 | PMCSR n_13 | PMCSR n_12 | PMCSR n_11 | PMCSR n_10 | PMCSR n_9 | PMCSR n_8 | PMCSR n_7 | PMCSR n_6 | PMCSR n_5 | PMCSR n_4 | PMCSR n_3 | PMCSR n_2 | PMCSR n_1 | PMCSR n_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 2.10 PMCSRn Register Contents

| Bit Position | Bit Name | Function |
|--------------|--------------------|--|
| 31 to 16 | PMCSRn_ [31:16] | Specifies whether the value of the corresponding lower bit of PMCSRn_[15:0] is written to PMCN_m: 0: PMCN_m does not depend on PMCSRn_m. 1: The value of PMCN_m is the same as that of PMCSRn_m. Example: When PMCSRn.PMCSRn_31 = 1, the value of bit PMCSRn.PMCSRn_15 is written to bit PMCN.PMCn_15. |
| 15 to 0 | PMCSRn_ [15:0] | Specifies the PMCN_m value when the corresponding upper bit PMCSRn_(m+16) is 1: 0: PMCN_m = 0 1: PMCN_m = 1 |

NOTES

- The control bits of the JTAG port mode control set/reset register (JPMCSR0) are JPMCSR0_[31:0].
- For details about the relevant port groups and bits, see Section 2.4.1.1, List of Port Registers.

(3) PIPCN — Port IP Control Register

This register specifies whether the I/O direction of pin Pn_m is controlled by the port mode register PMn.PMn_m or by an alternative function.

When the Pn_m pin is operated in alternative mode (PMcn.PMCn_m = 1) and the alternative function directly controls the I/O direction of Pn_m, PIPCN.PIPCn_m must be set to 1 as well.

This hands over I/O control to the alternative function and overrules the PMn.PMn_m setting.

Access: This register can be read/written in 16-bit units.

Address: PIPCN: <PORT_base> + 4008_H + n × 40_H^{*1}

Value after reset: 0000_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (Table 2.36, List of Registers in Port Group 0, Table 2.37, List of Registers in Port Group 1, Table 2.38, List of Registers in Port Group 2, Table 2.39, List of Registers in Port Group 3, Table 2.40, List of Registers in Port Group 4, Table 2.41, List of Registers in Port Group 5) in Section 2.4.1.1, List of Port Registers.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|----------|----------|----------|----------|----------|----------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| | PIPCn_15 | PIPCn_14 | PIPCn_13 | PIPCn_12 | PIPCn_11 | PIPCn_10 | PIPCn_9 | PIPCn_8 | PIPCn_7 | PIPCn_6 | PIPCn_5 | PIPCn_4 | PIPCn_3 | PIPCn_2 | PIPCn_1 | PIPCn_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 2.11 PIPCN Register Contents

| Bit Position | Bit Name | Function |
|--------------|--------------|---|
| 15 to 0 | PIPCn_[15:0] | Specifies the I/O control mode. 0: I/O mode is selected by PMn.PMn_m (software I/O control). 1: I/O mode is selected by the peripheral function (direct I/O control). |

NOTE

For details about the relevant port groups and bits, see Section 2.4.1.1, List of Port Registers.

(4) PMn/JPM0 — Port Mode Register

The PMn register specifies whether the individual pins of port group n are in input mode or in output mode.

Access: PMn: This register can be read/written in 16-bit units.
JPM0: This register can be read/written in 8-bit units.

Address: PMn: <PORT_base> + 0010_H + n × 40_H
JPM0: <JPORT0_base> + 0010_H*1

Value after reset: PM0: FBFF_H, PM1 to 5: FFFF_H
JPM0: FF_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (Table 2.36, List of Registers in Port Group 0, Table 2.37, List of Registers in Port Group 1, Table 2.38, List of Registers in Port Group 2, Table 2.39, List of Registers in Port Group 3, Table 2.40, List of Registers in Port Group 4, Table 2.41, List of Registers in Port Group 5, Table 2.42, List of Registers in Port Group JP0) in Section 2.4.1.1, List of Port Registers.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|------------|------------|------------|------------|--------|------------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| | PMn_1 5 | PMn_1 4 | PMn_1 3 | PMn_1 2 | PMn_11 | PMn_1 0 | PMn_9 | PMn_8 | PMn_7 | PMn_6 | PMn_5 | PMn_4 | PMn_3 | PMn_2 | PMn_1 | PMn_0 |
| Value after reset | 1 | 1 | 1 | 1 | 1 | *1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. PM0: 0
PM1 to PM5: 1

Table 2.12 PMn Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------|---|
| 15 to 0 | PMn_[15:0] | Specifies input/output mode of the corresponding pin. 0: Output mode (output enabled) 1: Input mode (output disabled) |

NOTES

- When a port is used in input port mode (PMnCn.PMCn_m = 0 and PMn.PMn_m = 1), the input buffer needs to be enabled (PIBCn.PIBCn_m = 1).
- After reset, PIPCN.PIPCN_m = 0 is set (I/O mode is controlled with PMn.PMn_m). Thus, PMn_m specifies the I/O direction of port mode (PMnCn.PMCn_m = 0) and alternative mode (PMnCn.PMCn_m = 1).
- The control bits of the JTAG port mode register (JPM0) are JPM0_[7:0].
- For details about the relevant port groups and bits, see Section 2.4.1.1, List of Port Registers.

(5) PMSRn/JPMSR0 — Port Mode Set/Reset Register n

This register provides an alternative method to write data to a bit in the PMn register.

The upper 16 bits of PMSRn specify whether the data of the corresponding lower 16 bits of PMSRn is written to the PMn.PMn_m bit.

Access: This register can be read/written in 32-bit units.
PMSRn: Bits 31 to 16 are always read as 0000_H. Reading bits 15 to 0 returns the value of the PMn register.
JPMSRn: Bits 31 to 8 are always read as 0000 00_H. Reading bits 7 to 0 returns the value of the JPMCn register.

Address: PMSRn: <PORT_base> + 0020_H + n × 40_H
JPMSR0: <JPORT0_base> + 0020_H^{*1}

Value after reset: PMSR0: 0000 FBFF_H, PMSR1 to 5: 0000 FFFF_H
JPMSR0: 0000 00FF_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (Table 2.36, List of Registers in Port Group 0, Table 2.37, List of Registers in Port Group 1, Table 2.38, List of Registers in Port Group 2, Table 2.39, List of Registers in Port Group 3, Table 2.40, List of Registers in Port Group 4, Table 2.41, List of Registers in Port Group 5, Table 2.42, List of Registers in Port Group JP0) in Section 2.4.1.1, List of Port Registers.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|
| | PMSRn _31 | PMSRn _30 | PMSRn _29 | PMSRn _28 | PMSRn _27 | PMSRn _26 | PMSRn _25 | PMSRn _24 | PMSRn _23 | PMSRn _22 | PMSRn _21 | PMSRn _20 | PMSRn _19 | PMSRn _18 | PMSRn _17 | PMSRn _16 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | PMSRn _15 | PMSRn _14 | PMSRn _13 | PMSRn _12 | PMSRn _11 | PMSRn _10 | PMSRn _9 | PMSRn _8 | PMSRn _7 | PMSRn _6 | PMSRn _5 | PMSRn _4 | PMSRn _3 | PMSRn _2 | PMSRn _1 | PMSRn _0 |
| Value after reset | *1 | *1 | *1 | *1 | *1 | *2 | *1 | *1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. PMSR0 to PMSR5: 1
JPMSR0: 0

Note 2. PMSR1 to PMSR5: 1
PMSR0, JPMSR0: 0

Table 2.13 PMSRn Register Contents

| Bit Position | Bit Name | Function |
|--------------|---------------|---|
| 31 to 16 | PMSRn_[31:16] | Specifies whether the value of the corresponding lower bit of PMSRn_[15:0] is written to PMn_m: 0: PMn_m does not depend on PMSRn_m. 1: The value of PMn_m is the same as that of PMSRn_m. Example: When PMSRn.PMSRn_31 = 1, the value of bit PMSRn.PMSRn_15 is written to bit PMn.PMn_15 and output. |
| 15 to 0 | PMSRn_[15:0] | Specifies the PMn_m value when the corresponding upper bit PMSRn_(m+16) is 1: 0: PMn_m = 0 1: PMn_m = 1 |

NOTES

- The control bits of the JTAG port mode set/reset register (JPMSR0) are JPMSR0_[31:0]
- For details about the relevant port groups and bits, see **Section 2.4.1.1, List of Port Registers.**

(6) PIBCn/JPIBC0 — Port Input Buffer Control Register

This register enables and disables the input buffer in input port mode (PMnCn.PMCn_m = 0 and PMn.PMn_m = 1).

Additionally, when pins are in bidirectional mode (PBDCn.PBDCn_m = 1), it is capable of selecting shared output level loop-back function and pin output level-read function with the setting of PIBCn.PIBCn_m. For details, see **(1) PBDCn/JPBDC0 — Port Bi-Direction Control Register** in **Section 2.3.4.3, Pin Data Input/Output**.

Access: PIBCn: This register can be read/written in 16-bit units.
JPIBC0: This register can be read/written in 8-bit units.

Address: PIBCn: <PORT_base> + 4000_H + n × 40_H
JPIBC0: <JPORT0_base> + 4000_H*1

Value after reset: PIBCn: 0000_H
JPIBC0: 00_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (Table 2.36, List of Registers in Port Group 0, Table 2.37, List of Registers in Port Group 1, Table 2.38, List of Registers in Port Group 2, Table 2.39, List of Registers in Port Group 3, Table 2.40, List of Registers in Port Group 4, Table 2.41, List of Registers in Port Group 5, Table 2.42, List of Registers in Port Group JP0) in Section 2.4.1.1, List of Port Registers.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|----------|----------|----------|----------|----------|----------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| | PIBCn_15 | PIBCn_14 | PIBCn_13 | PIBCn_12 | PIBCn_11 | PIBCn_10 | PIBCn_9 | PIBCn_8 | PIBCn_7 | PIBCn_6 | PIBCn_5 | PIBCn_4 | PIBCn_3 | PIBCn_2 | PIBCn_1 | PIBCn_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 2.14 PIBCn Register Contents

| Bit Position | Bit Name | Function |
|--------------|--------------|---|
| 15 to 0 | PIBCn_[15:0] | Enables/disables the input buffer: 0: Input buffer is disabled. 1: Input buffer is enabled. |

NOTES

- When the input buffer is disabled, it does not consume flow-through current even if the pin level is in Hi-Z state. Thus, the pin does not need to be fixed to a high or low level externally.
- The control bits of the JTAG port input buffer control register (JPIBC0) are JPIBC0_[7:0].
- For details about the relevant port groups and bits, see **Section 2.4.1.1, List of Port Registers**.

(7) PFCn — Port Function Control Register

This register, together with the PFCEn and PFCAEn registers, specifies an alternative function of the pins.

Some alternative functions require direct I/O control of pin Pn_m. For such alternative functions PIPCN.PIPCN_m must be set to 1 as well.

For other alternative functions, input/output must be specified by PMn.PMn_m.

Access: This register can be read/written in 16-bit units.

Address: <PORT_base> + 0018_H + n × 40_H^{*1}

Value after reset: 0000_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (Table 2.36, List of Registers in Port Group 0, Table 2.37, List of Registers in Port Group 1, Table 2.38, List of Registers in Port Group 2, Table 2.39, List of Registers in Port Group 3, Table 2.40, List of Registers in Port Group 4, Table 2.41, List of Registers in Port Group 5) in Section 2.4.1.1, List of Port Registers.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|---------|---------|---------|---------|---------|---------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| | PFCn_15 | PFCn_14 | PFCn_13 | PFCn_12 | PFCn_11 | PFCn_10 | PFCn_9 | PFCn_8 | PFCn_7 | PFCn_6 | PFCn_5 | PFCn_4 | PFCn_3 | PFCn_2 | PFCn_1 | PFCn_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 2.15 PFCn Register Contents

| Bit Position | Bit Name | Function |
|--------------|-------------|--|
| 15 to 0 | PFCn_[15:0] | Specifies an alternative function of a pin. See Table 2.6, Outline of Alternative Mode Selection (PMcn.PMCn_m = 1). |

NOTE

For details about the relevant port groups and bits, see Section 2.4.1.1, List of Port Registers.

(8) PFCEn / JPFCE0 — Port Function Control Expansion Register

This register, together with the PFCn and PFCAEn registers, specifies an alternative function of the pins.

Some alternative functions directly controls input/output of pin Pn_m. For such alternative functions PIPCn.PIPCn_m must be set to 1 as well.

For other alternative functions, input/output must be specified by PMn.PMn_m.

Access: PFCEn: This register can be read/written in 16-bit units.
JPFCE0: This register can be read/written in 8-bit units.

Address: PFCEn: <PORT_base> + 001C_H + n × 40_H
JPFCE0: <JPORT0_base> + 001C_H¹

Value after reset: PFCEn: 0000_H
JPFCE0: 00_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (Table 2.36, List of Registers in Port Group 0, Table 2.37, List of Registers in Port Group 1, Table 2.38, List of Registers in Port Group 2, Table 2.39, List of Registers in Port Group 3, Table 2.40, List of Registers in Port Group 4, Table 2.41, List of Registers in Port Group 5, Table 2.42, List of Registers in Port Group JP0) in Section 2.4.1.1, List of Port Registers.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|--------------|--------------|--------------|--------------|--------------|--------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|
| | PFCEn _15 | PFCEn _14 | PFCEn _13 | PFCEn _12 | PFCEn _11 | PFCEn _10 | PFCEn _9 | PFCEn _8 | PFCEn _7 | PFCEn _6 | PFCEn _5 | PFCEn _4 | PFCEn _3 | PFCEn _2 | PFCEn _1 | PFCEn _0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 2.16 PFCEn Register Contents

| Bit Position | Bit Name | Function |
|--------------|--------------|--|
| 15 to 0 | PFCEn_[15:0] | Specifies an alternative function of a pin. See Table 2.6, Outline of Alternative Mode Selection (PMcN.PMcN_m = 1) for details. |

NOTES

1. The control bits of the JTAG port function control expansion register (JPFCE0) are JPFCE0_[7:0].
2. For details about the relevant port groups and bits, see Section 2.4.1.1, List of Port Registers.

(9) PFCAEn — Port Function Control Additional Expansion Register

This register, together with the PFCn and PFCEn registers, specifies an alternative function of the pins. Some alternative functions directly controls input/output of pin Pn_m. For such an alternative functions PIPCn.PIPCn_m must be set to 1 as well. For other alternative functions, input/output must be specified by PMn.PMn_m.

Access: This register can be read/written in 16-bit units.

Address: <PORT_base> + 0028_H + n × 40_H^{*1}

Value after reset: 0000_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (Table 2.36, List of Registers in Port Group 0, Table 2.37, List of Registers in Port Group 1, Table 2.38, List of Registers in Port Group 2, Table 2.39, List of Registers in Port Group 3, Table 2.40, List of Registers in Port Group 4, Table 2.41, List of Registers in Port Group 5) in Section 2.4.1.1, List of Port Registers.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|---------------|---------------|---------------|---------------|---------------|---------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|
| | PFCAE n_15 | PFCAE n_14 | PFCAE n_13 | PFCAE n_12 | PFCAE n_11 | PFCAE n_10 | PFCAE n_9 | PFCAE n_8 | PFCAE n_7 | PFCAE n_6 | PFCAE n_5 | PFCAE n_4 | PFCAE n_3 | PFCAE n_2 | PFCAE n_1 | PFCAE n_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 2.17 PFCAEn Register Contents

| Bit Position | Bit Name | Function |
|--------------|---------------|--|
| 15 to 0 | PFCAEn_[15:0] | Specifies an alternative function of a pin. See Table 2.6, Outline of Alternative Mode Selection (PMcN.PMcN_m = 1) for details. |

Table 2.18 Setting Alternative Functions

| PFCAEn_m | PFCEn_m | PFCn_m | PMn_m | Function | | |
|----------|---------|--------|-------|-----------------------------------|-----------------------------------|-----------------------------------|
| 0 | 0 | 0 | 1 | 1st alternative function / Input | | |
| | | | 0 | 1st alternative function / Output | | |
| | | | 1 | 1 | 2nd alternative function / Input | |
| | | | | 0 | 2nd alternative function / Output | |
| | | | 1 | 0 | 1 | 3rd alternative function / Input |
| | | | | | 0 | 3rd alternative function / Output |
| 1 | 0 | 0 | 1 | 4th alternative function / Input | | |
| | | | 0 | 4th alternative function / Output | | |
| | | | 1 | 1 | 5th alternative function / Input | |
| | | | | 0 | 5th alternative function / Output | |
| | | | 1 | 1 | 1 | 6th alternative function / Input |
| | | | | | 0 | 6th alternative function / Output |
| 1 | 1 | X | X | Setting prohibited | | |

CAUTION

- After selecting the alternative function by the PFCn_m, PFCEn_m or PFCAEn_m register, set the PMcN_m register to 1.
- With this product, the I/O of some functions is multiplexed in two pins, but only either one can be used as a pin function. Setting the same pin function in two pins is prohibited. For example, if the a/b/c pin is used as b, the b/d/e pin cannot be used as b. In this case, the b/d/e pin must be configured as the pin function other than b.

NOTE

For details about the relevant port groups and bits, see **Section 2.4.1.1, List of Port Registers**.

2.3.4.3 Pin Data Input/Output

(1) PBDCn/JPBDC0 — Port Bi-Direction Control Register

This register enables the input buffer when a port is used in output mode and sets in bi-direction mode. In bi-direction mode, PPRn.PPRn_m can read the level of the Pn_m pin.

- **Alternative output level loopback function**
When the Pn_m pin is used as the alternative output function, the actual pin output level based on the alternative output function can be looped back to the alternative input side by setting PBDCn.PBDCn_m = 1 and PIBCn.PIBCn_m = 0. For example, the pin output level based on the first alternative function can be looped back to the same alternative input side. Also the pin output level can be read via PPRn.PPRn_m.
- **Pin output level read function**
When the Pn_m pin is used as the general output port function or the alternative output function, the actual pin output level can be read via PPRn.PPRn_m by setting PBDCn.PBDCn_m = 1 and PIBCn.PIBCn_m = 1. Under this setting, the pin output level will never be looped back to the alternative input side even in alternative output mode.

Access: PBDCn: This register can be read/written in 16-bit units.
JPBDC0: This register can be read/written in 8-bit units.

Address: PBDCn: <PORT_base> + 4004_H + n × 40_H
JPBDC0: <JPOR0_base> + 4004_H^{*1}

Value after reset: PBDCn: 0000_H
JPBDC0: 00_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (Table 2.36, List of Registers in Port Group 0, Table 2.37, List of Registers in Port Group 1, Table 2.38, List of Registers in Port Group 2, Table 2.39, List of Registers in Port Group 3, Table 2.40, List of Registers in Port Group 4, Table 2.41, List of Registers in Port Group 5, Table 2.42, List of Registers in Port Group JP0) in Section 2.4.1.1, List of Port Registers.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|--------------|--------------|--------------|--------------|--------------|--------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|
| | PBDCn _15 | PBDCn _14 | PBDCn _13 | PBDCn _12 | PBDCn _11 | PBDCn _10 | PBDCn _9 | PBDCn _8 | PBDCn _7 | PBDCn _6 | PBDCn _5 | PBDCn _4 | PBDCn _3 | PBDCn _2 | PBDCn _1 | PBDCn _0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 2.19 PBDCn Register Contents

| Bit Position | Bit Name | Function |
|--------------|--------------|---|
| 15 to 0 | PBDCn_[15:0] | Enables/disables bi-direction mode of the corresponding pin. 0: Bi-direction mode disabled 1: Bi-direction mode enabled |

CAUTION

When the Pn_m port is used as an alternative output function (PMc.PMc_m = 1, PMn.PMn_m = 0), if bidirectional mode is enabled (PBDCn.PBDCn_m = 1), the level of the Pn_m pin can be read with PPRn.PPRn_m.

However, the output of the alternative output function is input to the alternative input function of the same pin (the alternative input function that is set with PFCn.PFCn_m, PFCEn.PFCEn_m, and PFCAEn.PFCAEn_m). If this alternative input function is used in another pin, note that the output of the alternative output function and alternative input in other pins are input internally (OR input).

NOTES

1. The control bits of the JTAG port bi-direction control register (JPBDC0) are JPBDC0_[7:0].
2. For details about the relevant port groups and bits, see **Section 2.4.1.1, List of Port Registers**.

(2) PPRn/JPPR0 — Port Pin Read Register

This register reflects an actual Pn_m pin level, a Pn.Pn_m bit value, or an output level of the alternative function. The value to be read depends on various control settings as described in **Table 2.7, PPRn_m Read Values**.

Access: PPRn: This register can be read only in 16-bit units.
JPPR0: This register can only be read in 8-bit units.

Address: PPRn: <PORT_base> + 000C_H + n × 40_H
JPPR0: <JPORT0_base> + 000C_H*1

Value after reset: PPRn: 0000_H
JPPR0: 00_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (**Table 2.36, List of Registers in Port Group 0, Table 2.37, List of Registers in Port Group 1, Table 2.38, List of Registers in Port Group 2, Table 2.39, List of Registers in Port Group 3, Table 2.40, List of Registers in Port Group 4, Table 2.41, List of Registers in Port Group 5, Table 2.42, List of Registers in Port Group JP0**) in **Section 2.4.1.1, List of Port Registers**.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Table 2.20 PPRn Register Contents

| Bit Position | Bit Name | Function |
|--------------|-------------|---|
| 15 to 0 | PPRn_[15:0] | Pin Pn_m, Pn.Pn_m value or alternative function output. |

NOTES

1. For details about the read value of the PPRn register, see **Section 2.3.2.3, Pin Data Input/Output**.
2. The control bits of the JTAG port pin read register (JPPR0) are JPPR0_[7:0].
3. For details about the relevant port groups and bits, see **Section 2.4.1.1, List of Port Registers**.

(3) Pn/JP0 — Port Register

This register sets and holds the Pn.Pn_m data to be output via the related Pn_m port in output port mode (PMCn.PMCn_m = 0 and PMn.PMn_m = 0).

Access: Pn: This register can be read/written in 16-bit units.
JP0: This register can be read/written in 8-bit units.

Address: Pn: <PORT_base> + 0000_H + n × 40_H
JP0: <JP0_base> + 0000_H*¹

Value after reset: Pn: 0000_H
JP0: 00_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (Table 2.36, List of Registers in Port Group 0, Table 2.37, List of Registers in Port Group 1, Table 2.38, List of Registers in Port Group 2, Table 2.39, List of Registers in Port Group 3, Table 2.40, List of Registers in Port Group 4, Table 2.41, List of Registers in Port Group 5, Table 2.42, List of Registers in Port Group JP0) in Section 2.4.1.1, List of Port Registers.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|-------|-------|-------|-------|-------|-------|------|------|------|------|------|------|------|------|------|------|
| | Pn_15 | Pn_14 | Pn_13 | Pn_12 | Pn_11 | Pn_10 | Pn_9 | Pn_8 | Pn_7 | Pn_6 | Pn_5 | Pn_4 | Pn_3 | Pn_2 | Pn_1 | Pn_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 2.21 Pn Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|--|
| 15 to 0 | Pn_[15:0] | Sets the output level of pin m (m = 0 to 15): 0: Low level output 1: High level output |

NOTES

- The bits of this register can be manipulated by various means; refer to the subsection, **Write to the Pn Register** in Section 2.3.2.3, Pin Data Input/Output.
- The control bits of the JTAG port register (JP0) are JP0_[7:0].
- For details about the relevant port groups and bits, see Section 2.4.1.1, List of Port Registers.

(4) PNOTn/JPNOT0 — Port NOT Register

This register enables inverting the Pn_m bit of the port register without directly writing to Pn.

Access: PNOTn: This register can be written in 16-bit units. The read value is always 0000_H.
JPNOT0: This register can only be written in 8-bit units. The read value is always 00_H.

Address: PNOTn: <PORT_base> + 0008_H + n × 40_H
JPNOT0: <JPORT0_base> + 0008_H^{*1}

Value after reset: PNOTn: 0000_H
JPNOT0: 00_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (Table 2.36, List of Registers in Port Group 0, Table 2.37, List of Registers in Port Group 1, Table 2.38, List of Registers in Port Group 2, Table 2.39, List of Registers in Port Group 3, Table 2.40, List of Registers in Port Group 4, Table 2.41, List of Registers in Port Group 5, Table 2.42, List of Registers in Port Group JP0) in Section 2.4.1.1, List of Port Registers.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|--------------|--------------|--------------|--------------|--------------|--------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|
| | PNOTn _15 | PNOTn _14 | PNOTn _13 | PNOTn _12 | PNOTn _11 | PNOTn _10 | PNOTn _9 | PNOTn _8 | PNOTn _7 | PNOTn _6 | PNOTn _5 | PNOTn _4 | PNOTn _3 | PNOTn _2 | PNOTn _1 | PNOTn _0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |

Table 2.22 PNOTn Register Contents

| Bit Position | Bit Name | Function |
|--------------|--------------|---|
| 15 to 0 | PNOTn_[15:0] | Specifies if Pn.Pn_m is inverted or not: 0: Pn.Pn_m is not inverted (Pn_m → Pn_m) 1: Pn.Pn_m is inverted ($\overline{Pn_m}$ → Pn_m) |

NOTES

1. The control bits of the JTAG port not register (JPNOT0) are JPNOT0_[7:0].
2. For details about the relevant port groups and bits, see Section 2.4.1.1, List of Port Registers.

(5) PSRn/JPSR0 — Port Set/Reset Register

This register provides an alternative method to write data to a bit in the Pn register.

The upper 16 bits of PSRn specify whether the data of the corresponding lower 16 bits of PSRn is written to the Pn.Pn_m bit.

Access: This register can be read/written in 32-bit units.
 PSRn: Bits 31 to 16 are always read as 0000_H. Reading bits 15 to 0 returns the value of the PMCN register.
 JPSRn: Bits 31 to 8 are always read as 0000 00_H. Reading bits 15 to 0 returns the value of the JPn register.

Address: PSRn: <PORT_base> + 0004_H + n × 40_H
 JPSR0: <JPORT0_base> + 0004_H^{*1}

Value after reset: PSRn: 0000 0000_H
 JPSR0: 0000 0000_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (Table 2.36, List of Registers in Port Group 0, Table 2.37, List of Registers in Port Group 1, Table 2.38, List of Registers in Port Group 2, Table 2.39, List of Registers in Port Group 3, Table 2.40, List of Registers in Port Group 4, Table 2.41, List of Registers in Port Group 5, Table 2.42, List of Registers in Port Group JP0) in Section 2.4.1.1, List of Port Registers.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| | PSRn_31 | PSRn_30 | PSRn_29 | PSRn_28 | PSRn_27 | PSRn_26 | PSRn_25 | PSRn_24 | PSRn_23 | PSRn_22 | PSRn_21 | PSRn_20 | PSRn_19 | PSRn_18 | PSRn_17 | PSRn_16 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | PSRn_15 | PSRn_14 | PSRn_13 | PSRn_12 | PSRn_11 | PSRn_10 | PSRn_9 | PSRn_8 | PSRn_7 | PSRn_6 | PSRn_5 | PSRn_4 | PSRn_3 | PSRn_2 | PSRn_1 | PSRn_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 2.23 PSRn Register Contents

| Bit Position | Bit Name | Function |
|--------------|--------------|--|
| 31 to 16 | PSRn_[31:16] | Specifies whether the value of the corresponding lower bit of PSRn_[15:0] is written to Pn_m: 0: Pn_m does not depend on PSRn_m. 1: The value of Pn_m is the same as that of PSRn_m. Example: When PSRn.PSRn_31 = 1, the value of bit PSRn.PSRn_15 is written to bit Pn.Pn_15. |
| 15 to 0 | PSRn_[15:0] | Specifies the Pn_m value when the corresponding upper bit PSRn_(m+16) is 1: 0: Pn_m = 0 1: Pn_m = 1 |

NOTES

- The control bits of the JTAG port set/reset register (JPSR0) are JPSR0_[31:0].
- For details about the relevant port groups and bits, see Section 2.4.1.1, List of Port Registers.

(6) PINVn — Port Output Level Inversion Register

This register enables inverting the output level from a pin. It is effective when the pin is in output mode regardless of port output mode or alternative output mode.

Access: This register can be read/written in 32-bit units.

Address: <PORT_base> + 0030_H + n × 40_H⁺¹

Value after reset: 0000 0000_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (Table 2.36, List of Registers in Port Group 0, Table 2.37, List of Registers in Port Group 1, Table 2.38, List of Registers in Port Group 2, Table 2.39, List of Registers in Port Group 3, Table 2.40, List of Registers in Port Group 4, Table 2.41, List of Registers in Port Group 5) in Section 2.4.1.1, List of Port Registers.

| | | | | | | | | | | | | | | | | |
|-------------------|--------------|--------------|--------------|--------------|--------------|--------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | PINVn_ 15 | PINVn_ 14 | PINVn_ 13 | PINVn_ 12 | PINVn_ 11 | PINVn_ 10 | PINVn_ 9 | PINVn_ 8 | PINVn_ 7 | PINVn_ 6 | PINVn_ 5 | PINVn_ 4 | PINVn_ 3 | PINVn_ 2 | PINVn_ 1 | PINVn_ 0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 2.24 PINVn Register Contents

| Bit Position | Bit Name | Function |
|--------------|--------------|---|
| 31 to 16 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 15 to 0 | PINVn_[15:0] | Specifies whether the output level from a pin is inverted or not. 0: Pin output level is not inverted. 1: Pin output level is inverted. |

NOTE

For details about the relevant port groups and bits, see **Section 2.4.1.1, List of Port Registers.**

2.3.4.4 Configuration of Electrical Characteristics

(1) PUn/JPU0 — Pull-up Option Register

This register specifies whether an on-chip pull-up resistor is connected to an input pin.

Access: PUn: This register can be read/written in 16-bit units.
JPU0: This register can be read/written in 8-bit units.

Address: PUn: <PORT_base> + 400C_H + n × 40_H
JPU0: <JPORT0_base> + 400C_H*1

Value after reset: PUn: 0000_H
JPU0: 00_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (Table 2.36, List of Registers in Port Group 0, Table 2.37, List of Registers in Port Group 1, Table 2.38, List of Registers in Port Group 2, Table 2.39, List of Registers in Port Group 3, Table 2.40, List of Registers in Port Group 4, Table 2.41, List of Registers in Port Group 5, Table 2.42, List of Registers in Port Group JP0) in Section 2.4.1.1, List of Port Registers.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|--------|--------|--------|--------|--------|--------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| | PUn_15 | PUn_14 | PUn_13 | PUn_12 | PUn_11 | PUn_10 | PUn_9 | PUn_8 | PUn_7 | PUn_6 | PUn_5 | PUn_4 | PUn_3 | PUn_2 | PUn_1 | PUn_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 2.25 PUn Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------|---|
| 15 to 0 | PUn_[15:0] | Specifies whether an on-chip pull-up resistor is connected to the corresponding pin: 0: No on-chip pull-up resistor is connected. 1: On-chip pull-up resistor is connected. |

NOTES

- Do not set PUn.PUn_m = 1 and PDn.PDn_m = 1 to a single pin.
- The on-chip pull-up resistor has no effect when the pin is operated in output mode.
- The control bits of the JTAG pull-up option register (JPU0) are JPU0_[7:0].
- For details about the relevant port groups and bits, see Section 2.4.1.1, List of Port Registers.

(2) PDn/JPD0 — Pull-down Option Register

This register specifies whether an on-chip pull-down resistor is connected to an input pin.

Access: PDn: This register can be read/written in 16-bit units.
JPD0: This register can be read/written in 8-bit units.

Address: PDn: <PORT_base> + 4010_H + n × 40_H
JPD0: <JPORT0_base> + 4010_H*1

Value after reset: PDn: 0000_H
JPD0: 00_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (Table 2.36, List of Registers in Port Group 0, Table 2.37, List of Registers in Port Group 1, Table 2.38, List of Registers in Port Group 2, Table 2.39, List of Registers in Port Group 3, Table 2.40, List of Registers in Port Group 4, Table 2.41, List of Registers in Port Group 5, Table 2.42, List of Registers in Port Group JP0) in Section 2.4.1.1, List of Port Registers.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|--------|--------|--------|--------|--------|--------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| | PDn_15 | PDn_14 | PDn_13 | PDn_12 | PDn_11 | PDn_10 | PDn_9 | PDn_8 | PDn_7 | PDn_6 | PDn_5 | PDn_4 | PDn_3 | PDn_2 | PDn_1 | PDn_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 2.26 PDn Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------|--|
| 15 to 0 | PDn_[15:0] | Specifies whether a on-chip pull-down resistor is connected to the corresponding pin: 0: No on-chip pull-down resistor is connected. 1: On-chip pull-down resistor is connected. |

NOTES

- Do not set PUn.PUn_m = 1 and PDn.PDn_m = 1 to a single pin.
- The on-chip pull-down resistor has no effect when the pin is operated in output mode.
- The control bits of the JTAG pull-down option register (JPD0) are JPD0_[7:0].
- For details about the relevant port groups and bits, see Section 2.4.1.1, List of Port Registers.

(3) PODCn/JPODC0 — Port Open-drain Control Register

This register selects push-pull or open-drain as the output buffer function.

Access: This register can be read/written in 32-bit units.

Address: PODCn: <PORT_base> + 4014_H + n × 40_H
JPODC0: <JPORT0_base> + 4014_H*1

Value after reset: PODC0: 0000 0400_H, PODC1 to 5: 0000 0000_H
JPODC0: 0000 0000_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (Table 2.36, List of Registers in Port Group 0, Table 2.37, List of Registers in Port Group 1, Table 2.38, List of Registers in Port Group 2, Table 2.39, List of Registers in Port Group 3, Table 2.40, List of Registers in Port Group 4, Table 2.41, List of Registers in Port Group 5, Table 2.42, List of Registers in Port Group JP0) in Section 2.4.1.1, List of Port Registers.

| | | | | | | | | | | | | | | | | |
|-------------------|--------------|--------------|--------------|--------------|--------------|--------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | 1 | 1 |
| | | Output Circuit Characteristics |
| | | Push-pull |
| | | N-ch open-drain |
| | | Push-pull |
| | | P-ch open-drain |
| | Specify the output circuit characteristics of JPN_m (m = 0 to 15). | |
| | JPODCn_m | Output Circuit Characteristics |
| | 0 | Push-pull |
| | 1 | N-ch open-drain |

NOTES

- The control bits for the JTAG port open-drain control register (JPODC0) are JPODC0_[31:0].
- For details on the relevant port groups and bits, see Section 2.4.1.1, List of Port Registers.

(4) PODCEn — Port Open-drain Control Expansion Register

This register selects push-pull or open-drain as the output buffer function.

Access: This register can be read/written in 32-bit units.

Address: <PORT_base> + 403C_H + n × 40_H^{*1}

Value after reset: 0000 0000_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (Table 2.36, List of Registers in Port Group 0, Table 2.37, List of Registers in Port Group 1, Table 2.38, List of Registers in Port Group 2, Table 2.39, List of Registers in Port Group 3, Table 2.40, List of Registers in Port Group 4, Table 2.41, List of Registers in Port Group 5) in Section 2.4.1.1, List of Port Registers.

| | | | | | | | | | | | | | | | | |

Table 2.28 PODCEn Register Contents

| Bit Position | Bit Name | Function | |
|--------------|---------------------------------|---|-----------------|
| 31 to 16 | Reserved | When read, the value after reset is read. When writing, write the value after reset. | |
| 15 to 0 | PODCE _n [15:0] | Specify the output circuit characteristics of pin m (m = 0 to 15), together with the PODCn_ _[15:0] bits. | |
| | PODCE _n _m | PODCn_ _m | |
| | 0 | 0 | Push-pull |
| | 0 | 1 | N-ch open-drain |
| | 1 | 0 | Push-pull |
| | 1 | 1 | P-ch open-drain |

(5) PDSCn/JPDSC0 — Port Drive Strength Control Register

This register specifies the output drive strength of a port pin. High- or low-speed mode (high or low drive strength) of an output buffer is selectable by using this function.

Access: This register can be read/written in 32-bit units.

Address: PDSCn: <PORT_base> + 4018_H + n × 40_H
JPDSC0: <JPORT0_base> + 4018_H^{*1}

Value after reset: PDSC0: 0000 0400_H, PDSC1 to 5: 0000 0000_H
JPDSC0: 0000 0000_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (Table 2.36, List of Registers in Port Group 0, Table 2.37, List of Registers in Port Group 1, Table 2.38, List of Registers in Port Group 2, Table 2.39, List of Registers in Port Group 3, Table 2.40, List of Registers in Port Group 4, Table 2.41, List of Registers in Port Group 5, Table 2.42, List of Registers in Port Group JP0) in Section 2.4.1.1, List of Port Registers.

PDSC1 to PDSC5, JPDSC0: 0

Table 2.29 PDSCn Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------------|--|
| 31 to 16 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 15 to 0 | PDSCn_[15:0] | Specifies the output buffer characteristics of pin m (m = 0 to 15), together with the PUCcn_[15:0] bits. |
| | PUCcn_m | PDSCn_m |
| | 0 | 0 |
| | 0 | 1 |
| | 1 | 0 |
| | 1 | 1 |
| | | Output Buffer Characteristics |
| | | SLOW |
| | | FAST |
| | | MIDDLE |
| | | MIDDLE |

NOTES

- The control bits for the JTAG port drive strength control register (JPDSC0) are JPDSC0_[31:0].
- For details about the relevant port groups and bits, see Section 2.4.1.1, List of Port Registers.
- For the output buffer characteristics of the driving ability, see Section 37.9.2, Driving Ability.
- Settings for driving ability are effective even if an alternative function is in use on the pin.
- When the driving ability is set to “fast”, the pin produces a larger driving current than when the setting is “slow”. For the allowable total driving currents, see Section 37.8.3, Allowed Output Current.

(6) PUCcN/JPUCc0 — Port Universal Control Register

This register expands the function to specify the characteristics of an output buffer.

It can specify three output buffer characteristics, together with the Port Drive Strength Control Register (PDSCn).

Access: This register can be read/written in 32-bit units.

Address: PUCcN: <PORT_base> + 4028_H + n × 40_H
 JPUCc0: <JPORT0_base> + 4028_H*1

Value after reset: PUCcN: 0000 0000_H
 JPUCc0: 0000 0000_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (Table 2.36, List of Registers in Port Group 0, Table 2.37, List of Registers in Port Group 1, Table 2.38, List of Registers in Port Group 2, Table 2.39, List of Registers in Port Group 3, Table 2.40, List of Registers in Port Group 4, Table 2.41, List of Registers in Port Group 5, Table 2.42, List of Registers in Port Group JP0) in Section 2.4.1.1, List of Port Registers.

Table 2.30 PUCcN Register Contents

| Bit Position | Bit Name | Function |
|--------------|--------------|--|
| 31 to 16 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 15 to 0 | PUCcN_[15:0] | Specifies the output buffer characteristics of pin m (m = 0 to 15), together with the PDSCn_[15:0] bits. |

| PUCcN_m | PDSCn_m | Output Buffer Characteristics |
|---------|---------|-------------------------------|
| 0 | 0 | SLOW |
| 0 | 1 | FAST |
| 1 | 0 | MIDDLE |
| 1 | 1 | MIDDLE |

NOTES

1. The control bits of the JTAG port universal control register (JPUCc0) are JPUCc0_[31:0].
2. For details about the relevant port groups and bits, see Section 2.4.1.1, List of Port Registers.
3. For the output buffer characteristics of the driving ability, see Section 37.9.2, Driving Ability.
4. Settings for driving ability are effective even if an alternative function is in use on the pin.
5. When the driving ability is set to “fast”, the pin produces a larger driving current than when the setting is “slow”. For the allowable total driving currents, see Section 37.8.3, Allowed OutputCurrent.

(7) PISAn/JPISA0 — Port Input Buffer Selection Register

This register specifies the input buffer characteristics.

Access: PISAn: This register can be read/written in 16-bit units.
JPISA0: This register can be read/written in 8-bit units.

Address: PISAn: <PORT_base> + 402C_H + n × 40_H
JPISA0: <JPORT0_base> + 402C_H*1

Value after reset: PISA0: 0400_H, PISA1 to 4: 0000_H
JPISA0: 00_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (Table 2.36, List of Registers in Port Group 0, Table 2.37, List of Registers in Port Group 1, Table 2.38, List of Registers in Port Group 2, Table 2.39, List of Registers in Port Group 3, Table 2.40, List of Registers in Port Group 4, Table 2.42, List of Registers in Port Group JP0) in Section 2.4.1.1, List of Port Registers.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|--------------|--------------|--------------|--------------|--------------|--------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|
| | PISA n_15 | PISA n_14 | PISA n_13 | PISA n_12 | PISA n_11 | PISA n_10 | PISA n_9 | PISA n_8 | PISA n_7 | PISA n_6 | PISA n_5 | PISA n_4 | PISA n_3 | PISA n_2 | PISA n_1 | PISA n_0 |

Note 1. PISA0: 1
PISA1 to PISA4, JPISA0: 0

Table 2.31 PISAn Register Contents

| Bit Position | Bit Name | Function |
|--------------|--------------|--|
| 15 to 0 | PISAn_[15:0] | Specify the input buffer characteristics. 0: Type 1 (Schmitt) 1: Type 2 (CMOS) |

NOTES

- For details about the definition of type 1 and type 2, see Section 2.3.5.4, Input Buffer Control (PISA).
- For details about the relevant port groups and bits, see Section 2.4.1.1, List of Port Registers.
- The control bits for the JTAG port input buffer select register (JPISA0) are JPISA0_[7:0]

2.3.4.5 Pin-unit Register

(1) PCRn_m/JPCR0_m — Port Control Register

Each register of a port group can be accessed via this register and a PCR register can set some functions of a single pin. For example, setting bit 6 of the PCRn_m register to 1 sets bit m of the PMCN register to 1 also.

Access: This register can be read/written in 32-bit units.

Address: PCRn_m: <PORT_base> + 2000_H + n × 40_H + 4_H × m
JPCR0_m: <JPORT0_base> + 2000_H + 4_H × m^{*1}

Value after reset: PCR0_10: 1140 0000_H, PCRn_m except for PCR0_10: 0000 0010_H
JPCR0_m: 0000 0010_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (Table 2.36, List of Registers in Port Group 0, Table 2.37, List of Registers in Port Group 1, Table 2.38, List of Registers in Port Group 2, Table 2.39, List of Registers in Port Group 3, Table 2.40, List of Registers in Port Group 4, Table 2.41, List of Registers in Port Group 5, Table 2.42, List of Registers in Port Group JP0) in Section 2.4.1.1, List of Port Registers.

Note 2. The PINVn, PODCn, PODCEn, PUCn, and PDSCn registers cannot be set via this register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|----|------|----|------|-------|----|-----|------|----|------|------|-----|-----|-----|------|------|
| | — | PINV | — | PODC | PODCE | — | PUC | PDSC | — | PISA | — | — | PU | PD | PBDC | PIBC |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | *1 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R/W | R | R | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | P | — | — | — | PPR | — | PMC | PIPC | PM | — | PFC | PFCE | PFC |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | *2 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R | R | R | R | R | R/W | R/W | R/W | R | R/W | R/W | R/W |

Note 1. PCR0_10: 1
PCRn_m except PCR0_10, JPCR0_m: 0

Note 2. PCR0_10: 0
PCRn_m except PCR0_10, JPCR0_m: 1

Table 2.32 PCRn_m Register Contents (1/2)

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 31 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 30 | PINV | The value of bit m of the PINVn register can be read. |
| 29 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 28 | PODC | The value of bit m of the PODCn register can be read. |
| 27 | PODCE | The value of bit m of the PODCEn register can be read. |
| 26 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 25 | PUC | The value of bit m of the PUCn register can be read. |
| 24 | PDSC | The value of bit m of the PDSCn register can be read. |
| 23 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 22 | PISA | Same function as bit m of the PISAn register. |
| 21, 20 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 19 | PU | Same function as bit m of the PUn register |

Table 2.32 PCRn_m Register Contents (2/2)

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 18 | PD | Same function as bit m of the PDn register |
| 17 | PBDC | Same function as bit m of the PBDCn register |
| 16 | PIBC | Same function as bit m of the PIBCn register |
| 15 to 13 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 12 | P | Same function as bit m of the Pn register |
| 11 to 9 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 8 | PPR | The value of bit m of the PPRn register can be read. |
| 7 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 6 | PMC | Same function as bit m of the PMcN register |
| 5 | PIPC | Same function as bit m of the PIPcN register |
| 4 | PM | Same function as bit m of the PMn register |
| 3 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 2 | PFCAE | Same function as bit m of the PFCAEn register |
| 1 | PFCE | Same function as bit m of the PFCEn register |
| 0 | PFC | Same function as bit m of the PFCn register |

NOTE

For details about the relevant port groups and bits, see **Section 2.4.1.1, List of Port Registers**.

2.3.4.6 Example of Port Configuration Flowchart

The followings are examples of the port configuration flow.

CAUTION

When a pin is set to an alternative output mode while the PIPn.PIPn_m bit is 0, it may be temporarily switched to an alternative input mode. This occurs during the period between setting of the PMn.PMn_m bit to 1 and setting of the PIPn.PIPn_m bit to 0. Due to this possibility of a pin being temporarily switched to an alternative input mode, if a pin has an interrupt-related signal as an alternative function, disable the interrupt or make sure that it is ignored.

(1) Batch Setting

The following shows an example to collectively set a port group.

Figure 2.5 Example of Port Configuration Flow (batch setting)

(2) Individual Setting

The following shows an example to individually set a port group.

And it is capable of setting simultaneous bits at once within the configurable range described below by using PCRn_m register.

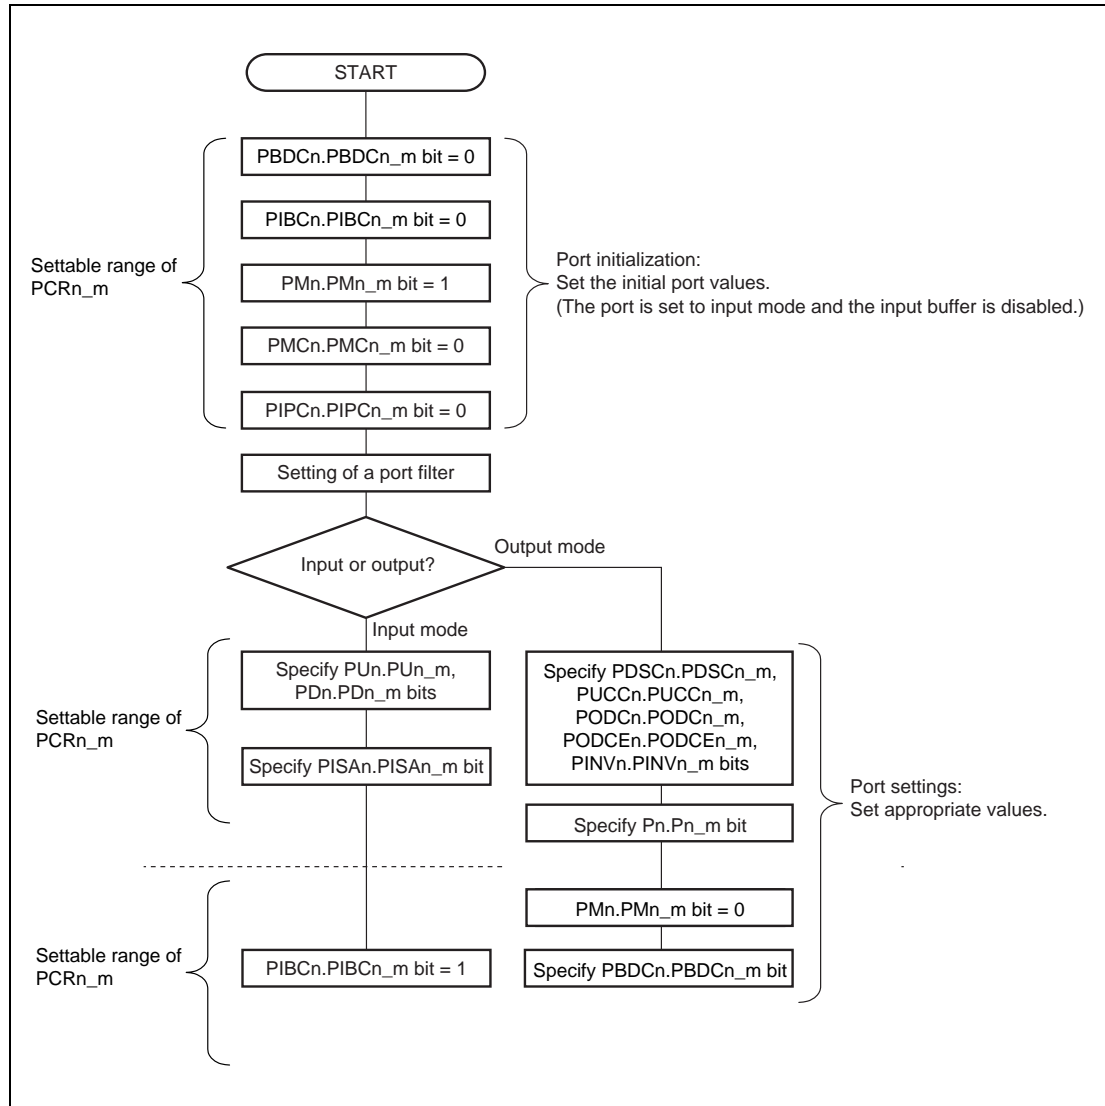

Figure 2.6 Example of Port Configuration Flow (in port mode)

Figure 2.7 Example of Port Configuration Flow (in alternative mode)(1/2)

Figure 2.8 Example of Port Configuration Flow (in alternative mode) (2/2)

2.3.5 Functional Selection

2.3.5.1 Register Configuration in Use of the Alternative Function

When the pin alternative function is used, set $PMc_n_m = 1$ and select the alternative numbers of $PFCn_m$, $PFCEn_m$, and $PFCAEn_m$. In several peripheral functions, a single alternative I/O function is allocated to multiple pins. However, such an alternative function should not be enabled in multiple pins at the same time. For example, an external interrupt input, $INTP0$ is allocated to $P0_2$ and $P2_5$, but this alternative function can only be selected in either of them.

2.3.5.2 Alternative Function to be used in Direct I/O Control Alternative Mode

When the pins listed in **Table 2.33** are used, switch to direct I/O control alternative mode. When setting $PIPCn_m = 1$, the PMn_m value which has been set is ignored because the peripheral function enables or disables inputs and outputs of the buffer.

Table 2.33 List of the Pins which is Available for Direct I/O Control Alternative Mode Setting

| Function | Pin Name |
|----------|----------|
| CSIH0 | CSIH0SCO |
| | CSIH0SO |
| CSIH1 | CSIH1SCO |
| | CSIH1SO |
| CSIH2 | CSIH2SCO |
| | CSIH2SO |
| CSIH3 | CSIH3SCO |
| | CSIH3SO |
| CSIG0 | CSIG0SCO |
| | CSIG0SO |
| TSG30 | TSG30O1 |
| | TSG30O2 |
| | TSG30O3 |
| | TSG30O4 |
| | TSG30O5 |
| | TSG30O6 |
| TSG31 | TSG31O1 |
| | TSG31O2 |
| | TSG31O3 |
| | TSG31O4 |
| | TSG31O5 |
| | TSG31O6 |

CAUTION

Do not set $PIPCn_m$ to 1 at pins not listed in Table 2.33.

2.3.5.3 Register Setting in Use of an Analog Input Pin

Since ADCGnIm (SAR-A/D) for an analog input are always connected to the A/D converter, setting of a port register to select a pin function is not required.

2.3.5.4 Input Buffer Control (PISA)

This device can select the input buffer characteristics (type 1 or type 2) of a port with the PISAn register. The following table lists applicable pins.

Table 2.34 Selection of Input Buffer Characteristics (1/2)

| Port Name | Input Buffer Selection | | Remarks | Device | | | |
|-----------|------------------------|----------------------|---------|---------------|---------------|---------------|---------------|
| | Type 1 (PISAn_m = 0) | Type 2 (PISAn_m = 1) | | 100-pin (eVR) | 100-pin (DPS) | 144-pin (eVR) | 144-pin (DPS) |
| P0_3 | SHMT | CMOS | | — | — | √ | √ |
| P0_4 | SHMT | CMOS | | — | — | √ | √ |

Note: P0_10: RESETOUT

P0_10 is in initial state, RESETOUT, and outputs low level.

After reset release, the setting will be as below.

- PM0.PM0_10 = 0: output port
- PODC0.PODC0_10: Nch open-drain output

After reset release, RESETOUT output is stopped by changing the setting above.

When a reset is generated during operation, this pin becomes RESETOUT and outputs low level.

For the state of pins, see Section 8.4.8, Reset Output (RESETOUT).

2.4.1.4 Port 1 (P1)

Table 2.44 Port 1 (P1)

2.5 DNF

Digital Noise Filter (DNF) eliminates digital noise from external input signals. This product includes two sorts of DNF: peripheral function DNF and edge detection DNF.

2.5.1 Example of Noise Elimination

Figure 2.9 shows an example of noise elimination in peripheral function DNF and edge detection DNF. In this example, the sampling clock, the sampling count, and the current output level are set to 1/2 of the DNF input clock, two (twice), and low, respectively. “○” in the figure means that high level is detected.

In input examples 1, 2, and 3, in which the same level is detected twice consecutively, the change in the input signal is output internally.

In input examples 4, 5, and 6, in which the same level is not detected twice consecutively, input signal is regarded as noise and eliminated. Therefore, no change in the internal output is found.

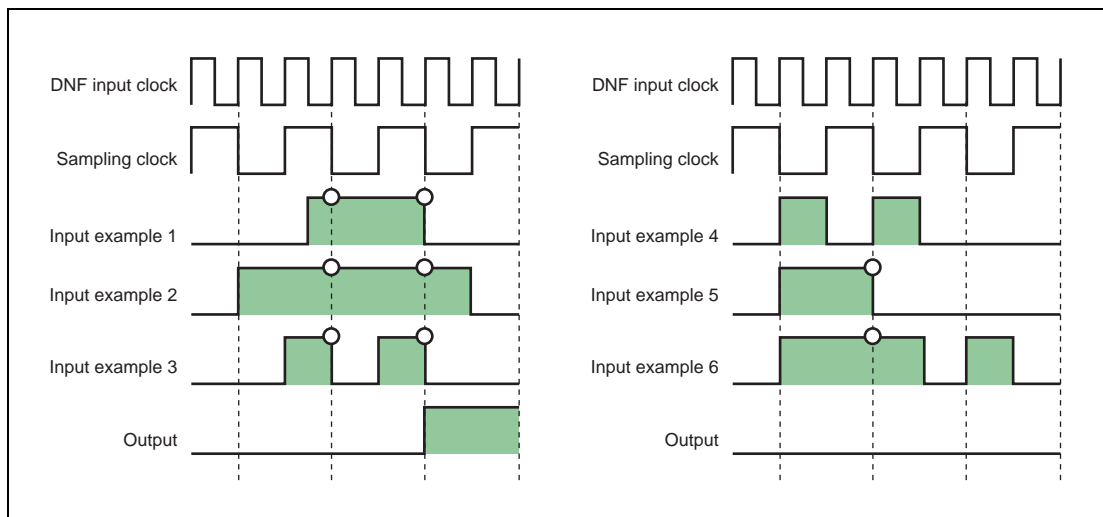

Figure 2.9 Timing Chart of Digital Noise Elimination

2.6 Noise Filter and Edge Level Detection Circuit

Some signals that are input to a pin pass the filter to eliminate noises and glitches. This product supports both analog filter and digital filter.

Additionally, the product also supports the function of detecting an edge or level after a pass through a filter.

The first section describes port input signals to which filters are allocated and the types of the filters, the noise filter and edge level detection control register and its control bits, and an overview of the register address and others.

For details about the digital/analog filter function and the noise filter and edge level detection control register, see **Section 2.6.1, Allocation of Port Filters**.

2.6.1 Allocation of Port Filters

The following is a list of input pins that have analog filter or digital filter.

Table 2.50 List of Input Pins with a Noise Filter (1/6)

2.6.2 Filter Type

2.6.2.1 Digital Filter Type A (INTP/RXD Alternative) Input Pin

The input pin of digital filter type A has a digital filter and the edge detection function. The digital filter and edge detection are controlled with the following registers. Interrupt signals and data received signals of peripheral functions are shared.

- Filter control register FCLAnCTLm
Ports with each digital filter have the dedicated FCLAnCTLm register.
- Digital noise elimination control register DNFACTL
Each DNFACTL control register controls digital filter processing.
- Digital noise elimination enable register DNFAEN
The register enables or disables digital noise elimination.

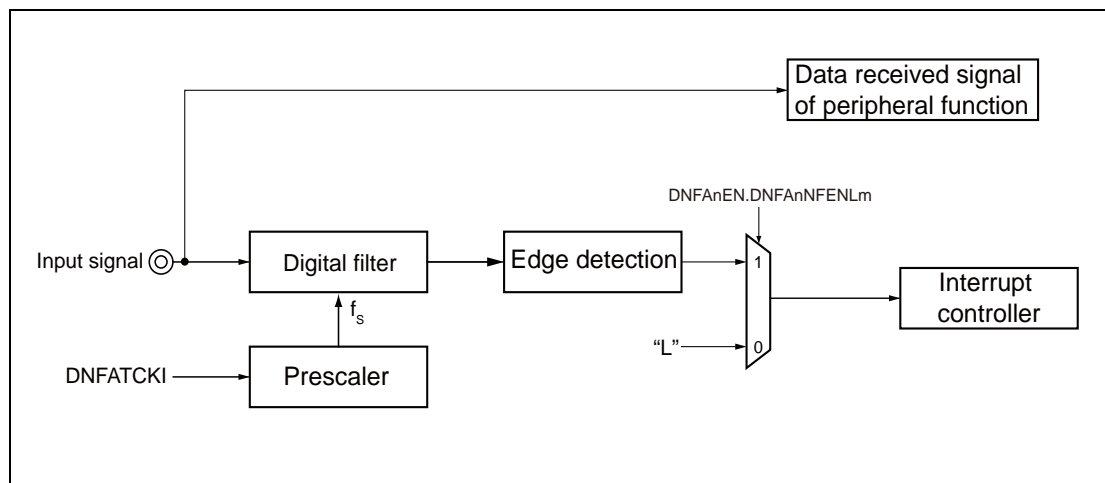

Figure 2.10 Block Diagram of Digital Filter Type A

CAUTION

Set DNFAEN.DNFAENFENLm to 1 to enable input to interrupt controller.

2.6.2.2 Digital Filter Type B (INTP/ESO Alternative) Input Pin

The input pin of digital filter type B has a digital filter, analog filter, and the edge detection function. The digital filter and edge detection are controlled with the following registers. Interrupt signals and Hi-Z output control signals are shared.

- Filter control register FCLAnCTLm
Ports with each digital filter have the dedicated FCLAnCTLm register.
- Digital noise elimination control register DNFACTL
Each DNFACTL control register controls digital filter processing.
- Digital noise elimination enable register DNFAEN
The register selects a digital filter or analog filter.

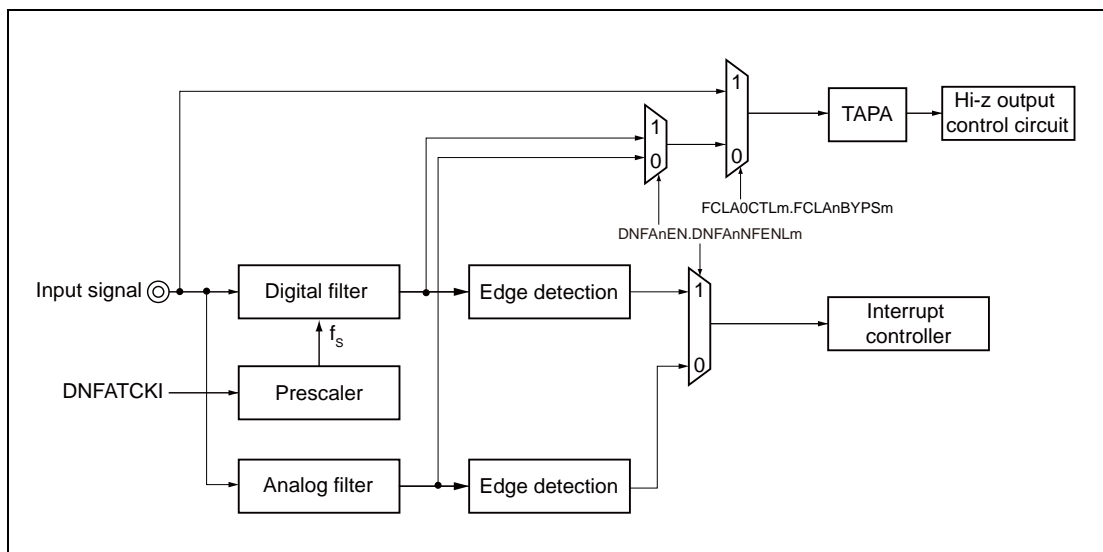

Figure 2.11 Block Diagram of Digital Filter Type B

2.6.2.3 Digital Filter Type C (for INTP9 and NMI) Input Pin

The input pin of digital filter type C has a digital filter and the edge detection function. The digital filter and edge detection are controlled with the following registers.

- Filter control register FCLAnCTLm
Ports with each digital filter have the dedicated FCLAnCTLm register.
- Digital noise elimination control register DNFAAnCTL
Each DNFAAnCTL control register controls digital filter processing.
- Digital noise elimination enable register DNFAAnEN
The register enables or disables digital noise elimination.

Figure 2.12 Block Diagram of Digital Filter Type C

CAUTION

Set DNFAAnEN.DNFAAnNFENLm to 1 to enable input to interrupt controller.

2.6.2.4 Digital Filter Type D (for SENT, PSI5) Input Pin

The input pin of digital filter type D has a digital filter and analog filter. The digital filter and analog filter are controlled with the following registers.

- Filter control register FCLAnCTLm
The dedicated FCLAnCTLm register is available for each port with digital filter.
- Digital noise elimination control register DNFAAnCTL
Each DNFAAnCTL control register controls digital filter processing.
- Digital noise elimination enable register DNFAAnEN
The register selects a digital filter or analog filter.

Figure 2.13 Block Diagram of Digital Filter Type D

2.6.2.5 Digital Filter Type E (No Edge Detection) Input Pin

The input pin of digital filter type E has a digital filter. The digital filter is controlled with the following register.

- Digital noise elimination control register DNFA_nCTL
Each DNFA_nCTL control register controls digital filter processing.
- Digital noise elimination enable register DNFA_nEN
This register enables or disables digital noise elimination.

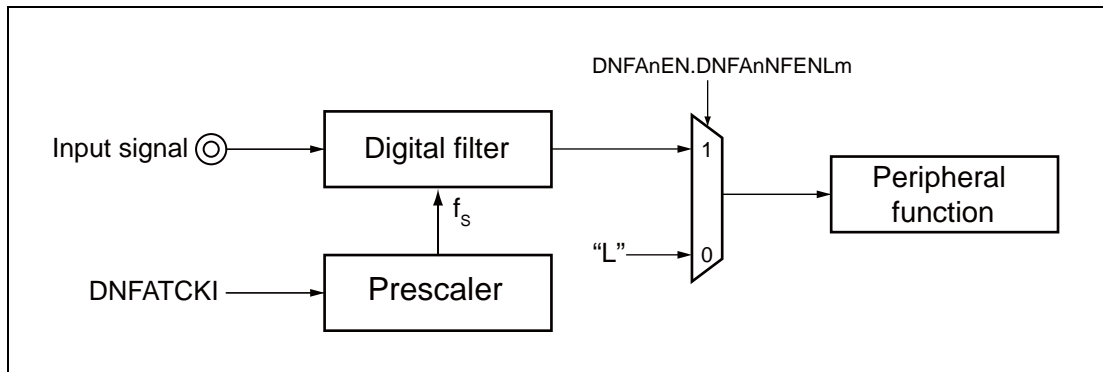

Figure 2.14 Block Diagram of Digital Filter Type E

2.6.2.6 Digital Filter Type F (No Edge Detection) Input Pin

The input pin of digital filter type F has a digital filter. The digital filter is controlled with the following register.

- Digital noise elimination control register DNFA_nCTL
Each DNFA_nCTL control register controls digital filter processing.
- Digital noise elimination enable register DNFA_nEN
This register enables or disables digital noise elimination.

Figure 2.15 Block Diagram of Digital Filter Type F

2.6.2.7 Analog Filter ANF Input Pin

The analog filter input pin has only an analog filter.

Figure 2.16 Block Diagram of Analog Filter ANF

2.6.3 Registers

2.6.3.1 List of Registers

The digital noise filter is controlled and operated by the following registers.

Table 2.51 List of Digital Noise Filter Registers

| Register Name | Symbol | Address |
|---|-------------|--|
| Filter control register | FCLAnCTLm | See Table 2.50, List of Input Pins with a Noise Filter. |
| Digital noise elimination control register | DNFAnCTL | FFC3 0000 _H + n × 100 _H |
| Digital noise elimination enable register | DNFAnEN | FFC3 0000 _H + n × 100 _H + 4 _H |
| Digital noise elimination enable register L | DNFAnENL | FFC3 0000 _H + n × 100 _H + C _H |
| Digital noise elimination sampling clock source select register | DNFCKSnC | See Section 2.6.3.6, DNFCKSnC — Digital Noise Elimination Sampling Clock Source Selection Register. |
| Digital noise elimination sampling clock source status register | DNFCSCnSTAT | See Section 2.6.3.7, DNFCSCnSTAT — Digital Noise Elimination Sampling Clock Source Status Register. |

CAUTIONS

1. Do not change any setting of any related control register (FCLAnCTLm, DNFAnCTL, DNFAnEN, DNFAnENL, and DNFCKSnC) while the digital filter is enabled (DNFAnEN.DNFAnNFENLm = 1). Attempting to change any of the settings may lead to unexpected output from the filter.
2. Each of the registers has bits to which no function is assigned. Unless otherwise specified, do not write any value other than the initial value to these bits. Correct operation cannot be guaranteed if writing of other values is attempted.

2.6.3.2 FCLAnCTLm — Filter Control Register

This register controls the analog and digital filter operation.

Operations differ according to the filter type. For details, see **Section 2.6.2, Filter Type**.

Access: This register can be read/written in 8-bit or 1-bit units.

Address: See **Table 2.50, List of Input Pins with a Noise Filter**.

Value after reset: 00_H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Table 2.52 FCLAnCTLm Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------|--|
| 7 | FCLAnBYPSm | Filter and bypass control of the alternative function 0: Filters and bypasses are disabled. 1: Filters and bypasses are enabled. |
| 6 to 2 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 1 | FCLAnINTFm | Falling edge detection control 0: Falling edge detection disabled 1: Falling edge detection enabled |
| 0 | FCLAnINTRm | Rising edge detection control 0: Rising edge detection disabled 1: Rising edge detection enabled |

NOTE

For details about the relevant Pins, see **Table 2.50, List of Input Pins with a Noise Filter**.

2.6.3.3 DNFACTL — Digital Noise Elimination Control Register

This register specifies characteristics of the digital noise elimination filter.

Access: This register can be read/written in 8-bit units.

Address: See Table 2.50, List of Input Pins with a Noise Filter.

Value after reset: 00_H

NOTE

For details about the relevant Pins, see Table 2.50, List of Input Pins with a Noise Filter.

2.6.3.4 DNFA_nEN — Digital Noise Elimination Enable Register

This register enables or disables digital noise elimination for an arbitrary input signal.

Operations differ according to the filter type. For details, see **Section 2.6.2, Filter Type**.

Access: This register can be read/written in 16-bit units.

Address: See **Table 2.50, List of Input Pins with a Noise Filter**.

Value after reset: 0000_H

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Table 2.54 DNFA_nEN Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------------------------------|---|
| 15 to 8 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 7 to 0 | DNFA _n NFENL [7:0] | Digital Noise Elimination Control 0: Digital noise elimination disabled (Analog noise elimination is enabled.)*1 1: Digital noise elimination enabled |

Note 1. For digital filter Type B and D

NOTE

- For details about the relevant Pins, see **Table 2.50, List of Input Pins with a Noise Filter**.
- Bits DNFA_nNFENL[7:0] which are not listed in **Table 2.59, List of Input Pins with a Noise Filter** are reserved. When read, the value after reset is read. When writing, write the value after reset.

2.6.3.5 DNFA_nENL — Digital Noise Elimination Enable Register

This register corresponds to the lower 8 bits of the DNFA_nEN register.

Access: This register can be read/written 8- and 1- bit units.

Address: FFC3 0000_H + n × 100_H + C_H

Value after reset: 00_H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|
| | DNFA _n NFENL7 | DNFA _n NFENL6 | DNFA _n NFENL5 | DNFA _n NFENL4 | DNFA _n NFENL3 | DNFA _n NFENL2 | DNFA _n NFENL1 | DNFA _n NFENL0 |

| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

For details of the respective bit functions, see **Section 2.6.3.4, DNFA_nEN — Digital Noise Elimination Enable Register**.

2.6.3.6 DNFCKSnC — Digital Noise Elimination Sampling Clock Source Selection Register

This register selects the clock source for digital noise sampling clock frequency (DNFATCKI). (n = 100 to 114)

Access: This register can be read / written in 32-bit units.

Address: DNFCKS100C FFF8 9120_H
 DNFCKS101C FFF8 9128_H
 DNFCKS106C FFF8 9130_H
 DNFCKS107C FFF8 9138_H

2.6.3.7 DNFCSCnSTAT — Digital Noise Elimination Sampling Clock Source Status Register

This register is used to check the status of the sampling clock source for digital noise sampling clock (DNFATCKI). (n = 100 to 114)

Access: This register can be read only in 32-bit units.

| 1 | 1 | | | | | | | | | | | | | | |
| 0 | CLKACTn | Operation of clock source selected by the DNFCSCnC Register can be checked. 0: The clock source stops 1: The clock source in operation | | | | | | | | | | | | | |

2.6.4 Notes for Digital Noise Filter

- (1) When digital filter output signal is input for alternative function:

Enable the digital filter (DNFAnEN.DNFAnENm (m = 0 to 7) = 1), and switch the port pin to alternative function after a lapse of the following time.

$$s = \text{DNFAnNFSTS}[1:0] + 2$$

$$\text{Time} = s \times 1/\text{fs} + 2 \times 1/\text{DNFATCKI}$$

- (2) When an event output signal of the digital filter is used as an interrupt:

Enable the digital filter (DNFAnEN.DNFAnENm (m = 0 to 7) = 1 while interrupt is disabled.

Enable the digital filter and clear the interrupt request flag after a lapse of the following time, then enable the interrupt.

$$\text{Time} = s \times 1/\text{fs} + 3 \times 1/\text{DNFATCKI}$$

2.7 Pin State

Table 2.57, Table 2.58, and Table 2.59 show detailed pin states. Some pins may not be included depending on grades and packages of the product. For the pins included in each product, see Table 2.1, Pin Assignment, in Section 2.1, Pin Connection Diagrams.

Table 2.57 Pin State in Single Chip Mode (Normal Mode)

| Port | Pin Category | OPJTAG/ OPEVTI/ OPEVTO | Power OFF | DCUTRST = L | | | | |
|----------|--------------------------|----------------------------------|--------------|--------------------------------------|--------------------|------------|--|-----------|
| | | | | RESET pin = L Power ON | Reset Release*1 | Field BIST | RUN (User program) | CVM Reset |
| GPIO | | — | — | Hi-Z | Hi-Z | Hi-Z | Operate | Hi-Z |
| JP0_x | JP0_0 to JP0_3, JP0_5 | OPJTAG = 00 | — | Hi-Z | Hi-Z | Hi-Z | Operate | Hi-Z |
| | DCUTDI | OPJTAG = 11 | — | | | | | |
| | DCUTDO | | | | | | | |
| | DCUTCK | | | | | | | |
| | DCUTMS | | | | | | | |
| | DCUTRDY | OPJTAG = 01 | — | | | | | |
| | LPDI | | | | | | | |
| | LPDO | | | | | | | |
| | LPDCLK | | | | | | | |
| | JP0_3 LPDCLKOUT | | | | | | | |
| P0_13 | GPIO (EVTI) | OPEVTI = 1 | — | Hi-Z | | | Operate | Hi-Z |
| | EVTI | OPEVTI = 0 | — | | | | | |
| RESET | | — | — | L (PD) | H (PD) | H (PD) | H (PD) | H (PD) |
| ERROROUT | | — | — | Hi-Z before RESET is released. | L | L | Operate | Hi-Z |
| P0_10 | RESETOUT (/GPIO) | OPEVTO = 1 or DCUTRST = L | — | L | L | L | H*4 (set "High" by user program) | L |
| | EVT0 | OPEVTO = 0 and DCUTRST = H | — | N.A. | N.A. | N.A. | N.A. | N.A. |
| CVMOUT | | — | — | L → H*2 | H | H | H | L |
| FLMD0*3 | | — | — | L (PD) | L (PD) | L (PD) | L (PD) | L (PD) |
| P3_14 | FLMD1(/GPIO) | — | — | Hi-Z | Hi-Z | Hi-Z | Operate*4 | Hi-Z |
| X1/X2 | | — | — | Stop → Run | Run | Run | Run | Run |
| ANI | | — | — | Hi-Z | Hi-Z | Hi-Z | Operate | Hi-Z |
| DCUTRST | | — | — | L (PD) | L (PD) | L (PD) | L (PD) | L (PD) |

Note 1. The states listed in the table are those following release from a pin reset, ECM reset, SW reset, or CVM reset.

Note 2. Once CVMOUT is driven high, it continues to reflect the voltage status even if the RESET pin is driven low.

Note 3. Drive FLMD0 low.

Note 4. This pin functions as a port pin.

Table 2.58 Pin State in Single Chip Mode (Debug Mode)

| Port | Pin Category | OPJTAG/ OPEVTI/ OPEVTO | DCUTRST = H | | | | |
|---------------------|-----------------------|---|---|---------------|-----------------------------|--------------------------|-----------|
| | | | RUN | RESET pin = L | Reset Release* ¹ | Debugger Initiated Reset | CVM Reset |
| GPIO | | — | Operate | Hi-Z | Hi-Z | Hi-Z | Hi-Z |
| JP0_x | JP0_0 to JP0_3, JP0_5 | OPJTAG = 00 | N.A. | | | N.A. | N.A. |
| | DCUTDI | OPJTAG = 11 | Operate (If JTAG is selected based on OPJTAG setting.) | | | Operate | Operate |
| | DCUTDO | | | | | | |
| | DCUTCK | | | | | | |
| | DCUTMS | | | | | | |
| | DCUTRDY | | | | | | |
| | LPDI | OPJTAG = 01 | Operate (If LPD4P is selected based on OPJTAG setting.) | | | Operate | Operate |
| | LPDO | | | | | | |
| | LPDCLK | | | | | | |
| | JP0_3 | | Operate | Hi-Z | Hi-Z | | |
| LPDCLKOUT | | Operate (If LPD4P is selected based on OPJTAG setting.) | | | Operate | Operate | |
| P0_13 | GPIO (EVTI) | OPEVTI = 1 | Operate | Hi-Z | Hi-Z | Hi-Z | Hi-Z |
| | EVTI | OPEVTI = 0 | Operate (If EVTI is selected based on OPEVTI setting.) | | | Operate | Operate |
| RESET | — | H (PD) | L (PD) | H (PD) | H (PD) | H (PD) | |
| ERROROUT | — | Operate | Hi-Z | L | L | Hi-Z | |
| P0_10 | RESETOUT (/GPIO) | OPEVTO = 1 or DCUTRST = L | H* ² (Set to "High" by user program) | L | L | L | L |
| | EVTO | OPEVTO = 0 and DCUTRST = H | Operate (If EVTO is selected based on OPJTAG setting.) | | | Operate | Operate |
| CVMOUT | — | H | H | H | L | L | |
| FLMD0* ³ | — | L (PD) | L (PD) | L (PD) | L (PD) | L (PD) | |
| P3_14 | FLMD1(/GPIO) | — | Operate* ² | Hi-Z | Hi-Z | Hi-Z | Hi-Z |
| X1/X2 | — | Run | Run | Run | Run | Run | |
| ANI | — | Operate | Hi-Z | Hi-Z | Hi-Z | Hi-Z | |
| DCUTRST | — | H (PD) | H (PD) | H (PD) | H (PD) | H (PD) | |

Note 1. The states listed in the table are those following release from a pin reset, debug reset, ECM reset, SW reset, or CVM reset.

Note 2. This pin functions as a port pin.

Note 3. Drive FLMD0 low.

Table 2.59 Pin State in Serial Programming Mode

| Port | Pin Category | OPJTAG/ OPEVTI/ OPEVTO | Power OFF | DCUTRST = L | | |
|----------|--|------------------------------|--------------|---------------|------------------|---|
| | | | | RESET pin = L | | RUN (Serial Programming Mode) |
| | | | | Power ON | Reset Release | |
| GPIO | | — | — | Hi-Z | Hi-Z | Operate |
| JP0_x | JTAG PORT (FLSCI3RXD (FPDR)/ FLSCI3TXD (FPDT)/ FLSCI3SCKI (FPCK)) | OPJTAG = xx | — | Hi-Z | Hi-Z | Operate |
| P0_13 | GPIO (EVTI) | OPEVTI = x | — | Hi-Z | Hi-Z | Operate as GPIO (not depend on OPEVTI setting) |
| RESET | | — | — | L (PD) | H (PD) | H (PD) |
| ERROROUT | | — | — | Hi-Z | L | Operate |
| P0_10 | RESETOUT/(GPIO) | OPEVTO = x or DCUTRST = x | — | L | L | L |
| CVMOUT | | — | — | L → H | H (masked) *1 | H (masked) *1 |
| FLMD0*2 | | — | — | H (PD) | H (PD) | H (PD) |
| P3_14 | FLMD1/(GPIO)*2 | — | — | L | L | L |
| X1/X2 | | — | — | Stop → Run | Run | Run |
| ANI | | — | — | Hi-Z | Hi-Z | Operate |
| DCUTRST | | — | — | L (PD) | L (PD) | L (PD) |

Note 1. CVMOUT is masked and outputs high level in serial programming mode.

Note 2. Drive the FLMD0 pin to the high level and the FLMD1 pin to the low level.

2.8 Handling of Unused Pins

The alternative functions can be selected in the option bytes, please refer **Section 35.10.3, OPBT2 — Option Byte 2**.

We recommend use of pull-up/-down resistor with the value of 1 kΩ or above.

When pull-up/-down resistor is used, connect a resistor between two pins. Do not directly connect the pins with a wire.

Table 2.60 Handling of Unused Pins (JP0)

| Pin Name | Alternative Function | Handling of Unused Pins |
|----------|----------------------|---|
| JP0_0 | GPI/O | Input: When input buffer is disabled in input port mode (JPIBC0_m=0 and JPMC0_m=0): Open When input buffer is enabled in input port mode or input is selected in S/W I/O control alternative mode (JPIBC0_m = 1 or JPMC0_m = 1): Connected to E1VCC or E1VSS through resistor Output: Open |
| | DCUTDI | Connected to E1VCC through resistor |
| | LPDI | Open |
| JP0_1 | GPI/O | Input: When input buffer is disabled in input port mode (JPIBC0_m=0 and JPMC0_m=0): Open When input buffer is enabled in input port mode or input is selected in S/W I/O control alternative mode (JPIBC0_m=1 or JPMC0_m=1): Connected to E1VCC or E1VSS through resistor Output: Open |
| | DCUTDO | Open |
| | LPDO | Open |
| JP0_2 | GPI | Input: When input buffer is disabled in input port mode (JPIBC0_m=0 and JPMC0_m=0): Open When input buffer is enabled in input port mode or input is selected in S/W I/O control alternative mode (JPIBC0_m=1 or JPMC0_m=1): Connected to E1VCC or E1VSS through resistor |
| | DCUTCK | Open |
| | LPDCLK | Open |
| JP0_3 | GPI/O | Input: When input buffer is disabled in input port mode (JPIBC0_m=0 and JPMC0_m=0): Open When input buffer is enabled in input port mode or input is selected in S/W I/O control alternative mode (JPIBC0_m=1 or JPMC0_m=1): Connected to E1VCC or E1VSS through resistor Output: Open |
| | DCUTMS | Connected to E1VCC through resistor |
| JP0_4 | DCUTRST | Connected to VSS |
| JP0_5 | GPI/O | Input: When input buffer is disabled in input port mode (JPIBC0_m=0 and JPMC0_m=0): Open When input buffer is enabled in input port mode or input is selected in S/W I/O control alternative mode (JPIBC0_m=1 or JPMC0_m=1): Connected to E1VCC or E1VSS through resistor Output: Open |
| | DCUTRDY | Open |
| | LPDCLKOUT | Open |

Table 2.61 Handling of Unused Pins (P0) (1/2)

| Pin Name | Alternative Function | Handling of Unused Pins |
|----------|----------------------|---|
| P0_0 | GPI/O | Input: When input buffer is disabled in input port mode (PIBCn_m=0 and PMCN_m=0): Open |
| P0_1 | | |

Section 3 CPU System

3.1 Overview

3.1.1 Block Configuration

Figure 3.1 shows the block configuration diagram.

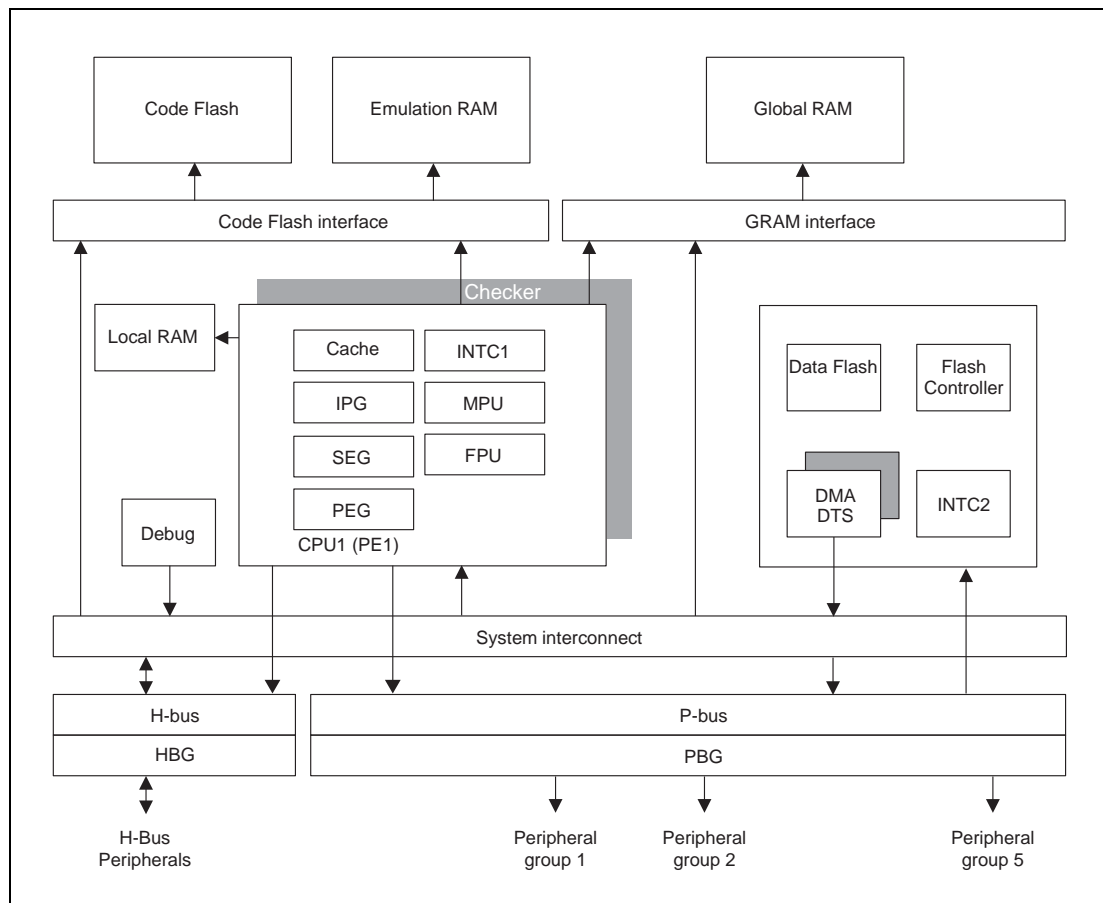

Figure 3.1 Block Configuration Diagram

CPU1 (PE1)

The RH850 G3M core is included as a main CPU. CPU1 also includes the checker core for safety assurance.

Local RAM

A high-speed accessible local RAM is included.

Global RAM

The Global RAM is a mass on-chip RAM that all PEs can share.

Code Flash

A mass Code Flash is included for program storage. CPU1 and the Code Flash are connected with each other via the Code Flash interface.

Emulation RAM

It is a RAM to emulate the Code Flash. The programs can be replaced without rewriting the Code Flash through control from an external tool.

Data Flash

It is a Flash memory being rewritable by the CPU.

P-Bus and H-Bus

The P-bus and H-bus connect the peripheral IPs. The P-bus is divided into peripheral groups 1, 2 and 5.

INTC1, INTC2

The interrupt controller consists of INTC1 and INTC2. INTC1 has a redundant configuration with the checker core.

DMA

Two DMA transfer modules, DMAC and DTS, are included. The DMA is provided with a checker for safety.

Slave Guard

The slave guard is a system to prevent unauthorized access from the specific bus master, consisting of the following guard structures.

(1) PE Guard (PEG)

The PE guard is a system to prevent unauthorized access to the resources in the PE from the external master. After reset release, access is prohibited except access from the PE itself.

(2) Internal Peripheral Guard (IPG)

Each PE has an “Internal Peripheral Guard” (IPG) that protects the registers of peripherals inside the PE against unauthorized accesses.

(3) System Error Generation (SEG)

The registers controls how to response SYSERR.

(4) Global RAM Guard (GRG)

The global RAM guard is a system to prevent unauthorized access to the global RAM from the external master. After reset release, the global RAM is unprotected (accessible from all bus masters).

(5) Peripheral Guard (PBG, HBG)

The peripheral guard is a system to prevent unauthorized access to peripheral devices from the external master. Peripheral devices are in the protected state excluding PE1 after release from the reset state.

3.2 CPU

3.2.1 Core Functions

3.2.1.1 Features

Table 3.1 lists features of the RH850G3M core.

Table 3.1 Features of the RH850G3M Core

| Item | Feature |
|-------------------------|---|
| CPU | <ul style="list-style-type: none"> • Advanced 32-bit architecture for embedded control • 32-bit internal data bus • Thirty-two 32-bit general registers • RISC-type instruction sets <ul style="list-style-type: none"> – Long-/short-format load/store instructions – Three-operand instructions – Instruction sets based on C language • CPU operating modes <ul style="list-style-type: none"> – User mode and supervisor mode • Address space: 4-Gbyte linear address space for both data and instructions • Instructions: A snooze instruction (SNOOZE) is included for temporary suspension by switching the CPU clock signal (CLK_CPU) off for 32 clock cycles. |
| Coprocessor | <ul style="list-style-type: none"> • A floating-point operation coprocessor (FPU) mounted <ul style="list-style-type: none"> – Supports single precision (32 bits) and double precision (64 bits). – Supports data types and exceptions conforming to IEEE754. – Rounding mode: Neighborhood, 0 direction, +∞ direction, and -∞ direction – Handling denormalized numbers: Rounding down to 0 or exception notification to conform to IEEE754 |
| Exception/ Interrupt | <ul style="list-style-type: none"> • 16 interrupt priority levels settable for each channel • Vector selection method selectable according to performance request or memory usage <ul style="list-style-type: none"> – Direct branching exception vectors – Indirect branching exception vectors referring to the address table – Supports the high-speed save/restore processing of the context by the dedicated instructions (PUSHSP and POPSP) at the generation of an interrupt |
| Memory management | <ul style="list-style-type: none"> • Memory protection function (MPU): 16 areas settable |
| Cache | <ul style="list-style-type: none"> • Instruction cache |

3.2.1.2 Register Set

This subsection explains the program registers and system registers incorporated in this CPU.

(1) Program Registers

Program registers include the general-purpose registers (r0 to r31) and program counter (PC).

r0 always retains 0, whereas the value after reset is undefined in r1 to r31.

Table 3.2 List of Program Registers

| Program Register | Name | Function | Description |
|---------------------------|-----------|--|--|
| General-purpose registers | r0 | Zero register | Always retains "0" |
| | r1 | Assembler reserved register | Used as working register for generating addresses |
| | r2 | Register for address and data variables (used when the real-time OS used does not use this register) | |
| | r3 | Stack pointer (SP) | Used for generating a stack frame when a function is called |
| | r4 | Global pointer (GP) | Used for accessing a global variable in the data area |
| | r5 | Text pointer (TP) | Used as a register that indicates the start of the text area (area where program code is placed) |
| | r6 to r29 | Register for addresses and data variables | |
| | r30 | Element pointer (EP) | Used as a base pointer for generating addresses when accessing memory |
| | r31 | Link pointer (LP) | Used when the compiler calls a function |
| Program counter | PC | Retains instruction addresses during execution of programs | |

NOTE

For further descriptions of r1, r3 to r5, and r31 used for an assembler and/or C compiler, see the specification of each software development environment.

(a) General-Purpose Registers

A total of 32 general-purpose registers (r0 to r31) are provided. All of these registers can be used for either data variables or address variables.

Of the general-purpose registers, r0 to r5, r30, and r31 are assumed to be used for special purposes in software development environments, so it is necessary to note the following when using them.

1. r0, r3, and r30

These registers are implicitly used by instructions.

r0 is a register that always retains “0”. It is used for operations that use 0 and addressing with base address being 0.

r3 is implicitly used by the PREPARE, DISPOSE, PUSHSP, and POPSP instructions.

r30 is used as a base pointer when the SLD instruction or SST instruction accesses memory.

2. r1, r4, r5, and r31

These registers are implicitly used by the assembler and C compiler.

When using these registers, register contents must first be saved so they are not lost and can be restored after the registers are used.

3. r2

This register might be used by a real-time OS in some cases. If the real-time OS that is being used is not using r2, r2 can be used as a register for address variables or data variables.

(b) PC — Program Counter

The PC retains the address of the instruction being executed. Bit 0 is fixed to 0, and branching to an odd number address is disabled.

Table 3.3 PC Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|---|-----|-------------------|
| 31 to 1 | PC31-1 | These bits indicate the address of the instruction being executed. | R/W | *1 |
| 0 | PC0 | This bit is fixed to 0, and branching to an odd number address is disabled. | R/W | 0 |

Note 1. The value after reset differs depending on the setting value of the reset vector. For details, see (q) RBASE — Reset vector base address register.

(2) Basic System Registers

The basic system registers are used to control CPU status and to retain exception information.

System registers are read from or written to by using the LDSR and STSR instructions and specifying the system register number, which is made up of a register number and selection ID.

Table 3.4 Basic System Registers

| Register No. (regID, selID) | Name | Function | Access Permission |
|--------------------------------|--------|---|----------------------|
| SR0, 0 | EIPC | Status save registers when acknowledging EI level exception | SV |
| SR1, 0 | EIPSW | Status save registers when acknowledging EI level exception | SV |
| SR2, 0 | FEPC | Status save registers when acknowledging FE level exception | SV |
| SR3, 0 | FEPSW | Status save registers when acknowledging FE level exception | SV |
| SR5, 0 | PSW | Program status word | *1 |
| SR6, 0 | FPSR | Refer to (4) FPU Function Registers. | CU0 and SV |
| SR7, 0 | FPEPC | Refer to (4) FPU Function Registers. | CU0 and SV |
| SR8, 0 | FPST | Refer to (4) FPU Function Registers. | CU0 |
| SR9, 0 | FPCC | Refer to (4) FPU Function Registers. | CU0 |
| SR10, 0 | FPCFG | Refer to (4) FPU Function Registers. | CU0 |
| SR11, 0 | FPEC | Refer to (4) FPU Function Registers. | CU0 and SV |
| SR13, 0 | EIIC | EI level exception cause | SV |
| SR14, 0 | FEIC | FE level exception cause | SV |
| SR16, 0 | CTPC | CALLT execution status save register | UM |
| SR17, 0 | CTPSW | CALLT execution status save register | UM |
| SR20, 0 | CTBP | CALLT base pointer | UM |
| SR28, 0 | EIWR | EI level exception working register | SV |
| SR29, 0 | FEWR | FE level exception working register | SV |
| SR31, 0 | BSEL | Not implemented. A value of 0 is returned when read and writing is ignored. | SV |
| SR0, 1 | MCFG0 | Machine configuration | SV |
| SR2, 1 | RBASE | Reset vector base address | SV |
| SR3, 1 | EBASE | Exception handler vector address | SV |
| SR4, 1 | INTBP | Base address of the interrupt handler table | SV |
| SR5, 1 | MCTL | CPU control | SV |
| SR6, 1 | PID | Processor ID | SV |
| SR11, 1 | SCCFG | SYSCALL operation setting | SV |
| SR12, 1 | SCBP | SYSCALL base pointer | SV |
| SR0, 2 | HTCFG0 | Thread configuration | SV |
| SR6, 2 | MEA | Memory error address | SV |
| SR7, 2 | ASID | Address space ID | SV |
| SR8, 2 | MEI | Memory error information | SV |

Note 1. The access permission differs depending on the bit.

(a) EIPC — Status save register when acknowledging EI level exception

When an EI level exception is acknowledged, the address of the instruction that was being executed when the EI level exception occurred, or of the next instruction, is saved to the EIPC register (see “Types of Exceptions” in the *RH850G3M User's Manual: Software*).

Because there is only one pair of EI level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Be sure to set an even-numbered address to the EIPC register. An odd-numbered address must not be specified.

Table 3.5 EIPC Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|--|-----|-------------------|
| 31 to 1 | EIPC31-1 | These bits indicate the PC saved when an EI level exception is acknowledged. | R/W | Undefined |
| 0 | EIPC0 | This bit indicates the PC saved when an EI level exception is acknowledged. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the EIRET instruction is executed is 0. | R/W | Undefined |

(b) EIPSW — Status save register when acknowledging EI level exception

When an EI level exception is acknowledged, the current PSW setting is saved to the EIPSW register.

Because there is only one pair of EI level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

CAUTION

Bits 11 to 9 cannot usually be changed since these bits are associated with debugging.

Table 3.6 EIPSW Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|--|-----|-------------------|
| 31 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 30 | UM | This bit stores the PSW.UM bit setting when an EI level exception is acknowledged. | R/W | 0 |
| 29 to 19 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 18 to 16 | CU2-0 | These bits store the PSW.CU 2 to 0 field setting when an EI level exception is acknowledged. (CU2-1 are reserved for future expansion. Be sure to set to 0.) | R/W | 0 |
| 15 | EBV | This bit stores the PSW.EBV bit setting when an EI level exception is acknowledged. | R/W | 0 |
| 14 to 12 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 11 to 9 | Debug | These bits store the PSW.Debug field setting when an EI level exception is acknowledged. | R/W | 0 |
| 8 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 7 | NP | This bit stores the PSW.NP bit setting when an EI level exception is acknowledged. | R/W | 0 |
| 6 | EP | This bit stores the PSW.EP bit setting when an EI level exception is acknowledged. | R/W | 0 |
| 5 | ID | This bit stores the PSW.ID bit setting when an EI level exception is acknowledged. | R/W | 1 |
| 4 | SAT | This bit stores the PSW.SAT bit setting when an EI level exception is acknowledged. | R/W | 0 |
| 3 | CY | This bit stores the PSW.CY bit setting when an EI level exception is acknowledged. | R/W | 0 |
| 2 | OV | This bit stores the PSW.OV bit setting when an EI level exception is acknowledged. | R/W | 0 |
| 1 | S | This bit stores the PSW.S bit setting when an EI level exception is acknowledged. | R/W | 0 |
| 0 | Z | This bit stores the PSW.Z bit setting when an EI level exception is acknowledged. | R/W | 0 |

(c) FEPC — Status save register when acknowledging FE level exception

When an FE level exception is acknowledged, the address of the instruction that was being executed when the FE level exception occurred, or of the next instruction, is saved to the FEPC register (see “Types of Exceptions” in *RH850G3M User's Manual: Software*).

Because there is only one pair of FE level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Be sure to set an even-numbered address to the FEPC register. An odd-numbered address must not be specified.

Table 3.7 FEPC Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|---|-----|-------------------|
| 31 to 1 | FEPC31-1 | These bits indicate the PC saved when an FE level exception is acknowledged. | R/W | Undefined |
| 0 | FEPC0 | This bit indicates the PC saved when an FE level exception is acknowledged. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the FERET instruction is executed is 0. | R/W | Undefined |

(d) FEPSW — Status save register when acknowledging FE level exception

When an FE level exception is acknowledged, the current PSW setting is saved to the FEPSW register.

Because there is only one pair of FE level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

CAUTION

Bits 11 to 9 cannot usually be changed since these bits are associated with debugging.

Table 3.8 FEPSW Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|--|-----|-------------------|
| 31 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 30 | UM | This bit stores the PSW.UM bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 29 to 19 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 18 to 16 | CU2-0 | These bits store the PSW.CU 2 to 0 field setting when an FE level exception is acknowledged. (CU2-1 are reserved for future expansion. Be sure to set to 0.) | R/W | 0 |
| 15 | EBV | This bit stores the PSW.EBV bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 14 to 12 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 11 to 9 | Debug | These bits store the PSW.Debug field setting when an FE level exception is acknowledged. | R/W | 0 |
| 8 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 7 | NP | This bit stores the PSW.NP bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 6 | EP | This bit stores the PSW.EP bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 5 | ID | This bit stores the PSW.ID bit setting when an FE level exception is acknowledged. | R/W | 1 |
| 4 | SAT | This bit stores the PSW.SAT bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 3 | CY | This bit stores the PSW.CY bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 2 | OV | This bit stores the PSW.OV bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 1 | S | This bit stores the PSW.S bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 0 | Z | This bit stores the PSW.Z bit setting when an FE level exception is acknowledged. | R/W | 0 |

(e) PSW — Program status word

PSW (program status word) is a set of flags that indicate the program status (instruction execution result) and bits that indicate the operation status of the CPU (flags are bits in the PSW that are referenced by a condition instruction (Bcond, CMOV, etc.)).

CAUTIONS

1. When the LDSR instruction is used to change the contents of bits 7 to 0 in this register, the changed contents become valid immediately after completion of the LDSR instruction execution.
2. The access permission for the PSW register differs depending on the bit. All bits can be read, but some bits can only be written under certain conditions. See Table 3.9, Access Permission for PSW Register for the access permission for each bit.

Table 3.9 Access Permission for PSW Register

| Bit | Access Permission When Reading | Access Permission When Writing |
|----------|--------------------------------|--------------------------------|
| 30 | UM | SV* ¹ |
| 18 to 16 | CU2-0 | SV* ¹ |
| 15 | EBV | SV* ¹ |
| 11 to 9 | Debug | Special* ¹ |
| 7 | NP | SV* ¹ |
| 6 | EP | SV* ¹ |
| 5 | ID | SV* ¹ |
| 4 | SAT | UM |
| 3 | CY | UM |
| 2 | OV | UM |
| 1 | S | UM |
| 0 | Z | UM |

Note 1. The access permission for the whole PSW register is UM, so the PIE exception does not occur even if the register is written by using an LDSR instruction when PSW.UM is 1. In this case, writing is ignored.

| PSW | 31 | 30 | 29 | 19 | 18 | 16 | 15 | 14 | 12 | 11 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | Value after reset | | | | | | | | |
|-----|----|----|----|----|----|----|----|----|----|----|---|---|---|-------|-----|---|---|---|-------|---|-------------------|----|----|-----|----|----|---|---|------------------------|
| | 0 | UM | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | CU2-0 | EBV | 0 | 0 | 0 | Debug | 0 | NP | EP | ID | SAT | CY | OV | S | Z | 0000 0020 _H |

Table 3.10 PSW Register Contents (1/2)

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|--|-----|-------------------|
| 31 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 30 | UM | This bit indicates that the CPU is in user mode (UM mode). 0: Supervisor mode 1: User mode | R/W | 0 |
| 29 to 19 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 18 to 16 | CU2-CU0 | This bit indicates the coprocessor use permissions. When the bit corresponding to the coprocessor is 0, a coprocessor use prohibition exception is generated in response to execution of a coprocessor instruction or access to coprocessor resources system registers. CU2 bit 18 : (Reserved for future expansion. Be sure to clear to 0.) CU1 bit 17 : (Reserved for future expansion. Be sure to clear to 0.) CU0 bit 16 : FPU | R/W | 0 |

Table 3.10 PSW Register Contents (2/2)

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|-------------------|---|-----|-------------------|
| 15 | EBV | This bit indicates the reset vector and exception vector operation. See the description on RBASE ((q) RBASE — Reset Vector Base Address Register) and EBASE ((r) EBASE — Exception Handler Vector Address Register) in this section. | R/W | 0 |
| 14 to 12 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 11 to 9 | Debug | These bits are used in the debugging functions of development tools. In normal operation, set these bits to 0. | R/W | 0 |
| 8 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 7 | NP | This bit disables the acknowledgement of FE level exception. When an FE level exception is acknowledged, this bit is set to 1 to disable the acknowledgement of EI level and FE level exceptions. As for the exceptions which the NP bit disables the acknowledgment, see the <i>Exception Cause List of RH850G3M User's Manual: Software</i> . 0: The acknowledgement of FE level exception is enabled. 1: The acknowledgement of FE level exception is disabled. | R/W | 0 |
| 6 | EP | This bit indicates that an exception other than an interrupt controlled by the interrupt controller is being serviced. It is set to 1 when the corresponding exception occurs. This bit does not affect acknowledging an exception request even when it is set to 1. 0: An exception other than an interrupt is not being serviced. 1: An exception other than an interrupt is being serviced. | R/W | 0 |
| 5 | ID | This bit disables the acknowledgement of EI level exception. When an EI level or FE level exception is acknowledged, this bit is set to 1 to disable the acknowledgement of EI level exception. As for the exceptions which the ID bit disables the acknowledgment, see the <i>Exception Cause List of RH850G3M User's Manual: Software</i> . This bit is also used to disable EI level exceptions from being acknowledged as a critical section while an ordinary program or interrupt is being serviced. It is set to 1 when the DI instruction is executed, and cleared to 0 when the EI instruction is executed. The change of the ID bit by the EI or ID instruction will be enabled from the next instruction. 0: The acknowledgement of EI level exception is enabled. 1: The acknowledgement of EI level exception is disabled. | R/W | 1 |
| 4 | SAT* ¹ | This bit indicates that the operation result is saturated because the result of a saturated operation instruction operation has overflowed. This is a cumulative flag, so when the operation result of the saturated operation instruction becomes saturated, this bit is set to 1, but it is not cleared to 0 when the operation result for a subsequent instruction is not saturated. This bit is cleared to 0 by the LDSR instruction. This bit is neither set to 1 nor cleared to 0 when an arithmetic operation instruction is executed. 0: Not saturated 1: Saturated | R/W | 0 |
| 3 | CY | This bit indicates whether a carry or borrow has occurred in the operation result. 0: Carry or borrow has not occurred. 1: Carry or borrow has occurred. | R/W | 0 |
| 2 | OV* ¹ | This bit indicates whether or not an overflow has occurred during an operation. 0: Overflow has not occurred. 1: Overflow has occurred. | R/W | 0 |
| 1 | S* ¹ | This bit indicates whether or not the result of an operation is negative. 0: Result of operation is positive or 0. 1: Result of operation is negative | R/W | 0 |
| 0 | Z | This bit indicates whether or not the result of an operation is 0. 0: Result of operation is not 0. 1: Result of operation is 0. | R/W | 0 |

Note 1. The operation result of the saturation processing is determined in accordance with the contents of the OV flag and S flag during a saturated operation. When only the OV flag is set to 1 during a saturated operation, the SAT flag is set to 1.

| Operation result status | Flag status | | | Operation result after saturation processing |
|---------------------------------------|---------------------------------------|----|---|--|
| | SAT | OV | S | |
| Exceeded positive maximum value | 1 | 1 | 0 | 7FFF FFFF _H |
| Exceeded negative maximum value | 1 | 1 | 1 | 8000 0000 _H |
| Positive (maximum value not exceeded) | Value prior to operation is retained. | 0 | 0 | Operation result itself |
| Negative (maximum value not exceeded) | | | 1 | |

(f) EIIC — EI level exception source register

The EIIC register retains the source of any EI level exception that occurs. The value retained in this register is an exception code corresponding to a specific exception source.

Table 3.11 EIIC Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|---|-----|-------------------|
| 31 to 0 | EIIC31-0 | These bits store the exception source code when an EI level exception is acknowledged. See the Table 6.11, Interrupt Exception Handler and Priority , and "Exception Cause List" in the <i>RH850G3M User's Manual: Software</i> about stored exception source code. The EIIC31-16 field stores detailed exception source codes defined individually for each exception. If there is no particular definition, these bits are set to 0. | R/W | 0 |

(g) FEIC — FE level exception source register

The FEIC register retains the source of any FE level exception that occurs. The value retained in this register is an exception code corresponding to a specific exception source.

Table 3.12 FEIC Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|---|-----|-------------------|
| 31 to 0 | FEIC31-0 | These bits store the exception source code when an FE level exception is acknowledged. See the Table 6.11, Interrupt Exception Handler and Priority , and "Exception Cause List" in the <i>RH850G3M User's Manual: Software</i> about stored exception source code. The FEIC31-16 field stores detailed exception source codes defined individually for each exception. If there is no particular definition, these bits are set to 0. | R/W | 0 |

(h) CTPC — Status save register when executing CALLT register

When a CALLT instruction is executed, the address of the next instruction after the CALLT instruction is saved to CTPC. Be sure to set an even-numbered address to the CTPC register. An odd-numbered address must not be specified.

Table 3.13 CTPC Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|--|-----|-------------------|
| 31 to 1 | CTPC31-1 | These bits indicate the PC of the instruction after the CALLT instruction. | R/W | Undefined |
| 0 | CTPC0 | This bit indicates the PC of the instruction after the CALLT instruction. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the CTRET instruction is executed is 0. | R/W | Undefined |

(i) CTPSW — Status save register when executing CALLT register

When a CALLT instruction is executed, some of the PSW (program status word) settings are saved to CTPSW.

Table 3.14 CTPSW Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|---|-----|-------------------|
| 31 to 5 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 4 | SAT | This bit stores the PSW.SAT bit setting when the CALLT instruction is executed. | R/W | 0 |
| 3 | CY | This bit stores the PSW.CY bit setting when the CALLT instruction is executed. | R/W | 0 |
| 2 | OV | This bit stores the PSW.OV bit setting when the CALLT instruction is executed. | R/W | 0 |
| 1 | S | This bit stores the PSW.S bit setting when the CALLT instruction is executed. | R/W | 0 |
| 0 | Z | This bit stores the PSW.Z bit setting when the CALLT instruction is executed. | R/W | 0 |

(j) CTBP — CALLT base pointer register

The CTBP register is used to specify table addresses of the CALLT instruction and generate target addresses.

Be sure to set the CTBP register to a Half-word address.

Table 3.15 CTBP Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|--|-----|-------------------|
| 31 to 1 | CTBP31-1 | These bits indicate the base pointer address of the CALLT instruction. These bits indicate the first address in the table used by the CALLT instruction. | R/W | Undefined |
| 0 | CTBP0 | These bits indicate the base pointer address of the CALLT instruction. These bits indicate the first address in the table used by the CALLT instruction. Always set this bit to 0. | R | 0 |

(k) ASID — Address space ID register

This is the address space ID. This is used to identify the address space provided by the memory management function.

Table 3.16 ASID Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|---|-----|-------------------|
| 31 to 10 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 9 to 0 | ASID | This is the address space ID. | R/W | Undefined |

(l) EIWR — EI level exception working register

The EIWR register is used as a working register when an EI level exception has occurred.

Table 3.17 EIWR Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|---|-----|-------------------|
| 31 to 0 | EIWR31-0 | These bits constitute a working register that can be used for any purpose during the processing of an EI level exception. Use this register for purposes such as storing the values of general-purpose registers. | R/W | Undefined |

(m) FEWR — FE level exception working register

The FEWR register is used as a working register when an FE level exception has occurred.

Table 3.18 FEWR Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|---|-----|-------------------|
| 31 to 0 | FEWR31-0 | These bits constitute a working register that can be used for any purpose during the processing of an FE level exception. Use this register for purposes such as storing the values of general-purpose registers. | R/W | Undefined |

(n) HTCFG0 — Thread configuration register

Table 3.19 HTCFG0 Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|--|-----|-------------------|
| 31 to 19 | Reserved | (Reserved for future expansion. When read, the value after reset is read.) | R | 0 |
| 18 to 16 | PEID | These bits indicate the processor element number. | R | *2 |
| 15 | Reserved | (Reserved for future expansion. When read, the value after reset is read.) | R | 1 |
| 14 to 0 | Reserved | (Reserved for future expansion. When read, the value after reset is read.) | R | 0 |

Note 1. The value for CPU1 (PE1) in this device is 0001 8000_H.

Note 2. The value for CPU1 (PE1) in this device is 001_B.

(o) MEA — Memory error address register

Table 3.20 MEA Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|--|-----|-------------------|
| 31 to 0 | MEA | These bits store the violation address when an MAE (misaligned) or MPU occurs. | R/W | Undefined |

(p) MEI — Memory error information register

This register is used to store information about the instruction that caused the exception when a misaligned (MAE) or memory protection (MDP) exception occurs.

Table 3.21 MEI Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|---|-----|-------------------|
| 31 to 21 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 20 to 16 | REG4-0 | These bits indicate the number of the source or destination register of the instruction that caused the exception. For details, see Table 3.22, Instructions Causing Exceptions and Values of MEI Register. | R/W | Undefined |
| 15 to 11 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 10, 9 | DS | These bits indicate the data type of the instruction that caused the exception.*1 0: Byte (8 bits) 1: Half-word (16 bits) 2: Word (32 bits) 3: Double-word (64 bits) For details, see Table 3.22, Instructions Causing Exceptions and Values of MEI Register. | R/W | Undefined |
| 8 | U | These bits indicate the sign extension method of the instruction that caused the exception. 0: Signed 1: Unsigned For details, see Table 3.22, Instructions Causing Exceptions and Values of MEI Register. | R/W | Undefined |
| 7, 6 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 5 to 1 | ITYPE4-0 | These bits indicate the instruction that caused the exception. For details, see Table 3.22, Instructions Causing Exceptions and Values of MEI Register. | R/W | Undefined |
| 0 | RW | This bit indicates whether the operation of the instruction that caused the exception was read (Load-memory) or write (Store-memory) 0: Read (Load-memory) 1: Write (Store-memory) For details, see Table 3.22, Instructions Causing Exceptions and Values of MEI Register. | R/W | Undefined |

Note 1. Even if the data is divided and access is made several times due to the specifications of the hardware, the original data type indicated by the instruction is stored.

Table 3.22 Instructions Causing Exceptions and Values of MEI Register (1/2)

| Instruction | REG | DS | U | RW | ITYPE |
|---------------|-----|---------------|--------------|-----------|--------------------|
| SLD.B | dst | 0 (Byte) | 0 (Signed) | 0 (Read) | 00000 _B |
| SLD.BU | dst | 0 (Byte) | 1 (Unsigned) | 0 (Read) | 00000 _B |
| SLD.H | dst | 1 (Half-word) | 0 (Signed) | 0 (Read) | 00000 _B |
| SLD.HU | dst | 1 (Half-word) | 1 (Unsigned) | 0 (Read) | 00000 _B |
| SLD.W | dst | 2 (Word) | 0 (Signed) | 0 (Read) | 00000 _B |
| SST.B | src | 0 (Byte) | 0 (Signed) | 1 (Write) | 00000 _B |
| SST.H | src | 1 (Half-word) | 0 (Signed) | 1 (Write) | 00000 _B |
| SST.W | src | 2 (Word) | 0 (Signed) | 1 (Write) | 00000 _B |
| LD.B (disp16) | dst | 0 (Byte) | 0 (Signed) | 0 (Read) | 00001 _B |

Table 3.22 Instructions Causing Exceptions and Values of MEI Register (2/2)

| Instruction | REG | DS | U | RW | ITYPE |
|---|-----|-----------------|--------------|------------------------|--------------------|
| LD.BU (disp16) | dst | 0 (Byte) | 1 (Unsigned) | 0 (Read) | 00001 _B |
| LD.H (disp16) | dst | 1 (Half-word) | 0 (Signed) | 0 (Read) | 00001 _B |
| LD.HU (disp16) | dst | 1 (Half-word) | 1 (Unsigned) | 0 (Read) | 00001 _B |
| LD.W (disp16) | dst | 2 (Word) | 0 (Signed) | 0 (Read) | 00001 _B |
| ST.B (disp16) | src | 0 (Byte) | 0 (Signed) | 1 (Write) | 00001 _B |
| ST.H (disp16) | src | 1 (Half-word) | 0 (Signed) | 1 (Write) | 00001 _B |
| ST.W (disp16) | src | 2 (Word) | 0 (Signed) | 1 (Write) | 00001 _B |
| LD.B (disp23) | dst | 0 (Byte) | 0 (Signed) | 0 (Read) | 00010 _B |
| LD.BU (disp23) | dst | 0 (Byte) | 1 (Unsigned) | 0 (Read) | 00010 _B |
| LD.H (disp23) | dst | 1 (Half-word) | 0 (Signed) | 0 (Read) | 00010 _B |
| LD.HU (disp23) | dst | 1 (Half-word) | 1 (Unsigned) | 0 (Read) | 00010 _B |
| LD.W (disp23) | dst | 2 (Word) | 0 (Signed) | 0 (Read) | 00010 _B |
| ST.B (disp23) | src | 0 (Byte) | 0 (Signed) | 1 (Write) | 00010 _B |
| ST.H (disp23) | src | 1 (Half-word) | 0 (Signed) | 1 (Write) | 00010 _B |
| ST.W (disp23) | src | 2 (Word) | 0 (Signed) | 1 (Write) | 00010 _B |
| LD.DW (disp23) | dst | 3 (Double-word) | 0 (Signed) | 0 (Read) | 00010 _B |
| ST.DW (disp23) | src | 3 (Double-word) | 0 (Signed) | 1 (Write) | 00010 _B |
| LDL.W | dst | 2 (Word) | 0 (Signed) | 0 (Read) | 00111 _B |
| STC.W | src | 2 (Word) | 0 (Signed) | 1 (Write) | 00111 _B |
| CAXI | dst | 2 (Word) | 1 (Unsigned) | 0 (Read) ^{*1} | 01000 _B |
| SET1 | — | 0 (Byte) | 1 (Unsigned) | 0 (Read) ^{*1} | 01001 _B |
| CLR1 | — | 0 (Byte) | 1 (Unsigned) | 0 (Read) ^{*1} | 01001 _B |
| NOT1 | — | 0 (Byte) | 1 (Unsigned) | 0 (Read) ^{*1} | 01001 _B |
| TST1 | — | 0 (Byte) | 1 (Unsigned) | 0 (Read) | 01001 _B |
| PREPARE | — | 2 (Word) | 1 (Unsigned) | 1 (Write) | 01100 _B |
| DISPOSE | — | 2 (Word) | 1 (Unsigned) | 0 (Read) | 01100 _B |
| PUSHSP | — | 2 (Word) | 1 (Unsigned) | 1 (Write) | 01101 _B |
| POPSP | — | 2 (Word) | 1 (Unsigned) | 0 (Read) | 01101 _B |
| SWITCH | — | 1 (Half-word) | 0 (Signed) | 0 (Read) | 10000 _B |
| CALLT | — | 1 (Half-word) | 1 (Unsigned) | 0 (Read) | 10001 _B |
| SYSCALL | — | 2 (Word) | 1 (Unsigned) | 0 (Read) | 10010 _B |
| CACHE | — | — | — | 0/1 ^{*2} | 10100 _B |
| Interrupt (table reference) ^{*3} | — | 2 (Word) | 1 (Unsigned) | 0 (Read) | 10101 _B |

Note 1. This exception occurs when the instruction executes a read access.

Note 2. It depends on actual operation.

Note 3. When the table reference interrupt vector is read.

NOTE

dst: Destination register number, src: Source register number

(q) RBASE — Reset vector base address register

This register indicates the reset vector address when there is a reset. If the PSW.EBV bit is 0, this vector address is also used as the exception vector address.

Table 3.23 RBASE Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|-----------|---|-----|-------------------|
| 31 to 9 | RBASE31-9 | These bits indicate the value of the upper 23 bits (bits 31 to 9) of the reset vector address when there is a reset. The lower 9 bits (bits 8 to 0) of the reset vector address are all handled as 0. This address is also used as the exception vector when PSW.EBV = 0. | R | *1 |
| 8 to 1 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 0 | RINT | When the RINT bit is set, the exception handler address for interrupt processing is reduced. For details, see "Direct vector method" in the <i>RH850G3M User's Manual: Software</i> . This bit is valid when PSW.EBV = 0. | R | 0 |

Note 1. Please refer to **Figure 35.4, Utilizing the Variable Reset Vector Function to Update the Boot Program** for detail.

(r) EBASE — Exception handler vector address register

This register indicates the exception handler vector address. This register is valid when the PSW.EBV bit is 1.

Table 3.24 EBASE Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|-----------|---|-----|-------------------|
| 31 to 9 | EBASE31-9 | The upper 23 bits (bits 31 to 9) of the base address of the exception handler routine are set to the address specified by this register. The lower 9 bits (bits 8 to 0) of the base address are all handled as 0, and are converted to an address to which the offset address of each exception is added. | R/W | Undefined |
| 8 to 1 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 0 | RINT | When the RINT bit is set, the offset address of the exception handler used during interrupt servicing is decremented. For details, see "Direct vector method" in the <i>RH850G3M User's Manual: Software</i> . | R/W | Undefined |

(s) INTBP — Base address of the interrupt handler table register

This register indicates the base address of the address table when the table reference method is selected as the interrupt handler address selection method.

Table 3.25 INTBP Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|-----------|--|-----|-------------------|
| 31 to 9 | INTBP31-9 | These bits indicate the base pointer address of the table reference method of the interrupt. The value indicated by these bits is the first address in the table used to determine the exception handler when the interrupt specified to use the table reference method (EIINT0 to EIINT383) is acknowledged. The bit names are not assigned because EBASE8-0 bits are always 0. | R/W | Undefined |
| 8 to 0 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |

(t) PID — Processor ID register

The PID register retains a processor identifier that is unique to the CPU. The PID register is a read-only register.

CAUTION

The PID register indicates information used to identify the incorporated CPU core and CPU core configuration. Usage such that the software behavior varies dynamically according to the PID register information is not assumed.

Table 3.26 PID Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|--|-----|-------------------|
| 31 to 24 | PID | Architecture identifier This identifier indicates the architecture of the processor. | R | 05 _H |
| 23 to 8 | | Function identifier This identifier indicates the functions of the processor. These bits indicate whether or not functions defined per bit are implemented (1: implemented, 0: not implemented). Bit 23 to 11 Reserved Bit 10 Double-precision floating-point operation function Bit 9 Single-precision floating-point operation function Bit 8 Memory protection function (MPU) | R | 8007 _H |
| 7 to 0 | | Version identifier This identifier indicates the version of the processor. | R | 14 _H |

(u) SCCFG — SYSCALL operation setting register

This register is used to specify operations related to the SYSCALL instruction. Be sure to set an appropriate value to this register before using the SYSCALL instruction.

Table 3.27 SCCFG Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|--|-----|-------------------|
| 31 to 8 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 7 to 0 | SIZE | These bits specify the maximum number of entries of a table that the SYSCALL instruction references. The maximum number of entries the SYSCALL instruction references is 1 if SIZE is 0, and 256 if SIZE is 255. By setting the maximum number of entries appropriately in accordance with the number of functions branched by the SYSCALL instruction, the memory area can be effectively used. If a vector exceeding the maximum number of entries is specified for the SYSCALL instruction, the first entry is selected. Place an error processing routine at the first entry. | R/W | Undefined |

(v) SCBP — SYSCALL base pointer register

The SCBP register is used to specify a table address of the SYSCALL instruction and generate a target address. Be sure to set an appropriate value to this register before using the SYSCALL instruction.

Be sure to set a word address to the SCBP register.

Table 3.28 SCBP Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|--|-----|-------------------|
| 31 to 2 | SCBP31-2 | These bits indicate the base pointer address of the SYSCALL instruction. These bits indicate the first address in the table used by the SYSCALL instruction. | R/W | Undefined |
| 1, 0 | SCBP1-0 | These bits indicate the base pointer address of the SYSCALL instruction. These bits indicate the first address in the table used by the SYSCALL instruction. Always set these bits to 0. | R | 0 |

(w) MCFG0 — Machine configuration register

This register indicates the CPU configuration.

Table 3.29 MCFG0 Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|--|-----|--------------------|
| 31 to 21 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 20 to 16 | SPID | These bits indicate the system protection number. It is not possible to write "00000 _B "/"00001 _B " to SPID. If written, these value is "00010 _B ". | R/W | 00010 _B |
| 15 to 4 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 3 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 2 | Reserved | (Reserved for future expansion. Be sure to set to 1.) | R | 1 |
| 1 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 0 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |

(x) MCTL — Machine control register

This register is used to control the CPU.

Table 3.30 MCTL Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|---|-----|-------------------|
| 31 | Reserved | (Reserved for future expansion. Be sure to set to 1.) | R | 1 |
| 30 to 2 | Reserved | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 1 | MA | This bit specifies the operation when a misaligned access occurs. 0: An exception occurs.*1 1: An exception does not occur.*2 | R/W | 0 |
| 0 | UIC | This bit is used to control the interrupt enable/disable operation in user mode. When this bit is set to 1, executing the EI/DI instruction become possible in user mode. | R/W | 0 |

Note 1. Excluding LD.DW and ST.DW instructions executed at an address at a word boundary.

Note 2. If the MA bit is 1, the CPU divides a single misaligned data access into multiple aligned accesses. In this case, the instruction atomicity is not guaranteed.

When MA bit is “1”, CPU divides the transaction from one misaligned data access to multiple aligned data accesses. In this case, atomic characteristics of the instruction are not guaranteed.

| Access Conditions | | Cycles Divided by the CPU | | |
|-------------------|---------|---------------------------|-------------------------|------------------------|
| Data Width | Address | 1st | 2nd | 3rd |
| 16 bits | 2n + 1 | 8-bit access to 2n + 1 | 8-bit access to 2n + 2 | — |
| 32 bits | 4n + 1 | 8-bit access to 4n + 1 | 16-bit access to 4n + 2 | 8-bit access to 4n + 4 |
| 32 bits | 4n + 2 | 16-bit access to 4n + 2 | 16-bit access to 4n + 4 | — |
| 32 bits | 4n + 3 | 8-bit access to 4n + 3 | 16-bit access to 4n + 4 | 8-bit access to 4n + 6 |

(3) Interrupt Function Registers

(a) Interrupt function system register

Reading from/writing to an interrupt function system register is performed by specifying the system register number, which consists of the register number and selection identifier, with the LDSR or STSR instructions.

Table 3.31 Interrupt Function System Registers

| Register No. (reg.ID, sel.ID) | Symbol | Function | Access Permission |
|----------------------------------|--------|--|-------------------|
| SR7, 1 | FPIPR | FPI exception interrupt priority setting | SV |
| SR10, 2 | ISPR | Priority of interrupt being serviced | SV |
| SR11, 2 | PMR | Interrupt priority masking | SV |
| SR12, 2 | ICSR | Interrupt control status | SV |
| SR13, 2 | INTCFG | Interrupt function setting | SV |

(b) FPIPR — FPI exception interrupt priority setting register

This register specifies the FPI exception interrupt priority.

Table 3.32 FPIPR Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|---|-----|-------------------|
| 31 to 5 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 4 to 0 | FPIPR | These bits specify the priority of the floating-point operation exception interrupt (FPI, indicating imprecision). Values from 0 to 16 should be used; a value greater than or equal to 17 is prohibited. FPI exceptions are handled according to this interrupt priority, which is specified in advance. When generated at the same time as another interrupt with the same priority level, the FPI takes priority. | R/W | 0 |

NOTE

If these bits are set to 16 or higher values, handling is as if the setting were 16.

(c) ISPR — Priority of interrupt being serviced register

This register holds the priority of the EIINTn interrupt being serviced by the CPU per priority. This priority value is then used to perform priority ceiling processing when multiple interrupts are generated.

Table 3.33 ISPR Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|--|-----------------|-------------------|
| 31 to 16 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 15 to 0 | ISP15-0 | These bits indicate the acknowledgment status of an EIINTn interrupt with a priority that corresponds to the relevant bit position* ¹ . 0: An interrupt request for an interrupt whose priority corresponds to the relevant bit position has not been acknowledged. 1: An interrupt request for an interrupt whose priority corresponds to the relevant position is being serviced by the CPU core. | R* ⁴ | 0 |

The bit positions correspond to the following priority levels:

| Bit | Priority |
|-----|----------------------|
| 0 | Priority 0 (highest) |
| 1 | Priority 1 |
| : | : |
| 14 | Priority 14 |
| 15 | Priority 15 |

When an interrupt request (EIINTn) is acknowledged, the bit corresponding to the acknowledged interrupt request is automatically set to 1. If PSW.EP is 0 when the EIRET instruction is executed, the bit with the highest priority among the ISP15-0 bits that are set (0 is the highest priority) is cleared to 0.*²

While a bit in this register is set to 1, same and lower priority interrupts (EIINTn) and FPI exception*³ are masked. Priority level judgment is therefore not performed when the system is determining whether to acknowledge an exception, meaning that exceptions will not be acknowledged.

When performing software-based priority control using the PMR register, be sure to clear this register by using the INTCFG.ISPC bit functions.

- Note 1. For details, see “Exception Priority of Interrupts and the Priority Mask” in the *RH850G3M User’s Manual: Software*.
- Note 2. Interrupt acknowledgment and auto-updating of values when the EIRET instruction is executed are disabled by setting (1) the INTCFG.ISPC bit. It is recommended to enable auto-updating of values, so in normal cases, the INTCFG.ISPC bit should be cleared to 0.
- Note 3. Since FPI exceptions have the same level of priority as this interrupt (EIINTn), they are affected by the ISPR in the same way as the interrupt. The priority of the FPI exception is set by the FPIPR register.
- Note 4. This is R or R/W, depending on the setting of the INTCFG.ISPC bit. It is recommended to use this register as a read-only (R) register in normal cases.

(d) PMR — Interrupt priority masking register

This register is used to mask the specified interrupt priority.

Table 3.34 PMR Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|--|-----|-------------------|
| 31 to 16 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 15 to 0 | PM15-0 | These bits mask an interrupt request with a priority level that corresponds to the relevant bit position. 0: Servicing of an interrupt request with a priority that corresponds to the relevant bit position is enabled. 1: Servicing of an interrupt request with a priority that corresponds to the relevant bit position is disabled. | R/W | 0 |

The bit positions correspond to the following priority levels:

| Bit | Priority |
|-----|--------------------------------------|
| 0 | Priority 0 (highest) |
| 1 | Priority 1 |
| : | : |
| 14 | Priority 14 |
| 15 | Priority 15 and priority 16 (lowest) |

While a bit in this register is set to 1, interrupts (EIINTn) with the priority corresponding to that bit and FPI exception*¹ are masked. Priority level judgment is therefore not performed when the system is determining whether to acknowledge an exception, meaning that exceptions will not be acknowledged*².

- Note 1. Since a FPI exception is specified as the same level of priority as that of an interrupt (EIINTn), it is affected by the PMR like interrupts. The priority of FPI exception is set by the FPIPR register.
- Note 2. Specify the masks by setting the bits to 1 in order from the lowest-priority bit. For example, FF00_H can be set, but F0F0_H or 00FF_H cannot.

(e) ICSR — Interrupt control status register

This register indicates the interrupt control status in the CPU.

Table 3.35 ICSR Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|---|-----|-------------------|
| 31 to 2 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 1 | PMFP | This bit indicates that an FPI exception with the priority level masked by the PMR register exists. | R | 0 |
| 0 | PMEI | This bit indicates that an interrupt (EIINTn) with the priority level masked by the PMR register exists | R | 0 |

(4) FPU Function Registers

(a) Floating-point operation registers

The FPU uses the CPU general-purpose registers (r0 to r31). There are no register files used only for floating-point operations.

- Single-precision floating-point instruction

Thirty-two 32-bit registers can be specified. These correspond to the general-purpose registers r0 to r31.

- Double-precision floating-point instruction

Sixteen 64-bit registers can be specified. These correspond to the register pairs each using one pair of general-purpose registers, ({r1, r0}, {r3, r2} ... {r31, r30}). Each register pair is specified in the instruction format with an even numbered register. Because r0 is a zero register (always holds "0"), in principle {r1, r0} should not be used by a double-precision floating-point instruction.

(b) Floating-point system registers

The FPU can use the following system registers to control floating-point operation. Reading from/writing to a floating-point system register is performed by specifying the system register number, which consists of the register number and selection identifier, with the LDSR or STSR instructions. For details of the registers, see "*Floating-Point Function System Registers*" in the *RH850G3M User's Manual: Software*.

Table 3.37 FPU System Registers

| Register No. (reg.ID, sel.ID) | Symbol | Function | Access Permission |
|----------------------------------|--------|--|----------------------|
| SR6, 0 | FPSR | Floating-point operation setting/status | CU0 and SV |
| SR7, 0 | FPEPC | Floating-point operation exception program counter | CU0 and SV |
| SR8, 0 | FPST | Floating-point status | CU0 |
| SR9, 0 | FPCCR | Floating-point operation comparison result | CU0 |
| SR10, 0 | FPCFG | Floating-point function setting | CU0 |
| SR11, 0 | FPEC | Floating-point operation exception control | CU0 and SV |

(5) MPU Function Registers**(a) MPU function system registers**

Reading from/writing to an MPU function system register is performed by specifying the system register number, which consists of the register number and selection identifier, with the LDSR or STSR instructions.

Table 3.38 MPU Function System Registers (1/2)

| Register No. (reg.ID, sel.ID) | Symbol | Function | Access Permission |
|----------------------------------|--------|--|----------------------|
| SR0, 5 | MPM | Memory protection operation mode setting | SV |
| SR1, 5 | MPRC | MPU region control | SV |
| SR4, 5 | MPBRGN | MPU base region number | SV |
| SR5, 5 | MPTRGN | MPU end region number | SV |
| SR8, 5 | MCA | Memory protection setting check address | SV |
| SR9, 5 | MCS | Memory protection setting check size | SV |
| SR10, 5 | MCC | Memory protection setting check command | SV |
| SR11, 5 | MCR | Memory protection setting check result | SV |
| SR0, 6 | MPLA0 | Protection area minimum address | SV |
| SR1, 6 | MPUA0 | Protection area maximum address | SV |
| SR2, 6 | MPAT0 | Protection area attribute | SV |
| SR4, 6 | MPLA1 | Protection area minimum address | SV |
| SR5, 6 | MPUA1 | Protection area maximum address | SV |
| SR6, 6 | MPAT1 | Protection area attribute | SV |
| SR8, 6 | MPLA2 | Lower address of the protection area | SV |
| SR9, 6 | MPUA2 | Protection area maximum address | SV |
| SR10, 6 | MPAT2 | Protection area attribute | SV |
| SR12, 6 | MPLA3 | Protection area minimum address | SV |
| SR13, 6 | MPUA3 | Protection area maximum address | SV |
| SR14, 6 | MPAT3 | Protection area attribute | SV |
| SR16, 6 | MPLA4 | Protection area minimum address | SV |
| SR17, 6 | MPUA4 | Protection area maximum address | SV |
| SR18, 6 | MPAT4 | Protection area attribute | SV |
| SR20, 6 | MPLA5 | Protection area minimum address | SV |
| SR21, 6 | MPUA5 | Protection area maximum address | SV |
| SR22, 6 | MPAT5 | Protection area attribute | SV |
| SR24, 6 | MPLA6 | Protection area minimum address | SV |
| SR25, 6 | MPUA6 | Protection area maximum address | SV |
| SR26, 6 | MPAT6 | Protection area attribute | SV |
| SR28, 6 | MPLA7 | Protection area minimum address | SV |
| SR29, 6 | MPUA7 | Protection area maximum address | SV |
| SR30, 6 | MPAT7 | Protection area attribute | SV |
| SR0, 7 | MPLA8 | Protection area minimum address | SV |
| SR1, 7 | MPUA8 | Protection area maximum address | SV |
| SR2, 7 | MPAT8 | Protection area attribute | SV |
| SR4, 7 | MPLA9 | Protection area minimum address | SV |
| SR5, 7 | MPUA9 | Protection area maximum address | SV |

Table 3.38 MPU Function System Registers (2/2)

| Register No. (reg.ID, sel.ID) | Symbol | Function | Access Permission |
|----------------------------------|--------|---------------------------------|-------------------|
| SR6, 7 | MPAT9 | Protection area attribute | SV |
| SR8, 7 | MPLA10 | Protection area minimum address | SV |
| SR9, 7 | MPUA10 | Protection area maximum address | SV |
| SR10, 7 | MPAT10 | Protection area attribute | SV |
| SR12, 7 | MPLA11 | Protection area minimum address | SV |
| SR13, 7 | MPUA11 | Protection area maximum address | SV |
| SR14, 7 | MPAT11 | Protection area attribute | SV |
| SR16, 7 | MPLA12 | Protection area minimum address | SV |
| SR17, 7 | MPUA12 | Protection area maximum address | SV |
| SR18, 7 | MPAT12 | Protection area attribute | SV |
| SR20, 7 | MPLA13 | Protection area minimum address | SV |
| SR21, 7 | MPUA13 | Protection area maximum address | SV |
| SR22, 7 | MPAT13 | Protection area attribute | SV |
| SR24, 7 | MPLA14 | Protection area minimum address | SV |
| SR25, 7 | MPUA14 | Protection area maximum address | SV |
| SR26, 7 | MPAT14 | Protection area attribute | SV |
| SR28, 7 | MPLA15 | Protection area minimum address | SV |
| SR29, 7 | MPUA15 | Protection area maximum address | SV |
| SR30, 7 | MPAT15 | Protection area attribute | SV |

(b) MPM — Memory protection operation mode register

The memory protection mode register is used to define the basic operating state of the memory protection function.

Table 3.39 MPM Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|--|-----|-------------------|
| 31 to 2 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 1 | SVP | In SV mode. (when PSW.UM = 0), this bit is used to specify whether to restrict access according to the SX, SW, and SR bits of the MPAT register for each protection area.*1 0: As usual, implicitly enable all access in SV mode. 1: Restrict access according to the SX, SW, and SR bits even in SV mode.*2 | R/W | 0 |
| 0 | MPE | This bit is used to specify whether to enable or disable MPU function. 0: Disable 1: Enable | R/W | 0 |

Note 1. When the SVP bit is set to 1, access is restricted according to the setting of each protection area even in SV mode. Therefore, specify protection areas before setting the SVP bit to prevent the access of the program itself from being restricted.

Note 2. If access is restricted in SV mode, execution of MDP exceptions or the MIP exception handling itself might not be possible depending on the settings. Be careful to specify settings so that access to the memory area necessary for the exception handler and exception handling is permitted.

(c) MPRC — MPU region control register

Bits used to perform special memory protection function operations are located in this register.

Table 3.40 MPRC Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|--|-----|-------------------|
| 31 to 16 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 15 to 0 | E15-E0 | These are the enable bits for each protection area. Bit En is a copy of bit MPATn.E (where n = 15 to 0). | R/W | 0 |

(d) MPBRGN — MPU base region register

This register indicates the minimum usable MPU area number.

Table 3.41 MPBRGN Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|--|-----|-------------------|
| 31 to 5 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 4 to 0 | MPBRGN | These bits indicate the smallest number of an MPU area. These bits are always read as 0. | R | 0 |

(e) MPTRGN — MPU end region register

This register indicates the maximum usable MPU area number + 1.

Table 3.42 MPTRGN Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|---|-----|-------------------|
| 31 to 5 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 4 to 0 | MPTRGN | These bits indicate the largest number of an MPU area + 1. These bits indicate the maximum number of MPU areas incorporated into the hardware. The number of protection areas in this device is 16. | R | 10 _H |

(f) MCA — Memory protection setting check address register

This register is used to specify the base address of the area for which a memory protection setting check is to be performed.

Table 3.43 MCA Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|--|-----|-------------------|
| 31 to 0 | MCA31-0 | These bits are used to specify the start address of the memory area subject to a memory protection setting check in bytes. | R/W | Undefined |

(g) MCS — Memory protection setting check size register

This register is used to specify the size of the area for which a memory protection setting check is to be performed.

Table 3.44 MCS Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|---|-----|-------------------|
| 31 to 0 | MCS31-0 | These bits specify the size of the target area to specify the size of the memory area subject to a memory protection setting check in bytes. Checking in areas below the address value in the MCS register is not possible because the specified size is handled as an unsigned integer. Do not set 0000 0000 _H in the MCS register. | R/W | Undefined |

(h) MCC — Memory protection setting check command register

This command register is used to start a memory protection setting check.

Table 3.45 MCC Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|--|-----|-------------------|
| 31 to 0 | MCC31-0 | When any value is written to the MCC register, a memory protection setting check starts. Setting the MCA and MCS registers and then writing to this register leads to storage of the result of checking in the MCR register. Since writing any value to this register starts the check, doing so does not require any extra registers when r0 is used as a source register. The result of checking is reflected according to any area setting regardless of the setting of the PSW.UM bit. The value read from the MCC register is always 0000 0000 _H . | R/W | 0 |

(i) MCR — Memory protection setting check result register

This register is used to store the results of a memory protection setting check.

CAUTION

1. If the specified area to be checked crosses 0000 0000_H, it is judged as an area setting error, and the MCR.OV bit is set to 1. This means that the MCR.OV bit must be checked to access the check results. Do not use the check result until it is confirmed that the result is not invalid (OV = 0).
2. When the default set (MPM.DX, DW, DR) is set to 1, a correct result may not be obtained in some cases. If the specified default is to be enabled, do not use the memory protection setting check function.

Table 3.46 MCR Register Contents (1/2)

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|--|-----|-------------------|
| 31 to 9 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 8 | OV | If the specified area includes 0000 0000 _H or 7FFF FFFF _H , 1 is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |
| 7, 6 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 5 | SXE | If the specified area is contained within one protection area and execution is permitted for that area in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |
| 4 | SWE | If the specified area is contained within one protection area and writing to that area is permitted in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |
| 3 | SRE | If the specified area is contained within one protection area and reading from that area is permitted in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |

Table 3.46 MCR Register Contents (2/2)

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|--|-----|-------------------|
| 2 | UXE | If the specified area is contained within one protection area and execution is permitted for that area in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |
| 1 | UWE | If the specified area is contained within one protection area and writing to that area is permitted in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |
| 0 | URE | If the specified area is contained within one protection area and reading from that area is permitted in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |

(j) MPLAn — Protection area minimum address register

These registers indicate the minimum address of area n (where n = 0 to 15).

Table 3.47 MPLAn Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|--|-----|-------------------|
| 31 to 2 | MPLA31-2 | These bits indicate the minimum address of area n. The MPLAn.MPLA1-0 bits are implicitly set to 0. | R/W | Undefined |
| 1, 0 | Reserved | Reserved for future expansion. Be sure to clear these bits to 0. | R | 0 |

(k) MPUAn — Protection area maximum address register

These registers indicate the maximum address of area n (where n = 0 to 15).

Table 3.48 MPUAn Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|--|-----|-------------------|
| 31 to 2 | MPUA31-2 | These bits indicate the maximum address of area n. The MPUAn.MPUA1-0 bits are implicitly set to 1. | R/W | Undefined |
| 1, 0 | Reserved | Reserved for future expansion. Be sure to clear these bits to 0. | R | 0 |

(I) MPATn — Protection area attribute register

These registers indicate the attributes of area n (where n = 0 to 15).

Table 3.49 MPATn Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|---|-----|-------------------|
| 31 to 26 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 25 to 16 | ASID | These bits indicate the ASID value to be used as the area match condition. | R/W | Undefined |
| 15 to 8 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 7 | E | This bit indicates whether area n is enabled or disabled. 0: Area n is disabled. 1: Area n is enabled. | R/W | 0 |
| 6 | G | 0: ASID match is the condition. 1: ASID match is not the condition. When this bit is 0, the condition of the area match is MPATn.ASID = ASID.ASID. When this bit is 1, the values of MPATn.ASID and ASID.ASID is not the condition. | R/W | Undefined |
| 5 | SX | This bit indicates the execution privilege in supervisor mode.*1 0: Execution is disabled. 1: Execution is enabled. | R/W | Undefined |
| 4 | SW | This bit indicates the write permission in supervisor mode.*1 0: Writing is disabled. 1: Writing is enabled. | R/W | Undefined |
| 3 | SR | This bit indicates the read permission in supervisor mode*1 0: Reading is disabled. 1: Reading is enabled. | R/W | Undefined |
| 2 | UX | This bit indicates the execution privilege in user mode. 0: Execution is disabled. 1: Execution is enabled. | R/W | Undefined |
| 1 | UW | This bit indicates the write permission in user mode. 0: Writing is disabled. 1: Writing is enabled. | R/W | Undefined |
| 0 | UR | This bit indicates the read permission in user mode. 0: Reading is disabled. 1: Reading is enabled. | R/W | Undefined |

Note 1. If access is restricted in SV mode, execution of MDP exceptions or the MIP exception handling itself might not be possible depending on the settings. Be careful to specify settings so that access to the memory area necessary for the exception handler and exception handling is permitted.

(6) Cache Operation Function Registers

(a) Cache control function system registers

Cache control function system registers are read from or written to by using the LDSR and STSR instructions and specifying the system register number, which is made up of a register number and selection ID.

Table 3.50 Cache Operation Function Registers

| Register No. (reg.ID, sel.ID) | Symbol | Function | Access Permission |
|----------------------------------|--------|----------------------------------|----------------------|
| SR16, 4 | ICTAGL | Instruction cache tag Lo access | SV |
| SR17, 4 | ICTAGH | Instruction cache tag Hi access | SV |
| SR18, 4 | ICDACL | Instruction cache data Lo access | SV |
| SR19, 4 | ICDATH | Instruction cache data Hi access | SV |
| SR24, 4 | ICCTRL | Instruction cache control | SV |
| SR26, 4 | ICCFG | Instruction cache configuration | SV |
| SR28, 4 | ICERR | Instruction cache error | SV |

(b) ICTAGL — Instruction cache tag Lo access register

This register is used for CIST and CILD instructions for the instruction cache. This register holds values to be stored in the tag RAM of the instruction cache by the execution of CIST instructions and values read from the tag RAM of the instruction cache by the execution of CILD instructions.

Table 3.51 ICTAGL Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|---|-----|----------------------|
| 31 to 10 | LPN | These bits hold the values of 24 to 12 bits of physical page numbers. When writing, always write 0 to bits 31 to 25 and bits 11 to 10. | R/W | Undefined |
| 9 to 6 | Reserved | (Reserved for future expansion. When writing, always write 0 to these bits.) | R | 0 |
| 5, 4 | LRU | These bits indicate the LRU information of the specified cache line. The CIST instruction cannot be used to change the LRU information to desired values. | R/W | Undefined |
| 3 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 2 | L | This bit holds the lock information. | R/W | Undefined |
| 1 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 0 | V | This bit retains whether the specified cache line is enabled or disabled. | R/W | Undefined |

(c) ICTAGH — Instruction cache tag Hi access register

This register is used for a CIST or CILD instruction for the instruction cache. This register stores the value to be stored in the instruction cache tag RAM on CIST execution and the value read from the instruction cache tag RAM on CILD execution.

Table 3.52 ICTAGH Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|---|-----|-------------------|
| 31 | WD | When this bit is set to 1, executing a CIST instruction updates the cache data RAM. | R/W | Undefined |
| 30 | PD | When this bit is set to 1 during CIST execution, values in the DATAECC field are overwritten to ECC for data RAM. When this value is 0, ECC is generated automatically from the write data. | R/W | Undefined |
| 29 | WT | When this bit is set to 1 during CIST execution, tag RAM of cache is updated. | R/W | Undefined |
| 28 | PT | When this bit is set to 1 during CIST execution, values in the TAGECC field are overwritten to ECC for tag RAM. When this value is 0, ECC is generated automatically from the write data. | R/W | Undefined |
| 27 to 24 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 23 to 16 | DATAECC | These bits store ECC for data RAM. | R/W | Undefined |
| 15 to 8 | TAGECC | These bits store ECC for tag RAM. Write 0 to bit 15. | R/W | Undefined |
| 7 | Reserved | When read, the value after reset is read. When writing, write the value after reset. | R | 0 |
| 6 | Reserved | When read, an undefined value is read. When writing, always write 0. | R | Undefined |
| 5 to 2 | Reserved | When read, the value after reset is read. When writing, write the value after reset. | R | 0 |
| 1, 0 | Reserved | When read, an undefined value is read. When writing, always write 0. | R | Undefined |

(d) ICDATL — Instruction cache data Lo access register

This register is used by the CIST/CILD instruction in relation to the instruction cache. During execution of CIST, values that are stored to the data RAM for the instruction cache are stored. During execution of CILD, values read from the data RAM for the instruction cache are stored.

Table 3.53 ICDATL Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|--|-----|-------------------|
| 31 to 0 | DATAL | Bits 31 to 0 or bits 95 to 64 are stored among the instruction data of a block in the specified cache line. The stored bits are specified by the offset of index. Offset of index = 0000: Bits 31 to 0 Offset of index = 1000: Bits 95 to 64 | R/W | Undefined |

(e) ICDATH — Instruction cache data Hi access register

This register is used by the CIST/CILD instruction in relation to the instruction cache. During execution of CIST, values that are stored to the data RAM for the instruction cache are stored. During execution of CILD, values read from the data RAM for the instruction cache are stored.

Table 3.54 ICDATH Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|--|-----|-------------------|
| 31 to 0 | DATAH | Bits 63 to 32 or bits 127 to 96 are stored among the instruction data of a block in the specified cache line. The stored bits are specified by the offset of index. Offset of index = 0000: Bits 63 to 32 Offset of index = 1000: Bits 127 to 96 | R/W | Undefined |

(f) ICCTRL — Instruction cache control register

This register controls the instruction cache.

Table 3.55 ICCTRL Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|--|-----|-------------------|
| 31 to 18 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 17 | D1EIV | This bit selects the operation in response to 1-bit errors in the data RAM. 0: The error is corrected and then processing continues, but the address of the entry that had an error is retained. 1: The error is not corrected, the entry is cleared, and fetching is repeated. This bit is read as the previous value until the setting is actually reflected in the instruction cache. | R/W | 1 |
| 16 | Reserved | (Reserved for future expansion. Be sure to set to 1.) | R | 1 |
| 15 to 9 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 8 | ICHCLR | Setting this bit to 1 clears the whole instruction cache in a single operation. After this bit has been set to 1, it will be read as 1 until clearing is completed. The read value of this bit is 0 once clearing of the cache is completed. | R/W | 0 |
| 7 to 3 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 2 | ICHEIV | Setting this bit to 1 allows the instruction cache to be automatically disabled (ICHEN bit to be cleared to 0) when a cache error occurs. | R/W | 0 |
| 1 | ICHEMK | Setting this bit to 1 selects masking of cache error exception notifications for the CPU when cache errors are encountered. | R/W | 1 |
| 0 | ICHEN | This bit disables or enables the instruction cache. 0: Instruction cache is disabled. 1: Instruction cache is enabled. This bit is read as the previous value until the setting is actually reflected in the instruction cache. | R/W | 1 |

(g) ICCFG — Instruction cache configuration register

This register shows the configuration of the instruction cache.

Table 3.56 ICCFG Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|--|-----|-------------------|
| 31 to 17 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 16 | Reserved | (Reserved for future expansion. Be sure to set to 1.) | R | 1 |
| 15 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 14 to 8 | ICHSIZE | These bits indicate the capacity (in Kbytes) of the instruction cache. 001 0000: 16 Kbytes | R | 10 _H |
| 7 to 4 | ICHLINE | These bits indicate the number of lines per 1 way in the instruction cache. 1000: 256 lines | R | 8 _H |
| 3 to 0 | ICHWAY | These bits indicate the number of ways of the instruction cache. 0100: 4 ways | R | 4 _H |

(h) ICERR — Instruction cache error register

This register stores cache error data of the instruction cache.

Once the ICHERR bit is set to 1, subsequent cache error data is not stored in this register until the ICHERR bit is cleared to 0. Also, the ICERR register is not updated while the cache is being accessed by the CILD instruction.

Table 3.57 ICERR Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|--|-----|-------------------|
| 31 | CISTW | This bit is set to indicate that the destination way specified for a CISTI instruction was in error. Although the entry information is overwritten so that writing is completed, the V bit will be cleared the next time the cache line is read (i.e. reading will be judged to have missed the cache). However, setting of this bit is not accompanied by an exception for the CPU. | R/W | 0 |
| 30 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 29 | ESMH | Error status: multi-hit | R/W | Undefined |
| 28 | ESPBSE | Error status: way error | R/W | Undefined |
| 27 | ESTE1 | Error status: 1-bit error in the tag RAM | R/W | Undefined |
| 26 | ESTE2 | Error status: 2-bit error in the tag RAM | R/W | Undefined |
| 25 | ESDC | Error status: 1-bit correction in the data RAM | R/W | Undefined |
| 24 | ESDE | Error status: 2-bit error in the data RAM | R/W | Undefined |
| 23, 22 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 21 | ERMMH | Error exception notification mask: multi-hit | R/W | 0 |
| 20 | ERMPBSE | Error exception notification mask: way error | R/W | 0 |
| 19 | ERMTE1 | Error exception notification mask: 1-bit error in the tag RAM | R/W | 0 |
| 18 | ERMTE2 | Error exception notification mask: 2-bit error in the tag RAM | R/W | 0 |
| 17 | ERMDC | Error exception notification mask: 1-bit correction in the data RAM | R/W | 0 |
| 16 | ERMDE | Error exception notification mask: 2-bit error in the data RAM | R/W | 0 |
| 15 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 14, 13 | ICHEWY | These bits retain a way number where a cache error occurs. | R/W | Undefined |
| 12 to 5 | ICHEIX | These bits retain a cache index where a cache error occurs. | R/W | Undefined |
| 4 | ICHERQ | Setting of this bit to 1 indicates that the CPU is being notified of a cache error exception. If cache error exceptions are masked, however, the CPU is not notified of an exception even when this bit is set to 1. | R/W | 0 |
| 3 | ICCHED | This bit indicates that an error occurs in the data RAM. | R/W | 0 |
| 2 | ICHET | This bit indicates that an error occurs in the tag RAM. | R/W | 0 |
| 1 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 0 | ICHERR | This bit is set to 1 when a cache error occurs. | R/W | 0 |

(7) Data Buffer Operation Function Registers

(a) Data buffer control function system registers

Data buffer control system registers are read from or written to by using the LDSR and STSR instructions and specifying the system register number, which is made up of a register number and selection ID.

Table 3.58 Data Buffer Operation Function Registers

| Register No. (reg.ID, sel.ID) | Symbol | Function | Access Permission |
|----------------------------------|--------|------------------------------|----------------------|
| SR24,13 | CDBCR | Data buffer control register | SV |

(b) CDBCR — Data Buffer Control Register

This register controls the data buffer.

Table 3.59 CDBCR Register Contents

| Bit Position | Bit Name | Function | R/W | Value After Reset |
|--------------|----------|--|-----|-------------------|
| 31 to 2 | Reserved | (Reserved for future expansion. Be sure to clear to 0.) | R | 0 |
| 1 | CDBCLR | When this bit is set to 1, the data buffer is cleared at a time. This bit is always read as 0. | W | 0 |
| 0 | CDBEN | This bit disables or enables the data buffer. 0: Data buffer is disabled. 1: Data buffer is enabled. | R/W | 1 |

3.2.2 Instruction Cache and Data Buffer

3.2.2.1 Features

A 16-Kbyte and 4-way set-associative Instruction Cache is mounted between the CPU1 and the Code Flash. The Instruction Cache and the Code Flash are connected to each other via a 128-bit dedicated bus to minimize penalties caused by a cache miss-hit. Also a Data Buffer is mounted between the CPU1 and the Code Flash to achieve high-speed data access. The 32-MB area from 0000 0000_H to 01FF FFFF_H in the address space is intended for the Instruction Cache and Data Buffer.

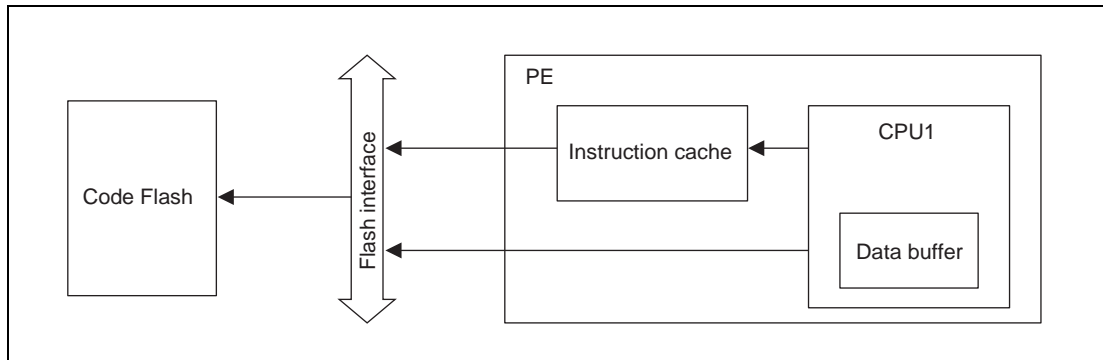

Figure 3.2 Instruction Cache and Data Buffer

3.2.2.2 Instruction Cache Function

The 16-Kbyte and 4-way set-associative cache includes four ways consisting of 256-entry blocks of four words per line, amounting to 16-Kbyte capacity in total. The ways are divided into two groups, way group 0 consisting of way0 and way1 and way group 1 consisting of way2 and way3. The way group can be selected and used by decoding of the address information of the access destination. If a cache error occurs, each line is refilled by a replace algorithm using LRU. CPU instruction fetches from the Code Flash are performed via the instruction cache.

Figure 3.3 Instruction Cache Configuration

Tag Array

- V bit** This bit indicates whether valid data is stored in the cache line. Setting of this bit to 1 makes the cache line data valid. The V bit is initialized to 0 by reset.
- L bit** This bit indicates whether a cache line is locked or not. Setting of this bit to 1 locks the cache line and it can not be replaced with new data. The L bit is valid only when the V bit is 1, and it is not initialized by reset.
- TAG** Among 32 bits in the operable addresses of the data line to be cached, bits 24 to 12 are stored in this bit. The TAG bit is not initialized by reset.
- ECC** The ECC of the tag array is stored in this bit. The ECC bit is not initialized by reset.

Data Array

| | |
|---|---|
| DATH_H, DATH_L, DATL_H, DATL_L | The 128-bit cache line data is stored per 32 bits as follows: the bits [127:96], [95:64], [63:32], [31:0] in the DATH_H, DATL_H, DATH_L, and DATL_L, respectively. In the CIST or CILD operation in response to a cache instruction, the ICDATH register is used for DATH_H and DATH_L and ICATL is used for DATL_H and DATL_L. |
| ECC_H, ECC_L | The ECC of the data in bits [127:64] and [63:0] are stored in ECC_H and ECC_L, respectively. |

LRU

| | |
|-----|--|
| LRU | The LRU information in the same way group is stored in this data array. The LRU is initialized by reset. |
|-----|--|

CAUTION

When writing test data to the tag array of the instruction cache in the CIST instruction and then fetching the relevant line, write the tag information in units of way group. For example, when writing tag information to a line on the way 0 side of way group 0, also write the tag information of the same line on the way 1 side and then perform instruction fetch

- When writing data to way group 0 (way0, way1), write a value that makes the Exclusive OR of the ICTAGL.LPN bit 0.
- When writing data to way group 1 (way2, way3), write a value that makes the Exclusive OR of the ICTAGL.LPN bit 1.

When a value other than those above is written to the tag array and instruction fetch is performed, a way error occurs and the ICERR.ESPBSE bit is set to 1. When the same tag information is written to the same lines of two ways in a way group and instruction fetch is performed, a multi-hit error occurs and the ICERR.ESMH bit is set to 1.

3.2.2.3 Data Buffer Function

The four-line buffer with 128 bits per line is mounted as a data buffer. The data of 128 bits per line read from the Code Flash is stored in the data buffer. The data is read out from the data buffer after the next access to the same address, so the Code Flash is not accessed again.

3.2.3 Reliability Functions

3.2.3.1 PE Guard Function (PEG)

(1) Overview of the PEG Function

The PEG is a constituent of the slave guard system to prevent unauthorized access to the resources in the PE from the external master. This function protects access to the local RAM in the PE. In the initial state after a reset, all access by masters other than the PE itself is disabled. Setting the registers listed in **(3) List of PEG Protection Setting Registers**, enables access by masters other than the PE itself.

- Detecting PE guard violation

If the external master outside the PE makes an unauthorized access to the resource area in the PE for which PE guard is set, the access is detected as a PE guard violation. PE Guard informs it to ECM and reports the details about the access in registers.

- Blocking unauthorized accesses

When a PE guard violation is detected, unauthorized accesses to the internal resources of the PE are blocked to prevent the contents of PE resources from being modified illegally.

- Notifying occurrence of violation

An error response to an unauthorized access is sent to the request source of external master (except H-Bus master peripherals). When the DMAC or DTS makes an unauthorized access, meanwhile, a DMA transfer error is detected.

(2) Protection Made by SPID

- Setting PEG Protection

- Up to eight areas can be set depending on the Local RAM address of the own PE.
- The area range is specified by the base address and the mask bit (4 Kbytes to 4 Gbytes).
- “Read enable” and “write enable” can be set for each area.
- “Enable” or “disable” can be selected on each system protection identifier (SPID) for each area.

- Access permission by the system protection identifier (SPID) (see **Figure 3.4**)

1. When any of enabled area 0 to area 7 is to be accessed, go to step 2. Otherwise, return an error response.
2. Are all the conditions below for the relevant area met?
 - The system protection identifier (SPID) is enabled.
 - Required operations (read/write) are enabled.
 Otherwise, return an error response.

Figure 3.4 Access Permission by the System Protection Identifier (SPID)

(3) List of PEG Protection Setting Registers

Make necessary settings for the following registers to protect PE resources from unauthorized accesses by the external master.

- Accesses to the Local RAM in the PE are permitted as detection targets.
- For accesses to the register set, no access restriction is provided independently for the PEG function. Set access protections such as IPG at the user side as necessary.
- To set PEG protection, follow the procedure below. (n = 0 to 7)
 - Set the PE guard area n mask setting register as PEGGnMK.
 - Set the PE guard area n base setting register as PEGGnBA.

Table 3.60 PEG Protection Setting Registers (Base Address: FFFE E600_H)

| Address Offset | Size (Byte) | Register Name | Abbreviation | Right | R/W | Operable Bit | | | | Value After Reset |
|-------------------|-------------|---|--------------|-------|-----|--------------|---|----|----|------------------------|
| | | | | | | 1 | 8 | 16 | 32 | |

Table 3.61 PE guard Error Status Registers (Base Address of PE1: FFC4 A200_H)

| Address Offset | Register Name | Register Symbol | R/W | Value After Reset |
|------------------|--|------------------|-----|------------------------|
| +00 _H | PE guard Error Status Control Register | PGERRSTATCTL_PE1 | R/W | 0000 0000 _H |
| +04 _H | PE guard Error Status Register | PGERRSTAT_PE1 | R | 0000 0000 _H |
| +08 _H | PE guard Error Information Register | PGERRINFO_PE1 | R | 0000 0000 _H |

(4) Register Set

(a) PEGGnMK — PE Guard Area n Mask Setting Register (n = 0 to 7)

In combination with the PEGGnBA register, this register specifies a range or ranges within PE guard protection area n. Setting a GnMASK bit to 1 masks the corresponding address bit in the PEGGnBA register and places the corresponding area or area inside the range of PE guard area n. The minimum size of the PE guard protection area is 4KB.

Ex) With the settings of PEGGnBA[31:12]=FEBF6_H and PEGGnMK[31:12]=00008_H, the PE guard protection area n is specified within the ranges from FEBF 6000_H to FEBF 6FFF_H and FEBF E000_H to FEBF EFFF_H.

| | | | | | | | | | | | | | | | | |
|-------------------------|--------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Note 1. Refer to **Table 3.60, PEG Protection Setting Registers (Base Address: FFFE E600_H)**.

Table 3.62 PEGGnMK Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 31 to 12 | GnMASK | 0: Target address bits are compared when determining the PE guard area. 1: Target address bits are not compared when determining the PE guard area. |
| 11 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

(b) PEGGnBA — PE Guard Area n Base Setting Register (n = 0 to 7)

In combination with the PEGGnMK register, this register specifies a range or ranges within PE guard protection area n. Setting the GnEN bit to 1 brings the address enable conditions specified by this register and the PEGGnMK register into effect.

| | | | | | | | | | | | | | | | | |

| R/W | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | W | R | R/W | R/W | R/W |

Note 1. Refer to **Table 3.60, PEG Protection Setting Registers (Base Address: FFFE E600_H)**.

Table 3.63 PEGGnBA Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 12 | GnBASE | Base address that specifies PE guard protection area n |
| 11 to 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | GnLOCK | Enables write protect to the registers (PEGGnBA, PEGGnMK, PEGGnSP) of PE guard control. This bit can be written once after reset. 0: Registers are not protected. 1: Registers are protected. |
| 3 | Reserved | This bit is always read as 0. The write value should always be 0. |
| 2 | GnWR | Enables write access to PE guard protection area n. 0: Write access is disabled. 1: Write access is enabled. |
| 1 | GnRD | Enables read access to PE guard protection area n. 0: Read access is disabled. 1: Read access is enabled. |
| 0 | GnEN | Enables the access enable condition settings for the PE guard protection area n. 0: Settings for access enable conditions are disabled 1: Settings for access enable conditions are enabled |

CAUTION

PEGGnBA.GnEN is cleared by writing to the PEGGnMK register.

(c) PEGGnSP — PE Guard Area n enable Setting Register (n = 0 to 7)

| | | | | | | | | | | | | | | | | |
|---------------------------------|-------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|

Table 3.67 PGERRINFO_PE1 Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 31 to 8 | Reserved | When written, write value after reset. Read value is always value after reset. |
| 7 to 5 | PEID | PEID of the bus master that initiated the access |
| 4 to 0 | SPID | SPID of the bus master that initiated the access |

3.2.3.2 PE's Internal Peripherals Protection Function (IPG)

(1) Overview of the IPG Function

The IPG is a system to prevent unauthorized accesses to peripherals from the CPU core equipped with the IPG. The IPG achieves the following functions. The IPG covers accesses to resources except the Code Flash and the local RAM.

step (1) Detecting violation of peripherals protection

If the CPU makes an unauthorized access to an area (peripherals) for which peripherals protection is set, the access is detected as "violation of peripherals protection."

step (2) Storing unauthorized-access information

When a violation of peripherals protection is detected, the unauthorized-access information is stored in the IPG's internal register.

step (3) Blocking unauthorized accesses

When a violation of peripherals protection is detected, unauthorized accesses to peripherals are blocked to prevent contents of peripherals from being modified illegally.

step (4) Notifying violation

When a violation of peripherals protection is detected, a system error exception (SYSERR exception) request for generating an exception is made to ask the CPU to stop the processing.

For system error exceptions (SYSERR exceptions), see **Section 3.2.3.3, System Error Notification Control Function (SEG)**.

step (5) Invalidating subsequent accesses

When a violation of peripherals protection is detected, subsequent accesses (regardless of authorized or unauthorized accesses) are blocked until instructions from the CPU are received.

NOTE

Even if a request for generating an exception is immediately sent to the CPU in step (4) above, a subsequent access issued (before receiving a request from the IPG) by the CPU that does not know an occurrence of violation may illegally modify contents of peripherals. (Accesses after a violation has occurred result in unauthorized accesses.)

(2) IPG Function

- This function invalidates accesses according to their attributes (including address, transfer type, and access right).
- After an access right violation is detected until the error flag (described later) is cleared by writing by the software, subsequent accesses are invalidated. However, invalidation is applied only to accesses from the CPU and is not applied to accesses from outside the CPU core. Invalidation is performed independently of addresses.
- When a request for accessing different peripherals simultaneously is made due to misalignment or double-word access, the access is executed when all such accesses are enabled.

(3) IPG Protection Setting Registers for Illegal Users

To protect peripherals from unauthorized accesses by programs in user mode, necessary settings are required for the registers listed below.

- Accesses in user mode are to be detected.
- This register set is intended for IPG settings related to user mode and reading the IPG settings in own machine.

Table 3.68 IPG registers (Base Address: FFFE E000_H)

| Address Offset | Size (Byte) | Register Name | Abbreviation | Right ^{*1} | R/W | Operable Bit | | | | Value After Reset |
|-------------------|-------------|--|--------------|---------------------|-----|--------------|---|----|----|----------------------|
| | | | | | | 1 | 8 | 16 | 32 | |
| +002 _H | 2 | Peripherals protection violation access information register | IPGECRUM | SV | R/W | — | — | √ | — | Undefined (retained) |
| +008 _H | 4 | Peripherals protection violation access address register | IPGADRUM | SV | R/W | — | — | — | √ | Undefined (retained) |
| +00D _H | 1 | Peripherals protection enable register | IPGENUM | SV | R/W | √ | √ | — | — | 00 _H |
| +020 _H | 1 | Peripherals protection setting register 0 | IPGPMTUM0 | SV | R/W | √ | √ | — | — | 00 _H |
| +021 _H | 1 | Peripherals protection setting register 1 | IPGPMTUM1 | SV | R/W | √ | √ | — | — | 00 _H |
| +022 _H | 1 | Peripherals protection setting register 2 | IPGPMTUM2 | SV | R/W | √ | √ | — | — | 00 _H |
| +023 _H | 1 | Peripherals protection setting register 3 | IPGPMTUM3 | SV | R/W | √ | √ | — | — | 00 _H |
| +024 _H | 1 | Peripherals protection setting register 4 | IPGPMTUM4 | SV | R/W | √ | √ | — | — | 00 _H |

Note 1. Registers for which "SV" is described are accessible by accesses with SV right (UM = 0).

(4) Register Set**(a) IPGECRUM — Peripherals Protection Violation Access Information Register**

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|----|----|----|----|----|----|---|---|-----|-----|-----|-----|-----|-----|-----|-----|
| | — | — | — | — | — | — | — | — | DS | | | EX | WR | RD | VD | |
| Value after reset | 0 | 0 | x | x | x | x | x | x | x | x | x | x | x | x | x | x |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

x: Undefined (retained)

Table 3.69 Register Contents of IPGECRUM

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 15, 14 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 13 to 8 | Reserved | The read value is undefined. The write value should always be 0. |
| 7 to 4 | DS | These bits store the data size of access that made a violation. 1000: Double-word (8 bytes) 0100: Word (4 bytes) 0010: Half-word (2 bytes) 0001: Byte Other than above: RFU |
| 3 | EX | This bit is set to 1 when a violation occurred in an instruction fetch read access. In other cases, this bit is cleared to 0. |
| 2 | WR | This bit is set to 1 when a violation occurred in a write access or bit operation or CAXI. In other cases, this bit is cleared to 0. |
| 1 | RD | This bit is set to 1 when a violation occurred in a read access or bit operation or CAXI. In other cases, this bit is cleared to 0. |
| 0 | VD | This bit is set to 1 when a violation of peripherals protection is detected by a program with the relevant right. If another violation of peripheral protection is detected, data of this IPGECRUM register and the IPGADRUM register is updated. |

NOTE

When the IRE bit value of the IPGENUM register (described later) is 0 and violation of peripherals protection by a program operating in user mode is an instruction fetch read access, no bit of this register is updated.

(b) IPGADRUM — Peripherals Protection Violation Access Address Register

| | | | | | | | | | | | | | | | | |
|-------------------|------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

x: Undefined (retained)

Table 3.70 Register Contents of IPGADRUM

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 0 | EADR | These bits store the address of the access in which a violation occurred. |

NOTE

When the IRE bit value of the IPGENUM register (described later) is 0 and violation of peripherals protection by a program operating in user mode is an instruction fetch read access, no bit of this register is updated.

(c) IPGENUM — Peripherals Protection Enable Register

| | | | | | | | | |
|-------------------|---|---|---|---|---|---|-----|-----|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | IRE | E |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 3.71 Register Contents of IPGENUM

| Bit Position | Bit Name | Function |
|---|----------|--|
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | IRE | This bit sets whether to store the access information in the peripherals protection violation access address register and the peripherals protection violation access information register when a violation of peripherals protection occurred in an instruction fetch access. 0: Instruction fetch access information is not stored. (Value after reset) 1: Instruction fetch access information is stored. |
| CAUTION | | |
| If you do not want to detect speculative instruction fetches (no instruction is executed in some cases), clear this bit to 0. | | |
| 0 | E | This bit enables or disables the peripherals protection function against accesses by the relevant access right. 0: The peripherals protection function is disabled. (Value after reset) 1: The peripherals protection function is enabled. |

(d) IPGPMTUM0 — Peripherals Protection Setting Register 0

| | | | | | | | | |
|-------------------|---|-----|-----|-----|---|---|---|---|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | X1 | W1 | R1 | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| R/W | R | R/W | R/W | R/W | R | R | R/W | R/W |

Table 3.76 Register Contents of IPGPMTUM4

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | X1 | This bit sets whether to enable instruction fetch read access to peripherals to be connected to the H-Bus. 0: Instruction fetch read access to peripherals to be connected to the H-Bus is treated as violation. (Value after reset) 1: Instruction fetch read access to peripherals to be connected to the H-Bus is not restricted. |
| 5 | W1 | This bit sets whether to enable write access to peripherals to be connected to the H-Bus. 0: Write access to peripherals to be connected to the H-Bus is treated as violation. (Value after reset) 1: Write access to peripherals to be connected to the H-Bus is not restricted. |
| 4 | R1 | This bit sets whether to enable read access to peripherals to be connected to the H-Bus. 0: Read access to peripherals to be connected to the H-Bus is treated as violation. (Value after reset) 1: Read access to peripherals to be connected to the H-Bus is not restricted. |
| 3, 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | W0 | This bit sets whether to enable write access to PEG. 0: Write access to PEG is treated as violation. (Value after reset) 1: Write access to PEG is not restricted. |
| 0 | R0 | This bit sets whether to enable read access to PEG. 0: Read access to PEG is treated as violation. (Value after reset) 1: Read access to PEG is not restricted |

3.2.3.3 System Error Notification Control Function (SEG)

Errors due to an instruction fetch or data access can be the sources of system error exceptions. A SYSERR exception is an FE level exception from which return or recovery is not possible.

SEG (SysErrGen) controls the notification and record of the error by the data access. Instruction cache errors occurred on the RAM are notified to the SEG. For details, see section (a) **SEGCONT — Error Notification Control Register** and (c) **Additional information on SYSERR exception**.

Multiple error occurrence inputs are categorized according to error factors, and are processed sequentially from the highest-priority error factor, generating an FE-level asynchronous exception (SYSERR).

The bit position of the SEGFLAG register becomes the priority of error factors. Error factors of lower bits take precedence over error factors of upper bits.

Error information is recorded once regardless of error frequency.

The error with the highest priority of error factor (in case errors occurred simultaneously) is valid. Recorded error information is not overwritten by subsequent errors.

(1) List of SEG Function Control Registers

Table 3.77 SEG Register (Base Address: FFFE E980_H)

| Address Offset | Size (Byte) | Register Name | Abbreviation | Right | R/W | Operable Bit | | | | Value After Reset |
|------------------|-------------|---|--------------|-------|--------|--------------|---|----|----|----------------------|
| | | | | | | 1 | 8 | 16 | 32 | |
| +00 _H | 2 | Error notification control register | SEGCONT | — | R/W *1 | — | — | √ | — | 0000 _H |
| +02 _H | 2 | Error occurrence retention register | SEGFLAG | — | R/W *1 | — | — | √ | — | 0000 _H |
| +08 _H | 4 | Error factor retention register (address) | SEGADDR | — | R/W *1 | — | — | √ | √ | Undefined (retained) |

Note 1. Write accesses from user mode are ignored.

NOTE

- If an access is made with an address offset or operable bits other than those specified above, an error response is returned.
- Write access is only possible with the SV privilege (UM = 0). Attempting to write, if these conditions do not hold, leads to an error response being returned.
- No restriction is provided for read accesses.
 - Read accesses to ranges permitted by other protection systems are enabled at any time.

(2) Register Set**(a) SEGCONT — Error Notification Control Register**

- This register is used to enable (= 1) or disable (= 0) notification of SYSERR request in response to error flags that store error occurrence status according to factors.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|----|----|----|----|----|----|------|------|---|------|---|------|---|------|---|-----|

| R/W | R | R | R | R | R | R | R/W | R/W | R | R/W | R | R/W | R | R/W | R | R/W |

Table 3.78 SEGCONT Register Contents (1/2)

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 15 to 10 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 9 | VPGE | This bit notifies an error in writing access to P-Bus. The error includes the followings: <ul style="list-style-type: none"> P-Bus guard error Address EDC error Data ECC error Access to unimplemented area in the P-Bus |
| 8 | VCRE | This bit notifies the IPG violation access detection and subsequent access blocking (including instruction fetch). ^{*1} |
| 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | TCME | This bit notifies an error in accessing data to local RAM. The error includes the following cases: <ul style="list-style-type: none"> ECC error Access to the RAM-unimplemented area in the local RAM |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

Table 3.78 SEGCONT Register Contents (2/2)

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 4 | VCIE | <p>This bit notifies an error from the GRAM, Code Flash, H-bus or P-bus. The error includes the followings:</p> <ul style="list-style-type: none"> • in reading access to P-Bus <ul style="list-style-type: none"> – P-Bus guard error – Address EDC error – Data ECC error – access to unimplemented area in the P-Bus • access to unimplemented area in the CPU-specific functions • in access to H-Bus <ul style="list-style-type: none"> – H-Bus guard error – access to unimplemented area in the H-Bus area • in access to Code Flash <ul style="list-style-type: none"> – Address Parity error – Data ECC error • in access to system peripheral <ul style="list-style-type: none"> – FFFF 0000_H to FFFF 4FFF_H – FFFE 0000_H to FFFE BFFF_H – FB00 0000_H to FE9F FFFF_H – F300 0000_H to F8FF FFFF_H • in access to Global RAM <ul style="list-style-type: none"> – GRAM guard error – Address ECC error – Data ECC error • This bit notifies of an IPG violation access detection and subsequent access blocking.*¹ • This bit notifies of an access privilege violation. <ul style="list-style-type: none"> – Read or write access to the IPG Protection Setting Registers by user mode (PSW.UM = 1). – Write access to the SEG Function Control Registers by user mode (PSW.UM = 1). |
| 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | ICCE | <p>Instruction cache error notification enable</p> <p>The error occurred in the instruction cache is handled when the instruction cache system register, ICCTRL.ICHEMK, is set to 0 (whose value after reset is 1):</p> <p>For instruction cache errors, see (h) ICERR — Instruction Cache Error Register in Section 3.2.1.2, Register Set</p> |
| 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | NEE | <p>This bit notifies the correctable ECC error. Code Flash, Global RAM, Local RAM.</p> <p>To enable this function, it is necessary to set VCIE or TCME bit to 1 at the same time.</p> |

Note 1. Please refer the IPGADRUM register of **Section 3.2.3.2, PE's Internal Peripherals Protection Function (IPG)** for an error factor addresses.

(b) SEGFLAG — Error Occurrence Retention Register

- The register SEGFLAG indicates from which slaves error responses have been received so far. SEGFLAG is not cleared automatically. Clearing can be performed by writing a zero into the register.
- Writing to the register enables both setting and clearing.

| | | | | | | | | | | | | | | | | |
|-------------------|----|----|----|----|----|----|------|------|---|------|---|------|---|------|---|---|
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Table 3.79 SEGFLAG Register Contents

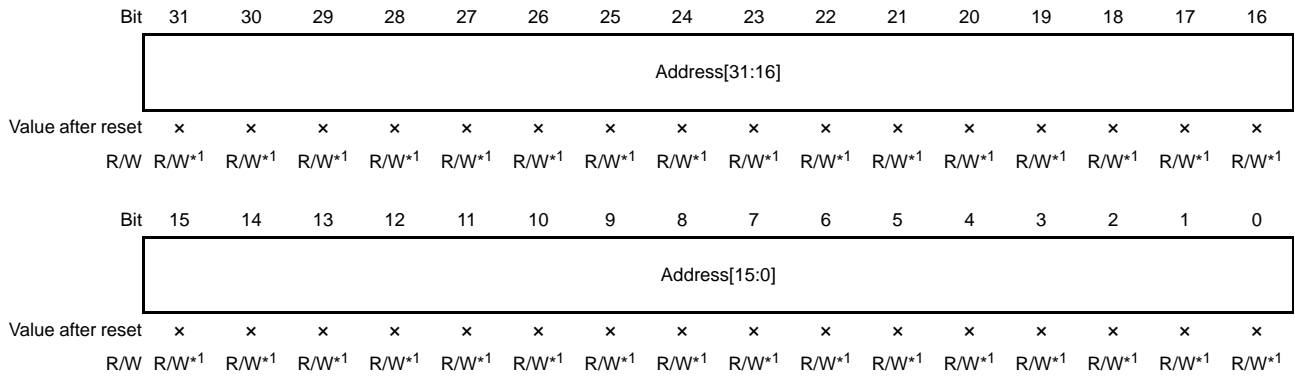

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 15 to 10 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 9 | VPGF | Flag corresponding to bit 9 of the SEGCONT register |
| 8 | VCRF | Flag corresponding to bit 8 of the SEGCONT register |
| 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | TCMF | Flag corresponding to bit 6 of the SEGCONT register |
| 5 | Reserved | When read, the undefined value is returned. When writing, write the value after reset. |
| 4 | VCIF | Flag corresponding to bit 4 of the SEGCONT register |
| 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | ICCF | Flag corresponding to bit 2 of the SEGCONT register |
| 1, 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

Table 3.80 Relationship Between System Error Exception Cause Code and SEGFLAG

| FEIC | Error Cause |
|-----------------|--|
| 10 _H | Reserved |
| 11 _H | Instruction fetch from Code Flash |
| 12 _H | SEGFLAG.ICCF |
| 13 _H | Instruction fetch from other than Code Flash |
| 14 _H | SEGFLAG.VCIF |
| 15 _H | Reserved |
| 16 _H | SEGFLAG.TCMF |
| 17 _H | Reserved |
| 18 _H | SEGFLAG.VCRF |
| 19 _H | SEGFLAG.VPGF |

(c) SEGADDR — SEG Error Information Register (Address)

This register records information of an error source that notifies a SYSERR request (only one history is recorded). It records the addresses where the error factors for the VCIF and TCMF bits of the SEGFLAG register were found. The error factors except VCIF and TCMF bits will be recorded as 0000 0000_H. This register cannot be modified when the error occurrence flag to enable notification is set.

x: Undefined (retained)

Note 1. This register cannot be modified when the error occurrence flag to enable notification is set.

Table 3.81 SEGADDR Register Contents

| Bit Position | Bit Name | Function |
|--------------|---------------|---|
| 31 to 0 | Address[31:0] | These bits hold the address at which SYSERR was generated. (If the error was caused by an access to the local RAM area, the lower 19 bits of the address are held, and the upper 13 bits are cleared to 0.) |

(3) SEG Function**(a) SEG function: Notifying a SYSERR request due to an error flag**

- Setting an error flag takes precedence over clearing the same flag.
 - Simultaneous clearing operation is ignored.
- Priority of error factors
 - The bit position of the notification-enabled SEGFLAG register becomes the priority of error factors. Error factors of lower bits take precedence over error factors of upper bits. Notification is made from the highest-priority error factor.
 - The bit position of error factors is notified as a “SYSERR factor code.”
- Conditions for starting SYSERR request notification
 - Even if a SEGFLAG register bit is set to 1, notification is not made.
 - Notification is made immediately after a SEGCONT register bit is set to 1.
 - After clearing SEGFLAG register bits of error notification subject, notification is made depending on priority of SEGFLAG register bits except for cleared bits (re-arbitration).
- Finishing notification at a SYSERR request response
 - Even after notification is finished, the flag is not cleared automatically.
 - Notification is not made until re-arbitration is performed by setting or clearing the flag.
 - If an error flag that is prioritized higher than the error factor is set prior to a request response, the notification information may be replaced with an upper SYSERR factor code.

(b) SEG function: Recording error factor information

- When notification-enabled error occurrence is input, the error address is retained in the above register.
 - No information is retained by setting or clearing an error flag described in “**(3) (a) SEG function: Notifying a SYSERR request due to an error flag**” above.
 - When multiple error occurrence inputs are present simultaneously, information other than the prioritized error factor is not retained.
- While the notification-enabled error flag described in “**(3) (a) SEG function: Notifying a SYSERR request due to an error flag**” above is set to 1, overwrite to the above register is inhibited
 - If error occurrence input continues, information of subsequent error factors is not retained.
 - To cancel the register overwrite prohibition, clear either SEGCONT or SEGFLAG register (or both of them).

(c) Additional information on SYSERR exception

- Even if an SYSERR exception occurs, the value of the PSW.EBV bit is kept and the base address of an exception handler does not change.
- Error detection in instruction cache

Even if an error is detected in instruction cache, resumable SYSERR exception by instruction fetch factor does not occur. Instruction cache automatically invalidates the entry which includes an error and the CPU continues the instruction execution by re-fetching from the Code Flash. When the ICCTRL.ICHEMK bit in the system register is set to 0, an error occurred in instruction cache is notified to the SEG.

3.2.3.4 Checker Core

The CPU1 (PE1) has the Checker Core for safety assurance, resulting in a highly reliable system. Monitoring the outputs from the CPU1 (PE1) and the Checker Core with the comparator all the time enables immediate detection of the CPU1 (PE1) abnormal operations. Duplication by the checker core covers the CPU core, FPU, MPU, PEG, IPG, SEG, and INTC1. The CPU1 can also conduct a fault diagnosis test of its own comparator through a pseudo-error generated by the COMPTEST module. Please refer to **Section 31, Functional Safety** for detail.

CAUTION

Reading of any register with an undefined value after a reset in a PE or writing to memory or a register outside the PE may cause a lock step comparison error. The values of some program registers and system registers are undefined after a reset, so pay attention to this when saving register values on the stack in RAM.

3.3 Inter CPU Functions Overview

3.3.1 Processor Element Identifier

The PEID, each processor element ID number, can be read from the PEID field in the HTCFCG0 register. Which CPU core performs a specific program can be understood by referring to the PEID. The following shows the PEID of this product.

| CPU core | PEID |
|------------|------------------|
| CPU1 (PE1) | 001 _B |

3.3.2 Exclusive Function

The Local RAM and Global RAM are available as a resource for exclusive control. Atomic operation instructions LDL/STC, CAXI, SET1, CLR1, and NOT1 can be performed for the Local RAM and the Global RAM. Such instructions can not be performed to H-Bus area.

3.3.3 Write-Through Buffer for Global RAM

It is accessible by CPU core through a 64-bit bus. CPU1 (PE1) has a Write-Through Buffer (WT-Buffer or WT-Buf for short). The WT-Buf consists of 2 banks (one for each GRAM bank) and each bank consists of 8 entries x 64bits. The WT-Buf behavior is summarized below according to access type from PE:

Read hit: data are returned from the WT-Buf.

Read miss: data are read from GRAM and they are registered in WT-Buf

Write hit: Both WT-Buf and GRAM are updated

Write miss (no RmW): Both WT-Buf and GRAM are updated

Write miss (with RmW): Read from GRAM first and write the parts to both WT-Buf and GRAM

The data coherency between GRAM and WT-Buffer is always kept because the same data is always written to GRAM and WT-Buffer at the same time. The data coherency between PE and DMA is also kept, as DMA writes to GRAM as well as WT-Buffer at the same time and DMA always reads from GRAM not from WT-Buffer.

The WT-Buffer equips invalidation timer to invalidate the entries automatically. Invalidation timer cycle count can be chosen from 16-cycles/64-cycles/256-cycles. Software invalidation is also possible and one register is provided for this purpose.

The WT-Buffer configuration itself can also be chosen either On or Off. After reset, WT-Buffer is set as On.

(1) List of Write-Through Buffer Control Registers**Table 3.82 Write-Through Buffer Control Register (Base Address: FFFF 7A00_H)**

| Address | Register Name | Function | Access Width | Value after reset |
|--------------------------------------|-----------------|--------------------------------------|--------------|------------------------|
| <GRAMC_QOSREG_base> + 4 _H | GRAMCWTBCONFIG0 | GRAMC WTBuf Configuration Register 0 | 32bit | 0000 0001 _H |
| <GRAMC_QOSREG_base> + 8 _H | GRAMCWTBCONFIG1 | GRAMC WTBuf Configuration Register 1 | 32bit | 0000 0007 _H |
| <GRAMC_QOSREG_base> + C _H | GRAMCWTBCONFIG2 | GRAMC WTBuf Configuration Register 2 | 32bit | 0000 0000 _H |

Note 1. The function of this bit is used by read access.

Table 3.85 GRAMCWTBCONFIG2 Register Contents

| Bit Position | Bit Name | Function |
|--------------|-------------|---|
| 31 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | WTBufTmcClr | When this register is read, All WT Buf entries are flushed. The read value of this bit is always 0. |

3.4 Usage Notes

3.4.1 Synchronization of Store Instruction Completion and Subsequent Instruction Generation

When a control register is updated by a store instruction, there is a time lag after the CPU executes the store instruction and before the control register is actually updated. Therefore, if the updated content of the control register is to be used by the instruction following the store instruction, the appropriate synchronization is required. How to perform synchronization processing is shown below. For the procedures to synchronize updating system registers by LDSR instruction and the subsequent instruction execution, see APPENDIX A. HAZARD RESOLUTION PROCEDURE FOR SYSTEM REGISTERS in the RH850G3M User's Manual: Software.

3.4.1.1 When updated results in the control registers are reflected in the implementation of a subsequent instruction:

[Example 1]

This includes the following case: an interrupt is enabled by implementation of an EI instruction after an interrupt request is cleared by access from the control register in the INTC2 and the peripheral circuits. Proceed as follows in this case.

1. Execute the store instruction to update a control register (ST.W, etc.).
2. Perform a dummy read of the above control register (LD.W etc.).
3. Execute SYNC.P.
4. Execute the subsequent instruction (EI).

[Example 2]

Implement the same processing even when the access required after waiting to secure the updating of a given control register (register A) is to another control register (register B). This includes the following cases: the interlinked operation of different peripheral modules and when releasing the interrupt mask in INTC after making peripheral module settings. However, this processing is unnecessary if control registers A and B are in the same group of peripheral IP modules or control registers A and B are both in the CPU's own peripheral modules.

1. Execute the store instruction to update control register A (ST.W, etc.).
2. Perform a dummy read of the above control register (LD.W, etc.).
3. Execute SYNC.P.
4. Execute the store instruction to access control register B (ST.W, LD.W, etc.).

The same processing is also required when access to control registers and memory within the scope of protection starts after waiting for the completion of settings for safety functions such as memory protection, ECC checking, and so on.

For details of the peripheral groups, see **Section 1.4, Block Configuration**.

For the procedures to synchronize updating system registers by LDSR instruction and the subsequent instruction execution, see *APPENDIX A. Hazard Resolution Procedure for System Registers* in the *RH850G3M User's Manual: Software*.

3.4.1.2 When the updated results of the control registers or memory to be used in the instruction fetch of the subsequent instruction:

- (a) In case of writing the instructions to the RAM before jumping to the RAM to execute instructions from the RAM, take the following procedure.
 1. Execute the store instruction to update a memory (ST.W, etc.).
 2. Perform a dummy read of the above-mentioned memory (LD.W, etc.).
 3. Execute SYNCP.
 4. Execute SYNCL.
 5. Execute the subsequent instruction (branch instruction, etc.).
- (b) In case of updating control registers for memory protection and ECC functions before jumping to the memory to be controlled by the registers, take the following procedure.
 1. Execute the store instruction to update a control register (ST.W, etc.).
 2. Perform a dummy read of the above-mentioned control register (LD.W, etc.).
 3. Execute SYNCP.
 4. Execute SYNCL.
 5. Execute the subsequent instruction (branch instruction, etc.).

3.4.1.3 When switching the code flash memory area:

In this case, see *Section 9, Usage Notes, (7) Update of BFASCLR register* in the *RH850/P1M-E Flash Memory User's Manual: Hardware Interface*.

3.4.2 Accesses to Registers by Bit-Manipulation Instructions

Writing by using bit-manipulation instructions consists of atomic read-modify-write processing in 8-bit units. Thus, access by a bit-manipulation instruction is only possible for registers for which reading and writing in 8-bit units is possible. If a register includes multiple flag bits, the read-modify-write operation may lead to the clearing of flags that were not actually targets for clearing.

Write access to the FlexRay registers by using bit-manipulation instructions is not atomic. Access by other masters may interrupt the read-modify-write processing of these instructions.

3.4.3 Ensuring Coherency after Code Flash Programming

The CPU has an efficient instruction cache and data buffer for the code flash area.

Therefore, after using self-programming to program the code flash memory, clear the instruction cache and data buffer to ensure coherency. The instruction cache and data buffer can be cleared by using the ICCTRL register and the CDBCR register, respectively.

3.4.4 Overwriting Context when Acknowledging Multiple Exceptions

Acceptance of an exception depends on the type of exception source, regardless of the states of the ID and NP bits in the PSW register. When multiple exceptions are generated, the contents of the system register which hold the context information are overwritten. For the conditions for acceptance and whether correct return or recovery is possible for each exception source, see the List of Exception Sources in the *RH850G3M User's Manual: Software*.

3.4.5 Usage Notes on Prefetching

CPU executes speculative instruction fetching from locations later than the current value of the program counter to maintain the throughput of instruction fetches. Reading from memory due to such prefetching may proceed even from locations to which instruction codes have not been assigned (note 1 in **Figure 3.5**). Please note the following. The CPU does not execute values read in such cases.

These notes apply to instruction fetching from memory in general.

- Occurrence of ECC errors due to values in memory being undefined

This prefetching may lead to an ECC error in case of reading from the code flash memory after it has been erased or from the local RAM before initialization. When instruction codes are assigned to memory, initialize said area with values as desired (note 1 in **Figure 3.5**).

- Detection of illegal access by the IPG

The IPG may detect such prefetching as illegal access. To prevent prefetching being detected as an illegal access, do not allow any region of overlap area with said areas (note 1 in **Figure 3.5**) and areas to which access is prohibited by the IPG. Reading from an area protected by the MPU does not cause a memory protection exception.

- Access to Access Prohibited Area

Assign instruction codes to memory without allowing any overlap between said area (note 1 in **Figure 3.5**) and an access-prohibited area.

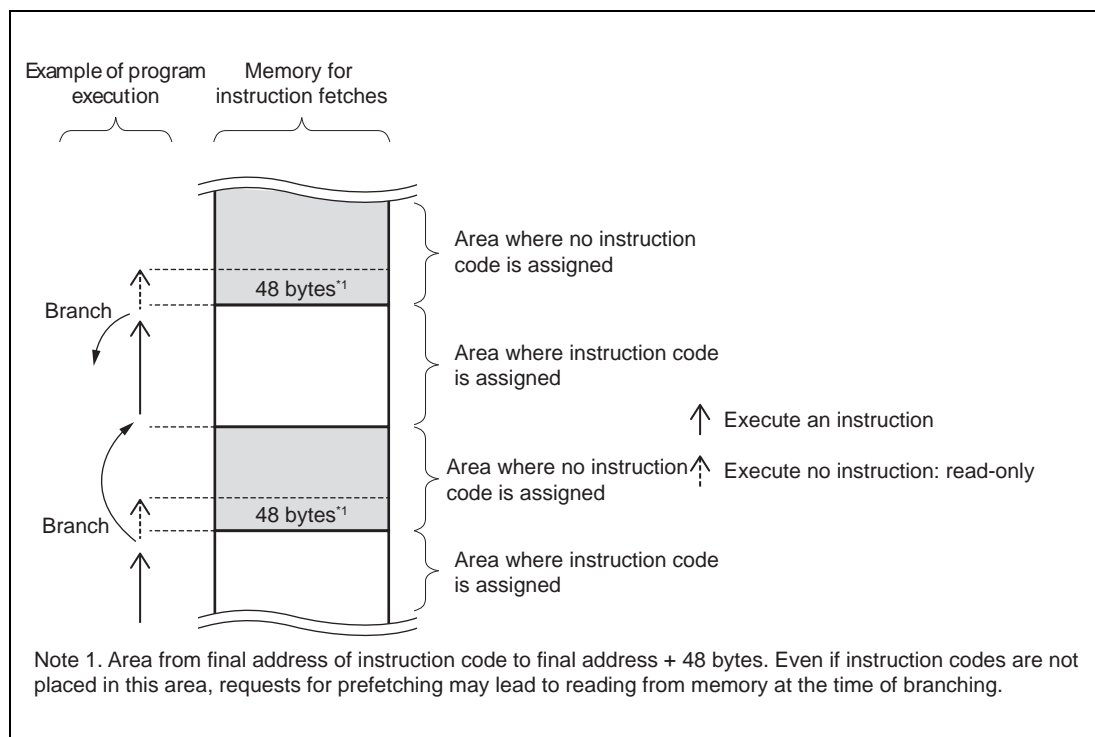

Figure 3.5 Area that Requires Attention Regarding Prefetching

3.4.6 Usage Note when Exception is Acknowledged

SYNCP instruction must be inserted in front of exception handler, depending on the exception sources.

For the details, see the *RH850G3M User's Manual: Software*.

Section 4 Address Space

Table 4.1 shows the address space of the RH850/P1M-E.

CAUTION

When making an access to the on-chip I/O register space, access the addresses shown in this manual. Do not access an address that is reserved or not specified in this manual. Otherwise, operation is not guaranteed.

4.1 Address Space

Table 4.1 Address Space

| Address | Address Space Type | Size |
|---|---|---------------------------------|
| 0000 0000 _H to * ¹ | Code Flash (user area) | 1 MB/2 MB |
| * ¹ to 00FF FFFF _H | Reserved | |
| 0100 0000 _H to 0100 7FFF _H | Code Flash (extended user area) | 32 KB |
| 0100 8000 _H to 0100 9FFF _H | Reserved | |
| 0100 A000 _H to 0100 BFFF _H | ECC test area | 8 KB |
| 0100 C000 _H to 0FFF FFFF _H | Reserved | |
| 1000 0000 _H to 1FFF FFFF _H | On-chip I/O register (H-Bus Area) | 256 MB |
| 2000 0000 _H to FEBD FFFF _H | Reserved | |
| FEBE 0000 _H to FEBF FFFF _H | Local RAM (PE1 area) | 128 KB |
| FEC0 0000 _H to FEDD FFFF _H | Reserved | |
| FEDE 0000 _H to FEDF FFFF _H | Local RAM (self) | 128 KB |
| FEE0 0000 _H to FEEF 7FFF _H | Reserved | |
| FEEF 8000 _H to FEEF FFFF _H | Global RAM (Bank A) | 32 KB |
| FEF0 0000 _H to FEF0 7FFF _H | Global RAM (Bank B) | 32 KB |
| FEF0 8000 _H to FEFF FFFF _H | Reserved | |
| FF00 0000 _H to FFFD FFFF _H (FF20 0000 _H to * ³) | On-chip I/O register (P-Bus Area) (Data flash) | 16 MB – 128 KB (32 KB/64 KB) |
| FFFE 0000 _H to FFFE DFFF _H | Reserved | |
| FFFE E000 _H to FFFE FFFF _H | On-chip I/O register (LPB Area self* ²) | 8 KB |
| FFFF 0000 _H to FFFF 4FFF _H | Reserved | |
| FFFF 5000 _H to FFFF FFFF _H | On-chip I/O register (P-Bus Area) | 44 KB |

Note 1. 1-MB device: 000F FFFF_H, 2-MB device: 001F FFFF_H

Note 2. The "self" on-chip I/O registers are in an area to which CPU-specific functions (SEG, PEG, IPG, INTC1) are allocated. This area can only be accessed by CPU1 (PE1).

Note 3. 1-MB device: FF20_7FFF_H, 2-MB device: FF20_FFFF_H

4.2 Address Space Viewed from Each Bus Master

Figure 4.1 shows address spaces viewed from each bus master.

4.2.1 Space in which instructions can be fetched

1. Instructions of PE1 can be fetched from the code flash, the local RAM (self) and the global RAM.
2. The reset vector (RBASE initial value) of PE1:
 - When the startup mat is the user mat, its head address is 0000 0000_H.

4.2.2 Data space accessible by PE1

All spaces are accessible.

4.2.3 Data space accessible by DMA (DMAC, DTS)

See Figure 4.1 for the accessible spaces from the DMA.

4.2.4 Data space accessible by H-Bus master

See **Figure 4.1** for the accessible spaces from the H-Bus.

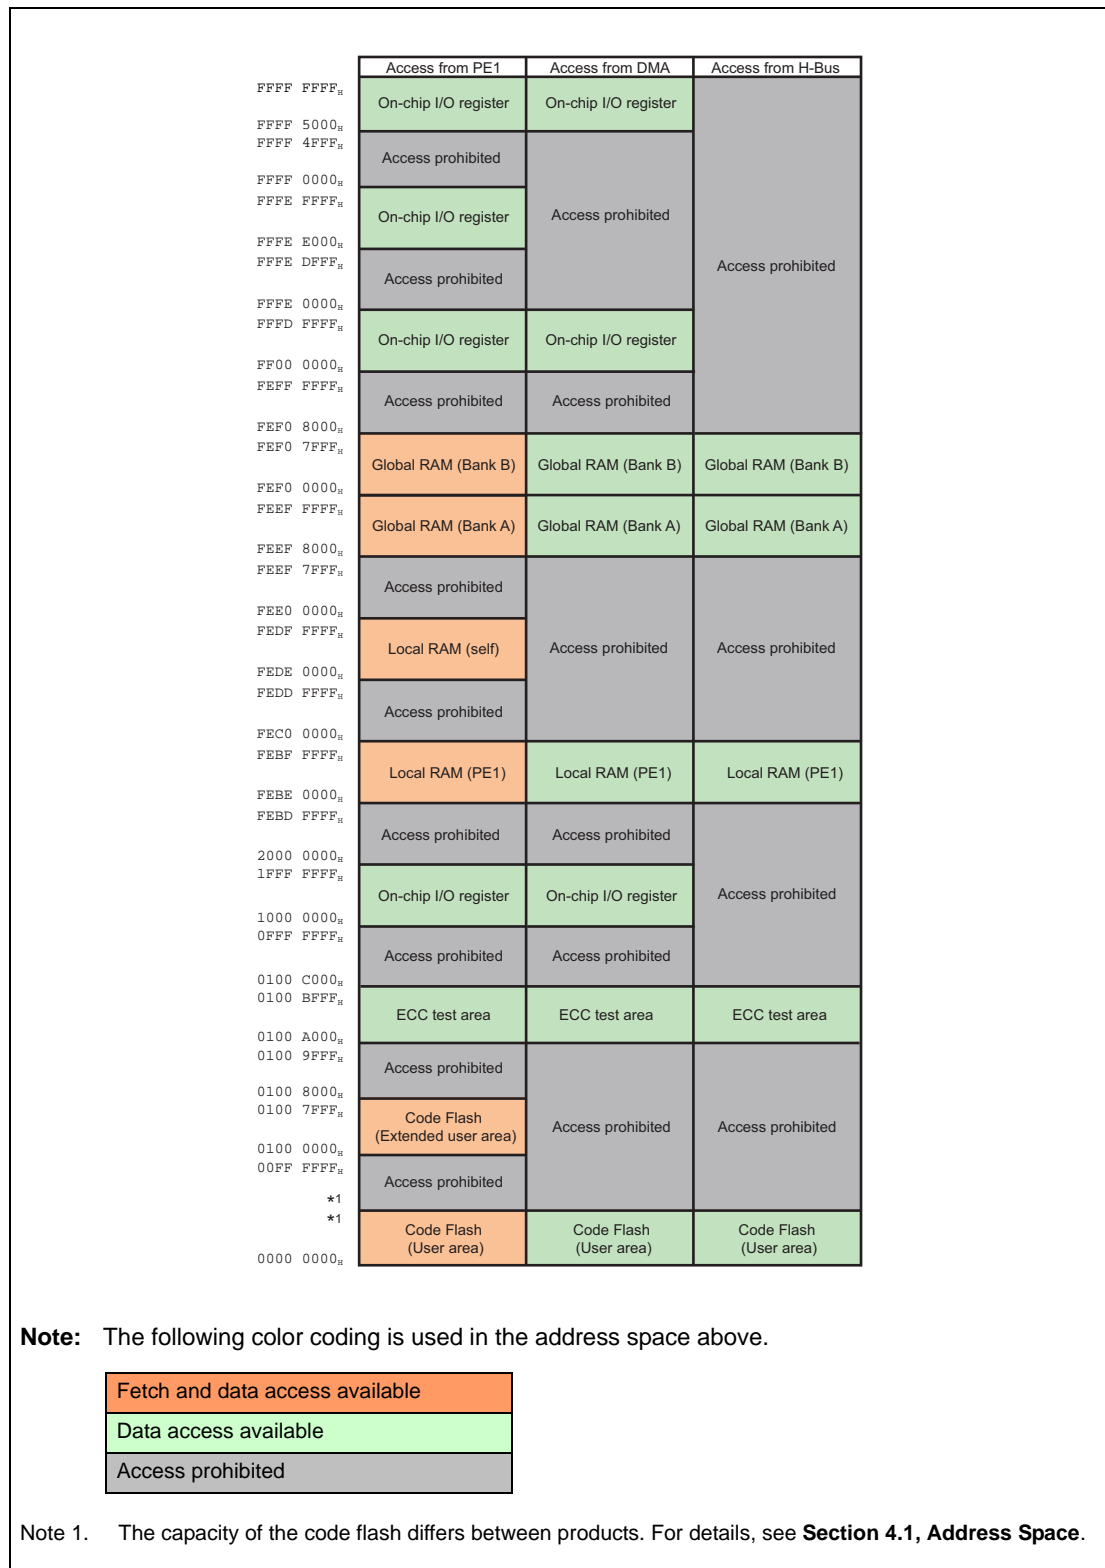

Figure 4.1 Address Space Viewed from Each Bus Master

4.3 Guard Function

The following table shows the guard function for each of memory area. In addition to these guard functions, each PE has MPU function in itself.

Table 4.2 Guard function

| Memory Area | Access from | Guard function |
|-----------------|---------------------------------|---------------------------------|
| P-Bus Area | All bus masters | P-Bus Guard (PBG) |
| LPB Area | Own PE | Internal Peripheral Guard (IPG) |
| | Other bus masters | PE Guard (PEG) |
| Local RAM Area | All bus masters (except own PE) | PE Guard (PEG) |
| H-Bus Area | All bus masters | H-Bus Guard (HBG) |
| Global RAM Area | All bus masters | GRAM Guard (GRG) |

Section 5 Operating Modes

5.1 Features

The device supports 2 operating modes.

Operating modes are selected by the FLMD0 and FLMD1 pins, and decided when pin reset is released.

Table 5.1 shows the list of the operating modes.

Table 5.1 Selection of Operating Modes

| Pins | | Operating Mode |
|------------------|---------------|-------------------------|
| FLMD0 | FLMD1 (P3_14) | |
| 0 | x | Normal operating mode |
| 1 | 0 | Serial programming mode |
| Other than above | | Settings are prohibited |

5.1.1 Normal Operating Mode

This mode is for execution of the user program. The on-chip debug capabilities also use this mode. After release from the reset state, instruction fetch is carried out from the user area. For reset vector of a CPU, see **Section 35, Flash Memory**.

5.1.2 Serial Programming mode

The dedicated flash memory programmer enables erasing/writing to the flash memory. After release from the reset state, this device boots up from the on-chip boot program and starts connection in the specified transmission method. For details, see **Section 35, Flash Memory**.

5.2 External Input Pins

Table 5.2 shows the list of external input pins. Pin levels latched from the FLMD0 and FLMD1 pins are reflected to the mode register (MODE). FLMD1 can be used as GPIO. The level on the FLMD0 pin can be set to prohibit programming and erasure of the code flash memory. When the FLMD0 pin is at the high level, programming and erasure of the flash memory are permitted; when it is at the low level it is prohibited to program or erase the flash memory. For details, see **Section 35, Flash Memory**.

Table 5.2 External Input Pins

| Pin Name | I/O | Function |
|----------|-------|-------------------------------------|
| FLMD0 | input | Primary operating mode select pin |
| FLMD1 | input | Secondary operating mode select pin |

5.3 Register Description

5.3.1 List of Registers

Table 5.3 Register Configuration

| Register Name | Description | Access Width | Initial Value | Address |
|---------------|---------------|--------------|------------------------|------------------------|
| MODE | Mode Register | 32 | 0000 000X _H | FFF8 0104 _H |

Table 5.4 Register Reset Condition

| Register Name | Reset Condition | | | |
|---------------|-----------------|----------------|----------------|---------------------|
| | Power On Reset | System Reset 1 | System Reset 2 | Application Reset 1 |
| MODE | — | √*1 | — | — |

Note 1. Pin reset only

5.3.2 MODE — Mode Register

This register indicates the operating mode of the device.

The pin levels to be latched from FLMD0 and FLMD1 pins when pin reset is released, are reflected.

Access: This register can only be read in 32-bit units.

Address: FFF8 0104_H

Value after reset: 0000 000X_H

| | | | | | | | | | | | | | | | | |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|-------|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 5.5 MODE Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 31 to 2 | Reserved | When read, the value after reset is read. |
| 1 | FLMD1 | This bit indicates the level of the latch for the FLMD1 pin 0: Low-level detection 1: High-level detection Note: This bit is always read "0" in normal operating mode. |
| 0 | FLMD0 | This bit indicates the level of the latch for the FLMD0 pin 0: Low-level detection 1: High-level detection |

Section 6 Interrupt

The interrupt controller (INTC) determines priority of interrupt sources and controls interrupt requests to the CPU. The INTC has a register to set priority of each interrupt. Interrupt requests are processed according to the priority set in this register by the user.

6.1 Overview

- Interrupt sources
 - One non-maskable interrupt (FENMI): FE level interrupt from ECM
 - One FE level maskable interrupt (FEINT): Pin NMI, OSTM3 to OSTM7
 - 384 EI level maskable interrupts (EIINT)
 - 32 high-speed interrupts
 - DMAC
 - ECM
 - Window watchdog timer
 - 352 low-speed interrupts
 - Timer
 - Communication
 - External interrupt
 - A/D interrupts
 - DTS
 - Flash

For details of FENMI, FEINT, and EIINT, refer to *the RH850G3M User's Manual: Software*.

- Sixteen interrupt priority levels can be set for the EI level interrupts.
Up to 16 priority levels of the EI level interrupts can be set in EI level interrupt control registers.
- Three detection methods
A method of detecting the pin NMI interrupt and external interrupt can be selected from rising edge, falling edge, and both edges.
- Direct branching method or table referencing method is selectable by setting two types of interrupt handler address setting registers.
- Software interrupts
Interrupts of desired priority can be generated from the program by setting software interrupt registers.

6.1.1 Reset Sources

Please refer to **Section 8, Reset Controller**.

6.2 Register Specifications

The INTC has registers listed in tables below. These registers are mainly used to set interrupt priority and to control detection of external interrupt input signals.

6.2.1 Register Configuration

Table 6.1 Interrupt Control

| Address | Register Symbol | Register Name | R/W | Value after Reset | Access Size |
|--|---------------------|-------------------------------------|-----|--|-------------|
| FFFE EA00 _H - FFFE EA3E _H (EIC0 to EIC31) FFFF B040 _H - FFFF B2FE _H (EIC32 to EIC383) | EICn ^{*1} | EI level interrupt control register | R/W | 008F _H ^{*4} 808F _H ^{*5} | 1/8/16 |
| FFFE EAF0 _H (IMR0) FFFF B404 _H - FFFF B42C _H (IMR1 to IMR11) | IMRn ^{*2} | EI level interrupt mask register | R/W | FFFF FFFF _H | 1/8/16/32 |

Note 2. n = 0 to 11

Note 3. n = 0 to 383

Note 4. Synchronous edge detection

Note 5. High-level detection

Among the registers shown in **Table 6.1**, the EIC0 to 31, IMR0, EIBD0 to 31, FNC, and FIC are located in INTC1 of the CPU-specific Peripheral. Each of these registers only can be accessed from the CPU which includes it. Writing is only possible in supervisor mode (PSW.UM = 0).

Of the registers listed in **Table 6.1**, EIC32 to EIC383, IMR1 to IMR11, and EIBD32 to EIBD383 are located in INTC2, the controller for interrupts from peripheral IP group 0. Writing to these registers is only possible for CPU1 in supervisor mode (PSW.UM = 0).

6.2.2 EIC0 - EIC383 — EI Level Interrupt Control Registers 0 to 383

These registers are used to set interrupt control conditions for each EI level interrupt source, and one register is provided for each source of this type. Writing to these registers requires care when a register is set for detection in synchronous edge detection mode. If 0 is written to the EIRFn bit immediately after a peripheral module generates the corresponding interrupt request, the request may be inadvertently lost. On the other hand, writing 1 to the EIRFn bit immediately after an interrupt is accepted by the CPU may lead to incorrect re-issuing of the request. Writing to any of these registers, therefore, should only proceed while peripheral modules are not generating interrupt requests and the CPU has not accepted any interrupt.

Writing to an EICn register includes writing by using the bit operation instructions (set1, clr1, and not1). The bit operation instructions proceed in the following sequence (1) reading the register, (2) processing the specified bit, and (3) writing the new value back to the register. When a bit operation instruction has a bit other than EIRFn as the operand, the value read in step (1) will be written back in step (3). Accordingly, the issuance of interrupt requests from peripheral modules or the acceptance of an interrupt request by the CPU between steps (1) and (3) may lead to the problems described above. Note that access to bits 15 to 13, 11 to 8, 5, and 4 using bit-manipulation instructions is prohibited.

Access: EICn can be read/written in 16-bit units.
EICnH and EICnL can be read/written in 8- or 1-bit units.

Address: FFFE EA00_H - FFFE EA3E_H (EIC0-31)
FFFF B040_H - FFFF B2FE_H (EIC32-383)

Value after reset: 008F_H (edge detection), 808F_H (high level detection)
This register is initialized by any reset source.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Note 1. 0: Synchronous edge detection, 1: High-level detection

Table 6.4 EIC0 - EIC383 Register Contents (1/2)

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 15 | EICTn | Interrupt Channel Type The following values are read according to the interrupt input interface. This is a read-only bit. 0: Synchronous edge detection 1: High-level detection When writing to this bit, write the value after reset. |
| 14, 13 | Reserved | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 12 | EIRFn | Interrupt Request Flag Operation varies with the interrupt input interface. 0: No interrupt request (Value after reset) 1: Interrupt request present <ul style="list-style-type: none"> Synchronous edge detection This flag is automatically cleared to 0 when an interrupt request of the self-channel is accepted by the CPU core. This bit can be set or cleared by the software. High level detection This bit cannot be set or cleared by the software. This is a read-only bit. |
| 11 to 8 | Reserved | When read, the value after reset is returned. When writing to these bits, write the value after reset. |

Table 6.4 EIC0 - EIC383 Register Contents (2/2)

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 7 | EIMKn | <p>Interrupt Mask</p> <p>While this bit is set to 1, interrupt requests set in the interrupt request flag (EIRFn) are masked to inhibit interrupt requests from the channel to the CPU core. Notification of presence of unprocessed interrupts is not made and the PMEI bit in ICSR is not set from channels for which this bit is set to 1. Even when interrupt processing is disabled by the setting of this bit, an input of interrupt signal is not masked and the interrupt request flag is set. Setting this bit is also reflected in the setting of corresponding bit of the interrupt mask register (IMR).</p> <p>0: Interrupt processing is enabled. 1: Interrupt processing is disabled. (Value after reset)</p> |
| 6 | EITBn | <p>Interrupt Vector Method Select</p> <p>0: Direct branching method based on priority 1: Table referencing method</p> |
| 5, 4 | Reserved | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 3 to 0 | EIP3n-0n | <p>These bits specify 16 interrupt priority levels (0: highest priority, 15: lowest priority).</p> <p>If two or more EI level interrupt requests are generated simultaneously, a source with higher priority specified by these bits is selected and is sent to the CPU core. If the priority specified by these bits is equal, a source of smaller channel number is selected as fixed priority.</p> |

Note: n = 0 to 383

NOTE

The addresses of the registers corresponding to the interrupt channels that are listed as reserved in **Table 6.11, Interrupt Exception Handler and Priority**, are also reserved. Therefore, access to these addresses is prohibited. Operation cannot be guaranteed if they are accessed.

6.2.3 IMR0 - IMR11 — EI Level Interrupt Mask Registers 0 to 11

These registers are aggregation of the EIMK bit in the EIC register. Setting of the corresponding EIMK bit is reflected in each bit in the IMRn register. Furthermore, setting of the IMRn register is reflected in the corresponding EIMK bit.

Access: IMRm can be read/written in 32-bit units.
IMRmH and IMRmL can be read/written in 16-bit units.
IMRmHH, IMRmHL, IMRmLH, and IMRmLL can be read/written in 8- or 1-bit units.

Address: IMR0: FFFE EAF0_H, IMR1: FFFF B404_H, IMR2: FFFF B408_H, IMR3: FFFF B40C_H,
IMR4: FFFF B410_H, IMR5: FFFF B414_H, IMR6: FFFF B418_H, IMR7: FFFF B41C_H,
IMR8: FFFF B420_H, IMR9: FFFF B424_H, IMR10: FFFF B428_H, IMR11: FFFF B42C_H

Value after reset: FFFF FFFF_H This register is initialized by any reset.

NOTE

The bits corresponding to the interrupt channels that are listed as reserved in **Table 6.11, Interrupt Exception Handler and Priority**, are also reserved. When read, the value after reset is read. When writing, write the value after reset.

6.2.4 EIBD0 - EIBD383 — EI Level Interrupt Bind Registers 0 to 383

These registers are provided for each EI level interrupt source to make correspondence between each source and PE.

Access: These registers can be read/written in 32-bit units.

Address: FFFE EB00_H - FFFE EB7C_H (EIBD0 to EIBD31)
FFFF B880_H - FFFF BDFC_H (EIBD32 to EIBD383)

Value after reset: 0000 0001_H This register is initialized by any reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 6.5 EIBD0 - EIBD383 Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 31 to 18 | Reserved | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 17, 16 | GPID | These bits are provided only in EIBD32 to EIBD383. Be sure to set these bits to 00 in this product. These bits are reserved for EIBD0 to EIBD31. When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 15 to 3 | Reserved | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 2 to 0 | PEID | These bits specify an interrupt bind (request) destination. These bits are fixed to 001 in EIBD0 to EIBD31 and cannot be modified. Be sure to set these bits in EIBD32 to EIBD383 to 001 in this product. |

NOTE

The addresses of the registers corresponding to the interrupt channels that are listed as reserved in **Table 6.11, Interrupt Exception Handler and Priority**, are also reserved. Therefore, access to these addresses is prohibited. Operation cannot be guaranteed if they are accessed.

CAUTION

Changing the corresponding EIBDn register during the processing of an EIINT request is prohibited.

6.2.5 FNC — FE Level NMI Control Register

This register is used to set FE level NMI control conditions.

Access: FNC can be read in 16-bit units.
FNCH and FNCL can be read in 8- or 1-bit units.

Address: FFFE EA78_H

Value after reset: 0000_H (synchronous edge detection), This register is initialized by any reset.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 6.6 FNC Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------------|--|
| 15 to 13 | Reserved | When read, the value after reset is returned. |
| 12 | FNR _F | Interrupt Request Flag 0: No interrupt request (Value after reset) 1: An interrupt request present This bit is automatically cleared to 0 when an FE level NMI interrupt request is accepted by the CPU core. |
| 11 to 0 | Reserved | When read, the value after reset is returned. |

6.2.6 FIC — FE Level Interrupt Control Register

This register is used to set FE level interrupt control conditions.

Access: FIC can be read in 16-bit units.
FICH and FICL can be read in 8- or 1-bit units.

Address: FFFE EA7A_H

Value after reset: 0000_H (synchronous edge detection), This register is initialized by any reset.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Table 6.7 FIC Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------------|--|
| 15 to 13 | Reserved | When read, the value after reset is returned. |
| 12 | FIR _F | Interrupt Request Flag 0: No interrupt request (Value after reset) 1: An interrupt request present This bit is automatically cleared to 0 when an FE level interrupt request is accepted by the CPU core. |
| 11 to 0 | Reserved | When read, the value after reset is returned. |

6.2.7 SINTR0 - SINTR4 — Software Interrupt Registers

SINTR0 to SINTR4 are 8-bit registers to control software interrupts 0 to 4 (SINT0 to SINT4).

Writing 01_H to any of these registers increments the counter value by 1. Writing 00_H to any of the registers decrements the counter value by 1. When the values of these registers are 1 or larger, a software interrupt (SINT0 to SINT4) is generated. The value read from any of these registers is the current value of the register.

Access: These registers can be read/written in 8- or 1-bit units.

Address: SINT0: FFC0 0000_H, SINT1: FFC0 0004_H, SINT2: FFC0 0008_H,
SINT3: FFC0 000C_H, SINT4: FFC0 0010_H

Value after reset: 00_H This register is initialized by any reset.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|---------|---------|---------|---------|---------|---------|---------|---------|
| | SINTCn7 | SINTCn6 | SINTCn5 | SINTCn4 | SINTCn3 | SINTCn2 | SINTCn1 | SINTCn0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 6.8 SINTR0 - SINTR4 Register Contents

| Bit Position | Bit Name | Function |
|--------------|-------------|---|
| 7 to 0 | SINTCn[7:0] | Software Interrupt Request These bits generate a software interrupt. [Reading operation] The counter value of the SINTn interrupt request count is read. [Writing operation] Writing 01 _H : The counter value is incremented.*1 Writing 00 _H : The counter value is decremented.*2 Other than the above: Forbidden (No guarantee of operation) |

Note 1. When 01_H is written while the value of the counter is FF_H, the value is not incremented, but remains at FF_H.

Note 2. When 00_H is written while the value of the counter is 00_H, the value is not decremented, but remains at 00_H.

6.2.8 PINT0 — PINT7 — Peripheral Interrupt Status Registers PINTCLR0 - PINTCLR7 — Peripheral Interrupt Status Clear Registers

The DTS transfer completion interrupt and transfer count match interrupt are merged in 32-channel units. PINT0 to PINT7 contain the interrupt status flags to indicate the originating channels for these interrupts.

Writing the interrupt status register value to the interrupt status clear register (PINTCLR0 to PINTCLR7) of the same channel in the interrupt handler clears interrupts. Interrupts on the lower-bits side take precedence to support multiplex interrupts.

PINT0 to PINT7 are initialized to 0000 0000_H by any reset source.

Access: PINT_n can be read in 32-bit units.

PINTCLR_n can be written in 32-bit units.

Address: PINT0: FFF9 8000_H, PINT1: FFF9 8004_H, PINT2: FFF9 8008_H, PINT3: FFF9 800C_H
PINT4: FFF9 8010_H, PINT5: FFF9 8014_H, PINT6: FFF9 8018_H, PINT7: FFF9 801C_H
PINTCLR0: FFF9 8020_H, PINTCLR1: FFF9 8024_H
PINTCLR2: FFF9 8028_H, PINTCLR3: FFF9 802C_H
PINTCLR4: FFF9 8030_H, PINTCLR5: FFF9 8034_H
PINTCLR6: FFF9 8038_H, PINTCLR7: FFF9 803C_H

Value after reset: 0000 0000_H

PINT0

| Bit Position | Bit Name | Function |
|--------------|--------------|---|
| 31 to 0 | INTDTS[31:0] | DTS transfer completion interrupt status on ch31 to ch0 |

PINT1

| Bit Position | Bit Name | Function |
|--------------|---------------|--|
| 31 to 0 | INTDTS[63:32] | DTS transfer completion interrupt status on ch63 to ch32 |

PINT2

| Bit Position | Bit Name | Function |
|--------------|---------------|--|
| 31 to 0 | INTDTS[95:64] | DTS transfer completion interrupt status on ch95 to ch64 |

PINT3

| Bit Position | Bit Name | Function |
|--------------|----------------|---|
| 31 to 0 | INTDTS[127:96] | DTS transfer completion interrupt status on ch127 to ch96 |

PINT4

| Bit Position | Bit Name | Function |
|--------------|----------------|--|
| 31 to 0 | INTCTDTS[31:0] | DTS transfer count match interrupt status on ch31 to ch0 |

PINT5

| Bit Position | Bit Name | Function |
|--------------|---------------------|---|
| 31 to 0 | INTCTDTS [63:32] | DTS transfer count match interrupt status on ch63 to ch32 |

PINT6

| Bit Position | Bit Name | Function |
|--------------|---------------------|---|
| 31 to 0 | INTCTDTS [95:64] | DTS transfer count match interrupt status on ch95 to ch64 |

PINT7

| Bit Position | Bit Name | Function |
|--------------|----------------------|--|
| 31 to 0 | INTCTDTS [127:96] | DTS transfer count match interrupt status on ch127 to ch96 |

PINTCLR0

| Bit Position | Bit Name | Function |
|--------------|--------------|---|
| 31 to 0 | INTCLR[31:0] | These bits clear the DTS transfer completion interrupt status on ch31 to ch0. Within the interrupt handler, these bits write the value read from PINT0. |

PINTCLR1

| Bit Position | Bit Name | Function |
|--------------|---------------|--|
| 31 to 0 | INTCLR[63:32] | These bits clear the DTS transfer completion interrupt status on ch63 to ch32. Within the interrupt handler, these bits write the value read from PINT1. |

PINTCLR2

| Bit Position | Bit Name | Function |
|--------------|---------------|--|
| 31 to 0 | INTCLR[95:64] | These bits clear the DTS transfer completion interrupt status on ch95 to ch64. Within the interrupt handler, these bits write the value read from PINT2. |

PINTCLR3

| Bit Position | Bit Name | Function |
|--------------|----------------|---|
| 31 to 0 | INTCLR[127:96] | These bits clear the DTS transfer completion interrupt status on ch127 to ch96. Within the interrupt handler, these bits write the value read from PINT3. |

PINTCLR4

| Bit Position | Bit Name | Function |
|--------------|----------------|--|
| 31 to 0 | INTCTCLR[31:0] | These bits clear the DTS transfer count match interrupt status on ch31 to ch0. Within the interrupt handler, these bits write the value read from PINT4. |

PINTCLR5

| Bit Position | Bit Name | Function |
|--------------|---------------------|---|
| 31 to 0 | INTCTCLR [63:32] | These bits clear the DTS transfer count match interrupt status on ch63 to ch32. Within the interrupt handler, these bits write the value read from PINT5. |

PINTCLR6

| Bit Position | Bit Name | Function |
|--------------|---------------------|---|
| 31 to 0 | INTCTCLR [95:64] | These bits clear the DTS transfer count match interrupt status on ch95 to ch64. Within the interrupt handler, these bits write the value read from PINT6. |

PINTCLR7

| Bit Position | Bit Name | Function |
|--------------|----------------------|--|
| 31 to 0 | INTCTCLR [127:96] | These bits clear the DTS transfer count match interrupt status on ch127 to ch96. Within the interrupt handler, these bits write the value read from PINT7. |

CAUTIONS

1. Peripheral Interrupt Status Clear Registers (PINTCLR0 - PINTCLR7) are always read as 0.
2. There is some delay between writing the INTCLRn (n=0 to 127) bit or INTCTCLRn (n=0 to 127) bit and clearing the INTDTSn (n=0 to 127) flag or the INTCTDTSn (n=0 to 127) flag. It is recommended to read Peripheral Interrupt Status Registers (PINT0 to PINT7) twice after clearing one of its bits. The second read operation will read the correct status.

6.2.9 FEINTF — FEINT Factor Register

The FE level interrupt (FEINT) factor register is used in common by the OSTM3 to OSTM7 interrupts and the pin NMI interrupt. When an FE level interrupt occurs, check the interrupt source by referring to this register.

Access: This register can be read in 32-bit units.

Address: FFD6 7000_H

Value after reset: 0000 0000_H This register is initialized by any reset.

| 0 | NMIFEIFC | NMIFEIF Clear 0: The NMIFEIF bit is not cleared. 1: The NMIFEIF bit is cleared. |

6.3 Interrupt Sources

There are five groups of interrupt sources: NMI, INTP_n, ECM interrupt, software interrupts (SINT), and interrupts from the on-chip peripheral modules. The priority level of each interrupt is represented by an interrupt priority value between 0 (the highest level) and 15 (the lowest level).

6.3.1 NMI Interrupts

NMI interrupts are input from the NMI pin. A method of detecting the NMI interrupt can be selected from rising edge, falling edge, and both edges. For details on the detection method, see **Section 2, Pin Functions**.

6.3.2 INTP_n Interrupts

INTP_n interrupts are input from INTP_n pins. A method of detecting the INTP_n interrupt can be selected from rising edge, falling edge, and both edges. For details on the detection method, see **Section 2, Pin Functions**.

Furthermore, interrupt priority levels 0 to 15 can be set for each pin in the interrupt control register (EIC_m).

When an interrupt request is detected by a change in the INTP_n pin, and an interrupt request signal is sent to the INTC. The INTP_n interrupt request detection result is retained until the interrupt request is accepted. Whether an INTP_n interrupt request has been detected or not can be checked by reading the EIRF_n bit in the corresponding EI level interrupt control register *n* (EIC_n) for INTP_n. Writing 0 clears the INTP_n interrupt request detection result.

When exiting the INTP_n interrupt exception handler, confirm that the EIRF_n bit has been cleared in the corresponding EI level interrupt control register *n* (EIC_n) for INTP_n to prevent re-acceptance by mistake, and then issue an instruction to return from interrupt.

6.3.3 ECM Interrupts

The Error Control Module (ECM) generates ECM interrupt requests by merging error interrupts from multiple sources. For details, see **Section 32, Error Control Module (ECM)** and **Section 31, Functional Safety**.

6.3.4 Software Interrupts

Software interrupt (SINT) priority can be set within priority levels 0 to 15 for each interrupt source.

6.3.5 On-Chip Peripheral Module Interrupts

For the on-chip peripheral module that generates an interrupt, see **Table 6.11, Interrupt Exception Handler and Priority**.

Since different interrupt vectors are assigned to each source, the interrupt exception handler need not decide sources. Priority can be set within priority levels 0 to 15 for each interrupt source.

6.4 Interrupt Exception Handler and Priority Operations

Table 6.11 lists interrupt sources, source codes, exception handler offset addresses, and interrupt priority.

There are two specifications for exception handler addresses: (1) standard specifications where exception handler addresses are determined by the PSW.EBV bit in the CPU core, RBASE register, and EBASE register and (2) extended specifications where exception handler addresses for interrupts are specified individually for each channel.

In the standard specifications, an offset address is added to the base address (RBASE register /EBASE register) in the CPU core to generate an exception handler address. The following two methods are provided for giving an interrupt offset address. For channels other than the interrupt channel, the specified offset address is given.

- An offset address is determined within a range of +100H to +1F0H according to the priority level (0 to 15) specified for each channel, regardless of interrupt channels (offset address, direct branch, RINT = 0 in **Table 6.11**).
- Every offset address is +100H regardless of the priority level. This is a function to reduce the memory occupation size of the exception handler (offset address, direct branch, RINT = 1 in **Table 6.11**).

In the extended specifications, a table for reading exception handler addresses for each interrupt channel is provided. The handler address is extracted by referencing the table. The table reference position is obtained by the following calculation formula (offset address, table reference in **Table 6.11**). The INTBP register exists in the CPU core.

$$\text{Exception handler address read position} = \text{INTBP} + \text{channel number} * 4\text{-byte}$$

For details of handler addresses, see *the RH850G3M User's Manual: Software*.

Priority levels 0 to 15 (0: highest) of INTP_n (external interrupts) and on-chip peripheral module interrupts can be set for each channel. If specified priority levels are equal, an interrupt source of smaller channel number is selected as fixed priority.

CAUTION

FENMI, FEINT, EIINT (direct vector method), SYSERR, FPI need insertion of SYNC instruction before the exception handler.

For details, see. the *RH850G3M User's Manual: Software*.

Table 6.11 Interrupt Exception Handler and Priority (1/9)

| Functional Module | Interrupt Source Name | Level Interrupt ¹ | Number of Interrupt Channel (EIINT) | Source Code | Offset Address | | | Interrupt Priority (Value after reset) | Default Priority | 1 MB | 2 MB |
|------------------------|--|------------------------------|-------------------------------------|-----------------|---|---|-------------------|--|------------------|------|------|
| | | | | | Direct Branch | | Table Reference | | | | |
| | | | | | RINT = 0 | RINT = 1 | | | | | |

Table 6.11 Interrupt Exception Handler and Priority (9/9)

| Functional Module | Interrupt Source Name | Level Interrupt ^{*1} | Number of Interrupt Channel (EIINT) | Source Code | Offset Address | | | Interrupt Priority (Value after reset) | Default Priority | 1 MB | 2 MB |
|-------------------|--|-------------------------------|-------------------------------------|-------------|---|---|-------------------|--|------------------|------|------|
| | | | | | Direct Branch | | Table Reference | | | | |
| | | | | | RINT = 0 | RINT = 1 | | | | | |
| | Reserved | | 378 | 117A | The offset address is the same in all channels and is determined between +100 _H and +1F0 _H according to priority. | The offset address is always +100 _H regardless of priority to reduce the offset address. | +5E8 _H | 0 to 15 (15) | High | — | — |
| Flash | Flash sequencer end interrupt (INTFLENDNM) ^{*3} | | 379 | 117B | | | +5EC _H | 0 to 15 (15) | | √ | √ |
| | Reserved | | 380 | 117C | | | +5F0 _H | 0 to 15 (15) | | — | — |
| | Reserved | | 381 | 117D | | | +5F4 _H | 0 to 15 (15) | | — | — |
| | Reserved | | 382 | 117E | | | +5F8 _H | 0 to 15 (15) | | — | — |
| Flash | Flash sequencer end error interrupt (INTFLERR) ^{*3} | √ | 383 | 117F | | | +5FC _H | 0 to 15 (15) | | √ | √ |

Note 1. The table indicates whether interrupts from each source are detected by level or edge. If a cell in this column is checked, the interrupt from that source is detected when the signal is at the high level. If it is blank, detection is of the selected edge. For interrupts from sources detected by the signal being at the high level, use software in the interrupt handler to clear the status register in the given module.

Note 2. For a level interrupt, the status register in each module should be cleared during interrupt processing by software.

Note 3. For details of interrupt generation factors, see *the RH850/P1M-E Flash Memory User's Manual: Hardware Interface*.

6.5 Operation

6.5.1 External Interrupts (NMI / INTP)

The external interrupts INTPm and NMI can be configured to generate an interrupt request upon a rising or falling edge or upon both edges of the external pin.

For the interrupt detection flow, see **Section 6.5.4, Interrupt Processing Flow**.

6.5.2 Software Interrupt

For the operation of software interrupts, see **Section 6.2.7, SINTR0 - SINTR4 — Software Interrupt Registers** and **Section 6.5.4, Interrupt Processing Flow**.

6.5.3 DTS Interrupt Merge Function

Up to 128 transfer end interrupts and up to 128 transfer count match interrupts are aggregated into one interrupt in units of 32 interrupts.

When multiplex interrupts have occurred, bits of only accepted interrupt sources are set to 1 in status registers (PINT0 to PINT7) so that accepted interrupts can be recognized. For the interrupt request flow by merging DTS interrupts, see **Section 6.5.4, Interrupt Processing Flow**.

Table 6.12 DTS Interrupt-related Registers

| Interrupt Source | CH | Status Register | Clear Register |
|------------------------------------|-----------|-----------------|----------------|
| DTS transfer end interrupt | 0 to 31 | PINT0 | PINTCLR0 |
| | 32 to 63 | PINT1 | PINTCLR1 |
| | 64 to 95 | PINT2 | PINTCLR2 |
| | 96 to 127 | PINT3 | PINTCLR3 |
| DTS transfer count match interrupt | 0 to 31 | PINT4 | PINTCLR4 |
| | 32 to 63 | PINT5 | PINTCLR5 |
| | 64 to 95 | PINT6 | PINTCLR6 |
| | 96 to 127 | PINT7 | PINTCLR7 |

6.5.4 Interrupt Processing Flow

6.5.4.1 NMI Processing Flow

Figure 6.1 shows an NMI detection flow.

- Select an NMI detecting method (rising edge, falling edge, and both edges) by setting the FCLA0CTL0 register.
- After an NMI has been detected, an interrupt request is sent to the INTC.
- When the interrupt processing in the INTC has been completed, the INTC enters the NMI detection waiting state again.

Figure 6.1 NMI Processing Flow

6.5.4.2 External Interrupt Processing Flow

Figure 6.2 shows an INTP (external interrupt) detection flow.

- Select an INTP detecting method (rising edge, falling edge, and both edges) by setting the FCLAnCTLm register.
- After an INTP has been detected, an interrupt request is sent to the INTC.

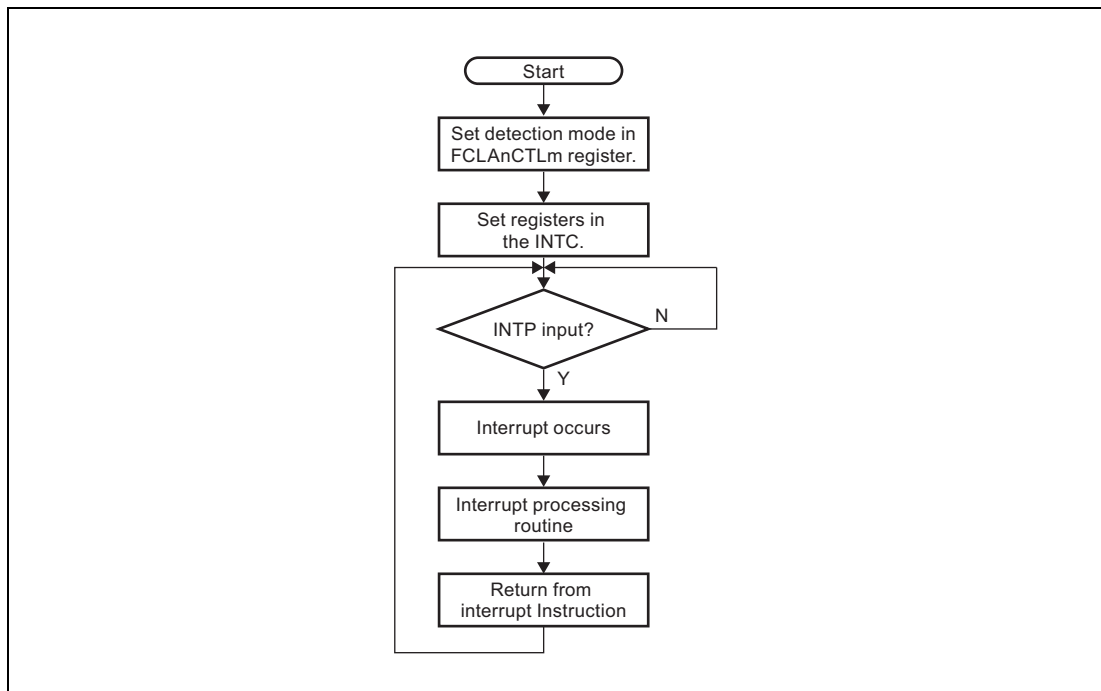

Figure 6.2 External Interrupt Processing Flow

6.5.4.3 Software Interrupt Processing Flow

Figure 6.3 shows the flow of software interrupt requests.

- Software interrupt requests are controlled by writing 00_H or 01_H to the counter bits SINTCn[7:0] in the software interrupt registers (SINTR0 to SINTR4).
- Writing 01_H increments the counter value by 1.
- Writing 00_H decrements the counter value by 1.
- If an incremented counter value is larger than 1, an interrupt request is issued to the INTC.
- On completion of other interrupt processing in the INTC, if SINTRn is 00_H, normal processing resumes.

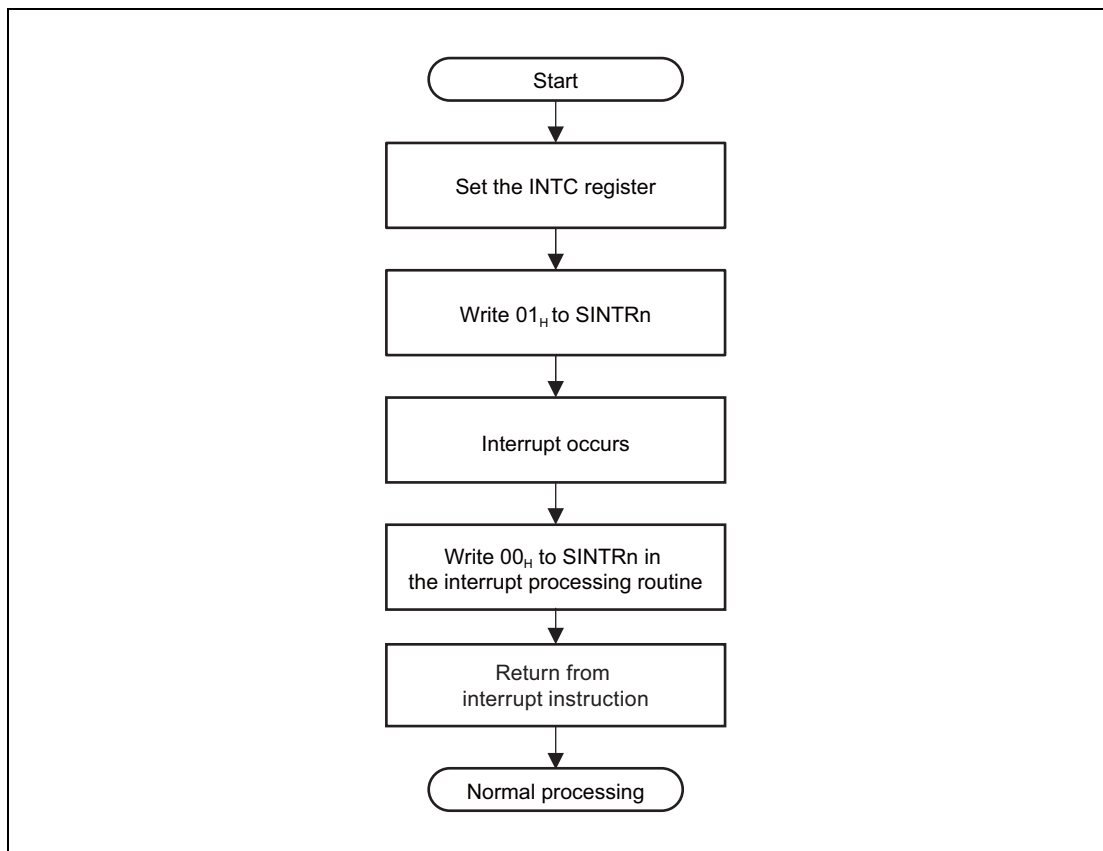

Figure 6.3 Software Interrupt Processing Flow

6.5.4.4 DTS Interrupt Processing Flow

Figure 6.4 shows a DTS interrupt request flow.

- When only one interrupt request is generated out of bundled 32 interrupt sources
 - The bit corresponding to the interrupt request in the PINTn register is set to 1 and an interrupt request is output.
 - On completion of other interrupt processing, write 1 to the interrupt clear register (PINTCLRn) to clear the interrupt request before issuing the return from interrupt instruction, then wait for the next one.
- When multiplex interrupt requests are generated out of bundled 32 interrupt sources
 - The highest-priority bit (interrupts on the lower-bits side take precedence) out of bits with interrupt request is extracted and only the extracted bit in the PINTn register is set to 1, and an interrupt request is output.
 - On completion of other interrupt processing, write 1 to the interrupt clear register (PINTCLRn) to clear the highest-priority interrupt request, then issue the return from interrupt instruction.
 - After the highest-priority interrupt request has been cleared, the second highest-priority interrupt request is accepted. The corresponding bit in the PINTn register is set to 1 in the same way as before, and an interrupt request is output.
 - These steps are repeated until all interrupt sources bundled into 32 bits are cleared.

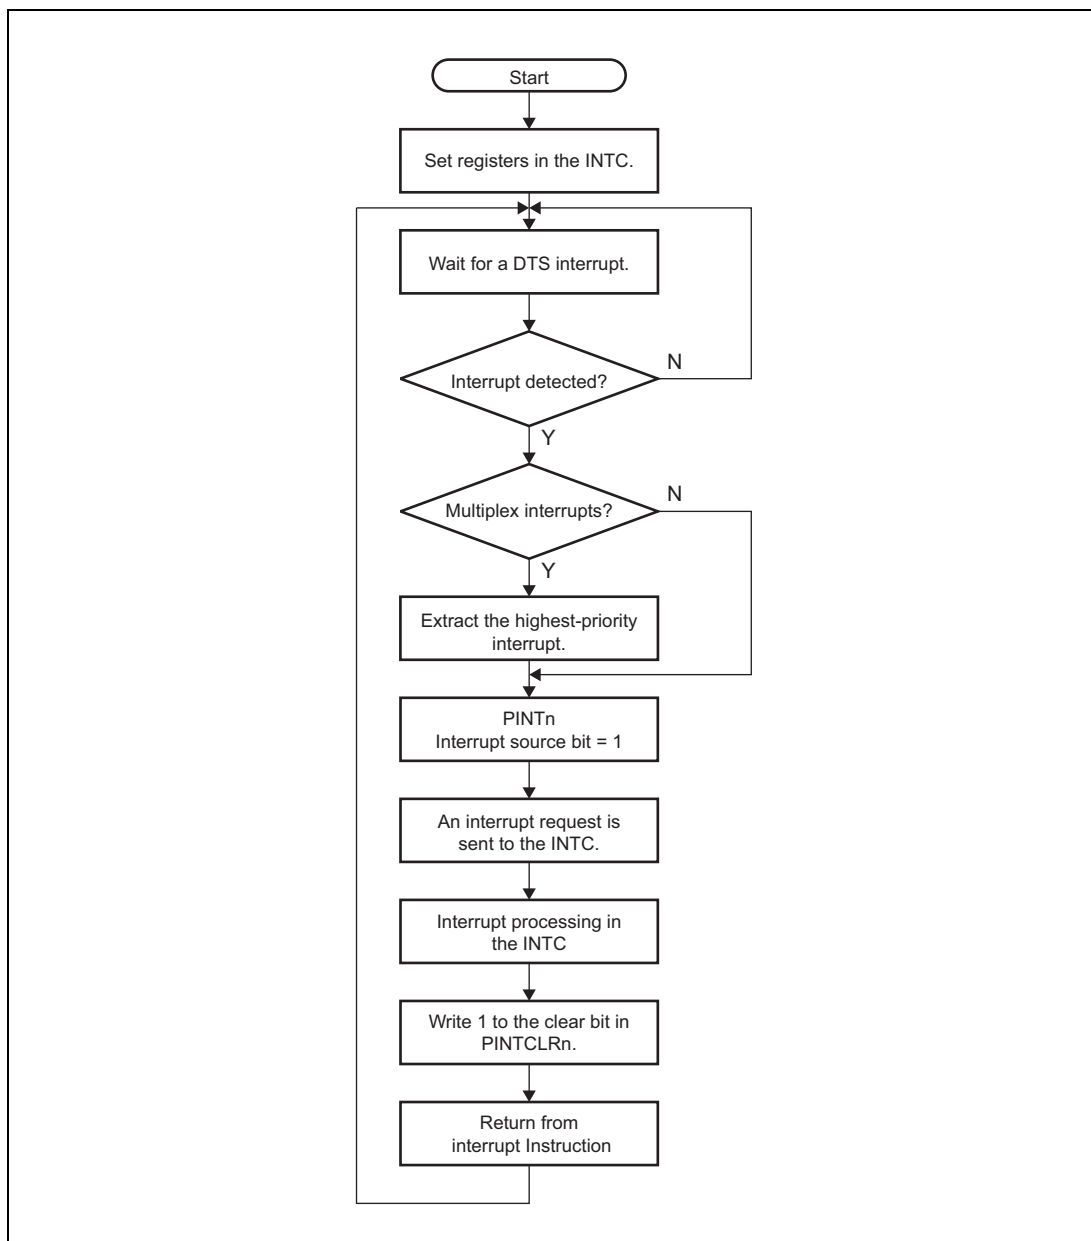

Figure 6.4 DTS Interrupt Processing Flow

6.6 Interrupt latency

The interrupt latency is summarized in **Table 6.13, Interrupt Latency**. The given values describe the response time from the assertion of the interrupt trigger at the INTC module and the instruction fetch of the first instruction inside the interrupt handling routine. The response time is the typical time for the given scenario. However, it is assumed that no other bus master accesses the code flash in case of an instruction cache miss. The unit of the response time is CPU1 clock cycle.

Table 6.13 Interrupt Latency

| Instruction cache | Interrupt detection | Exception handler addressing method | Address reference table location | Latency (CPU1) | |
|-------------------|---------------------|-------------------------------------|----------------------------------|----------------|-------|
| | | | | INTC1 | INTC2 |
| hit | edge | direct vector | NA | 7 | 12 |
| miss | edge | direct vector | NA | 10 | 15 |
| hit | level | direct vector | NA | 6 | 10 |
| miss | level | direct vector | NA | 9 | 13 |
| hit | edge | table reference | Local RAM | 11 | 16 |
| miss | edge | table reference | Local RAM | 14 | 19 |
| hit | level | table reference | Local RAM | 10 | 14 |
| miss | level | table reference | Local RAM | 13 | 17 |
| hit | edge | table reference | Code flash | 14 | 19 |
| miss | edge | table reference | Code flash | 17 | 22 |
| hit | level | table reference | Code flash | 13 | 17 |
| miss | level | table reference | Code flash | 16 | 20 |

6.7 Using Interrupt Request Signals to Initiate Data Transfer

An interrupt request signal activates the DMAC/DTS to perform data transfer. For details, see **Section 7, DMA**.

Section 7 DMA

7.1 Features of RH850/P1M-E DMA

7.1.1 Number of Channels

The products of the RH850/P1M-E series incorporate a DMA with the number of channels indicated below.

Table 7.1 Number of Channels

| Product Name | | RH850/P1M-E 100 pins | RH850/P1M-E 144 pins |
|--------------------|-----|-------------------------|-------------------------|
| Number of channels | DMA | 16ch Redundant | |
| | DTS | 128ch Redundant | |

Table 7.2 Indices

| Index | Description |
|-------|--|
| n | In this section, the DMA unit are identified with an index "n" (n = 0 to 15), for example, as DMACn.* ¹ |
| m | In this section, the DTS channels are identified with an index "m" (m = 000 to 127). |
| k | In this section, the DMA hardware transfer resource are identified with an index "k" (k = 0 to 127). |

Note 1. The correspondence between the channel number "n" and the channel is as follows.

| Channel Number n | Channel |
|------------------|-----------------|
| 0 | DMAC0 channel 0 |
| 1 | DMAC0 channel 1 |
| 2 | DMAC0 channel 2 |
| 3 | DMAC0 channel 3 |
| 4 | DMAC0 channel 4 |
| 5 | DMAC0 channel 5 |
| 6 | DMAC0 channel 6 |
| 7 | DMAC0 channel 7 |
| 8 | DMAC1 channel 0 |
| 9 | DMAC1 channel 1 |
| 10 | DMAC1 channel 2 |
| 11 | DMAC1 channel 3 |
| 12 | DMAC1 channel 4 |
| 13 | DMAC1 channel 5 |
| 14 | DMAC1 channel 6 |
| 15 | DMAC1 channel 7 |

7.1.2 Register Base Address

The DMA/DTS base address is indicated in the following table.

The DMA/DTS register address is expressed as an offset of the base address.

Table 7.3 Register Base Address

| Base Address Name | Base Address |
|-------------------|------------------------|
| <DMAC_base> | FFFF 8000 _H |
| <DTS_base> | FFFF 9000 _H |
| <DMATRG_base> | FFF9 9000 _H |

7.1.3 Interrupt Requests

The DMA/DTS interrupt requests are listed in the following table.

Table 7.4 Interrupt Requests (1/2)

| Unit Interrupt Name | Description | Interrupt Number | ECM* ¹ |
|---------------------|--|------------------|-------------------|
| INTDMA0 | DMA00 transfer end/count match | 16 | — |
| INTDMA1 | DMA01 transfer end/count match | 17 | — |
| INTDMA2 | DMA02 transfer end/count match | 18 | — |

Table 7.4 Interrupt Requests (2/2)

| Unit Interrupt Name | Description | Interrupt Number | ECM* ¹ |
|---------------------|---|------------------|-------------------|
| INTDTSCM3 | DTS count match interrupt CH96-CH127 | 251 | — |
| DMAERR | DMA transfer error | — | ○ |
| DMAVIOL | DMA illegal access error | — | ○ |

Note 1. For detail of the error input to ECM, see **Section 32, Error Control Module (ECM)**.

7.1.4 DMA Trigger Source

The table below shows the assignment of trigger sources to DMAC inputs.

The DMA trigger source assignment for each DMAC channel is set in the DTFR register.

Table 7.5 List of DMA Trigger Sources (1/4)

| Channel | Interrupt Name | DMA Trigger Source |
|-------------|----------------|---|
| DMACTRG[0] | INTP9 | External interrupt |
| DMACTRG[1] | INTTAUJ010 | TAUJ0 CH0 interrupt |
| DMACTRG[2] | INTTAUJ011 | TAUJ0 CH1 interrupt |
| DMACTRG[3] | INTTAUJ012 | TAUJ0 CH2 interrupt |
| DMACTRG[4] | INTTAUJ013 | TAUJ0 CH3 interrupt |
| DMACTRG[5] | INTTAUJ110 | TAUJ1 CH0 interrupt |
| DMACTRG[6] | INTTAUJ111 | TAUJ1 CH1 interrupt |
| DMACTRG[7] | INTTAUJ112 | TAUJ1 CH2 interrupt |

Note 1. For details, see the *RH850/P1M-E Flash Memory User's Manual: Hardware Interface*.

7.1.5 DTS Trigger Source

The table below shows the assignment of trigger sources to DTS inputs. Some of the trigger sources are selected from two sources (primary and secondary). After reset, the primary trigger source is selected. The secondary source is software selectable by writing a configuration register. The request status of selected trigger source is maintained in DTSFSL register.

Table 7.6 List of DTS Trigger Sources (1/4)

| Channel | Interrupt Name | DTS Trigger Source |
|------------|----------------|--|
| DTSTRG[0] | INTP9 | External interrupt |
| DTSTRG[1] | INTTAUJ0I0 | TAUJ0 CH0 interrupt |

7.2 Overview

7.2.1 Overview

Direct memory access (DMA) is used to access data without going through the CPU.

DMA consists of two types of DMA transfer modules: DMAC and DTS. A DMAC includes registers for storing transfer information, and a DTS stores transfer information in the dedicated RAM (DTSRAM). DMA has two 8-channel DMAC modules and one 128-channel DTS module.

In this manual, DTFR denotes the function to select among hardware DMA transfer sources for a DMAC and retain the DMA transfer request, and DTSFSL denotes the function to retain a DMA transfer request for each DTS channel. The DTFR can handle 128 types of hardware DMA transfer sources, and the DTSFSL can handle 128 types of them.

The address space that can be used for DMA transfer is a 4 GB address space represented by a 32-bit address. For information about which resource is assigned to a particular area in the 4 GB address space and which area is accessible from DMA, see **Section 4, Address Space**.

7.2.2 Term Definition

Table 7.7 shows the terms used in this section.

Table 7.7 Definition of Terms

| Term | Meaning |
|-------------------------------|--|
| DMA transfer | A general term for data transfer carried out by DMA. |
| DMA cycle | A series of actions that consist of reading an amount of data specified by the transfer size (8/16/32/64/128 bits) from the address specified by the source address and writing it to the address specified by the destination address. The first half of the DMA cycle (reading part) is called a read cycle, and the second half (writing part) is called a write cycle. |
| Hardware DMA transfer source | A trigger for a DMA transfer request given by an internal peripheral circuit. |
| Hardware DMA transfer request | A DMA transfer request generated by a hardware DMA transfer source |
| Software DMA transfer request | A DMA transfer request generated by software writing to a register. |
| DMA transfer request | A trigger to start DMA transfer with a DMAC or DTS. |
| Transfer information (TI) | The information required for DMA transfer, including the source address, destination address, transfer data size, and transfer count. The transfer information for a DTS is specifically termed as TI. |
| DTSRAM | RAM used by a DTS to store the transfer information. |
| Single transfer | DMA transfer consisting of one DMA cycle started by one DMA transfer request. |
| Block transfer 1 | DMA transfer consisting of a number of DMA cycles specified by the transfer count in the transfer information, started by one DMA transfer request. |
| Block transfer 2 | DMA transfer consisting of a number of DMA cycles specified by the address reload count in the transfer information, started by one DMA transfer request. |
| Block transfer | A general term for both block transfer 1 and block transfer 2. |
| Last transfer | The DMA cycle carried out when the transfer count in the transfer information is 1. |
| Address reload transfer | The DMA cycle carried out when the address reload count in the transfer information is 1 if the reload function 2 is used. |
| Suspension | An action of pausing DMA transfer during block transfer. You can resume DMA transfer after suspension. |
| Resume | An action of resuming suspended DMA transfer. |
| Transfer abort | An action of aborting DMA transfer in the middle. You cannot resume DMA transfer after that. |

7.3 DMA Function

7.3.1 Basic Operation of DMA Transfer

7.3.1.1 Transfer Mode

DMA has three transfer modes.

Single Transfer

One DMA cycle is executed when a DMA transfer request is accepted.

Block Transfer 1

A number of DMA cycles specified in the transfer count register are executed when a DMA transfer request is accepted.

Block Transfer 2

A number of DMA cycles specified by the address reload count are executed when a DMA transfer request is accepted. If the address reload count is larger than the value in the transfer count register, a number of DMA cycles specified in the transfer count register are executed.

7.3.1.2 Executing a DMA Cycle

DMA always executes a write cycle after a read cycle is complete. For example, if the transfer data size is 128 bits, a write cycle is executed after a read cycle for the 128-bit data is finished. A write cycle never starts in the middle of a read cycle.

7.3.1.3 Updating Transfer Information

When a DMA cycle is executed, DMA updates transfer information as follows.

Source Address and Destination Address

Transfer information will be updated as described in **Table 7.8** according to the settings for the source address and destination address and the settings in the transfer control register such as the count directions of source address and destination address and transfer data size.

Table 7.8 Updating the Source Address and the Destination Address

| Direction of Count | Transfer Data Size | Address after Update |
|--------------------|--------------------|--|
| Increment | 8 bit | (address before update) + 0000_0001 _H |
| | 16 bit | (address before update) + 0000_0002 _H |
| | 32 bit | (address before update) + 0000_0004 _H |
| | 64 bit | (address before update) + 0000_0008 _H |
| | 128 bit | (address before update) + 0000_0010 _H |
| Decrement | 8 bit | (address before update) – 0000_0001 _H |
| | 16 bit | (address before update) – 0000_0002 _H |
| | 32 bit | (address before update) – 0000_0004 _H |
| | 64 bit | (address before update) – 0000_0008 _H |
| | 128 bit | (address before update) – 0000_0010 _H |
| Fixed | — | Same as the address before update. |

When you use the reload function, a special update rule is applied other than the one described in **Table 7.8** is applied for the last transfer and the address reload transfer. For details, see **7.3.3, Reload Function**.

Transfer Count/Address Reload Count

The transfer count is decremented by one for every DMA cycle.

The address reload count is decremented by one for every DMA cycle when the reload function 2 or block transfer 2 is used. When the reload function 2 or block transfer 2 is not used, it is not updated.

When you use the reload function, a special update rule is applied for the last transfer and the address reload transfer. For details, see **7.3.3, Reload Function**.

Other Transfer Information

Other transfer information is not updated during execution of a DMA cycle.

7.3.1.4 Last Transfer and Address Reload Transfer

The last transfer means a DMA cycle executed when the value in the transfer count register, which shows the remaining number of transfers, is one. The last transfer differs in operation compared to other DMA cycles as follows.

- The transfer completion flag (DCSTn.TC) is set when the last transfer is complete. (Only applicable for a DMAC)
- The channel operation enable (DCENn.DTE) bit is cleared when the last transfer is complete. (Only applicable for a DMAC. When the continuous transfer is disabled.)
- When the transfer completion interrupt output enable is set, a transfer completion interrupt is output when the last transfer is complete.
- When the reload function 1 is enabled, the reload function 1 is executed at the timing of the last transfer. For details, see **7.3.3, Reload Function**.

The address reload transfer means a DMA cycle executed when the reload function 2 is enabled and the address reload count is one. The reload function 2 is executed during the address reload transfer. For details, see **7.3.3, Reload Function**.

7.3.1.5 Transfer Completion Interrupt and Transfer Count Match Interrupt Outputs

DMA can output a transfer completion interrupt and a transfer count match interrupt.

Transfer Completion Interrupt Output

When the transfer completion interrupt output enable (DTCTn.TCE) is set in the transfer control register, a DMAC requests a DMAC transfer completion interrupt when the last transfer is complete.

When the transfer completion interrupt output enable (DTTCTm.TCE) is set in the transfer control register, a DTS requests a DTS transfer completion interrupt when the last transfer is complete.

Transfer Count Match Interrupt Output

When the transfer count match interrupt enable (DTCTn.CCE) is set in the transfer control register, a DMAC requests a DMAC transfer count match interrupt when the DMA cycle in which the transfer count compare register and the transfer count have the same value is complete.

When the transfer count match interrupt enable (DTTCTm.CCE) is set in the transfer control register, a DTS requests a DTS transfer count match interrupt at the completion of the DMA cycle in which the transfer count compare register and the transfer count have the same value.

Figure 7.1 shows the operation of the transfer completion interrupt and the transfer count match interrupt.

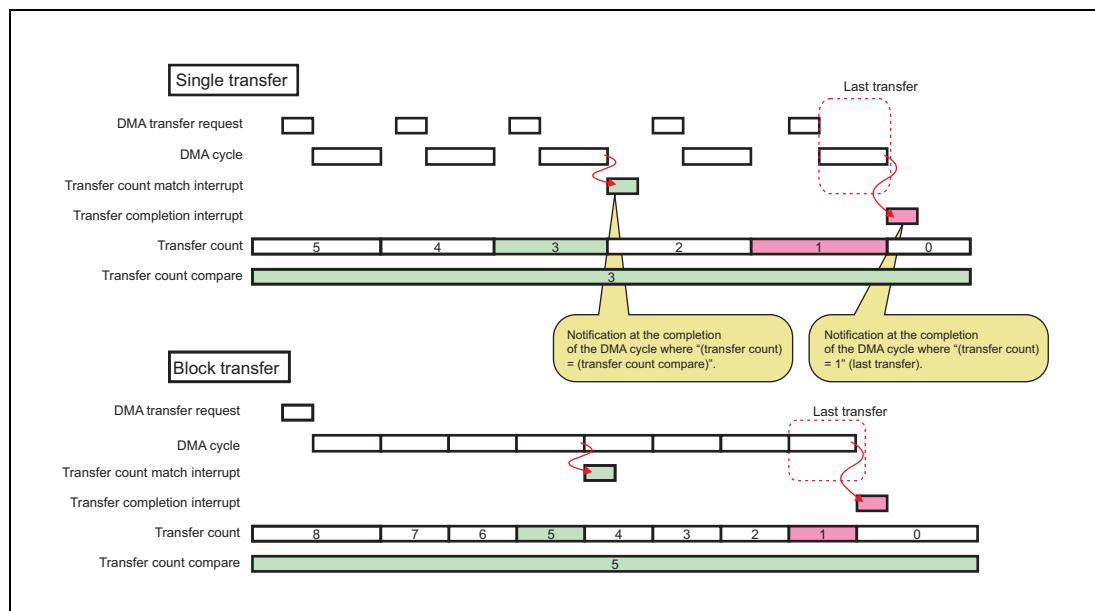

Figure 7.1 Transfer Completion Interrupt and Transfer Count Match Interrupt

7.3.1.6 Continuous Transfer

If the continuous transfer is not used, a DMAC sets the transfer completion flag (DCSTn.TC) and clears the channel operation enable (DCENn.DTE) bit when the last transfer is complete. In this case, a DMA transfer request is not accepted when the request is generated after the completion of the last transfer.

If the continuous transfer is used, the channel operation enable (DCENn.DTE) bit is not cleared when the last transfer is complete, and a DMA transfer request can be accepted even when the transfer completion flag is set. If DMA is used for a case where a specified number of DMA transfers are executed repetitively, software overhead associated with clearing the transfer completion flag and setting the channel operation enable bit after the completion of the last transfer can be reduced by using the continuous transfer.

The continuous transfer is enabled by setting the continuous transfer enable (DTCTn.MLE) in the DMAC transfer control register.

The continuous transfer is designed to work with the reload function 1. The continuous transfer function itself does not update the source address register, destination address register, and transfer count register. If, after the last transfer is complete, you want to restore the source address register, destination address register, and transfer count register to the state before the DMA transfer starts, set the values of source address register, destination address register, and transfer count register before the DMA transfer starts to the reload source address register, reload destination address register, and reload transfer count register respectively, and use reload function 1.

A DTS does not have a setting corresponding to the continuous transfer enable (DTCTn.MLE) for a DMAC. This is because a DTS does not have bits like the transfer completion flag (DCSTn.TC) and the channel operation enable (DCENn.DTE) a DMAC has.

A DTS does not start DMA transfer when a DMA transfer request is generated while the transfer count is 0. (This corresponds to the case for a DMAC where the continuous transfer is not used.)

If the reload function 1 is used for a DTS and the value other than 0 is reloaded to the transfer count when the last transfer is complete, DMA transfer can start when the next DMA transfer request is accepted. (This corresponds to the case for a DMAC where the continuous transfer is used.)

Figure 7.2 shows an operation of continuous transfer by a DMAC.

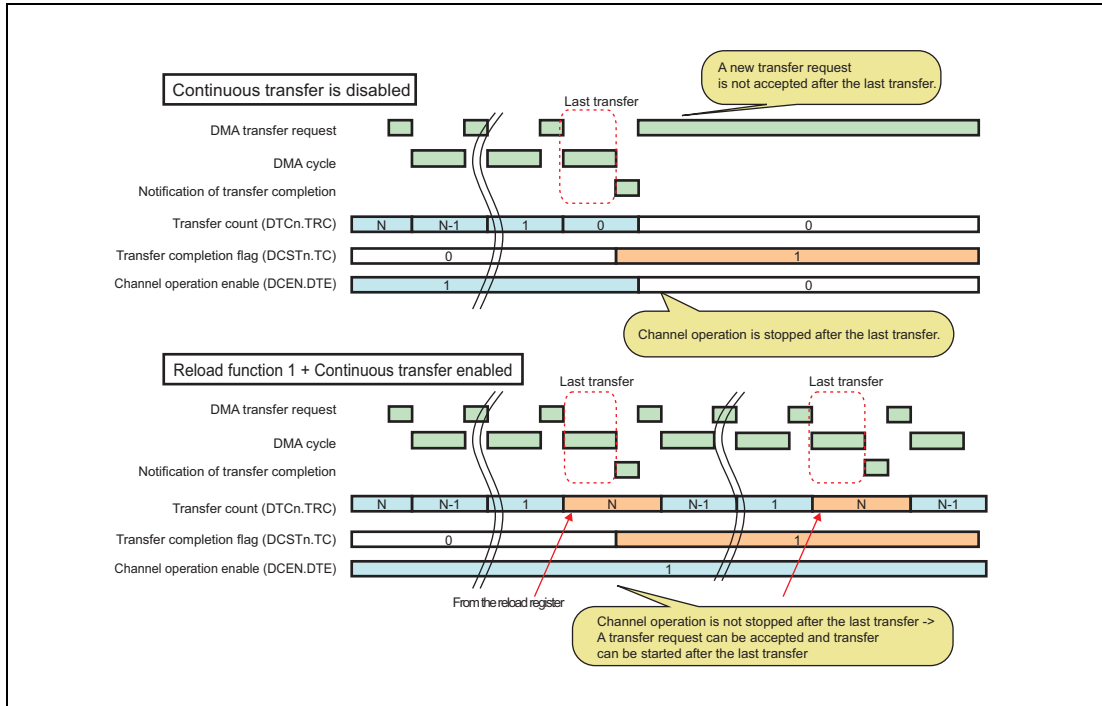

Figure 7.2 Operation of Continuous Transfer by a DMAC

7.3.2 Channel Priority Order

This subsection explains arbitration between multiple DMA channels.

7.3.2.1 DMAC Channel Arbitration

A DMAC select one channel out of eight channels with arbitration.

Arbitration is done according to the fixed priority order. The priority order is “channel 0 > channel 1 > channel 2 > channel 3 > channel 4 > channel 5 > channel 6 > channel 7” for DMAC0, and “channel 8 > channel 9 > channel 10 > channel 11 > channel 12 > channel 13 > channel 14 > channel 15” for DMAC1.

Arbitration is done for every DMA cycle. No arbitration occurs between the read and write of a DMA cycle.

If, at the timing when one DMA cycle in the middle of a block transfer of a channel is complete, there is a DMA transfer request from a channel with a higher priority than the channel, a DMA cycle of the channel with the higher priority will be executed next as the result of arbitration.

If a DMAC executes the block transfer 1 or block transfer 2, DMAC channel arbitration is done for every DMA cycle, and possibly a DMA cycle of another DMAC channel with a higher priority can cut in.

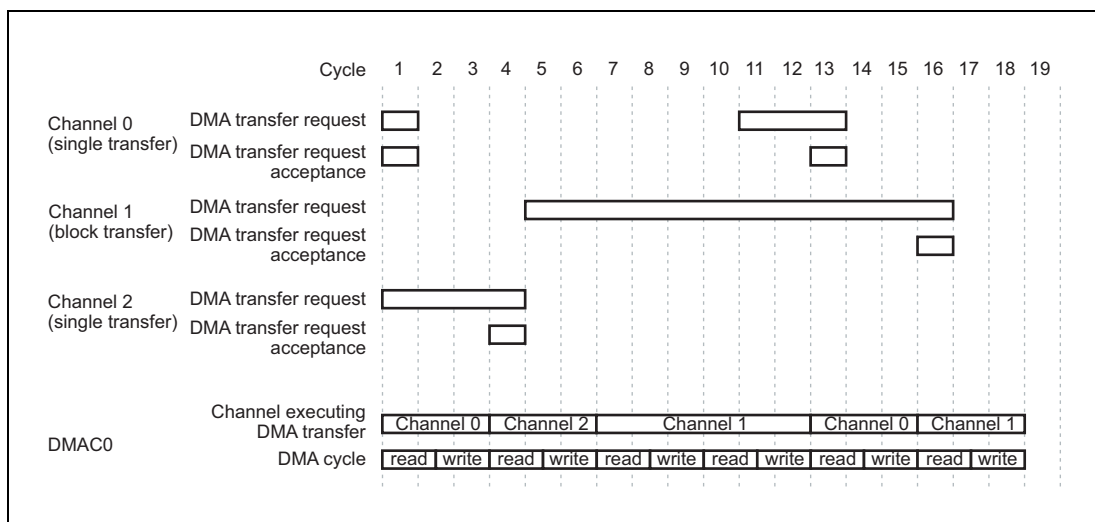

Figure 7.3 DMAC Channel Arbitration

Cycle numbers shown in **Figure 7.3** are for explanation purpose only. They do not indicate an actual number of cycles necessary for executing DMA transfer.

In **Figure 7.3**, DMA transfer requests for channels 0 and 2 are generated at Cycle 1. As a result of arbitration, a DMA cycle for channel 0 starts because its priority is higher. At Cycle 4, a DMA cycle for channel 2 starts. At Cycle 5, a DMA transfer request for channel 1 is generated. The DMA cycle for channel 2 is still ongoing and no arbitration is done at this point. At Cycle 7, a DMA cycle for channel 1 starts. Channel 1 uses block transfer. Another DMA cycle continues at Cycle 10 because there are no DMA transfer requests from other channels. At Cycle 11, a DMA transfer request for channel 0 is generated. The DMA cycle for channel 1 is still ongoing and no arbitration is done at this point. At Cycle 12, the DMA cycle for channel 1 is complete. At Cycle 13, a DMA cycle for channel 0 starts as a result of arbitration between DMA channels 0 and 1.

It should be noted that, even though a block transfer of channel 1 has been already started, a DMA cycle of not channel 1 but channel 0 is executed at Cycle 13 because the priority of the latter is higher. At Cycle 15, the DMA cycle for channel 0 is complete. At Cycle 16, a DMA cycle for channel 1 starts again. At Cycle 18, the last DMA cycle of the block transfer of channel 1 is complete.

7.3.2.2 DTS Channel Arbitration

If there are DMA transfer requests from multiple DTS channels, the DTSFSL arbitrates those DTS channels. For each DTS channel, a priority can be selected from four levels using DTS channel priority setting registers.

If there are DMA transfer request from multiple DTS channels, the arbitration is done as follows.

1. A channel with a higher priority level in the setting of DTS channel priority setting registers has a priority.
2. If two channels have the same priority level in the setting of DTS channel priority setting registers, a channel with a lower channel number has a priority.

The DTSFSL sends the DTS a DMA transfer request for the channel selected by arbitration. The DTS executes DMA transfer when it accepts the DMA transfer request.

Unlike DMA transfer with a DMAC, DMA transfer with a DTS does not allow arbitration between DTS channels in the middle of a block transfer. That means, even if a DMA transfer request with a higher priority comes during a block transfer for a channel with a lower priority, the DMA transfer with a higher priority does not start until the current block transfer for the channel with a lower priority is complete*1.

Note 1. Block transfer is complete when the last transfer for the block transfer 1 or the last transfer or address reload transfer for the block transfer 2 occurs.

When a DTS executes the block transfer 1 or block transfer 2, a DMA cycle of a DTS channel with a higher priority does not take over the ongoing block transfer until the last transfer.

Figure 7.4 DTS Channel Arbitration

Cycle numbers shown in **Figure 7.4** are for explanation purpose only. They do not indicate an actual number of cycles necessary for executing DMA transfer.

In **Figure 7.4**, DMA transfer requests for channels 0, 1 and 2 are generated at Cycle 1. The channel priority for channels 0 and 2 is 0 and is higher than the channel priority for channel 1, which is 3. In addition, if two channels have the same priority, the channel with the smaller channel number has a higher priority. Consequently, the priority order for arbitration is “channel 0 > channel 2 > channel 1”, and a DMA cycle for channel 0 starts because its priority is the highest. At Cycle 4, as a result of arbitration between channels 1 and 2, a DMA cycle for channel 2 starts. At Cycle 7, a DMA cycle for channel 1 starts. Channel 1 uses block transfer. Another DMA cycle continues at Cycle 10 because there are no DMA transfer requests from other channels. At Cycle 11, a DMA transfer request for channel 0 is generated. The DMA cycle for channel 1 is still ongoing and no arbitration is done until the block transfer of channel 1 is complete.

At Cycle 15, the block transfer of channel 1 is complete. At Cycle 16, a DMA cycle for channel 0 starts.

7.3.2.3 Interface Arbitration

The interface between the DMA and the System Interconnect is shown in **Figure 7.5**. DMAC0, DMAC1 and DTS operate independently and they can request bus transfers via the interface arbiter to the system interconnect. As the system interconnect performs non-blocking data transfers, multiple DMA transfers can be active coincidentally.

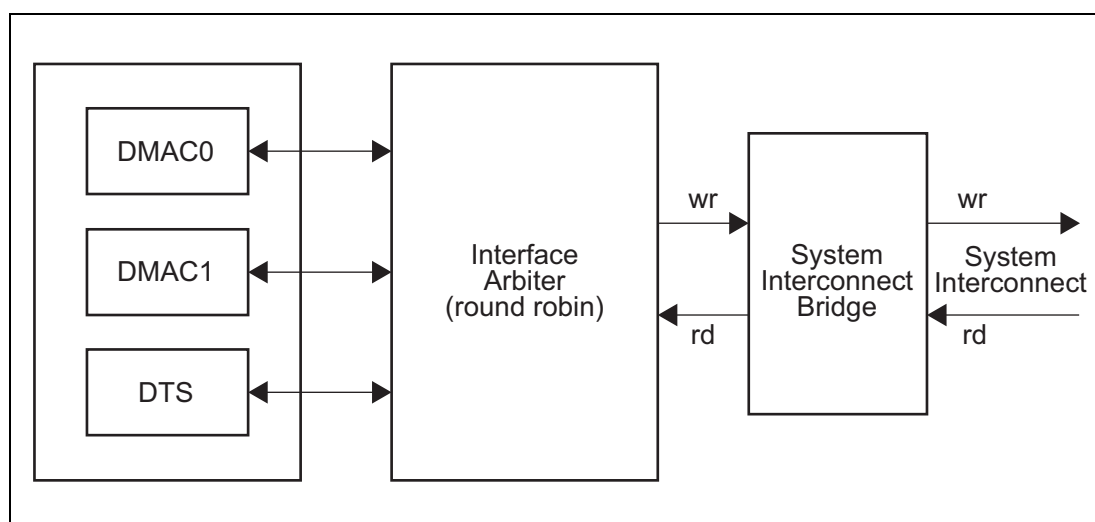

Figure 7.5 Interface Arbitration

Read and write busses are separated and they operate independently. In case of conflicts, the arbitration is done in round robin. Issuing a read or write request takes one DMA clock cycle. While the issuer waits for the response, another active unit may issue its request in the subsequent clock cycle. Note that one DMA clock cycle may take two CPU cycles.

7.3.3 Reload Function

7.3.3.1 Overview of the Reload Function

The reload function updates a portion of transfer information, more specifically, the source address, destination address, transfer count, and address reload count, to the predefined values during DMA transfer.

The reload function has two types of functions: reload function 1 and reload function 2.

7.3.3.2 Operation of Reload Function 1

When the reload function 1 is enabled, actions described in **Table 7.9** are executed at the timing of the last transfer according to the reload function 1 setting.

Table 7.9 Operation of Reload Function 1

| Reload Function 1 Setting (DTCTn.RLD1M[1:0]) | Register | Action at the Last Transfer |
|--|----------------------|---|
| 00 (Reload function 1 disabled.) | Source address | Not reloaded. |
| | Destination address | Not reloaded. |
| | Transfer count | Not reloaded. |
| | Address reload count | Not reloaded. |
| 01 (Reload function 1 enabled. Reloading source address and transfer count.) | Source address | The reload source address is copied to this. |
| | Destination address | Not reloaded. |
| | Transfer count | The reload transfer count is copied to this. |
| | Address reload count | <ul style="list-style-type: none"> If the reload function 2 is disable: Not reloaded. If the reload function 2 is enabled: The reload address reload count is copied to this. |
| 10 (Reload function 1 enabled. Reloading destination address and transfer count.) | Source address | Not reloaded. |
| | Destination address | The reload destination address is copied to this. |
| | Transfer count | The reload transfer count is copied to this. |
| | Address reload count | <ul style="list-style-type: none"> If the reload function 2 is disable: Not reloaded. If the reload function 2 is enabled: The reload address reload count is copied to this. |
| 11 (Reload function 1 enabled. Reloading source address, destination address, and transfer count.) | Source address | The reload source address is copied to this. |
| | Destination address | The reload destination address is copied to this. |
| | Transfer count | The reload transfer count is copied to this. |
| | Address reload count | <ul style="list-style-type: none"> If the reload function 2 is disable: Not reloaded If the reload function 2 is enabled: The reload address reload count is copied to this. |

Figure 7.6 shows an operation of the reload function 1.

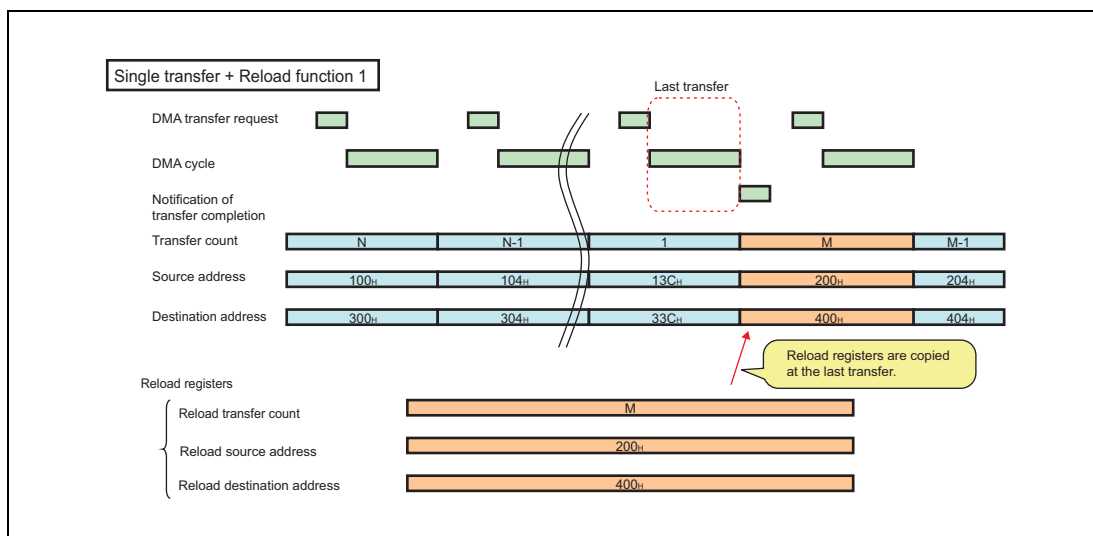

Figure 7.6 Operation of Reload Function 1

7.3.3.3 Reload Function 2

When the reload function 2 is enabled, actions described in Table 7.10 are executed at the timing of the address reload transfer according to the reload function 2 setting.

Table 7.10 Operation of Reload Function 2

| Reload Function 2 Setting (DTCTn.RLD2M[1:0]) | Register | Action at the Address Reload Transfer |
|--|----------------------|--|
| 00 (Reload function 2 disabled.) | Source address | Not reloaded. |
| | Destination address | Not reloaded. |
| | Address reload count | Not reloaded. |
| 01 (Reload function 2 enabled. Reloading source address.) | Source address | The reload source address is copied to this. |
| | Destination address | Not reloaded. |
| | Address reload count | The reload address reload count is copied to this. |
| 10 (Reload function 2 enabled. Reloading destination address.) | Source address | Not reloaded. |
| | Destination address | The reload destination address is copied to this. |
| | Address reload count | The reload address reload count is copied to this. |
| 11 (Reload function 2 enabled. Reloading source address and destination address.) | Source address | The reload source address is copied to this. |
| | Destination address | The reload destination address is copied to this. |
| | Address reload count | The reload address reload count is copied to this. |

Figure 7.7 shows an operation of the reload function 2.

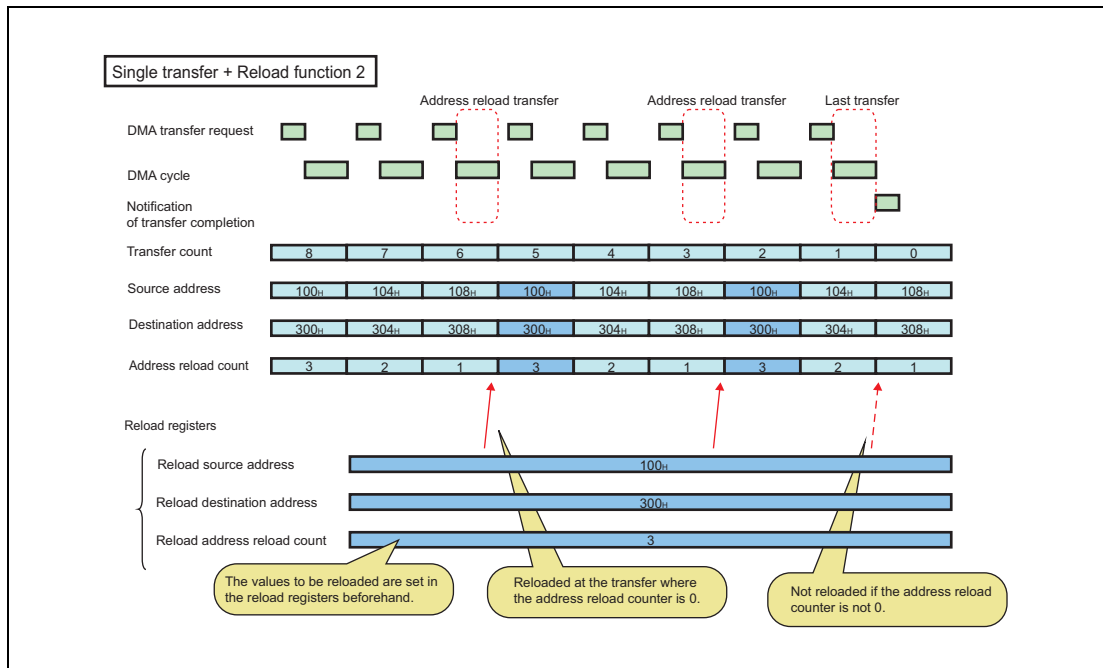

Figure 7.7 Operation of Reload Function 2

Figure 7.8 shows an operation when both the reload function 1 and the reload function 2 are used simultaneously.

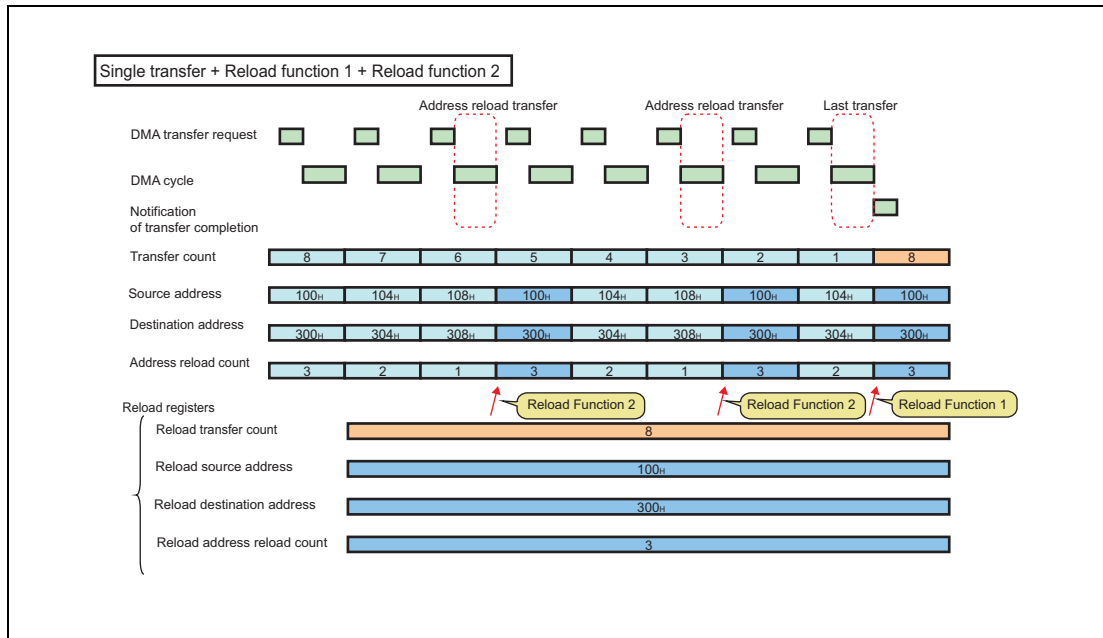

Figure 7.8 Operation when Combining the Reload Function 1 and the Reload Function 2

7.3.3.4 Timing of Setting DMAC Reload Registers

You can set up the reload source address register, reload destination address register, and reload transfer count register any time (even during DMA transfer). As an exception, if you update the reload source address register, reload destination address register, and reload transfer count register during DMA transfer, there may be a conflict between reloading at the last transfer or address reload transfer and updating the reload register. In order to avoid this conflict, setting up reload registers must be completed before the last transfer or address reload transfer starts.

If you need to update the reload source address register, reload destination address register, and reload transfer count register during DMA transfer, one way to know the right timing of update is to use a DMA transfer count match interrupt. In this case, you must set up the DMA transfer count compare register (DTCCn) so that you can have enough margin for the time necessary to update the reload registers.

7.3.3.5 Timing of Setting DTS Reload Registers

It should be noted that the right timing of setting up the reload source address information, reload destination address information, and reload transfer count information differs depending on the transfer mode.

In the single transfer mode, the TI fetched at the beginning of the last transfer or address reload transfer is used for reload at the completion of the DMA cycle. Therefore, if you use the reload function for single transfer, the reload source address information, reload destination address information, and reload transfer count information in the TI must be set up before the beginning of the last transfer or address reload transfer.

During block transfer, TI is fetched only at the beginning of DMA transfer. The TI fetched at the beginning of the DMA transfer is used for reload at the last transfer or address reload transfer. Therefore, if you use the reload function for block transfer, the reload source address information, reload destination address information, and reload transfer count information in the TI must be set up before the beginning of the DMA transfer. If you update the reload source address information, reload destination address information, and reload transfer count information in the TI in the middle of a block transfer, those new settings will not be used for reload at the completion of the block transfer.

7.3.4 Chain Function

7.3.4.1 Overview

DMA offers a function called chain function. If you use the chain function, the completion of the DMA cycle or last transfer for one channel can trigger a DMA transfer request for another channel.

A DMA transfer request for another channel initiated by the chain function is called a chain request.

You can select the condition for generating a chain request from the following two options.

- Always chain: A chain request is generated at the completion of every DMA cycle.
- Chain at the last transfer: A chain request is generated at the completion of the last transfer.

Figure 7.9 shows an operation of the case “always chain”.

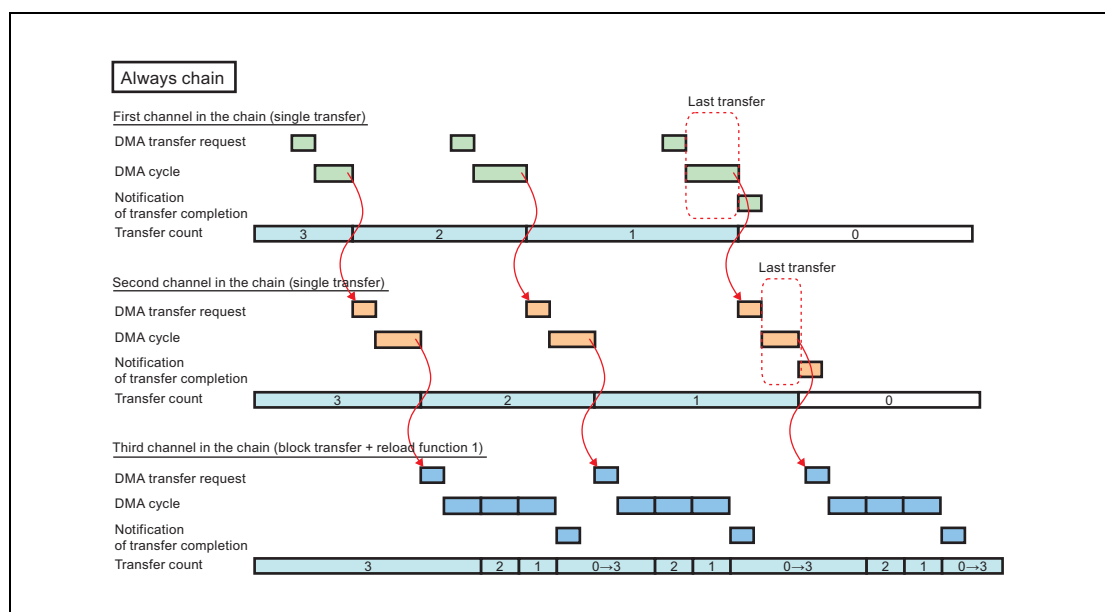

Figure 7.9 Operation of the Case “Always Chain”

Figure 7.10 shows an operation of the case “chain at the last transfer”.

Figure 7.10 Operation of the Case “Chain at the Last Transfer”

7.3.4.2 Setting Up the Chain Function

For a DMAC, you need to write to the chain enable (DTCTn.CHNE) and the next channel in the chain selection (DTCTn.CHNSEL) in the DMAC transfer control register in order to set up the type of chain function and the next channel number in the chain.

For a DTS, you need to write to the chain enable (DTTCTm.CHNE) and the next channel in the chain selection (DTTCTm.CHNSEL) in the DTS transfer control register in order to set up the type of chain function and the next channel number in the chain.

7.3.4.3 Caution for Using the Chain Function

The chain function sets the software DMA transfer request flag of the next channel in the chain as a part of its function. Therefore, you need to set up the channel settings of the next channel in the chain in the same way as when the software DMA transfer request is used. If you specify a channel that is set up to use the hardware DMA transfer request for the next channel in the chain, the chain function does not work.

A channel and its next channel in the chain must belong to the same module (DMAC0, DMAC1, and DTS). You cannot specify a channel in another module for its next channel in the chain.

7.3.5 DMAC Operation

7.3.5.1 Types of DMA Transfer Requests and Assigning DMA Transfer Requests

A DMAC starts DMA transfer by accepting a hardware DMA transfer request or software DMA transfer request. The DMA transfer request selection assignment (DRS) bit in the DMAC transfer control register (DTCTn) determines whether a hardware DMA transfer request or a software DMA transfer request is used.

In the case of a hardware DMA transfer request for a DMAC, one out of 128 hardware DMA transfer sources is selected and assigned for each channel of the DMAC in the DTFR. This assignment is configured in the DTFR setting registers.

7.3.5.2 Generating and Accepting a Hardware DMA Transfer Request

DMAC can handle an edge-detection type of hardware DMA transfer source.

(1) Edge-detection type

In case of using edge-detection type, DTFR detects a rising edge of hardware DMA transfer source input and keeps it as a hardware DMA transfer request. DTFR also notifies DMAC of the existence of hardware DMA transfer request. When DTFR receives acknowledgement of hardware DMA transfer request from DMAC, DTFR clears hardware DMA transfer request.

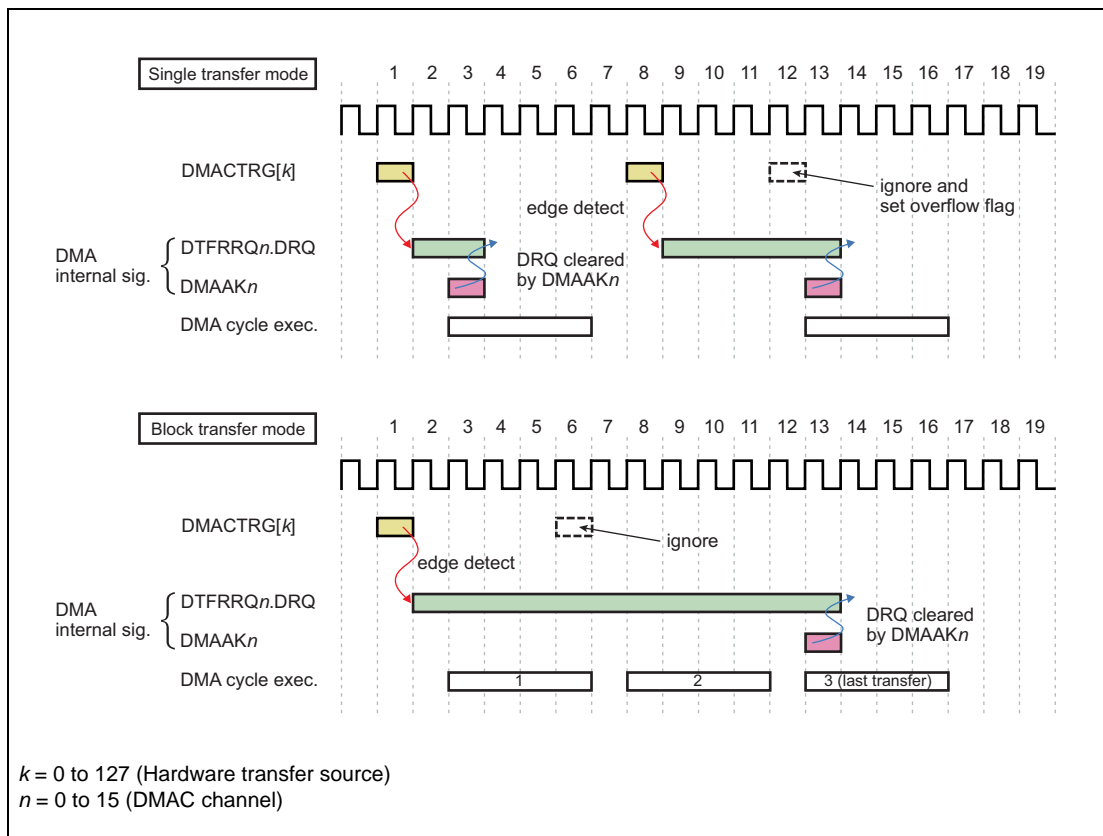

Figure 7.11 Operation of Hardware DMA Transfer Request by DMAC (Edge-detection Type)

In case of edge-detection type, DTFR can keep one hardware DMA transfer request per channel. If DTFR keeps a hardware DMA transfer request for a channel and additional rising edge of hardware

DMA transfer source is inputted for the same channel, DTFR set the hardware DMA transfer request overflow flag of corresponding channel.

(2) The Timing of Hardware DMA Transfer Acknowledgement Notification

CAUTION

Caution about the operation of DTFR hardware DMA transfer source selection enable bit during block transfer.

Be careful about the following operation when DMAC is used both with hardware DMA transfer request and with block transfer (1 or 2) mode.

If DTFR hardware DMA transfer source selection enable bit is set to disable (DTFRn.REQEN = 0) by software while DMAC is executing block transfer, the ongoing block transfer is suspended.

When DMAC is used both with hardware DMA transfer request and with block transfer (1 or 2) mode, it is recommended not to modify DTFR hardware DMA transfer source selection enable bit (DTFRn.REQEN) by software while DMAC is executing block transfer. It is also recommended to use DTCT.MLE bit to control the acknowledgement of succeeding hardware DMA transfer requests.

DTFR hardware DMA transfer request bit (DTFRRQn.DRQ) is kept set during block transfer and is cleared at the start of last transfer.(see the bottom figure of **Figure 7.12**). If DTFR hardware DMA transfer source selection enable bit is set to disable (DTFRn.REQEN = 0) by software while DMAC is executing block transfer, the hardware DMA transfer request is going to be masked and as a result DMAC cannot recognize the existence of hardware DMA transfer request.

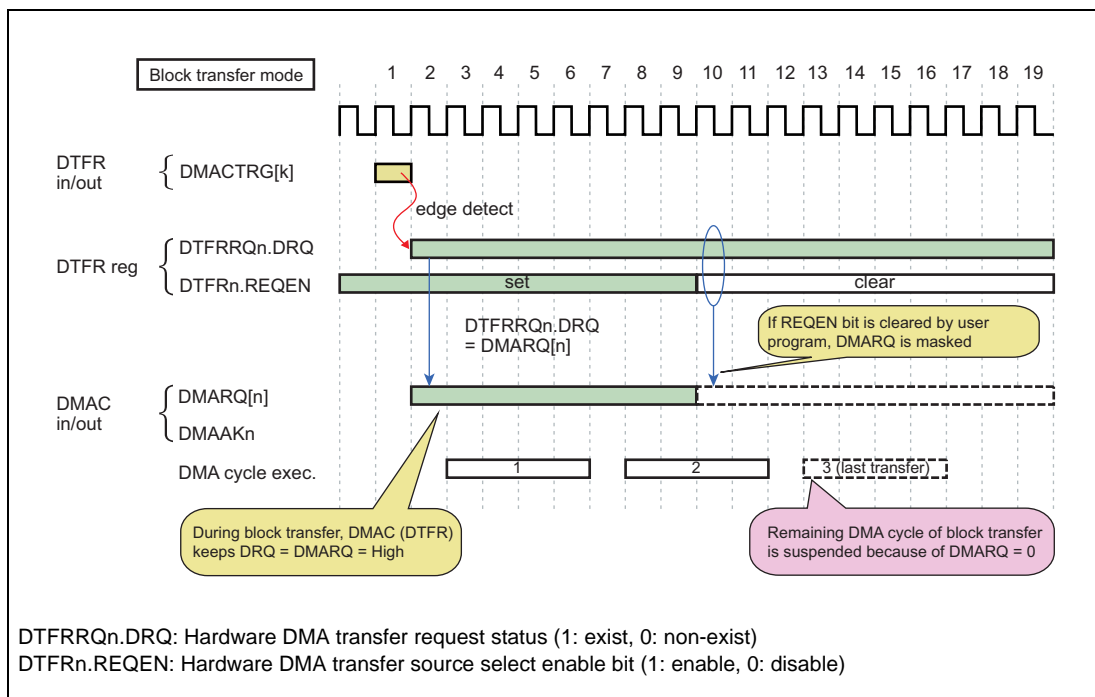

Figure 7.12 Caution about the Operation of DTFR Hardware DMA Transfer Source Selection Enable Bit during Block Transfer

This caution does not apply to the following situations.

- The case that DMAC is used both with hardware DMA transfer request and with single transfer.
- The case that DMAC is used with software DMA transfer request.
- The case that DTS is used.

7.3.5.3 Generating and Accepting a Software DMA Transfer Request

By setting the software DMA transfer request flag (SR) in the DMAC transfer status register (DCSTn) using the DMAC transfer status set register (DCSTS_n), a software DMA transfer request can be generated.

The software DMA transfer request flag is automatically cleared when the DMAC processes the DMA transfer request. The timing when the software DMA transfer request flag is automatically cleared differs depending on the transfer mode of the DMA transfer to be executed.

- In the single transfer mode, the software DMA transfer request flag is cleared whenever the software DMA transfer request is accepted.
- In the block transfer 1 mode, the software DMA transfer request flag is cleared when the last transfer starts.
- In the block transfer 2 mode, the software DMA transfer request flag is cleared when the last transfer or address reload transfer starts.

The software DMA transfer request flag can also be cleared by software using the DMAC transfer status clear register (DCSTC_n). When you abort a DMA transfer of a DMAC channel, you must clear the software DMA transfer request flag.

7.3.5.4 Execution of DMA transfer

The DMAC block executes the DMA transfer of the accepted channel. DMAC arbitration is done, when two or more channels request transfers at the same time.

Figure 7.13 shows one example of the DMAC transfer timing in single transfer mode, starting with a transfer count of 2.

Figure 7.13 Example of DMA Transfer Timing in Single Transfer Mode

Figure 7.14 shows an example of the DMAC transfer timing in block transfer mode, starting with a transfer count of 2.

Figure 7.14 Example of DMA Transfer Timing in Block Transfer Mode

Figure 7.15 shows the timing, in which the source address register, the destination address register, the transfer count register and the transfer completion flag are updated.

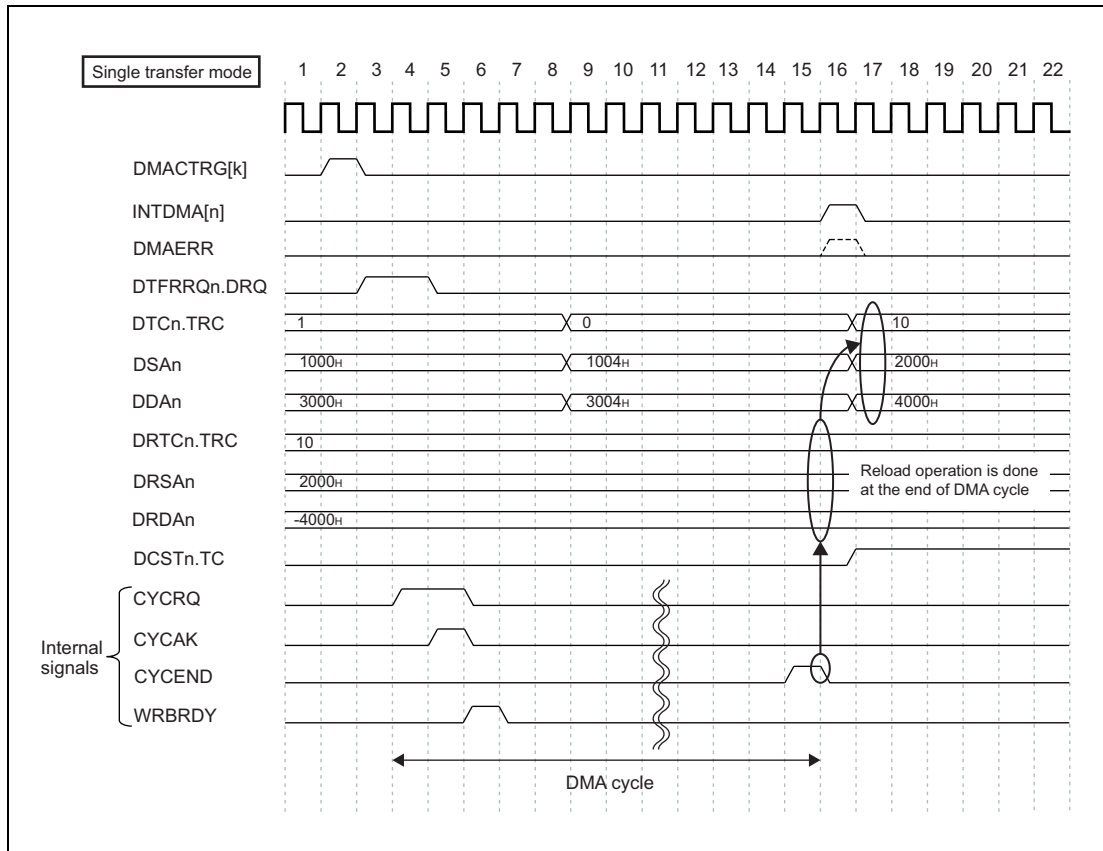

Figure 7.15 Example of DMA Transfer Timing with Reload Function 1

7.3.6 DTS Operation

7.3.6.1 Types of DMA Transfer Requests and Assigning DMA Transfer Requests

A DTS starts DMA transfer by accepting a hardware DMA transfer request or software DMA transfer request.

A transfer request for a DTS is retained in the transfer request pending bit of the DTSFSL for each channel.

As for the DTSFSL, both a hardware DMA transfer request and a software DMA transfer request are retained in the same transfer request pending bit. When executing DMA transfer, a DTS does not care whether a DMA transfer request is a hardware DMA transfer request or software DMA transfer request.

In the case of a hardware DMA transfer request for a DTS, each of 128 hardware DMA transfer sources is assigned to one of 128 channels in the DTSFSL in the fixed manner. You cannot change this assignment by, for example, register settings.

7.3.6.2 Generating and Accepting a DMA Transfer Request

When the DTSFSL detects a hardware DMA transfer source input, the DTSFSL sets the transfer request pending bit and retains the hardware DMA transfer source as a DMA transfer request. If the transfer request pending bit is set and the transfer request enable bit (DTFSLm.REQEN) in the DTSFSL operation setting register is set, the DTSFSL notifies the DTS of the DMA transfer request.

Software can also generate a DMA transfer request by setting the transfer request pending bit (DTFSTm.DRQ) of the DTSFSL transfer request status register using the DTSFSL transfer request set register (DTFSSm).

The DTSFSL can retain only one DMA transfer request per channel. If, while the transfer request pending bit for a channel is set, a new hardware DMA transfer source input for the same channel comes, DTSFSL sets request overflow flag of corresponding channel.

When the DTS accepts a DMA transfer request, it notifies of the acceptance of the DMA transfer request.

The transfer request pending bit is automatically cleared when the DTS accepts the DMA transfer request. The DTSFSL clears the transfer request pending bit automatically when the DTS accepts the DMA transfer request regardless of the type of the DMA transfer to be executed by the DTS.

The transfer request pending bit can also be cleared using the DTSFSL transfer request clear register (DTFSCm). If the transfer request pending bit of a channel is cleared before the DTS accepts the DMA transfer request, DMA transfer of the channel is not executed.

7.3.6.3 Executing DMA Transfer

When the DTS accepts a DMA transfer request for a channel, the DTS executes DMA transfer of the channel.

If there are DMA transfer requests from multiple channels, the DTSFSL arbitrates the DTS channels and picks up one channel for a DMA transfer request.

While the DTS is executing DMA transfer, the DTS transfer status (DTSSTS.DTSACT) bit in the DTS status register is set. In addition, the channel number of the currently ongoing DMA transfer is set in the DTS transfer channel (DTSSTS.DTSACH).

When the DMA transfer is complete or aborted because of DMA transfer error or writing to registers and no channel is currently executing DMA transfer, the DTS transfer status (DTSSTS.DTSACT) bit is cleared.

Figure 7.16 shows an example of a single DTS transfer. Note that the drawing shows also internal states, which are not reflected in registers. The DTS transfer is accepted in cycle 5 (ACK status), which causes fetching the transfer information (TI) in cycles 6 to 14 (TIFETCH status). The DMA cycle is executed in cycles 15 to 23 (TRANSFER status) and the TI information is written back in cycles 24 to 28 (TIWRITE status). The interval cycle is asserted in cycle 29 (FIN status). The state changes to idle (IDLE state) and the DTS waits for the next DMA request. This picture is an example and the clock cycles of each phase may differ from the depicted flow.

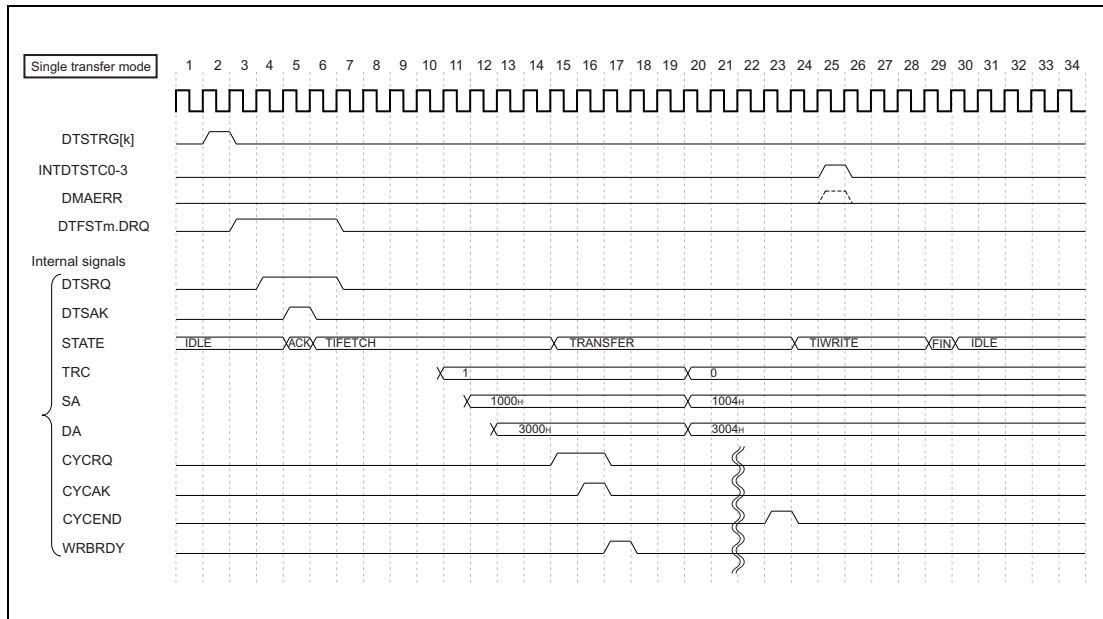

Figure 7.16 DTS Single Transfer Timing

Figure 7.17 shows an example of a DTS block transfer. The DTS transfer is accepted in cycle 5 (ACK status), which causes fetching the transfer information (TI) in cycles 6 to 10 (TIFETCH status). Three transfers are executed in cycles 11 to 25 (TRANSFER status) and the TI information is written back in cycles 26 to 30 (TIWRITE status). The interval cycle is asserted in cycle 31 (FIN status). In cycle 32, the state changes to idle (IDLE state) and the next DMA transfer can be executed.

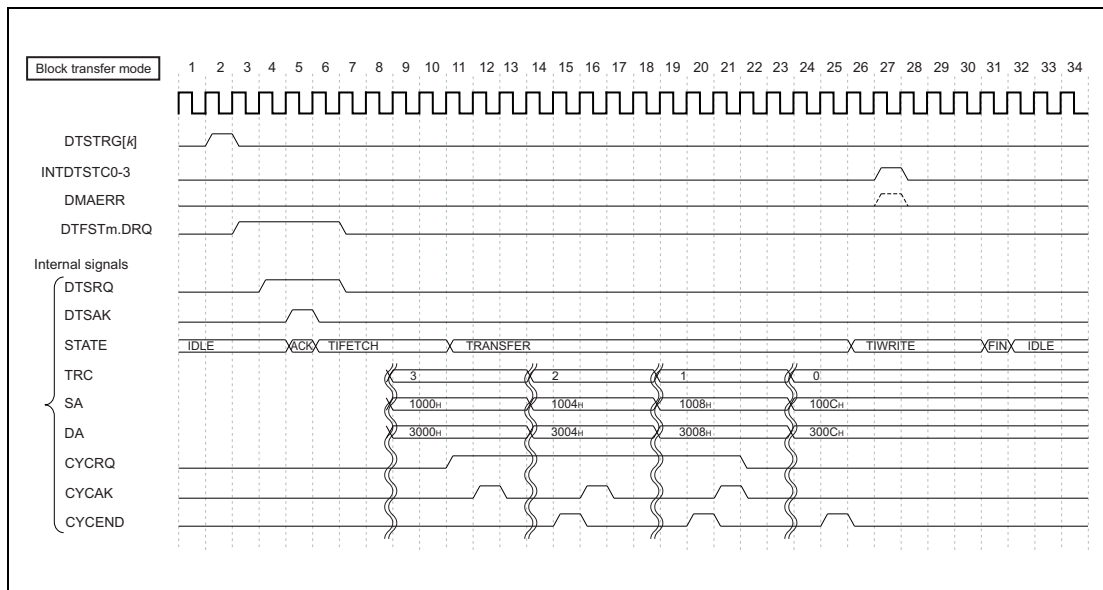

Figure 7.17 DTS Block Transfer Timing

7.3.6.4 DTSRAM Access

A DTS accesses the DTSRAM when DMA transfer starts and finishes.

A DTS's action of reading transfer information from the DTSRAM when DMA transfer starts is called TI fetch.

A DTS's action of updating the transfer information on the DTSRAM when DMA transfer finishes is called TI write back.

A single transfer performs a TI fetch at the beginning of a DMA cycle and a TI write back at the end of a DMA cycle.

A block transfer performs a TI fetch at the beginning of the first DMA cycle and a TI write back at the end of the DMA cycle that satisfies the block transfer completion condition (the last transfer or address reload transfer).

Therefore, in the case of single transfer, the transfer information on the DTSRAM is updated for each DMA cycle. In the case of block transfer, the transfer information on the DTSRAM is updated after the completion of the block transfer. If software reads the transfer information on the DTSRAM during execution of a block transfer, the transfer information at the beginning of the block transfer is read.

Table 7.11 Number of TI Fetch Cycles when not using the Chain Function

| Transfer Mode | Reload Function 1 | Reload Function 2 | Transfer Count | Address Reload Count | TI Fetch Cycles |
|---------------------|-------------------|-------------------|----------------|----------------------|-----------------|
| Single transfer | disabled | enabled | — | 1 | 12 cycles |
| | enabled | disabled | 1 | — | |
| | | enabled | >1 | 1 | — |
| | | | 1 | — | — |
| Block transfer 1 | disabled | enabled | — | Not zero | |
| | enabled | — | — | — | |
| Block transfer 2 | disabled | enabled | — | Not zero | |
| | enabled | — | — | — | |
| All other transfers | | | | | 9 cycles |

7.3.6.5 Execution Time of DTS Transfers

As shown in **Figure 7.16**, a DTS cycle is triggered by the DTSTRG signal, sampled with the rising edge of phase 3. The DTS cycle (CYCRQ) starts after TI fetch is completed. The DMAC needs two more clock cycles to issue a read and write request. The complete DTS cycle is completed after TI write back is done. TI fetch takes 9 DMA clock cycles, TI write back takes 5 DMA clock cycles.

Another two DMA clock cycles are needed to switch from write to read between the individual transfers.

In case of DTS block transfer of five words, when the DMA clock is m times slower than CPU clock, the total transfer time t_{fr_clk} for reading and writing the data by DTS is therefore:

$$t_{fr_clk} [\text{CPU clock cycle}] = (m \times 9) + (m \times 2) + 4 \times (\text{read latency} + (m \times 2) + \text{write latency} + (m \times 2)) + \text{read latency} + (m \times 2) + \text{write latency} + (m \times 1) + (m \times 5)$$

Note that the setup time for the DTS transfer (phase 3) is not considered in this example.

Note that the number of read and write latency is dependent on bus contention.

7.4 Temporarily Suspending DMA Transfers

DMA transfers can be temporarily suspended by disabling individual channels or the whole DMA controller. All DMA transfers are suspended, by setting the DMACTL.DMASPD bit. Setting the DTSTCTL1.DTSUST bit suspends DTS transfers. Each DMAC and DTS channel can hold one DMA request during executing DMA cycle, even if transfers are suspended or if the respective channel is disabled. Any additional transfer request is lost if a channel has already held a DMA request. Lost transfers due to such overflows are reported by the DTFRRQn.OVF and DTFSTm.OVF flags, again also during suspend and disable states.

7.4.1 Suspension, Restart and Abortion of a DMA Channel

DMA transfers for individual channels can be suspended by clearing the DCENn.DTE bit of that channel. A DMA cycle, which is ongoing while DTE is cleared, will be finished. DMA transfers resume, when DTE is set. As one DMA transfer request is stored during suspension, it is recommended to clear the hardware DMA transfer request in the DTFR in the case of a hardware DMA transfer request, the software DMA request flag DCSTn.SR by writing the register flag clear command into DCSTCn.SRC in the case of a software DMA transfer request, if the DMA transfer shall be entirely stopped.

Figure 7.18 shows an example of suspending, restarting and aborting DMA transfers. Both channels 0 and 1 execute block transfers. Channel 1 begins its transfer at t1 and is interrupted by the higher priority channel 0 at t2. The channel 0 transfers end at t3 and channel 1 resumes its transfer, which ends at t4. At t5, channel 1 starts the next block transfer, which is again interrupted at t6 due to the higher priority of channel 0. At t7, channel 0 is suspended and therefore channel 1 can finish its block transfer at t8. At t9, channel 0 has been restarted and it resumes its block transfer until it is again suspended at t10. At t11, the DMA channel 0 is stopped and the ongoing block transfer is aborted. Therefore, no further transfer is started at t12.

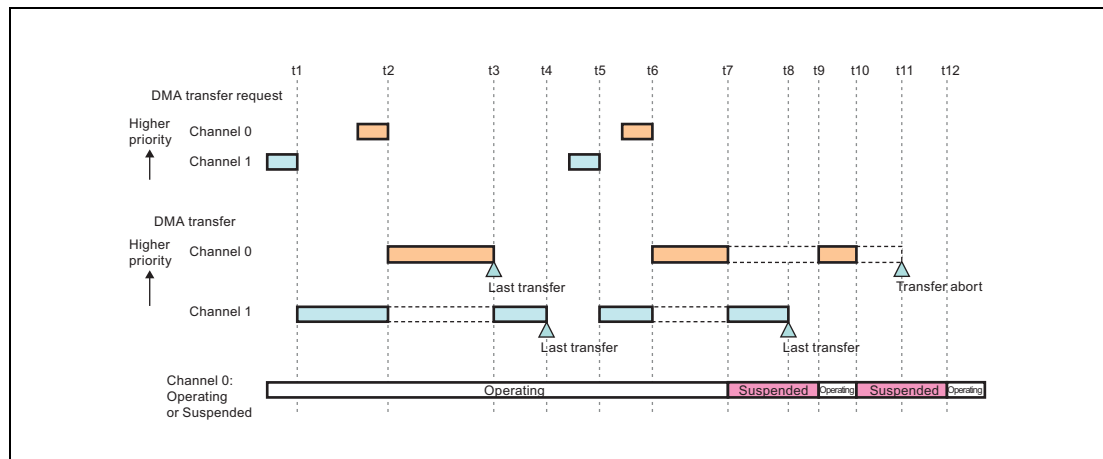

Figure 7.18 Example of Suspension, Resume, and Transfer Abort of a DMAC Channel

7.4.2 Suspension, Resume, and Transfer Abort of a DTS

You can suspend the DMA transfer executed by a DTS by setting the DTS suspend bit (DTSCCTL1.DTSUST) in the DTS control register 1. If a DMA cycle is ongoing, the DMA transfer is suspended at the timing when the DMA cycle is finished. If the ongoing DMA cycle is a single transfer or a transfer that completes a block transfer (the last transfer or address reload transfer), the DMA transfer is suspended after a TI write back after the completion of the DMA cycle. If the ongoing DMA cycle is a type other than the above, the DMA transfer is suspended after the completion of the DMA cycle without a TI write back. If you resume the DMA transfer while the DMA transfer is suspended, clear the DTS suspend bit in the DTS control register 1.

If you want to abort the currently ongoing DMA transfer executed by a DTS, suspend the DTS as described above, and then set the DTS transfer abort request bit (DTSCCTL2.DTSTIT) in the DTS control register 2 to abort the currently suspended DMA transfer. If transfer is aborted, no TI write back is executed. In addition, aborting the DMA transfer does not change the value of the DTS suspend bit (DTSCCTL1.DTSUST). If you want the DTS to accept another DMA transfer request after the abort, clear the DTS suspend bit.

Figure 7.19 shows an example of suspension, resume, and transfer abort of a DTS.

In **Figure 7.19**, channels 0, 1, and 2 are executing block transfer. At t1, a DMA transfer request for channel 1 is accepted and DMA transfer starts. At t2, DMA transfer requests for channels 0 and 2 are generated. At t3, the last transfer of channel 1 is complete, and as a result of DTS channel arbitration, a DMA transfer request for channel 0 is accepted, and DMA transfer of channel 0 starts because channel 0 has a higher priority than channel 2. At t4, the last transfer of channel 0 is complete, and DMA transfer of channel 2 starts. At t5, the DTS is put into the suspended state, and the DMA transfer of channel 2 is suspended. At t6, DMA transfer requests for channels 0 and 1 are generated. At t7, the suspended state for the DTS is cleared, and the DMA transfer of channel 2, which has been suspended in the middle of a block transfer, is resumed. If DMA transfer is suspended in the middle of a block transfer, no DTS channel arbitration is done when it is resumed. At t8, the last transfer of channel 2 is complete, and as a result of DTS channel arbitration, a DMA transfer request for channel 0 is accepted and the DMA transfer starts because channel 0 has a higher priority than channel 2. At t9, the DTS is put into the suspended state, and at t10, the suspended DMA transfer of channel 0 is aborted. When the suspended state of the DTS 0 is cleared at t11, DMA transfer of channel 1 starts because there is no currently ongoing DMA transfer and channel 1 is the only channel with a DMA transfer request.

Figure 7.19 Example of Suspension, Resume, and Transfer Abort of a DTS

7.4.3 Masking and Clearing a Hardware DMA Transfer Request by the DTFR

If a DMAC uses a hardware DMA transfer request, you can temporarily disable (mask) the hardware DMA transfer request output from the DTFR to the DMAC by clearing the hardware DMA transfer source selection enable bit (DTFRn.REQEN) in the DTFR setting register.

Also, if a hardware DMA transfer source is used, you can clear a hardware DMA transfer request retained in the DTFR by using the hardware DMA transfer request clear (DTFRn.DRQC) bit in the DTFR transfer request clear register.

Even if you suspend or abort DMA transfer of a DMAC channel, the hardware DMA transfer request selection/hold circuit of the DTFR is still running, and consequently, the DTFR may retain a hardware DMA transfer request that came to the DTFR during the suspension or transfer abort period of the DMAC channel. When you resume or start DMA transfer of a DMAC channel, clear the hardware DMA transfer request retained in the DTFR as required.

Be careful that if DTFR hardware DMA transfer source selection enable bit is set to disable (DTFRn.REQEN = 0) by software while DMAC is executing block transfer, the ongoing block transfer is suspended. (refer to **7.3.5.2, Generating and Accepting a Hardware DMA Transfer Request**)

7.4.4 Masking and Clearing a Hardware DMA Transfer Request by the DTSFSL

As for a DTS, you can temporarily disable (mask) a DMA transfer request from a channel to the DTS by clearing the transfer request enable bit (DTSFSLm.REQEN) in the DTSFSL operation setting register. (The masking is actually done by excluding the channel from the candidates in DTS channel arbitration in the DTSFSL.)

Also, you can clear a DMA transfer request retained in the DTSFSL by using the transfer request clear (DTSFSLm.DRQC) bit in the DTSFSL transfer request clear register.

Regardless of the state of the DTS and the transfer request enable bit (DTSFSLm.REQEN) of the DTSFSL, the DTSFSL always monitors the hardware transfer source input from outside, and a DMA transfer request for a channel is set when a hardware transfer source for the channel is input to the DTSFSL. When you resume or start DTS transfer, clear the hardware DMA transfer request retained in the DTSFSL as required.

7.4.5 List of Suspend, Resume, and Transfer Abort Functions

Table 7.12 List of Suspend, Resume, and Transfer Abort Functions

| Function | How to execute the function | Operation | Possibility of DMA transfer abort | Master that can execute the function (See 7.6, Reliability Function.) |
|---|--|--|--|---|
| DMA suspension and resume by software control | Setting and clearing the DMACCTL.DMASPD. | All channels are in the suspended state. | Not possible* ¹ | Special master |
| Suspension and resume of a DMAC channel | Clearing and setting the DCENn.DTE in each channel register.* ² | DMA transfer of a channel is suspended. | Possible (by clearing the DMA transfer request flag during suspension) | Special master, and general master assigned to the channel. |
| Suspension and resume of a DTS | Setting and clearing the DTSCn.DTSUST. | DMA transfer of a DTS is suspended. | Possible (by setting the DTSCn.DTSTIT during suspension) | Special master |

Note 1. In order to abort DMA transfer, you need to either abort transfer for the DMAC channel or abort transfer for the DTS.

Note 2. In case that the continuous transfer enable bit (DTCTn.MLE) is set, please clear (or set) the continuous transfer enable bit (DTCTn.MLE) first.

7.5 Error Control

7.5.1 Type of Error

DMA can generate the following two types of errors.

- DMA Transfer Error

This error is generated when error is detected in the read cycle or write cycle in a DMA cycle or when error is detected by checking ECC at read cycle. This error can be generated in all DMAC and DTS channels during execution of DMA transfer.

- DTSRAM Error

This error is generated when ECC error is detected in the DTSRAM read access by a DTS. This error can be generated in the TI fetch during execution of DMA transfer for a DTS or while software is accessing the DTS channel registers.

7.5.2 DMA Transfer Error

7.5.2.1 Operation of a DMAC When DMA Transfer Error Occurs

When DMA transfer error occurs in a DMAC, the transfer error flag (DCSTn.ER) in the DMAC transfer status register of the channel with the DMA transfer error is set. The DMAC error register (DMACER) shows the transfer error flags of all 16 DMAC channels.

In a channel where the transfer error flag is set, a new DMA cycle is not executed if the transfer error case DMA transfer disable setting (DTCTn.ESE) bit is set. On the other hand, a DMA cycle is executed regardless of the value of the transfer error flag if the transfer error case DMA transfer disable setting (DTCTn.ESE) bit is cleared.

If you want to abort the DMA transfer of a channel with DMA transfer error, follow the procedure to abort DMA transfer of the DMAC channel.

If DMA transfer error occurs during the read cycle of a DMA cycle, the write cycle is not executed. If DMA transfer error occurs during the write cycle of a DMA cycle, the validity of the write is not guaranteed.

Regardless of whether DMA transfer error occurs in the read cycle or write cycle of a DMA cycle, the source address, destination address, transfer count, and address reload count registers are updated.

7.5.2.2 Operation of a DTS When DMA Transfer Error Occurs

When DMA transfer error occurs in a DTS, the DTS error flag (DTSER1.DTSER) in the DTS error register is set, and the DTS channel number with the DMA transfer error is stored in the DTS error channel (DTSER1.DTSERCH) in the same register.

If DMA transfer error occurs in a single transfer, a TI write back is executed to finish the DMA cycle.

If DMA transfer error occurs in the middle of a block transfer and the transfer error case DMA transfer abort setting (DTTCTm.ESE) is set, the remaining DMA cycles in the block transfer are not executed, but a TI write back is executed to finish the DMA cycle. At the same time, the DTS transfer status (DTSSTS.DTSACT) bit in the DTS status register is cleared. If DMA transfer error occurs in the middle of a block transfer and the transfer error case DMA transfer abort setting (DTTCTm.ESE) is cleared, the block transfer continues regardless of the DMA transfer error.

If DMA transfer error occurs during the read cycle of a DMA cycle, the write cycle is not executed. If DMA transfer error occurs during the write cycle of a DMA cycle, the validity of the write is not guaranteed.

Regardless of whether DMA transfer error occurs in the read cycle or write cycle of a DMA cycle, the source address, destination address, transfer count, and address reload count registers are updated, and the TI is updated by a TI write back.

If the DTS error flag in the DTS error register is set, a TI fetch is executed when the DTS accepts a DMA transfer request for the channel with the same channel number as the one stored in the DTS error channel. If, as a result of the TI fetch, the transfer error case DMA transfer abort setting (DTTCTm.ESE) is found to be set, a DMA cycle and a TI write back are not executed. If the transfer error case DMA transfer abort setting (DTTCTm.ESE) is cleared, DMA transfer is executed.

If the DTS error flag in the DTS error register is set, DMA transfer is executed when the DTS accepts a DMA transfer request for a channel with a channel number other than the one stored in the DTS error channel.

7.5.3 DTSRAM Error

There are two types of DTSRAM errors detected in the DTSRAM read access: ECC 1-bit error and ECC 2-bit error.

If an ECC 1-bit error is detected during a TI fetch, error corrected data is used, and DMA transfer continues. If an ECC 1-bit error is detected during DTS channel register access from software, error corrected data is returned as read data. In either case, the DTSRAM SEC error flag (DTSER2.RAMSED) in the DTS error register 2 is set, and the address of the error location in the DTSRAM is stored to the DTSRAM SEC error address (DTSER2.RAMSEAD).

In addition, the error is notified to the ECM according to DTSRAM error notification control register (DTRERINT.SEDIE).

If an ECC 2-bit error is detected during a TI fetch, handling of the DMA transfer request is terminated without executing a DMA cycle and TI write back. If an ECC 2-bit error is detected during DTS channel register access from software, peripheral bus error is notified. In either case, the DTSRAM DED error flag (DTSER2.RAMDED) in the DTS error register 2 is set, and the address of the error location in the DTSRAM is stored to the DTSRAM DED error address (DTSER2.RAMDEDAD).

In addition, the error is notified to the ECM according to DTSRAM error notification control register (DTRERINT.DEDIE).

7.5.3.1 DTSRAM ECC Test

The proper generation of the error correction code of the DTS RAM can be tested with the following algorithm:

1. Make sure that the RAM location to be tested is not modified by any ongoing DTS transfer. It is recommended to disable DTS entirely.
2. Write 0x4000_0002 to DTSRAM Test Control Register (DTRTSCTL). Enable ECC Test Mode, encode ECC from write data.
3. Write data to any DTSRAM location.
4. Read data from the same DTSRAM location.
5. Check ECC data in DTSRAM Test Reading Data Register (DTRTRDAT).
6. Restore DTS activity as required.

7.5.3.2 Stimulation of DTSRAM ECC Error

DTSRAM ECC errors can be stimulated to test the proper operation of the error control module. The following algorithm can be used to stimulate such an ECC error:

1. Make sure that the RAM location to be tested is not modified by any ongoing DTS transfer.
It is recommended to disable DTS entirely.
2. Write 0x4000_0003 to DTSRAM Test Control Register (DTRTSCTL).
Enable ECC Test Mode, write ECC from DTRTWDAT.TWDAT[6:0].
3. Write good or faulty ECC into DTRTWDAT.TWDAT[6:0].
4. Write data to any DTSRAM location.
5. Read data from the same DTSRAM location.
good ECC should not generate an ECC error.
faulty ECC should generate an ECC error.
6. Restore DTS activity as required.

7.6 Reliability Function

7.6.1 Overview

In this product, DMA is a resource used by multiple masters (PE). In order for DMA to support multi-core configuration, the following reliability functions are offered.

- Register access protection function
- Master information inherit function

7.6.2 Register Access Protection Function

This product is designed to assign each DMA channel to a CPU1 (PE).

The register access protection function allows access to the transfer information of each DMA channel from the master (PE) assigned to the channel but prohibits access from other masters.

The register access protection function prevent the channel settings from being updated by masters other than the one assigned to the channel. Please note that any master can always read all registers and that the DMAC/DTS controller cannot read or write its own registers.

7.6.2.1 Identifying the Accessing Master

DMA identifies a master based on the ID of the accessing CPU (PEID), the system protection ID configured by the accessing CPU (SPID), and the state of PSW.UM.

7.6.2.2 Special Master Access

DMA treats access from the CPU1 supervisor mode as special master access.

7.6.2.3 General Master Access

In master access, access to the following registers is allowed.

- Channel registers of the channels assigned by the channel assignment. (For details, see **7.6.2.4, Channel Assignment**.)

In general master access, write access to registers other than the above is not allowed.

7.6.2.4 Channel Assignment

To each channel, DMA can assign a master (PE) so that the master is allowed to use the channel.

Channel assignment is configured in the channel master setting register (DMxCM (x = 00 to 07, 10 to 17) in the case of a DMAC and DTSmCM in the case of a DTS) by the CPU in the supervisor mode.

In general master access, the master assigned to a channel by channel assignment is allowed to access the channel registers of the channel. If the channel registers of a channel is write accessed by a master other than the master assigned to the channel, the access is called illegal access. For information about illegal access, see **7.6.2.5, Illegal Access**.

7.6.2.5 Illegal Access

DMA handles the following access as illegal access.

- (a) General master write access to the global registers
- (b) General master write access to the channel registers of a channel by a master other than the master assigned to the channel

DMA's actions against illegal access are as follows.

For both cases (a) and (b),

- Write access is ignored.

Only for the case (b),

- The information about the illegal access is stored in a register access protection violation register.
- The DMAC0, DMAC1, and DTS have their own register access protection violation registers (DM0CMV, DM1CMV, and DTSCMV respectively).
- DMA assert illegal access notification to ECM.

Only the special master can access the register access protection violation registers. The special master can check whether illegal access has occurred by checking the register access protection violation registers periodically or checking DMA illegal access error of ECM.

In addition, it is recommended that, when a master tries to use DMA and configures transfer information in the channel registers, the master should check whether the configuration has been successfully completed without illegal access by, for example, reading back the settings.

7.6.3 Master Information Inherit Function

In this product, DMA access inherits master information that is equivalent to the master information of the master assigned to the DMA channel.

The master information that is output from DMA is as in **Table 7.13**.

Table 7.13 Master Information That Is Output from DMA

| Meaning | Value that is output from DMA |
|--------------------|--|
| UM | UM bit value in the channel master setting register |
| SPID* ¹ | Same as the SPID bit value in the channel master setting register as long as it is between 2 and 31. |
| PEID | Fixed to 4 |

Note 1. In case that register value is 0 or 1, DMA outputs 2 instead of register value.

7.6.4 Other Reliability Functions

7.6.4.1 Restriction on the Next Channel in the Chain

The reliability function limits the channels you can select as the next channel in the chain.

When you use the chain function, the channel master settings of a channel and its next channel in the chain must be the same.

The chain function is designed so that a channel and its next channel in the chain are managed by the same master.

When DMA detects that different masters are assigned to a channel and its next channel in the chain, it is deemed illegal and the chain function is suppressed. More specifically, when DMA tries to execute the chain function, DMA compares the chain master settings of the channel and its next channel in the chain, and if the settings are the same for both PEID and UM, the chain function is allowed and a chain request is sent to the next channel. If the settings are not the same for either PEID or UM, a chain request is not sent.

7.7 Setting Up DMA Transfer

7.7.1 Overview of Setting Up DMA

Table 7.14 Channel Assignment

| No. | Master that configures the setting | Description | Register | | Necessity of the setting | |
|-----|---|-------------------------------|--------------------------|---------------------------------|---|-------------|
| 1 | Special master (CPU in the supervisor mode) | Overall DMA operation setting | DTSPR0 to DTSPR7 | DTS channel priority setting | Mandatory (if a DTS is used) | |
| 2 | | | DM00CM to DM17CM | DMAC channel master setting | Mandatory (if a DMAC is used) | |
| 3 | | | DTS000CM to DTS127CM | DTS channel master setting | Mandatory (if a DTS is used) | |
| 4 | | | Status clear | DTSERC | DTS error clear register | Recommended |
| 5 | | | | CMVC | Channel protection violation clear register | Recommended |
| 6 | Master assigned to the DMAC channel | Channel setting | DSAn | DMAC source address | Mandatory | |
| 7 | | | DDAn | DMAC destination address | Mandatory | |
| 8 | | | DTCn | DMAC transfer count | Mandatory | |
| 9 | | | DTCTn | DMAC transfer control | Mandatory | |
| 10 | | | DRSAn | DMAC reload source address | Mandatory if the reload function is used | |
| 11 | | | DRDAn | DMAC reload destination address | Mandatory if the reload function is used | |
| 12 | | | DRTCn | DMAC reload transfer count | Mandatory if the reload function is used | |
| 13 | | | DTCCn | DMAC transfer count compare | Mandatory if the transfer count match interrupt is used | |
| 14 | | | | DTFRn | DTFR setting register | Mandatory |
| 15 | | | Status clear | DCSTCn | DMAC transfer status clear | Mandatory |
| 16 | | | | DTFRRQCn | DTFR transfer request clear | Recommended |
| 17 | | | Channel operation enable | DCENn | DMAC channel operation enable setting | Mandatory |
| 18 | Master assigned to the DTS channel | Channel setting | DTSAm | DTS source address | Mandatory | |
| 19 | | | DTDAm | DTS destination address | Mandatory | |
| 20 | | | DTTCm | DTS transfer count | Mandatory | |
| 21 | | | DTTCTm | DTS transfer control | Mandatory | |
| 22 | | | DTRSAm | DTS reload source address | Mandatory if the reload function is used | |
| 23 | | | DTRDAm | DTS reload destination address | Mandatory if the reload function is used | |
| 24 | | | DTRTCm | DTS reload transfer count | Mandatory if the reload function is used | |
| 25 | | | DTTCCm | DTS transfer count compare | Mandatory if the transfer count match interrupt is used | |
| 26 | | | Status clear | DTFSCm | DTSFSL transfer request clear | Recommended |
| 27 | | | Transfer request enable | DTFSLm | DTSFSL operation setting | Mandatory |

7.7.2 Setting Up the Overall DMA Operation

You need to set up the overall DMA operation before you start using DMA.

To configure the overall DMA operation, the special master (a CPU in the supervisor mode) needs to set up global registers. Global registers can be set up only by special master access. For details, see **7.6, Reliability Function**.

The following registers must be set up to configure the overall DMA operation.

- DTS channel priority setting registers (DTSPRy, y = 0 to 7)
Those registers configure the priority level of each DTS channel used for DTS channel arbitration.
- DMAC channel master setting registers (DMxCM, x = 00 to 07, 10 to 17)
- DTS channel master setting registers (DTSmCM)

Those registers configure channel assignment. (For details, see **7.6, Reliability Function**.)

If the DMAC channel master setting registers and the DTS channel master setting registers are not properly set, DMA channel setting and DMA transfer cannot be executed properly.

Also, if errors are detected in the following registers while the overall DMA operation is set up, clearing the errors is recommended.

- DTS error register 1 (DTSER1)
- DTS error register 2 (DTSER2)
- DMAC0 register access protection violation register (DM0CMV)
- DMAC1 register access protection violation register (DM1CMV)
- DTS register access protection violation register (DTSCMV)

7.7.3 Setting Up the DMA Channel Setting

The DMA channel setting defines the transfer information and transfer source for each DMAC and DTS channel.

To configure the DMA channel setting, the master assigned to each channel by the channel assignment needs to set up channel registers.

7.7.3.1 Setting Up the DMAC Channel Setting

Follow the procedure below to set up the DMAC channel setting and use the DMAC.

(1) Disabling the DMAC Channel Operation

If the channel operation enable (DTE) in the DMAC channel operation enable setting register (DCENn) is set, clear the DTE bit to disable the channel operation.

(2) Setting Up the Transfer Information

When you set up the transfer information of the DMAC, the following registers need to be set up.

- DMAC source address register (DSAn)
- DMAC destination address register (DDAn)
- DMAC transfer count register (DTCn)
- DMAC transfer control register (DTCTn)
- DMAC reload source address register (DRSAn)
- DMAC reload destination address register (DRDAn)
- DMAC reload transfer count register (DRTCn)
- DMAC transfer count compare register (DTCCn)

(3) Setting Up the DMA Transfer Request

While setting the transfer information, you need to set up the DMA transfer request selection assignment (DTCTn.DRS) bit in the DMAC transfer control register (DTCTn) to define whether the hardware or software DMA transfer request is used.

You cannot use both the hardware and software DMA transfer requests for the same channel at the same time.

If you use the hardware DMA transfer request, you need to select one source used as the hardware DMA transfer request out of 128 hardware DMA transfer sources using the hardware DMA transfer source selection (DTFRn.REQSEL) in the DTFR setting register. Also, you need to enable the hardware DMA transfer source selection (DTFRn.REQEN) in the same register.

The DTFR may retain a hardware DMA transfer request that came before the hardware DMA transfer source is selected. Clear the hardware DMA transfer request (DTFRRQn.DRQ) retained in the DTFR using the DTFR transfer request clear register (DTFRRQCn) if necessary.

If you use the software DMA transfer request, disable the hardware DMA transfer source selection (DTFRn.REQEN) in the DTFR setting register.

(4) Clearing the Transfer Status

The DMAC transfer status register (DCSTn) may retain the result of the previous DMA transfer. You need to clear the flags in the DMAC transfer status register using the DMAC transfer status clear register (DCSTCn).

(5) Enabling the DMAC Channel Operation

Set the channel operation enable (DCENn.DTE) bit in the DMAC channel operation enable setting register to enable the channel operation.

After the channel operation enable bit is set, the DMAC can accept a DMA transfer request and start DMA transfer.

7.7.3.2 Setting Up the DTS Channel Setting

Follow the procedure below to set up the DTS channel setting and use the DTS.

(1) Disabling the Transfer Request by the DTSFSL

Clear the transfer request enable (DTFSLm.REQEN) bit in the DTSFSL operation setting register of the DTS channel you want to set up the channel setting for. This procedure is not mandatory but recommended in order to prevent a DMA transfer request from being sent mistakenly to the DTS channel currently being configured.

It is also recommended to check the DTS status register (DTSSTS) and confirm that DMA transfer is not ongoing for the DTS channel currently being configured.

(2) Setting Up the Transfer Information

When you set up the transfer information of the DTS, the following registers need to be set up to configure the transfer information.

- DTS source address register (DTSAm)
- DTS destination address register (DTDAm)
- DTS transfer count register (DTTCm)
- DTS transfer control register (DTTCTm)
- DTS reload source address register (DTRSAm)
- DTS reload destination address register (DTRDAm)
- DTS reload transfer count register (DTRTCm)
- DTS transfer count compare register (DTTCCm)

(3) Setting Up the DMA Transfer Request

Unlike a DMAC, a DTS does not care whether a DMA transfer request is a hardware DMA transfer request or software DMA transfer request. A DTS has a transfer request pending bit for each channel in the DTSFSL, and both a hardware and software DMA transfer requests are retained in the same transfer request pending bit (DTFSTm.DRQ). Therefore, a DTS has no setting for selecting whether the hardware or software transfer request is used.

The DTSFSL may retain a DMA transfer request that came before the transfer information is set up. Clear the DMA transfer request (DTFSTm.DRQ) retained in the DTSFSL if necessary, using the DTSFSL transfer request clear register (DTFSCm).

(4) Enabling the Transfer Request by the DTSFSL

Set the transfer request enable (DTFSLm.REQEN) bit in the DTSFSL operation setting register to enable the DMA transfer request for the DTS channel.

After the transfer request enable bit for the DTSFSL is set, the DTS can accept a DMA transfer request and start DMA transfer.

7.8 Global Register

7.8.1 List of Global Register Address

Address = <DMAC_base> “FFFF 8000_H” + Offset address

Table 7.15 List of Global Register Address (1/2)

| Offset Address | Register Symbol | Meaning | Accessed Permission*2 | |
|-------------------|-----------------|---|-----------------------|----------------|
| | | | Special Master | General Master |
| 0000 _H | DMACTL | DMA control register | √ | × |
| 0010 _H | DTSCTL1 | DTS control register 1 | √ | × |
| 0014 _H | DTSCTL2 | DTS control register 2 | √ | × |
| 0018 _H | DTSSTS | DTS status register | √ | × |
| 0020 _H | DMACER | DMAC error register | √ | × |
| 0024 _H | DTSER1 | DTS error register 1 | √ | × |
| 0028 _H | DTSER2 | DTS error register 2 | √ | × |
| 002C _H | DTSERC | DTS error clear register | √ | × |
| 0030 _H | DM0CMV | DMAC0 register access protection violation register | √ | × |

| 0130 _H | DM14CM | DMAC1 channel 4 channel master setting | √ | × |

Table 7.15 List of Global Register Address (2/2)

| Offset Address | Register Symbol | Meaning | Accessed Permission*2 | |
|---|-----------------|--|-----------------------|----------------|
| | | | Special Master | General Master |
| 0134 _H | DM15CM | DMAC1 channel 5 channel master setting | √ | × |
| 0138 _H | DM16CM | DMAC1 channel 6 channel master setting | √ | × |
| 013C _H | DM17CM | DMAC1 channel 7 channel master setting | √ | × |
| 0200 _H + 4 × [DTS channel number] *1 (0200 _H - 03FC _H) | DTSmCM*1 | DTS channel m channel master setting*1 | √ | × |

Note 1. [DTS channel number] and “m” in the register symbols and meanings are numbers in the range from 000 to 127.

Note 2. √: supported x: not supported

CAUTION

- It is forbidden to write to the following registers when operation of DMA is enabled (DTE bit = 1 for each DMA channel). If you do, the correct operation is not guaranteed.
 - DMxCM
- It is forbidden to write to the following registers when operation of DTS is enabled (DTSACT bit = 1). If you do, the correct operation is not guaranteed.
 - DTSPRy
 - DTRECCTL
 - DTRERINT
 - DTRTSCTL
 - DTRTWDAT
 - DTSmCM

7.8.2 Details of Global Registers

7.8.2.1 DMACTL — DMA Control Register

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0000_H

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------------|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DMA SPD |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

Table 7.16 DMACTL Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 1 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 0 | DMA SPD | <p>DMA suspension</p> <p>This bit shows whether DMA transfer for all channels is suspended. If a user writes 1 to this bit, DMA transfer for all channels can be suspended. If a user writes 0 to this bit, suspension of DMA transfer for all channels can be cleared. The suspension controlled by this bit is independent from the suspension controlled by the transfer enable bit (DCENn.DTE) of each DMAC channel and the suspension setting bit (DTSUST) for a DTS. That means, if this bit is 1, all DMA transfers are suspended regardless of the values of the DTE bit of each channel and the DTSUST bit of the DTS.</p> <p>Writing to this bit does not affect the DTE bit of each channel and the DTSUST bit of the DTS.</p> <p>0: DMA suspension cleared 1: DMA suspension request/DMA suspension ongoing</p> |

7.8.2.2 DTSTCTL1 — DTS Control Register 1

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0010_H

Value after reset: 0000 0000_H

| | | | | | | | | | | | | | | | | |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------------|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DTS UST |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

Table 7.17 DTSTCTL1 Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 1 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 0 | DTSUST | DTS suspension This bit shows whether DMA transfer of a DTS is suspended. If a user writes 1 to this bit, DMA transfer of a DTS can be suspended. 0: DTS suspension cleared 1: DTS suspension request/DTS suspension ongoing |

7.8.2.3 DTSTCTL2 — DTS Control Register 2

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0014_H

Value after reset: 0000 0000_H

| | | | | | | | | | | | | | | | | |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DTSTIT |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

Table 7.18 DTSTCTL2 Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 1 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 0 | DTSTIT | DTS transfer abort request While the DTS is suspended, a user can write 1 to this bit to abort the suspended DMA transfer. When the suspended DMA transfer of a DTS is aborted, the DTSSTS.DTSACT bit is cleared to 0. The read value is always 0. |

7.8.2.4 DTSSTS — DTS Status Register

Access: This register can be read in 32-bit units.

Address: <DMAC_base> + 0018_H

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | — | — | — | — | — | — | — | DTS CYC | DTSA CH6 | DTSA CH5 | DTSA CH4 | DTSA CH3 | DTSA CH2 | DTSA CH1 | DTSA CH0 | DTSA CT |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 7.19 DTSSTS Register Contents

| Bit Position | Bit Name | Function |
|--------------|-------------|---|
| 31 to 9 | Reserved | When read, the value after reset is read. |
| 8 | DTSCYC | DMA cycle execution state This bit shows whether a DMA cycle is ongoing in the DTS. 0: DMA cycle is not ongoing. 1: DMA cycle is ongoing. After suspending DTS transfers, DTSCYC may be polled to assure that any possibly ongoing DTS cycle has finished. |
| 7 to 1 | DTSACH[6:0] | DTS transfer channel If there is a channel in the DTS executing DMA transfer, the channel number is shown. If there is no channel in the DTS executing DMA transfer, the channel number of the last DMA transfer is shown. |
| 0 | DTSACT | DTS transfer status This bit shows whether there is a channel in the DTS executing DMA transfer. 0: There is a channel in the DTS executing DMA transfer. 1: There is no channel in the DTS executing DMA transfer. DTSACT is asserted during TI fetch, all DMA cycles and TI write-back. It is cleared after the last cycle of the TI write back is completed. If the DTS is put into the suspended state while there is a channel executing DMA transfer, this bit remains 1. If a DTS transfer abort request is made using the DTSTL2.DTSTIT bit, the suspended DTS transfer is aborted, and this bit is cleared to 0. When DMA transfer error occurs and the DMA transfer is aborted, this bit is cleared. |

7.8.2.5 DMACER — DMAC Error Register

Access: This register can be read in 32-bit units.

Address: <DMAC_base> + 0020_H

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 7.20 DMACER Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------|---|
| 31 to 16 | Reserved | When read, the value after reset is read. |
| 15 to 8 | DM1ER[7:0] | DMAC1 DMA transfer error status These bits show the DMA transfer error status of channels 0 through 7 of the DMAC1. Each bit is mapped from the DCSTn.ER bit of each channel of the DMAC1 and is read-only. 0: DMA transfer error is not generated 1: DMA transfer error is generated |
| 7 to 0 | DM0ER[7:0] | DMAC0 DMA transfer error status These bits show the DMA transfer error status of channels 0 through 7 of the DMAC0. Each bit is mapped from the DCSTn.ER bit of each channel of the DMAC0 and is read-only. 0: DMA transfer error is not generated 1: DMA transfer error is generated |

7.8.2.6 DTSER1 — DTS Error Register 1

Access: This register can be read in 32-bit units.

Address: <DMAC_base> + 0024_H

Value after reset: 0000 0000_H

| | | | | | | | | | | | | | | | | |
|-------------------|----|--------------|--------------|--------------|--------------|--------------|--------------|--------------|----|----|----|----|----|----|-------------|-------|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 7.21 DTSER1 Register Contents

| Bit Position | Bit Name | Function |
|--------------|--------------|--|
| 31 to 15 | Reserved | When read, the value after reset is read. |
| 14 to 8 | DTSERCH[6:0] | DTS error channel These bits show the DTS channel number of the first DMA transfer error after the DTSER bit is cleared to 0. These bits are read-only and cannot be cleared. |
| 7 to 2 | Reserved | When read, the value after reset is read. |
| 1 | DTSERWR | DTS DMA transfer error occurring cycle This bit is updated at the same time as setting of the DTS DMA transfer error flag (DTSER), indicating which cycle of read or write the DMA transfer error occurs in. This bit is not updated when a new DMA transfer error occurs after the DTSER bit has been set. If the DTSER bit is cleared, this bit is also cleared to 0. 0: DMA transfer error occurs in read cycle. 1: DMA transfer error occurs in write cycle. |
| 0 | DTSER | DTS DMA transfer error flag This bit shows whether DMA transfer error is generated in the DTS. 0: DMA transfer error is not generated 1: DMA transfer error is generated If DMA transfer error is generated in the DTS while this bit is 0, this bit is set, and DTSERCH6-0 retains the DTS channel number of the DMA transfer error. If DMA transfer error is generated in the DTS while this bit is 1, this bit remains 1, and DTSERCH6-0 does not change. This bit can be cleared by using the DTSERC register. |

7.8.2.7 DTSER2 — DTS Error Register 2

Access: This register can be read in 32-bit units.

Address: <DMAC_base> + 0028_H

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 7.22 DTSER2 Register Contents (1/2)

| Bit Position | Bit Name | Function |
|--------------|-----------------|--|
| 31 | RAMDED | DTSRAM DED error flag This bit shows whether the DED error is generated in the read access to the DTSRAM. 0: DED error is not generated in the DTSRAM 1: DED error is generated in the DTSRAM If DED error is generated in the DTSRAM while this bit is 0, this bit is set, and RAMDEDAD11-0 retains the DTSRAM address of the error. If DED error is generated in the DTSRAM while this bit is 1, this bit remains 1, and RAMDEDAD11-0 does not change. This bit can be cleared by using the DTSERC register. |
| 30 | RAMDEDOV | DTSRAM DED error overflow flag This bit is set when the RAMDED bit is 1 and the DED error occurs in DTSRAM read access whose address is different from that specified by the RAMDEDAD11-0 bit. This bit can be cleared by operation of the DTSERC register. |
| 29, 28 | Reserved | When read, the value after reset is read. |
| 27 to 16 | RAMDEDAD [11:0] | DTSRAM DED error address These bits show the DTSRAM address of the first DTSRAM DED error after the RAMDED bit is cleared to 0. These bits are read-only and cannot be cleared. |
| 15 | RAMSED | DTSRAM SED error flag This bit shows whether the SED error is generated in the read access to the DTSRAM. 0: SED error is not generated in the DTSRAM 1: SED error is generated in the DTSRAM If SED error is generated in the DTSRAM while this bit is 0, this bit is set, and RAMSEDAD11-0 retains the DTSRAM address of the error. If SED error is generated in the DTSRAM while this bit is 1, this bit remains 1, and RAMSEDAD11-0 does not change. This bit can be cleared by using the DTSERC register. |
| 14 | RAMSEDOV | DTSRAM SED error overflow flag This bit is set when the RAMSED bit is 1 and the SED error occurs in DTSRAM read access whose address is different from that specified by the RAMSEDAD11-0 bit. This bit can be cleared by operation of the DTSERC register. |
| 13, 12 | Reserved | When read, the value after reset is read. |

Table 7.22 DTSER2 Register Contents (2/2)

| Bit Position | Bit Name | Function |
|--------------|--------------------|---|
| 11 to 0 | RAMSEDAD [11:0] | DTSRAM SED error address These bits show the DTSRAM address of the first DTSRAM SED error after the RAMSED bit is cleared to 0. These bits are read-only and cannot be cleared. |

7.8.2.8 DTSERC — DTS Error Clear Register

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 002C_H

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|---------|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|
| | RAMDEDC | RAMDEDOVC | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | RAMSEDC | RAMSEDOVC | — | — | — | — | — | — | — | — | — | — | — | — | — | DTSERC |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

Table 7.23 DTSERC Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|---|
| 31 | RAMDEDC | DTSRAM DED error flag clear If a user writes 1 to this bit, the DTSRAM DED error flag (DTSER2.RAMDED) is cleared. The read value is always 0. |
| 30 | RAMDEDOVC | DTSRAM DED error overflow flag clear When the user writes 1 to this bit, the DTSRAM DED error overflow flag (DTSER2.RAMDEDOV) is cleared. The read value is always 0. |
| 29 to 16 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 15 | RAMSEDC | DTSRAM SED error flag clear If a user writes 1 to this bit, the DTSRAM SED error flag (DTSER2.RAMSED) is cleared. The read value is always 0. |
| 14 | RAMSEDOVC | DTSRAM SED error overflow flag clear When the user writes 1 to this bit, the DTSRAM SED error overflow flag (DTSER2.RAMSEDOV) is cleared. The read value is always 0. |
| 13 to 1 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 0 | DTSERC | DTS error flag clear If a user writes 1 to this bit, the DTS DMA error flag (DTSER1.DTSER) is cleared. The read value is always 0. |

7.8.2.9 DM0CMV — DMAC0 Register Access Protection Violation Register

Access: This register can be read in 32-bit units.

Address: <DMAC_base> + 0030_H

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | — | — | — | — | — | — | — | — | — | VCH2 | VCH1 | VCH0 | — | — | — | VF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 7.24 DM0CMV Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|---|
| 31 to 29 | PEID[2:0] | Illegal access master information These bits show the accessing master information of the first illegal access after the VF bit is cleared to 0. If illegal access occurs while the VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared. |
| 28 to 23 | Reserved | When read, the value after reset is read. |
| 22 to 18 | SPID[4:0] | Illegal access master information These bits show the accessing master information of the first illegal access after the VF bit is cleared to 0. If illegal access occurs while the VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared. |
| 17 | UM | Illegal access master information These bits show the accessing master information of the first illegal access after the VF bit is cleared to 0. If illegal access occurs while the VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared. |
| 16 to 7 | Reserved | When read, the value after reset is read. |
| 6 to 4 | VCH[2:0] | Illegal access channel These bits show the channel number (0-7) of the first illegal access after the VF bit is cleared to 0. If illegal access occurs while the VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared. |
| 3 to 1 | Reserved | When read, the value after reset is read. |
| 0 | VF | Illegal access flag This bit shows whether illegal access occurs in the DMAC0. 0: No illegal access has occurred in the DMAC0 1: Illegal access has occurred in the DMAC0 If illegal access occurs in the DMAC0 while this bit is 0, this bit is set, and PEID, SPID, UM and VCH store their respective information. If illegal access occurs in the DMAC0 while this bit is 1, this bit remains 1, and PEID, SPID, UM and VCH do not change. This bit can be cleared by using the CMVC register. |

7.8.2.10 DM1CMV — DMAC1 Register Access Protection Violation Register

Access: This register can be read in 32-bit units.

Address: <DMAC_base> + 0034_H

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|-------|-------|-------|----|----|----|----|----|----|-------|-------|-------|-------|-------|----|----|

| | — | — | — | — | — | — | — | — | — | VCH2 | VCH1 | VCH0 | — | — | — | VF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 7.25 DM1CMV Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|---|
| 31 to 29 | PEID[2:0] | Illegal access master information These bits show the accessing master information of the first illegal access after the VF bit is cleared to 0. If illegal access occurs while the VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared. |
| 28 to 23 | Reserved | When read, the value after reset is read. |
| 22 to 18 | SPID[4:0] | Illegal access master information These bits show the accessing master information of the first illegal access after the VF bit is cleared to 0. If illegal access occurs while the VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared. |
| 17 | UM | Illegal access master information These bits show the accessing master information of the first illegal access after the VF bit is cleared to 0. If illegal access occurs while the VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared. |
| 16 to 7 | Reserved | When read, the value after reset is read. |
| 6 to 4 | VCH[2:0] | Illegal access channel These bits show the channel number (0-7) of the first illegal access after the VF bit is cleared to 0. If illegal access occurs while the VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared. |
| 3 to 1 | Reserved | When read, the value after reset is read. |
| 0 | VF | Illegal access flag This bit shows whether illegal access occurs in the DMAC1. 0: No illegal access has occurred in the DMAC1 1: Illegal access has occurred in the DMAC1 If illegal access occurs in the DMAC1 while this bit is 0, this bit is set, and PEID, SPID, UM and VCH store their respective information. If illegal access occurs in the DMAC1 while this bit is 1, this bit remains 1, and PEID, SPID, UM and VCH do not change. This bit can be cleared by using the CMVC register. |

7.8.2.11 DTSCMV — DTS Register Access Protection Violation Register

Access: This register can be read in 32-bit units.

Address: <DMAC_base> + 0038_H

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 7.26 DTSCMV Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|---|
| 31 to 29 | PEID[2:0] | Illegal access master information These bits show the accessing master information of the first illegal access after the VF bit is cleared to 0. If illegal access occurs while the VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared. |
| 28 to 23 | Reserved | When read, the value after reset is read. |
| 22 to 18 | SPID[4:0] | Illegal access master information These bits show the accessing master information of the first illegal access after the VF bit is cleared to 0. If illegal access occurs while the VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared. |
| 17 | UM | Illegal access master information These bits show the accessing master information of the first illegal access after the VF bit is cleared to 0. If illegal access occurs while the VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared. |
| 16 to 11 | Reserved | When read, the value after reset is read. |
| 10 to 4 | VCH[6:0] | Illegal access channel These bits show the channel number (0-127) of the first illegal access after the VF bit is cleared to 0. If illegal access occurs while the VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared. |
| 3 to 1 | Reserved | When read, the value after reset is read. |
| 0 | VF | Illegal access flag This bit shows whether illegal access occurs in the DTS. 0: No illegal access has occurred in the DTS 1: Illegal access has occurred in the DTS If illegal access occurs in the DTS while this bit is 0, this bit is set, and PEID[2:0], SPID[4:0], UM and VCH[6:0] store their respective information. If illegal access occurs in the DTS while this bit is 1, this bit remains 1, and PEID[2:0], SPID[4:0], UM and VCH[6:0] do not change. This bit can be cleared by using the CMVC register. |

7.8.2.12 CMVC — Register Access Protection Violation Clear Register

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 003C_H

Value after reset: 0000 0000_H

| | | | | | | | | | | | | | | | | |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|-------|-------|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| | — | — | — | — | — | — | — | — | — | — | — | — | — | DTSVC | DM1VC | DM0VC |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W |

Table 7.27 CMVC Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 3 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 2 | DTSVC | DTS illegal access flag clear The DTS illegal access flag (DTSCMV.VF) can be cleared by writing 1 to this bit. The read value is always 0. |
| 1 | DM1VC | DMAC1 illegal access flag clear The DMAC1 illegal access flag (DM1CMV.VF) can be cleared by writing 1 to this bit. The read value is always 0. |
| 0 | DM0VC | DMAC0 illegal access flag clear The DMAC0 illegal access flag (DM0CMV.VF) can be cleared by writing 1 to this bit. The read value is always 0. |

7.8.2.13 Transfer Status Register (TFRSTS)

Access: This register can be read in 32-bit units.

Address: <DMAC_base> + 004C_H

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 7.28 TFRSTS Register Contents

| Bit Position | Bit Name | Function |
|--------------|--------------|--|
| 31 to 17 | Reserved | When read, the value after reset is read. |
| 16 | DTSCYC | DMA cycle state of DTS IP block: 0: No DTS-DMA cycle executing 1: DTS-DMA cycle is executing After suspending DTS transfers, DTSCYC may be polled to assure that any possibly ongoing DTS cycle has finished. This flag is a copy of DTSSTS.DTSCYC. |
| 15 to 8 | DMACY[17:10] | DMA cycle execution state This bit shows whether a DMA cycle is ongoing in this channel. 0: DMA cycle is not ongoing. 1: DMA cycle is ongoing. After suspending a DMA channel, CY may be polled to assure that any possibly ongoing DMA cycle has finished. These flags are copies from DCSTn.CY. |
| 7 to 0 | DMACY[07:00] | DMA cycle execution state This bit shows whether a DMA cycle is ongoing in this channel. 0: DMA cycle is not ongoing. 1: DMA cycle is ongoing. After suspending a DMA channel, CY may be polled to assure that any possibly ongoing DMA cycle has finished. These flags are copies from DCSTn.CY. |

7.8.2.14 DTSPR_y — DTS Channel Priority Setting (y = 0 to 7)

- DTSPR₀

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0060_H

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | SECDIS | ECCDIS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

Table 7.37 DTRECCTL Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|--|
| 31, 30 | PROT[1:0] | These bits enable or disable writing to the ECCDIS and SECDIS bits. The written data is not retained. The read value is always 0. These bits should be written when (PROT1, PROT0) = (0, 1). |
| 29 to 2 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 1 | SECDIS | DTSRAM SED error correction disable This bit enables or disables SED error correction when the ECCDIS bit is 0. ECC 1 bit error detection operation is always executed when ECCDIS bit is 0 regardless of the state of this bit. Set (PROT1, PROT0) = (0, 1) at the same time as writing to this bit. 0: Error correction is enabled when the SED error is detected. 1: Error correction is disabled when the SED error is detected. |
| 0 | ECCDIS | DTSRAM ECC disable This bit enables or disables DTSRAM ECC error detection and correction. Set (PROT1, PROT0) = (0, 1) at the same time as writing to this bit. 0: Error detection and correction are enabled. 1: Error detection and correction are disabled. The encoding function is effective when error detection and correction are disabled. |

7.8.2.16 DTRERINT — DTSRAM Error Notification Control Register

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0084_H

Value after reset: 0000 0002_H

| | | | | | | | | | | | | | | | | |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|-------|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DEDIE | SEDIE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

Table 7.38 DTRERINT Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 2 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 1 | DEDIE | DTSRAM DED error external notification enable This bit enables or disables notification of DED error detection to the ECM when the ECCDIS bit in DTRECCTL is 0. 0: Notification of DED error to ECM is disabled. 1: Notification of DED error to ECM is enabled. |
| 0 | SEDIE | DTSRAM SED error external notification enable This bit enables or disables notification of SED error detection to the ECM when the ECCDIS bit in DTRECCTL is 0. 0: Notification of SED error to ECM is disabled. 1: Notification of SED error to ECM is enabled. |

7.8.2.17 DTRTCTL — DTSRAM Test Control Register

This register is used for ECC test (self-diagnosis). It enables setting of ECC test mode and selection of ECC data to be written to the DTSRAM.

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0094_H

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|-------|-------|----|----|----|----|----|----|----|----|----|----|----|----|--------|--------|
| | PROT1 | PROT0 | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | ECCTST | DATSEL |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

Table 7.39 DTRTCTL Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|---|
| 31, 30 | PROT[1:0] | These bits enable or disable writing to the ECCTST and DATSEL bits. The written data is not retained. The read value is always 0. These bits should be written when (PROT1, PROT0) = (0, 1). |
| 29 to 2 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 1 | ECCTST | DTSRAM ECC Test Mode This bit enables or disables DTSRAM ECC test mode. Set (PROT1, PROT0) = (0, 1) at the same time as writing to this bit. 0: ECC test mode is disabled. 1: ECC test mode is enabled. |
| 0 | DATSEL | ECC Test Data Selection This bit is valid when ECCTST is 1 and selects ECC data to be written to the DTSRAM. Set (PROT1, PROT0) = (0, 1) at the same time as writing to this bit. 0: ECC encoded from the written data is used. 1: The value specified by the DTSRAM test data writing register (DTRTWDAT) is used. |

7.8.2.18 DTRTWDAT — DTSRAM Test Write Data Register

This register is used for ECC test (self-diagnosis). It specifies ECC data to be written to the DTSRAM after ECC test mode is enabled (ECCTST = 1).

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0098_H

Value after reset: 0000 0000_H

| | | | | | | | | | | | | | | | | |
|-------------------|----|----|----|----|----|----|----|----|----|------------|------------|------------|------------|------------|------------|------------|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 7.40 DTRTWDAT Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------|--|
| 31 to 7 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 6 to 0 | TWDAT[6:0] | ECC Test Write Data These bits specifies ECC data to be written to the DTSRAM when DTRTSCTL.ECCTST = 1 and DTRTSCTL.DATSEL = 1. Writing to this bit is enabled when DTRTSCTL.ECCTST = 1 When DTRTSCTL.ECCTST = 0, this bit cannot be written and its read value is 0. |

7.8.2.19 DTRTRDAT — DTSRAM Test Read Data Register

This register is used for ECC test (self-diagnosis). It reads out ECC data of the DTSRAM after ECC test mode is enabled (ECCTST = 1).

Access: This register can be read in 32-bit units.

Address: <DMAC_base> + 009C_H

Value after reset: 0000 0000_H

|--------------|------------|--|
| 31 to 7 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 6 to 0 | TRDAT[6:0] | ECC Test Read Data This bits retains the last ECC data read out from the DTSRAM when DTRTSCTL.ECCTST = 1. When DTRTSCTL.ECCTST = 0, the read value of this bit is 0. |

7.8.2.20 ADECCTCL — ECC on BUS Address ECC Test Control Register

This register is used for ECC test (self-diagnosis). (refer **31.2.9.6, Test Function**)

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 00A0_H

Value after reset: 0000 0000_H

| | | | | | | | | | | | | | | | | |

Table 7.42 ADECCTCL Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|---|
| 31, 30 | PROT[1:0] | These bits enable or disable writing to the ECCTST and RWSEL bits. The written data is not retained. The read value is always 0. These bits should be written when (PROT1, PROT0) = (0, 1). |
| 29 to 2 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 1 | ECCTST | Address ECC test mode Configures ECConBUS address ECC test mode. To update this bit, (PROT1, PROT0) = (0, 1) must be written at the same time. 0: Address ECC test mode is disabled. 1: Address ECC test mode is enabled. Address ECC output is replaced with the value of ADECCTDT register. |
| 0 | RWSEL | Address ECC test cycle selection Selects either read cycle or write cycle to test address ECC. This bit is valid only at ECCTST = 1. To update this bit, (PROT1, PROT0) = (0, 1) must be written at the same time. 0: Address ECC output is replaced with test data at DMA read cycle. 1: Address ECC output is replaced with test data at DMA write cycle. |

7.8.2.21 ADECCTDT — ECC on BUS Address ECC Test Data Register

This register is used for ECC test (self-diagnosis). (refer **31.2.9.6, Test Function**)

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 00A4_H

Value after reset: 0000 0000_H

| | | | | | | | | | | | | | | | | |
|-------------------|----|----|----|----|----|----|----|----|----|-------------|-------------|-------------|-------------|-------------|-------------|-------------|

Table 7.43 ADECCTDT Register Contents

| Bit Position | Bit Name | Function |
|--------------|-------------|--|
| 31 to 7 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 6 to 0 | ECCDAT[6:0] | ECC test data Specifies ECC test data used at ADECCTCL.ECCTST = 1. |

7.8.2.22 DMxCM — DMAC Channel Master Setting (x = 00 to 07, 10 to 17)

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0100_H + 4_H × Ch. No. n (n = 0 to 7)
<DMAC_base> + 0120_H + 4_H × Ch. No. n - 10 (n = 10 to 17)

Value after reset: 0000 2008_H

| | | | | | | | | | | | | | | | | |

Table 7.44 DMxCM Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|---|
| 31 to 16 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 15 to 13 | PEID[2:0] | Channel master PEID setting Specifies the PEID information of the master assigned to the channel. |
| 12 to 10 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 9 to 7 | Reserved | When writing, always write 0. |
| 6 to 2 | SPID[4:0] | Channel master SPID setting Specifies the SPID information used by the master assigned to the channel. SPID = 0 and 1 are reserved and must not be used. If SPID = 0 or 1 is set, DMA will use SPID = 2. |
| 1 | UM | Channel master UM setting Specifies the UM information of the master assigned to the channel. |
| 0 | Reserved | When writing, always write 0. |

CAUTION

DM00CM to DM07CM configure the channel master information of the DMAC0 channel 0 to 7 respectively.

DM10CM to DM17CM configure the channel master information of the DMAC1 channel 0 to 7 respectively.

For information about the functions this register offers, see **7.6, Reliability Function**.

7.8.2.23 DTSmCM — DTS Channel Master Setting Register (m = 000 to 127)

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0200_H + 4_H × Ch. No. n (n = 0 to 127)

Value after reset: Undefined

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 7.45 DTSmCM Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|---|
| 31 to 29 | PEID[2:0] | Channel master PEID setting Specifies the PEID information of the master assigned to the channel. |
| 28 to 23 | Reserved | When writing, write the value “0”. When read, the unfixed value after reset and “0” after write is read. |
| 22 to 18 | SPID[4:0] | Channel master SPID setting Specifies the SPID information used by the master assigned to the channel. SPID = 0 and 1 are reserved and must not be used. If SPID = 0 or 1 is set, DMA will use SPID = 2. |
| 17 | UM | Channel master UM setting Specifies the UM information of the master assigned to the channel. |
| 16 | Reserved | When writing, write the value “0”. When read, the unfixed value after reset and “0” after write is read. |
| 15 to 0 | CMC[15:0] | Transfer count compare In terms of contents, this field is the same as the bit [15:0] of the 7.10.3.8, DTTCCm — DTS Transfer Count Compare Register . |

CAUTIONS

1. DTS000CM to DTS127CM configure the channel master information of the DTS channel 0 to 127 respectively.
2. Register access for channels that are shown as reserved in **Table 7.6, List of DTS Trigger Sources** is prohibited.

For information about the functions this register offers, see **7.6, Reliability Function**.

CAUTION

The lowest 16 bits of this register are shared with the DTS transfer count compare register, one of the DTS channel registers.

If you write to this register, the DTS transfer count compare register is updated as well.

Recommended setup procedure of the DTS channel master setting register

When the special master configures the overall DTS operation, the channel master setting must be configured in the bits 31 to 29, 22 to 16 in this register, and 0 must be specified in the bits 28 to 23, 15 to 0.

The bits 28 to 23 of this register are reserved, but you can read and write those bits.

7.9 DMAC Channel Register

7.9.1 DMAC Channel Register Address

Address = <DMAC_base> “FFFF 8000_H” + Offset address

Table 7.46 DMAC Channel Register Address

| Offset Address | Register Symbol | Meaning | Accessed Permission*1 | |
|--|-----------------|---------------------------------------|-----------------------|----------------|
| | | | Special Master | General Master |
| 0400 _H + 40 _H × [channel number] | DSAn | DMAC source address | √ | √ |
| 0404 _H + 40 _H × [channel number] | DDAn | DMAC destination address | √ | √ |
| 0408 _H + 40 _H × [channel number] | DTCn | DMAC transfer count | √ | √ |
| 040C _H + 40 _H × [channel number] | DTCTn | DMAC transfer control | √ | √ |
| 0410 _H + 40 _H × [channel number] | DRSAn | DMAC reload source address | √ | √ |
| 0414 _H + 40 _H × [channel number] | DRDAn | DMAC reload destination address | √ | √ |
| 0418 _H + 40 _H × [channel number] | DRTCn | DMAC reload transfer count | √ | √ |
| 041C _H + 40 _H × [channel number] | DTCCn | DMAC transfer count compare | √ | √ |
| 0420 _H + 40 _H × [channel number] | DCENn | DMAC channel operation enable setting | √ | √ |
| 0424 _H + 40 _H × [channel number] | DCSTn | DMAC transfer status | √ | √ |
| 0428 _H + 40 _H × [channel number] | DCSTSn | DMAC transfer status set | √ | √ |
| 042C _H + 40 _H × [channel number] | DCSTCn | DMAC transfer status clear | √ | √ |
| 0430 _H + 40 _H × [channel number] | DTFRn | DTFR setting | √ | √ |
| 0434 _H + 40 _H × [channel number] | DTFRRQn | DTFR transfer request status | √ | √ |
| 0438 _H + 40 _H × [channel number] | DTFRRQCn | DTFR transfer request clear | √ | √ |

Note: The [channel number] in the offset addresses and “n” in the register symbols are numbers in the range from 0 to 15, and the correspondence between the channel number n and the channel is as follows.

| Channel number n | Channel |
|------------------|-----------------|
| 0 | DMAC0 channel 0 |
| 1 | DMAC0 channel 1 |
| 2 | DMAC0 channel 2 |
| 3 | DMAC0 channel 3 |
| 4 | DMAC0 channel 4 |
| 5 | DMAC0 channel 5 |
| 6 | DMAC0 channel 6 |
| 7 | DMAC0 channel 7 |
| 8 | DMAC1 channel 0 |
| 9 | DMAC1 channel 1 |
| 10 | DMAC1 channel 2 |
| 11 | DMAC1 channel 3 |
| 12 | DMAC1 channel 4 |
| 13 | DMAC1 channel 5 |
| 14 | DMAC1 channel 6 |
| 15 | DMAC1 channel 7 |

Note 1. √: supported x: not supported

7.9.2 Details of DMAC Channel Registers

The “n” in the register symbols indicates the DMA channel number (n = 0 to 15).

7.9.2.1 DSA_n — DMAC Source Address Register

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0400_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| | SA31 | SA30 | SA29 | SA28 | SA27 | SA26 | SA25 | SA24 | SA23 | SA22 | SA21 | SA20 | SA19 | SA18 | SA17 | SA16 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|------|------|------|------|------|------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| | SA15 | SA14 | SA13 | SA12 | SA11 | SA10 | SA9 | SA8 | SA7 | SA6 | SA5 | SA4 | SA3 | SA2 | SA1 | SA0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 7.47 DSA_n Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 31 to 0 | SA[31:0] | Source address Specifies the DMA transfer source address. Those bits are updated whenever a DMA cycle is executed. If you read from those bits, the transfer source address for the next DMA cycle is read. |

CAUTIONS

1. It is forbidden to write to those bits when the channel operation is enabled (DTE bit = 1). If you do, the correct operation is not guaranteed.
2. If transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the source address is updated.
3. DMA transfer for misaligned data is not supported. The possible lowest four bits of the address for each transfer data size is as follows. (x denotes an arbitrary one bit.)
The correct operation is not guaranteed if you select other setting.

| Data Size | SA3 | SA2 | SA1 | SA0 |
|-----------|-----|-----|-----|-----|
| 8 bits | x | x | x | x |
| 16 bits | x | x | x | 0 |
| 32 bits | x | x | 0 | 0 |
| 64 bits | x | 0 | 0 | 0 |
| 128 bits | 0 | 0 | 0 | 0 |

7.9.2.2 DDAn — DMAC Destination Address Register

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0404_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| | DA31 | DA30 | DA29 | DA28 | DA27 | DA26 | DA25 | DA24 | DA23 | DA22 | DA21 | DA20 | DA19 | DA18 | DA17 | DA16 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|------|------|------|------|------|------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| | DA15 | DA14 | DA13 | DA12 | DA11 | DA10 | DA9 | DA8 | DA7 | DA6 | DA5 | DA4 | DA3 | DA2 | DA1 | DA0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 7.48 DDAn Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 0 | DA[31:0] | Destination address Specifies the DMA transfer destination address. Those bits are updated whenever a DMA cycle is executed. If you read from those bits, the transfer destination address for the next DMA cycle is read. |

CAUTIONS

1. It is forbidden to write to those bits when the channel operation is enabled (DTE bit = 1). If you do, the correct operation is not guaranteed.
2. If transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the destination address is updated.
3. DMA transfer for misaligned data is not supported. The possible lowest four bits of the address for each transfer data size is as follows. (× denotes an arbitrary one bit.)
The correct operation is not guaranteed if you select other setting.

| Data Size | DA3 | DA2 | DA1 | DA0 |
|-----------|-----|-----|-----|-----|
| 8 bits | × | × | × | × |
| 16 bits | × | × | × | 0 |
| 32 bits | × | × | 0 | 0 |
| 64 bits | × | 0 | 0 | 0 |
| 128 bits | 0 | 0 | 0 | 0 |

7.9.2.3 DTCn — DMAC Transfer Count Register

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0408_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 7.49 DTCn Register Contents

| Bit Position | Bit Name | Function | | | | | | | | | | |
|-------------------|--|---|-----------|-----------|-------------------|--|-------------------|--|---|---|-------------------|--|
| 31 to 16 | ARC[15:0] | <p>Address reload count</p> <p>Specifies the number of transfers until the address reload when the reload function 2 is used, and also specifies the number of transfers when the block transfer 2 is used. If you read from those bits during DMA transfer, the address reload count for the next DMA cycle is read.</p> <p>When the reload function 2 or block transfer 2 is used, ARC[15:0] is decremented by one for every DMA cycle. When the reload function 2 or block transfer 2 is not used, ARC[15:0] is not updated.</p> <p>If the value is 0000_H, it means that the number of transfers until the address reload when the reload function 2 is used and the number of transfers when the block transfer 2 is used are 65536.</p> | | | | | | | | | | |
| 15 to 0 | TRC[15:0] | <p>Transfer count</p> <p>Configures the number of transfers. TRC[15:0] is decremented by one whenever a DMA cycle is executed. If you read from those bits, the remaining number of transfers for the next DMA cycle is read. If the reload function is not used, after the last transfer is complete, the value at the completion (0000_H) is retained.</p> <table border="1"> <thead> <tr> <th>TRC[15:0]</th><th>Operation</th></tr> </thead> <tbody> <tr> <td>0000_H</td><td>The number of transfers is 65536, or the transfer is complete.</td></tr> <tr> <td>0001_H</td><td>The number of transfers or remaining transfers is 1.</td></tr> <tr> <td>:</td><td>:</td></tr> <tr> <td>FFFF_H</td><td>The number of transfers or remaining transfers is 65535.</td></tr> </tbody> </table> | TRC[15:0] | Operation | 0000 _H | The number of transfers is 65536, or the transfer is complete. | 0001 _H | The number of transfers or remaining transfers is 1. | : | : | FFFF _H | The number of transfers or remaining transfers is 65535. |
| TRC[15:0] | Operation | | | | | | | | | | | |
| 0000 _H | The number of transfers is 65536, or the transfer is complete. | | | | | | | | | | | |
| 0001 _H | The number of transfers or remaining transfers is 1. | | | | | | | | | | | |
| : | : | | | | | | | | | | | |
| FFFF _H | The number of transfers or remaining transfers is 65535. | | | | | | | | | | | |

CAUTIONS

1. It is forbidden to write to those bits when the channel operation is enabled (DCENn.DTE bit = 1). If you do, the correct operation is not guaranteed.
2. If transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the transfer count and the address reload count are updated.

7.9.2.4 DTCTn — DMAC Transfer Control Register

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 040C_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 7.50 DTCTn Register Contents (1/3)

| Bit Position | Bit Name | Function |
|--------------|-------------|--|
| 31 to 28 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 27 | ESE | Transfer error case DMA transfer disable setting Configures whether a DMA cycle is executed when the DCSTn.ER bit is set due to DMA transfer error. If this bit is cleared to 0, even when the DCSTn.ER bit is set due to DMA transfer error, the following DMA cycles can be executed. If this bit is set to 1, the following DMA cycles are not executed when the DCSTn.ER bit is set due to DMA transfer error. 0: DMA cycles are executed while the DCSTn.ER bit is set. 1: DMA cycles are not executed while the DCSTn.ER bit is set. |
| 26 | DRS | DMA transfer request selection assignment Selects the type of DMA transfer requests to be accepted. 0: Software DMA transfer request 1: Hardware DMA transfer request |
| 25 to 21 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 20 to 18 | CHNSEL[2:0] | Next channel in the chain Specifies the next channel in the chain. The next channel must be another channel in the same DMAC. You cannot specify a channel in the different DMAC or in the DTS. You cannot specify the same channel for the next channel. (If you do, the correct operation is not guaranteed.) |
| 17, 16 | CHNE1, 0 | Chain enable Selects the chain function. 00: Disabled 01: Chain at the last transfer A chain request is generated at the completion of the DMA cycle in which the remaining transfer count is one. 10: (Forbidden. No guarantee of operation) 11: Always chain A chain request is generated at the completion of every DMA cycle. |
| 15 | CCE | Transfer count match interrupt enable If this bit is set, a transfer count match interrupt is generated at the completion of the DMA cycle in which the transfer count compare register and the remaining transfer count have the same value. |

Table 7.50 DTCTn Register Contents (2/3)

| Bit Position | Bit Name | Function | | | | | | | | | | | | | | | |
|--------------|-----------|---|-------|-------|--------------------|---|---|-----------|---|---|-----------|---|---|-------|---|---|---------------------------------------|
| 14 | TCE | Transfer completion interrupt enable If this bit is set, a transfer completion interrupt is generated at the completion of the last transfer. A transfer completion notification interrupt is also generated at the completion of the last transfer when DCSTn.TC = 1. | | | | | | | | | | | | | | | |
| 13 | MLE | Continuous transfer enable If this bit is set, the DTE bit is not cleared at the completion of DMA transfer. In addition, even if the TC bit is not cleared, DMA transfer starts when there is a DMA transfer request. 0: The DTE bit is cleared at the completion of DMA transfer. In addition, the next DMA transfer can start only after the TC bit is cleared. 1: The DTE bit is not cleared at the completion of DMA transfer. In addition, even if the TC bit is not cleared, DMA transfer starts when there is a DMA transfer request. | | | | | | | | | | | | | | | |
| 12, 11 | RLD2M1, 0 | Reload function 2 setting Configures the reload function 2. 00: Reload function 2 is disabled. 01: Reload function 2 is enabled. The source address and address reload count are reloaded at the completion of the DMA cycle in which the address reload count is 1. 10: Reload function 2 is enabled. The destination address and address reload count are reloaded at the completion of the DMA cycle in which the address reload count is 1. 11: Reload function 2 is enabled. The source address, destination address, and address reload count are reloaded at the completion of the DMA cycle in which the address reload count is 1. | | | | | | | | | | | | | | | |
| 10, 9 | RLD1M1, 0 | Reload function 1 setting Configures the reload function 1. 00: Reload function 1 is disabled. 01: Reload function 1 is enabled. The source address and transfer count are reloaded at the completion of the DMA cycle in which the remaining transfer count is 1. (If the reload function 2 is enabled, the address reload count is also reloaded.) 10: Reload function 1 is enabled. The destination address and transfer count are reloaded at the completion of the DMA cycle in which the remaining transfer count is 1. (If the reload function 2 is enabled, the address reload count is also reloaded.) 11: Reload function 1 is enabled. The source address, destination address, and transfer count are reloaded at the completion of the DMA cycle in which the remaining transfer count is 1. (If the reload function 2 is enabled, the address reload count is also reloaded.) | | | | | | | | | | | | | | | |
| 8, 7 | DACM1, 0 | Destination address count direction Specifies the count direction of the destination address. <table border="1" data-bbox="678 1568 1417 1758"> <thead> <tr> <th>DACM1</th> <th>DACM0</th> <th>Direction of Count</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>Increment</td> </tr> <tr> <td>0</td> <td>1</td> <td>Decrement</td> </tr> <tr> <td>1</td> <td>0</td> <td>Fixed</td> </tr> <tr> <td>1</td> <td>1</td> <td>Forbidden (No guarantee of operation)</td> </tr> </tbody> </table> | DACM1 | DACM0 | Direction of Count | 0 | 0 | Increment | 0 | 1 | Decrement | 1 | 0 | Fixed | 1 | 1 | Forbidden (No guarantee of operation) |
| DACM1 | DACM0 | Direction of Count | | | | | | | | | | | | | | | |

| Other than the above | | | Forbidden (No guarantee of operation) | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 1, 0 | TRM1, 0 | Transfer mode Specifies the DMA transfer mode. 00: Single transfer 01: Block transfer 1 (The number of transfers is specified by the transfer count.) 10: Block transfer 2 (The number of transfers is specified by the address reload count.) 11: Forbidden (No guarantee of operation) | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

CAUTIONS

1. Except for the case to clear DTCTn.MLE bit, it is forbidden to write to those bits when the channel operation is enabled (DCENn.DTE bit = 1). If you do, the correct operation is not guaranteed.
2. If forbidden settings are used for some of the bits, the correct operation is not guaranteed.

7.9.2.5 DRSA_n — DMAC Reload Source Address Register

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0410_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 7.51 DRSA_n Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|--|
| 31 to 0 | RSA[31:0] | Reload source address Specifies the source address to be reloaded to the DMA source address register when the reload function 1 and reload function 2 are used. |

CAUTION

DMA transfer for misaligned data is not supported. The possible lowest four bits of the address for each transfer data size is as follows. (× denotes an arbitrary one bit.) The correct operation is not guaranteed if you select other setting.

| Data Size | RSA3 | RSA2 | RSA1 | RSA0 |
|-----------|------|------|------|------|
| 8 bits | × | × | × | × |
| 16 bits | × | × | × | 0 |
| 32 bits | × | × | 0 | 0 |
| 64 bits | × | 0 | 0 | 0 |
| 128 bits | 0 | 0 | 0 | 0 |

7.9.2.6 DRDAn — DMAC Reload Destination Address Register

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0414_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| | RDA31 | RDA30 | RDA29 | RDA28 | RDA27 | RDA26 | RDA25 | RDA24 | RDA23 | RDA22 | RDA21 | RDA20 | RDA19 | RDA18 | RDA17 | RDA16 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|-------|-------|-------|-------|-------|-------|------|------|------|------|------|------|------|------|------|------|
| | RDA15 | RDA14 | RDA13 | RDA12 | RDA11 | RDA10 | RDA9 | RDA8 | RDA7 | RDA6 | RDA5 | RDA4 | RDA3 | RDA2 | RDA1 | RDA0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 7.52 DRDAn Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|---|
| 31 to 0 | RDA[31:0] | Reload destination address Specifies the destination address to be reloaded to the DMA destination address register when the reload function 1 or reload function 2 is used. |

CAUTION

DMA transfer for misaligned data is not supported. The possible lowest four bits of the address for each transfer data size is as follows. (× denotes an arbitrary one bit.) The correct operation is not guaranteed if you select other setting.

| Data Size | RDA3 | RDA2 | RDA1 | RDA0 |
|-----------|------|------|------|------|
| 8 bits | × | × | × | × |
| 16 bits | × | × | × | 0 |
| 32 bits | × | × | 0 | 0 |
| 64 bits | × | 0 | 0 | 0 |
| 128 bits | 0 | 0 | 0 | 0 |

7.9.2.7 DRTCn — DMAC Reload Transfer Count Register

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0418_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 7.53 DRTCn Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------|---|
| 31 to 16 | RARC[15:0] | Reload address reload count Specifies the value to be loaded to the address reload count in the transfer count register at the timing of reload when the reload function 2 is used. |
| 15 to 0 | RTRC[15:0] | Reload transfer count Specifies the value to be loaded to the transfer count in the transfer count register at the timing of reload when the reload function 1 (including a combination of reload function 1 and 2) is used. |

7.9.2.8 DTCCn — DMAC Transfer Count Compare Register

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 041C_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000_H

| | | | | | | | | | | | | | | | | |
|-------------------|-------|-------|-------|-------|-------|-------|------|------|------|------|------|------|------|------|------|------|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | CMC15 | CMC14 | CMC13 | CMC12 | CMC11 | CMC10 | CMC9 | CMC8 | CMC7 | CMC6 | CMC5 | CMC4 | CMC3 | CMC2 | CMC1 | CMC0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 7.54 DTCCn Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|---|
| 31 to 16 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 15 to 0 | CMC[15:0] | Transfer count compare Configures the transfer count to be compared to the transfer count register. At the completion of the DMA cycle in which the remaining transfer count is the same as the value in this register, the transfer count match flag (DCSTn.CC) in the DMAC transfer status register is set. Furthermore, if the transfer count match interrupt enable (DTCTn.CCE) bit is 1, a transfer count match interrupt is generated. If 0000 _H is set, comparison with the transfer count is disabled. In this case, the transfer count match flag in the DMAC transfer status register is never set, and a transfer count match interrupt is never generated. |

CAUTION

It is forbidden to write to those bits when the channel operation is enabled (DTE bit = 1). If you do, the correct operation is not guaranteed.

7.9.2.9 DCENn — DMAC Channel Operation Enable Setting Register

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0420_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000_H

| | | | | | | | | | | | | | | | | |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DTE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

Table 7.55 DCENn Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 1 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 0 | DTE | <p>Channel operation enable</p> <p>Specifies whether to enable or disable the transfer operation of the channel. If the DTE bit is 1, DMA transfer starts when there is a DMA transfer request. If the MLE bit is 0, the DTE bit is cleared automatically at the completion of the DMA transfer. In addition, if 0 is written to the DTE bit during DMA transfer, the DMA transfer is suspended. If 1 is written to the DTE bit during suspension, the suspension is cleared and the DMA transfer resumes.</p> <p>0: Channel operation is disabled/Channel suspended 1: Channel operation is enabled/Channel suspension cleared</p> |

7.9.2.10 DCSTn — DMAC Transfer Status Register

Access: This register can be read in 32-bit units.

Address: <DMAC_base> + 0424_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000_H

Table 7.56 DCSTn Register Contents (1/2)

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 31 to 12 | Reserved | When read, the value after reset is read. |
| 11 | ERWR | DMA Transfer Error occurring cycle This bit is updated at the same time as setting of the DMA transfer error flag (ER), indicating which cycle of read or write the DMA transfer error occurs in. This bit is not updated when a new DMA transfer error occurs after the ER bit has been set. If the ER bit is cleared, this bit is also cleared to 0. 0: DMA transfer error occurs in read cycle. 1: DMA transfer error occurs in write cycle. |
| 10, 9 | Reserved | When read, the value after reset is read. |
| 8 | CY | DMA cycle execution state This bit shows whether a DMA cycle is ongoing in this channel. 0: DMA cycle is not ongoing. 1: DMA cycle is ongoing. After suspending a DMA channel, CY may be polled to assure that any possibly ongoing DMA cycle has finished. |
| 7 | ER | Transfer error flag This bit is set when DMA transfer error is generated. If this bit is 1 and the DTCTn.ESE bit is set, a DMA cycle is not executed when a DMA transfer request is generated. 0: No DMA transfer error is generated 1: DMA transfer error is generated |
| 6 | Reserved | When read, the value after reset is read. |
| 5 | CC | Transfer count match flag This bit is set at the completion of the DMA cycle in which the remaining transfer count is the same as the value set in the transfer compare register. 0: No compare match has occurred with the transfer count compare register. 1: Compare match has occurred with the transfer count compare register. |
| 4 | TC | Transfer completion flag This bit is set at the completion of the last transfer and shows whether the DMA transfer is complete. If the MLE bit is 0 and this bit is 1, a DMA cycle is not executed when a DMA transfer request is generated. 0: DMA transfer incomplete 1: DMA transfer complete |
| 3, 2 | Reserved | When read, the value after reset is read. |

Table 7.56 DCSTn Register Contents (2/2)

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 1 | DR | <p>Hardware DMA transfer request status</p> <p>This bit shows whether there is a hardware DMA transfer request (DMARQ) from the DTFR.</p> <p>This bit changes regardless of the value of the DTE bit when a hardware DMA transfer request from the DTFR is generated. If the software DMA transfer request is selected by the transfer request selection bit (DTCTn.DRS) in the DMAC transfer control register, this bit is not set even when a hardware DMA transfer request is input from the DTFR.</p> <p>0: There is no hardware DMA transfer request 1: There is a hardware DMA transfer request</p> |
| 0 | SR | <p>Software DMA transfer request flag</p> <p>This bit shows whether there is a software DMA transfer request (DMARQ). This bit is automatically cleared at the completion of the last transfer. A user can set this bit by writing 1 to the DCSTS.SRS bit in the DMAC transfer status set register. In addition, a user can clear this bit by writing 1 to the SRC bit in the DMAC transfer status clear register, but if this is done, the ongoing DMA transfer is aborted and cannot be resumed.</p> <p>0: There is no software DMA transfer request 1: There is a software DMA transfer request</p> |

7.9.2.11 DCSTSn — DMAC Transfer Status Set Register

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0428_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000_H

Table 7.59 DTFRn Register Contents

| Bit Position | Bit Name | Function |
|--------------|-------------|--|
| 31 to 8 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 7 to 1 | REQSEL[6:0] | Hardware DMA transfer source selection Selects one out of 128 hardware DMA transfer sources as the hardware DMA transfer request. 000_0000: Selecting the DMACTRG[0] input : 111_1111: Selecting the DMACTRG[127] input |
| 0 | REQEN | Hardware DMA transfer source selection enable This bit enables/disables the hardware DMA transfer source selection. 0: Hardware DMA transfer source selection is disabled. 1: Hardware DMA transfer source selection is enabled. If this bit is 0, even when the hardware DMA transfer source selected by the REQSEL6 to 0 bits is activated, it is not recognized as a hardware DMA transfer request, and a hardware DMA transfer request is not generated. |

CAUTIONS

1. When changing the DTFR.REQSEL bit, do so while DTFR.REQEN is 0.
2. If the hardware DMA transfer source selection enable bit (DTFRn.REQEN) is set to 0 while the DMAC is executing block transfer, transfer requests sent from the DTFR to the DMAC will be masked at the end of the currently executing DMA cycle and the block being transferred will be suspended.

7.9.2.14 DTFRRQn — DTFR Transfer Request Status Register

Access: This register can be read in 32-bit units.

Address: <DMAC_base> + 0434_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|-----|

| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | OVF | DRQ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 7.60 DTFRRQn Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 2 | Reserved | When read, the value after reset is read. |
| 1 | OVF | DMA overflow flag If this bit is set, the DMA channel has received at least one more DMA requests than it can store or handle. One or more DMA requests are lost. OVF can only be read, not written. Write 1 to DTFRRQCn.OVFC to clear OVF. |
| 0 | DRQ | Hardware DMA transfer request status If this bit is set, it means that a hardware DMA transfer request exists or is retained. <ul style="list-style-type: none"> If the hardware DMA transfer request is an edge detection type*¹ This bit shows whether a hardware DMA transfer request generated by edge detection is retained. When the DMA transfer request acceptance signal (DMAAKn) from the DMAC is asserted, this bit is automatically cleared. A user can clear this bit by writing 1 to the DTFRRQCn.DRQC bit. If the hardware DMA transfer request is a level input type*¹ This bit shows whether there is a hardware DMA transfer request input from the outside. Even when the DMA transfer request acceptance signal (DMAAKn) from the DMAC is asserted, this bit is not automatically cleared. In addition, this bit is not cleared even when a user writes to the DTFRRQCn.DRQC bit. This bit changes regardless of the value of the DTFRn.REQEN bit when a hardware DMA transfer request from the outside is generated. 0: There is no hardware DMA transfer request 1: There is a hardware DMA transfer request |

Note 1. Whether the hardware DMA transfer request is an edge detection type or level input type depends on the hardware DMA transfer source selected by DTFRn.REQSEL. Note also that although the reception interrupts for the PSI50 and PSI51 DMA trigger sources (INTPSI50RI and INTPSI51RI) are level interrupts, a hardware DMA transfer request is acknowledged by the input of the edge detection signal to the DMAC.

7.9.2.15 DTFRRQCn — DTFR Transfer Request Clear Register

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0438_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000_H

| | | | | | | | | | | | | | | | | |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|------|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

Table 7.61 DTFRRQCn Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 2 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 1 | OVFC | DMA overflow flag clear Write 1 to OVFC to clear DTFRRQn.OVF. The read value is always 0. |
| 0 | DRQC | Hardware DMA transfer request clear If the hardware DMA transfer request is an edge detection type* ¹ , a user can clear the DTFRRQn.DRQ bit by writing 1 to this bit. If the hardware DMA transfer request is a level input type* ¹ , the DTFRRQn.DRQ bit cannot be cleared by writing to this bit. The read value is always 0. |

Note 1. Whether the hardware DMA transfer request is an edge detection type or level input type depends on the hardware DMA transfer source selected by DTFRn.REQSEL. The hardware DMA transfer request is only an edge detection type in this device.

7.10 DTS Channel Register

7.10.1 Transfer information of the DTS (TI)

7.10.1.1 Structure of the TI

The transfer information of the DTS is called TI. One set of TI consists of 32 bits. 8 sets of TI are assigned for each channel. The 8 sets of TI is called TI-A, TI-B, TI-C, TI-D, TI-E, TI-F, TI-G, and TI-H.

Figure 7.20 shows the structure of the TI.

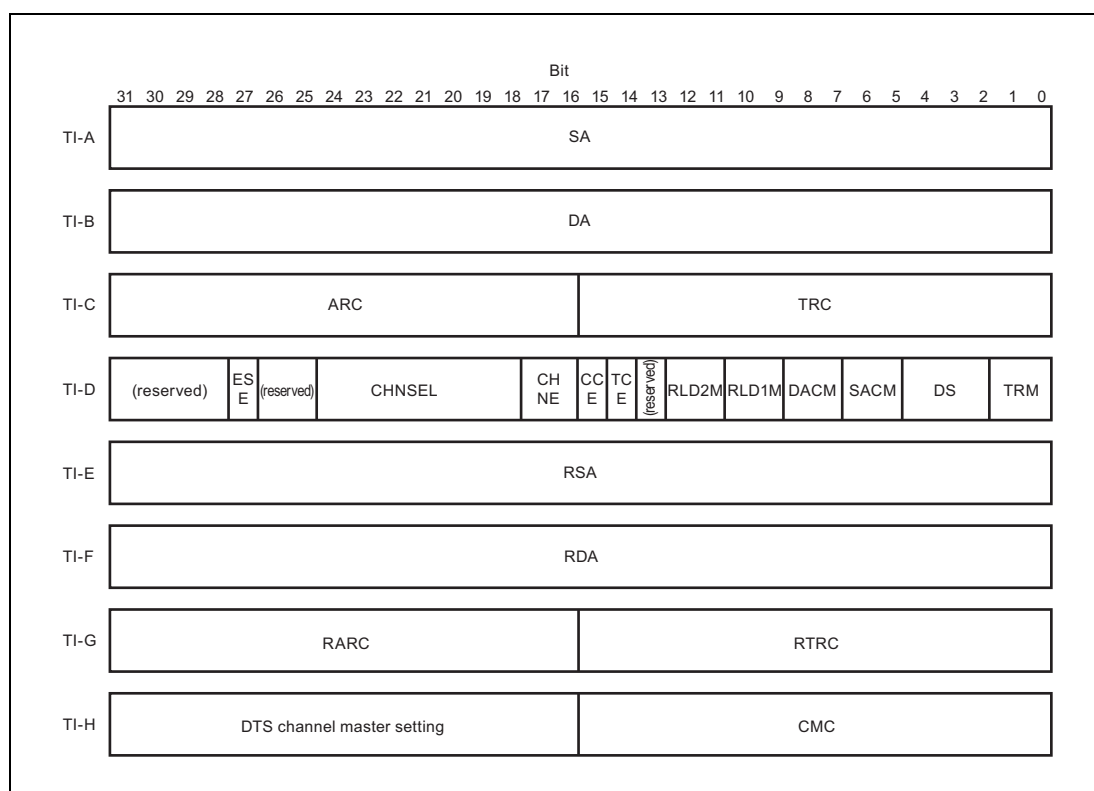

Figure 7.20 Structure of the TI

7.10.1.2 Organization of the TI in the DTSRAM

A user indirectly accesses the DTSRAM by way of the DTS channel registers for each channel and the DTS channel master setting registers.

Therefore, usually, a user does not have to think about the address organization of the TI in the DTSRAM.

As an exception, when ECC error occurs while the DTSRAM is read, the address of the ECC error in the DTSRAM is stored to the DTSRAM error register 2 (DTSER2), one of the global registers. In order to know which channel and TI have generated the error, you need to understand the address organization of the TI in the DTSRAM.

Figure 7.21 shows the address organization of the TI in the DTSRAM.

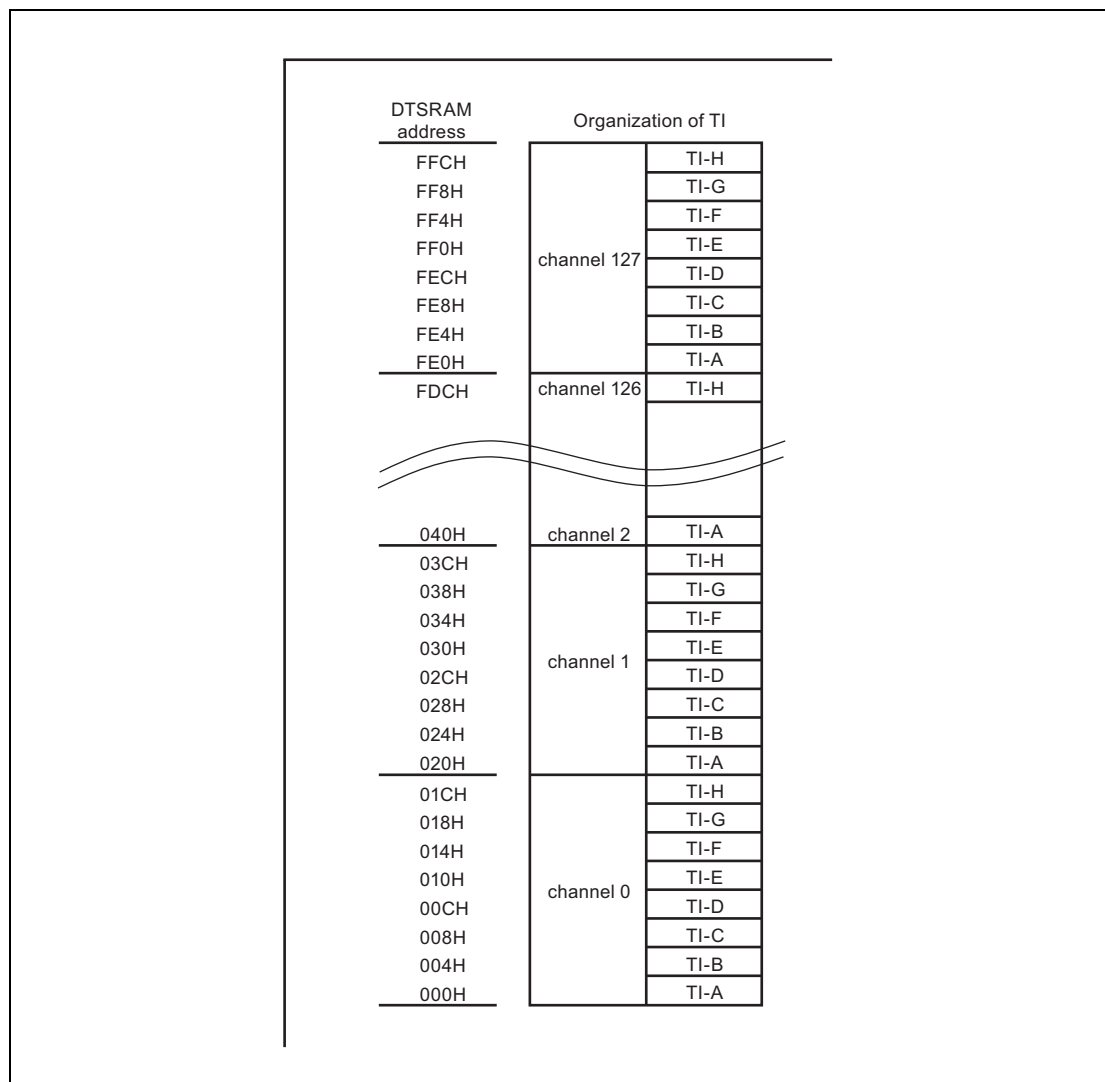

Figure 7.21 Organization of the TI in the DTSRAM

7.10.1.3 Accessing the TI

TI-A can be accessed by way of the DTS source address register (DTSAm) for each channel.

TI-B can be accessed by way of the DTS destination address register (DTDAm) for each channel.

TI-C can be accessed by way of the DTS transfer count register (DTTCm) for each channel.

TI-D can be accessed by way of the DTS transfer control register (DTTCTm) for each channel.

TI-E can be accessed by way of the DTS reload source address register (DTRSAm) for each channel.

TI-F can be accessed by way of the DTS reload destination address register (DTRDAm) for each channel.

TI-G can be accessed by way of the DTS reload transfer count register (DTRTCm) for each channel.

TI-H can be accessed by way of the channel master setting register (DTSmCM), which is a global register, and the transfer count compare register (DTTCCm) for each channel.

7.10.1.4 Caution about Accessing the TI

The data of the DTS channel master setting register and the data of the DTS transfer count compare register are stored to the same TI-H.

Access to the DTS channel master setting register (DTSmCM) is actually 32-bit access to the whole TI-H. Therefore, when you write to the DTS channel master setting register, the lower 16-bit data, which is the data for the DTS transfer count compare (CMC), is updated at the same time. When you read from the DTS channel master setting register, the value of the DTS transfer count compare (CMC) is read as the lower 16-bit data.

When you read from the DTS transfer count compare register (DTTCCm), 32-bit data is read from the TI-H, but only the lower 16-bit data is actually seen in the result of the register read. When you write to the DTS transfer count compare register (DTTCCm), lower 16-bit read/modify/write access to the 32-bit TI-H is used. Data in the TI immediately after the reset is undefined. It should be noted that, if you try to write to the DTS transfer count compare register (DTTCCm) before setting up the DTS channel master setting register, ECC error may be detected during the read of the read/modify/write access.

The bits 28 to 23 of the TI-H are not used, but you can read and write those bits by accessing the DTS channel master setting register. Our recommendation is as follows. When you write to those bits, write 0. When you read from those bits, discard the read value by software.

After the reset, the values of TI in DTSRAM are undefined. After the reset, if you read TI before you write to the TI, ECC error will occur.

Therefore, the first access to the following registers after the reset must be write access. The first access after the reset should never be read access.

- DTS source address register (DTSAm)
- DTS destination address register (DTDAm)
- DTS transfer count compare register (DTTCCm)
- DTS transfer control register (DTTCTm)
- DTS reload source address register (DTRSAm)
- DTS reload destination address register (DTRDAm)
- DTS reload transfer count register (DTRTCm)
- Channel master setting registers (DTSmCM)

In addition, the first access to DTS transfer count compare register (DTTCCm) after the reset must be done after write access to channel master setting register (DTSmCM).

You can access the TI from a CPU while the DTS is executing DMA transfer. But if you do so, the following should be noted.

- While a channel is executing DMA transfer, the TI of the channel should not be updated by TI access from CPU. If this situation happens, the result of the DMA transfer and the contents of the TI may mismatch.
- If TI access is requested from CPU while TI fetch or TI write back is executed, the TI access is executed after the completion of TI fetch or TI write back. If TI fetch or TI write back is requested while TI access request from CPU is processed, the TI fetch or TI write back is executed after the completion of TI access.

7.10.2 DTS Channel Register Address

Address = <DTS_base> “FFFF 9000_H” + Offset address

Table 7.62 DTS Channel Register Address

| Offset Address | Register Symbol | Meaning | Accessed Permission | |
|--|--------------------|--------------------------------|---------------------|----------------|
| | | | Special Master | General Master |
| 0000 _H + 40 _H × [channel number] | DTSA _m | DTS source address | enable | enable |
| 0004 _H + 40 _H × [channel number] | DTDA _m | DTS destination address | enable | enable |
| 0008 _H + 40 _H × [channel number] | DTTC _m | DTS transfer count | enable | enable |
| 000C _H + 40 _H × [channel number] | DTTCT _m | DTS transfer control | enable | enable |
| 0010 _H + 40 _H × [channel number] | DTRSA _m | DTS reload source address | enable | enable |
| 0014 _H + 40 _H × [channel number] | DTRDA _m | DTS reload destination address | enable | enable |
| 0018 _H + 40 _H × [channel number] | DTRTC _m | DTS reload transfer count | enable | enable |
| 001C _H + 40 _H × [channel number] | DTTCC _m | DTS transfer count compare | enable | enable |
| 0020 _H + 40 _H × [channel number] | DTFSL _m | DTSFSL operation setting | enable | enable |
| 0024 _H + 40 _H × [channel number] | DTFST _m | DTSFSL transfer request status | enable | enable |
| 0028 _H + 40 _H × [channel number] | DTFSS _m | DTSFSL transfer request set | enable | enable |
| 002C _H + 40 _H × [channel number] | DTFSC _m | DTSFSL transfer request clear | enable | enable |

Note 1. The [channel number] in the offset addresses is a number in the range from 0 to 127.
The “m” in the register symbols is a 3-digit number in the range from 000 to 127.

Note 2. Register access to the channels indicated as “reserved” in **Table 7.6, List of DTS Trigger Sources** is prohibited.

7.10.3 Details of DTS Channel Registers

The “m” in the register symbols indicates the DTS channel number (m = 000 to 127).

7.10.3.1 DTSAm — DTS Source Address Register

Access: This register can be read/written in 32-bit units.

Address: <DTS_base> + 0000_H + 40_H × Ch. No. m (m = 0 to 127)
Register access for channels that are shown as reserved in **Table 7.6, List of DTS Trigger Sources** is prohibited.

Value after reset: Undefined

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 0 | SA[31:0] | Source address Specifies the DMA transfer source address. SA[31:0] is updated at the timing of the TI write back and retains the DMA transfer source address for the next DMA transfer. |

CAUTION

DMA transfer for misaligned data is not supported. The possible lowest four bits of the address for each transfer data size is as follows. (x denotes an arbitrary one bit.) The correct operation is not guaranteed if you select other setting.

| Data Size | SA3 | SA2 | SA1 | SA0 |
|-----------|-----|-----|-----|-----|
| 8 bits | x | x | x | x |
| 16 bits | x | x | x | 0 |
| 32 bits | x | x | 0 | 0 |
| 64 bits | x | 0 | 0 | 0 |
| 128 bits | 0 | 0 | 0 | 0 |

7.10.3.2 DTDAm — DTS Destination Address Register

Access: This register can be read/written in 32-bit units.

Address: <DTS_base> + 0004_H + 40_H × Ch. No. m (m = 0 to 127)
Register access for channels that are shown as reserved in **Table 7.6, List of DTS Trigger Sources** is prohibited.

Value after reset: Undefined

| | | | | | | | | | | | | | | | | |
|-------------------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | DA31 | DA30 | DA29 | DA28 | DA27 | DA26 | DA25 | DA24 | DA23 | DA22 | DA21 | DA20 | DA19 | DA18 | DA17 | DA16 |
| Value after reset | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 7.64 DTDAm Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 0 | DA[31:0] | Destination address Specifies the DMA transfer destination address. DA[31:0] is updated at the timing of the TI write back and retains the DMA transfer destination address for the next DMA transfer. |

CAUTIONS

1. If DMA transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the destination address is updated.
2. DMA transfer for misaligned data is not supported. The possible lowest four bits of the address for each transfer data size is as follows. (× denotes an arbitrary one bit.) The correct operation is not guaranteed if you select other setting.

| Data Size | DA3 | DA2 | DA1 | DA0 |
|-----------|-----|-----|-----|-----|
| 8 bits | × | × | × | × |
| 16 bits | × | × | × | 0 |
| 32 bits | × | × | 0 | 0 |
| 64 bits | × | 0 | 0 | 0 |
| 128 bits | 0 | 0 | 0 | 0 |

7.10.3.3 DTTCm — DTS Transfer Count Register

Access: This register can be read/written in 32-bit units.

Address: <DTS_base> + 0008_H + 40_H × Ch. No. m (m = 0 to 127)
Register access for channels that are shown as reserved in **Table 7.6, List of DTS Trigger Sources** is prohibited.

Value after reset: Undefined

| | | | | | | | | | | | | | | | | |
|-------------------|-------|-------|-------|-------|-------|-------|------|------|------|------|------|------|------|------|------|------|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | TRC15 | TRC14 | TRC13 | TRC12 | TRC11 | TRC10 | TRC9 | TRC8 | TRC7 | TRC6 | TRC5 | TRC4 | TRC3 | TRC2 | TRC1 | TRC0 |
| Value after reset | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 7.65 DTTCm Register Contents

| Bit Position | Bit Name | Function | | | | | | | | | | |
|-------------------|--|---|-----------|-----------|-------------------|-----------------------------------|-------------------|--|---|---|-------------------|--|
| 31 to 16 | ARC[15:0] | <p>Address reload count</p> <p>Specifies the number of transfers until the address reload when the reload function 2 is used, and also specifies the number of transfers when the block transfer 2 is used. When the reload function 2 or block transfer 2 is used, ARC[15:0] is decremented by one for every DMA cycle and updated at the timing of the T1 write back. When the reload function 2 or block transfer 2 is not used, ARC[15:0] is not updated.</p> <p>If 0000_H is set, address reload is disabled.</p> <p>If the value is 0000_H at the start of the DMA cycle, the address reload count is not decremented even if a DMA cycle is generated.</p> | | | | | | | | | | |
| 15 to 0 | TRC[15:0] | <p>Transfer count</p> <p>Configures the number of transfers. TRC[15:0] is decremented by one whenever a DMA cycle is executed. It is updated at the timing of the T1 write back. If the reload function is not used, after the last transfer is complete, the value at the completion (0000_H) is retained.</p> <p>If 0000_H is set, DMA transfer is not executed even when a DMA transfer request is accepted.</p> <table border="1"> <thead> <tr> <th>TRC[15:0]</th> <th>Operation</th> </tr> </thead> <tbody> <tr> <td>0000_H</td> <td>Transfer is disabled or complete.</td> </tr> <tr> <td>0001_H</td> <td>The number of transfers or remaining transfers is 1.</td> </tr> <tr> <td>:</td> <td>:</td> </tr> <tr> <td>FFFF_H</td> <td>The number of transfers or remaining transfers is 65535.</td> </tr> </tbody> </table> | TRC[15:0] | Operation | 0000 _H | Transfer is disabled or complete. | 0001 _H | The number of transfers or remaining transfers is 1. | : | : | FFFF _H | The number of transfers or remaining transfers is 65535. |
| TRC[15:0] | Operation | | | | | | | | | | | |
| 0000 _H | Transfer is disabled or complete. | | | | | | | | | | | |
| 0001 _H | The number of transfers or remaining transfers is 1. | | | | | | | | | | | |
| : | : | | | | | | | | | | | |
| FFFF _H | The number of transfers or remaining transfers is 65535. | | | | | | | | | | | |

CAUTIONS

1. If transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the transfer count and the address reload count are updated.
2. Unlike a DMAC, "0000_H" in the transfer count of the DTS does not mean "65536 transfers" but means that transfer is disabled or complete.

7.10.3.4 DTTCTm — DTS Transfer Control Register

Access: This register can be read/written in 32-bit units.

Address: <DTS_base> + 000C_H + 40_H × Ch. No. m (m = 0 to 127)
Register access for channels that are shown as reserved in **Table 7.6, List of DTS Trigger Sources** is prohibited.

Value after reset: Undefined

| R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 7.66 DTTCTm Register Contents (1/3)

| Bit Position | Bit Name | Function |
|--------------|------------|---|
| 31 to 28 | Reserved | When writing, write the value “0”. When read, the unfixed value after reset and “0” after write is read. |
| 27 | ESE | Transfer error case DMA transfer abort setting Specifies whether to abort DMA transfer when DMA transfer error is generated. If this bit is cleared to 0, DMA transfer continues when DMA transfer error is generated. If this bit is set to 1, DMA transfer is aborted when DMA transfer error is generated. 0: DMA transfer continues when DMA transfer error is generated. 1: DMA transfer is aborted when DMA transfer error is generated. |
| 26, 25 | Reserved | When writing, write the value “0”. When read, the unfixed value after reset and “0” after write is read. |
| 24 to 18 | CHNSE[6:0] | Next channel in the chain Specifies the next channel in the chain. The next channel must be another channel in the DTS. You cannot specify a channel in a DMAC. You cannot specify the same channel for the next channel. (If you do, the correct operation is not guaranteed.) |
| 17, 16 | CHNE1, 0 | Chain enable Selects the chain function. 00: Disabled 01: Chain at the last transfer A chain request is generated at the completion of the DMA cycle in which the remaining transfer count is one. 10: (Forbidden. No guarantee of operation) 11: Always chain A chain request is generated at the completion of every DMA cycle. |
| 15 | CCE | Transfer count match interrupt enable If this bit is set, a transfer count match interrupt is generated at the completion of the DMA cycle in which the transfer count compare register and the remaining transfer count have the same value. |
| 14 | TCE | Transfer completion interrupt enable If this bit is set, a transfer completion interrupt is generated at the completion of the last transfer. |
| 13 | Reserved | When writing, write the value “0”. When read, the unfixed value after reset and “0” after write is read. |

| Other than the above | | | Forbidden (No guarantee of operation) | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Table 7.66 DTTCTm Register Contents (3/3)

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 1, 0 | TRM1, 0 | Transfer mode Specifies the DMA transfer mode. 00: Single transfer 01: Block transfer 1 (The number of transfers is specified by the transfer count.) 10: Block transfer 2 (The number of transfers is specified by the address reload count.) 11: Forbidden (No guarantee of operation) |

CAUTIONS

1. If forbidden settings are used for some of the bits, the correct operation is not guaranteed.
2. The bits 31-28, 26, 25, and bit 13 are reserved. Our recommendation is as follows. When you write to those bits, write 0. When you read from those bits, discard the read value.

7.10.3.5 DTRSAm — DTS Reload Source Address Register

Access: This register can be read/written in 32-bit units.

Address: <DTS_base> + 0010_H + 40_H × Ch. No. m (m = 0 to 127)
Register access for channels that are shown as reserved in **Table 7.6, List of DTS Trigger Sources** is prohibited.

Value after reset: Undefined

| | | | | | | | | | | | | | | | | |
|-------------------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | RSA31 | RSA30 | RSA29 | RSA28 | RSA27 | RSA26 | RSA25 | RSA24 | RSA23 | RSA22 | RSA21 | RSA20 | RSA19 | RSA18 | RSA17 | RSA16 |
| Value after reset | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 7.67 DTRSAm Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|---|
| 31 to 0 | RSA[31:0] | Reload source address Specifies the source address to be reloaded when the reload function 1 or reload function 2 is used. |

CAUTION

DMA transfer for misaligned data is not supported. The possible lowest four bits of the address for each transfer data size is as follows. (× denotes an arbitrary one bit.) The correct operation is not guaranteed if you select other setting.

| Data Size | RSA3 | RSA2 | RSA1 | RSA0 |
|-----------|------|------|------|------|
| 8 bits | × | × | × | × |
| 16 bits | × | × | × | 0 |
| 32 bits | × | × | 0 | 0 |
| 64 bits | × | 0 | 0 | 0 |
| 128 bits | 0 | 0 | 0 | 0 |

7.10.3.6 DTRDAm — DTS Reload Destination Address Register

Access: This register can be read/written in 32-bit units.

Address: <DTS_base> + 0014_H + 40_H × Ch. No. m (m = 0 to 127)
Register access for channels that are shown as reserved in **Table 7.6, List of DTS Trigger Sources** is prohibited.

Value after reset: Undefined

| | | | | | | | | | | | | | | | | |
|-------------------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 7.69 DTRTCm Register Contents

| Bit Position | Bit Name | Function |
|--------------|-------------------|--|
| 31 to 16 | RARC[15:0] | Reload address reload count Specifies the value to be reloaded to the address reload count when the reload function 2 is used. |
| 15 to 0 | RTRC[15:0] | Reload transfer count Specifies the value to be reloaded to the transfer count when the reload function 1 or reload function 2 is used. |
| | RTRC[15:0] | Operation |
| | 0000 _H | No DMA transfer |
| | 0001 _H | 1 transfer |
| | : | : |
| | FFFF _H | 65535 transfers |

7.10.3.8 DTTCCm — DTS Transfer Count Compare Register

Access: This register can be read/written in 32-bit units.

Address: <DTS_base> + 001C_H + 40_H × Ch. No. m (m = 0 to 127)
Register access for channels that are shown as reserved in **Table 7.6, List of DTS Trigger Sources** is prohibited.

Value after reset: Undefined

| | | | | | | | | | | | | | | | | |
|-------------------|-------|-------|-------|-------|-------|-------|------|------|------|------|------|------|------|------|------|------|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Table 7.70 DTTCCm Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|--|
| 31 to 16 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 15 to 0 | CMC[15:0] | Transfer count compare Configures the transfer count to be compared to the transfer count register. If the transfer count match interrupt enable (DTTCTm.CCE) bit in the DTS transfer control register is 1, a transfer count match interrupt is generated at the completion of the DMA cycle in which the remaining transfer count is the same as the value in this register. If 0000 _H is set, comparison with the transfer count is disabled. In this case, a transfer count match interrupt is not generated. |

CAUTION

This register must be accessed after the DTS channel master setting register is set up.
If you access this register without setting up the DTS channel master setting register after the reset, ECC error may be generated during access to this register.

7.10.3.9 DTFSLm — DTSFSL Operation Setting Register

Access: This register can be read/written in 32-bit units.

Address: <DTS_base> + 0020_H + 40_H × Ch. No. m (m = 0 to 127)
Register access for channels that are shown as reserved in **Table 7.6, List of DTS Trigger Sources** is prohibited.

Value after reset: 0000 0000_H

Table 7.71 DTFSLm Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 1 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 0 | REQEN | <p>DMA transfer request enable</p> <p>This bit selects whether a DMA transfer request from this channel retained in the DTSFSL is used as a candidate in DTS channel arbitration.</p> <p>0: A DMA transfer request from this channel is not used as a candidate in DTS channel arbitration.</p> <p>1: A DMA transfer request from this channel is used as a candidate in DTS channel arbitration.</p> <p>If this bit is 0, even if the DTSFSL retains a DMA transfer request, this channel is not a candidate in DTS channel arbitration inside the DTSFSL, and consequently a DMA transfer request from this channel is not generated.</p> |

7.10.3.10 DTFSTm — DTSFSL Transfer Request Status Register

Access: This register can be read in 32-bit units.

Address: <DTS_base> + 0024_H + 40_H × Ch. No. m (m = 0 to 127)

Register access for channels that are shown as reserved in **Table 7.6, List of DTS Trigger Sources** is prohibited.

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|-----|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 7.72 DTFSTm Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 2 | Reserved | When read, the value after reset is read. |
| 1 | OVF | DTS overflow flag If this bit is set, the DTS channel has received at least one more DMA requests than it can store or handle. One or more DMA requests are lost. OVF can only be read, not written. Write 1 to DTFSCm.OVFC to clear OVF. |
| 0 | DRQ | DMA transfer request pending This bit shows whether a DMA transfer request of this channel is pending. This bit is set when a rising edge is detected in the hardware transfer source input from the DTSTRG pin, or when software writes "1" to the DTFSSm.DRQ bit. This bit is automatically cleared when the DMA transfer request acceptance signal (DTSACK) from the DTS is asserted while the DTSFSL is requesting DMA transfer of this channel. Alternatively, software can clear this bit by writing 1 to the DTFSCm.DRQC bit. 0: A DMA transfer request is not pending. 1: A DMA transfer request is pending. |

7.10.3.11 DTFSSm — DTSFSL Transfer Request Set Register

Access: This register can be read/written in 32-bit units.

Address: <DTS_base> + 0028_H + 40_H × Ch. No. m (m = 0 to 127)
 Register access for channels that are shown as reserved in **Table 7.6, List of DTS Trigger Sources** is prohibited.

Value after reset: 0000 0000_H

| | | | | | | | | | | | | | | | | |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

Table 7.73 DTFSSm Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 31 to 1 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 0 | DRQS | DMA transfer request set A user can set the DTFSTm.DRQ bit by writing 1 to this bit. The read value is always 0. |

7.10.3.12 DTFSCm — DTSFSL Transfer Request Clear Register

Access: This register can be read/written in 32-bit units.

Address: <DTS_base> + 002C_H + 40_H × Ch. No. m (m = 0 to 127)

Register access for channels that are shown as reserved in **Table 7.6, List of DTS Trigger Sources** is prohibited.

Value after reset: 0000 0000_H

Table 7.78 DTSTRGSEL0 Register Contents (1/2)

| Bit Position | Bit Name | Function |
|--------------|-----------|---|
| 31 to 11 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 10 | DTSSEL010 | DTSTRG[23] selector DTSSEL010 specifies the DTS trigger input for DTS channel 23 DTSSEL010 = 0: TAUD0 CH10 interrupt is selected. DTSSEL010 = 1: COM_FIFO_DMA_request_2 from RS-CANFD is selected. |
| 9 | DTSSEL009 | DTSTRG[22] selector DTSSEL009 specifies the DTS trigger input for DTS channel 22 DTSSEL009 = 0: TAUD0 CH9 interrupt is selected. DTSSEL009 = 1: COM_FIFO_DMA_request_1 from RS-CANFD is selected. |
| 8 | DTSSEL008 | DTSTRG[21] selector DTSSEL008 specifies the DTS trigger input for DTS channel 21 DTSSEL008 = 0: TAUD0 CH8 interrupt is selected. DTSSEL008 = 1: COM_FIFO_DMA_request_0 from RS-CANFD is selected. |
| 7 | DTSSEL007 | DTSTRG[20] selector DTSSEL007 specifies the DTS trigger input for DTS channel 20 DTSSEL007 = 0: TAUD0 CH7 interrupt is selected. DTSSEL007 = 1: RX_FIFO_DMA_request_7 from RS-CANFD is selected. |
| 6 | DTSSEL006 | DTSTRG[19] selector DTSSEL006 specifies the DTS trigger input for DTS channel 19 DTSSEL006 = 0: TAUD0 CH6 interrupt is selected. DTSSEL006 = 1: RX_FIFO_DMA_request_6 from RS-CANFD is selected. |
| 5 | DTSSEL005 | DTSTRG[18] selector DTSSEL005 specifies the DTS trigger input for DTS channel 18 DTSSEL005 = 0: TAUD0 CH5 interrupt is selected. DTSSEL005 = 1: RX_FIFO_DMA_request_5 from RS-CANFD is selected. |
| 4 | DTSSEL004 | DTSTRG[17] selector DTSSEL004 specifies the DTS trigger input for DTS channel 17 DTSSEL004 = 0: TAUD0 CH4 interrupt is selected. DTSSEL004 = 1: RX_FIFO_DMA_request_4 from RS-CANFD is selected. |
| 3 | DTSSEL003 | DTSTRG[16] selector DTSSEL003 specifies the DTS trigger input for DTS channel 16 DTSSEL003 = 0: TAUD0 CH3 interrupt is selected. DTSSEL003 = 1: RX_FIFO_DMA_request_3 from RS-CANFD is selected. |
| 2 | DTSSEL002 | DTSTRG[15] selector DTSSEL002 specifies the DTS trigger input for DTS channel 15 DTSSEL002 = 0: TAUD0 CH2 interrupt is selected. DTSSEL002 = 1: RX_FIFO_DMA_request_2 from RS-CANFD is selected. |

Table 7.78 DTSTRGSEL0 Register Contents (2/2)

| Bit Position | Bit Name | Function |
|--------------|-----------|---|
| 1 | DTSSEL001 | DTSTRG[14] selector DTSSEL001 specifies the DTS trigger input for DTS channel 14 DTSSEL001 = 0: TAUD0 CH1 interrupt is selected. DTSSEL001 = 1: RX_FIFO_DMA_request_1 from RS-CANFD is selected. |
| 0 | DTSSEL000 | DTSTRG[13] selector DTSSEL000 specifies the DTS trigger input for DTS channel 13 DTSSEL000 = 0: TAUD0 CH0 interrupt is selected. DTSSEL000 = 1: RX_FIFO_DMA_request_0 from RS-CANFD is selected. |

7.11.1.4 DTSTRGSEL1 — DTS Primary/Secondary Select Register 1

Access: This register can be read/written in 32-bit units.

Address: <DMATRGR_base> + 000C_H

Value after reset: 0000 0000_H

Table 7.79 DTSTRGSEL1 Register Contents (1/2)

| Bit Position | Bit Name | Function |
|--------------|-----------|---|
| 31 to 11 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 10 | DTSSEL110 | DTSTRG[44] selector DTSSEL110 specifies the DTS trigger input for DTS channel 44 DTSSEL110 = 0: TAUD1 CH15 interrupt is selected. DTSSEL110 = 1: COM_FIFO_DMA_request_2 from RS-CANFD is selected. |
| 9 | DTSSEL109 | DTSTRG[43] selector DTSSEL109 specifies the DTS trigger input for DTS channel 43 DTSSEL109 = 0: TAUD1 CH14 interrupt is selected. DTSSEL109 = 1: COM_FIFO_DMA_request_1 from RS-CANFD is selected. |
| 8 | DTSSEL108 | DTSTRG[42] selector DTSSEL108 specifies the DTS trigger input for DTS channel 42 DTSSEL108 = 0: TAUD1 CH13 interrupt is selected. DTSSEL108 = 1: COM_FIFO_DMA_request_0 from RS-CANFD is selected. |
| 7 | DTSSEL107 | DTSTRG[41] selector DTSSEL107 specifies the DTS trigger input for DTS channel 41 DTSSEL107 = 0: TAUD1 CH12 interrupt is selected. DTSSEL107 = 1: RX_FIFO_DMA_request_7 from RS-CANFD is selected. |
| 6 | DTSSEL106 | DTSTRG[40] selector DTSSEL106 specifies the DTS trigger input for DTS channel 40 DTSSEL106 = 0: TAUD1 CH11 interrupt is selected. DTSSEL106 = 1: RX_FIFO_DMA_request_6 from RS-CANFD is selected. |
| 5 | DTSSEL105 | DTSTRG[39] selector DTSSEL105 specifies the DTS trigger input for DTS channel 39 DTSSEL105 = 0: TAUD1 CH10 interrupt is selected. DTSSEL105 = 1: RX_FIFO_DMA_request_5 from RS-CANFD is selected. |
| 4 | DTSSEL104 | DTSTRG[38] selector DTSSEL104 specifies the DTS trigger input for DTS channel 38 DTSSEL104 = 0: TAUD1 CH9 interrupt is selected. DTSSEL104 = 1: RX_FIFO_DMA_request_4 from RS-CANFD is selected. |
| 3 | DTSSEL103 | DTSTRG[37] selector DTSSEL103 specifies the DTS trigger input for DTS channel 37 DTSSEL103 = 0: TAUD1 CH8 interrupt is selected. DTSSEL103 = 1: RX_FIFO_DMA_request_3 from RS-CANFD is selected. |
| 2 | DTSSEL102 | DTSTRG[36] selector DTSSEL102 specifies the DTS trigger input for DTS channel 36 DTSSEL102 = 0: TAUD1 CH7 interrupt is selected. DTSSEL102 = 1: RX_FIFO_DMA_request_2 from RS-CANFD is selected. |

Table 7.79 DTSTRGSEL1 Register Contents (2/2)

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 1 | DTSEL101 | DTSTRG[35] selector DTSEL101 specifies the DTS trigger input for DTS channel 35 DTSEL101 = 0: TAUD1 CH6 interrupt is selected. DTSEL101 = 1: RX_FIFO_DMA_request_1 from RS-CANFD is selected. |
| 0 | DTSEL100 | DTSTRG[34] selector DTSEL100 specifies the DTS trigger input for DTS channel 34 DTSEL100 = 0: TAUD1 CH5 interrupt is selected. DTSEL100 = 1: RX_FIFO_DMA_request_0 from RS-CANFD is selected. |

Section 8 Reset Controller

8.1 Features

The Reset Controller controls all factors that have an influence on the reset behavior of the device.

The device has several kinds of reset categories depending on the areas that are reset. Each of reset categories is triggered by one or multiple reset sources.

The relation between reset categories and their sources is shown in **Table 8.1**. The relation between reset categories and initialized area is shown in **Table 8.2**.

Table 8.1 Reset Categories and Reset Sources

| Reset Category | Source |
|---------------------|--|
| Power On Reset | <ul style="list-style-type: none"> Power On Reset*¹ Debug Initiated Reset |
| System Reset 1 | <ul style="list-style-type: none"> Pin Reset CVM Reset Debugger Disconnect Reset |
| System Reset 2 | <ul style="list-style-type: none"> Software Reset (by SWSRESA0) ECM Reset (if RESC0 = 0) |
| Application Reset 1 | <ul style="list-style-type: none"> Software Reset (by SWARESAS0) ECM Reset (if RESC0 = 1: initial setting) |

Note 1. Power On Reset is asserted when VCC supply voltage is under VPOC level and is released when VCC supply voltage is over VPOC level. About VPOC, please refer to **Section 9, Power Supply Circuit** and **Section 37, Electrical Specifications**.

Table 8.2 Reset Categories and Initialized Area (1/2)
(√: Reset (Initialized) —: Without Reset (Kept))

| Initialized Area (module) | | Reset category | | | |
|---------------------------|----------------------------------|----------------|----------------|----------------|---------------------|

Note 1. The execution of RAM initialization is configurable by a register setting.

Note 2. In case of Pin Reset, the execution of RAM initialization is configurable by a register setting.

Note 3. For details, please refer to **Section 32, Error Control Module (ECM)**.

Note 4. Pin Reset only.

Note 5. For details, please refer to **Section 10, Core Voltage Monitor**.

Note 6. CVM Reset only.

Note 7. Except Debug Initiated Reset.

8.2 Input/Output Pins

I/O pins related to reset are shown in **Table 8.3**.

Table 8.3 I/O Pins

| Pin function name | Direction | Description |
|-------------------|-----------|--------------|
| RESET | Input | Reset Input |
| RESETOUT | Output | Reset Output |

8.3 Register Description

The register list related to reset is shown in **Table 8.4**.

Registers can be protected from inadvertent write access due to erroneous program execution, etc. by configuration of the P-Bus Guards. For details, see **Section 31, Functional Safety**.

Table 8.4 List of Registers

| Address | Register Name | Description | Access Width | Value after Reset |
|------------------------|---------------|---|--------------|------------------------|
| FFF8 1000 _H | RESF | Reset Factor Register | 32 | 0000 0XXX _H |
| FFF8 1008 _H | RESFC | Reset Factor Clear Register | 32 | 0000 0000 _H |
| FFF8 1100 _H | SWSRESA0 | Software System Reset Request Register 0 | 32 | 0000 0000 _H |
| FFF8 1200 _H | SWARESAS0 | Software Application Reset Request Register 0 | 32 | 0000 0000 _H |
| FFF8 2800 _H | RESC | Reset Configuration Register | 32 | 0000 0001 _H |
| FFF8 1320 _H | STAC_DTSRAM | RAM Initialization Mode Control Register for DTS RAM | 32 | 0000 0003 _H |
| FFF8 1420 _H | STAC_GRAM | RAM Initialization Mode Control Register for Global RAM | 32 | 0000 0003 _H |
| FFF8 1520 _H | STAC_LM0 | RAM Initialization Mode Control Register for Local RAM | 32 | 0000 0003 _H |
| FFF8 1E20 _H | STAC_LM10 | RAM Initialization Mode Control Register for CSIH | 32 | 0000 0003 _H |

Register reset condition is shown in **Table 8.5**.

Table 8.5 Register Reset Condition

| Register Name | Reset Condition | | | |
|---------------|-----------------|----------------|----------------|---------------------|
| | Power On Reset | System Reset 1 | System Reset 2 | Application Reset 1 |
| RESF | √ | √*1 | | |
| RESFC | √ | √ | √ | √ |
| SWSRESA0 | √ | √ | √ | |
| SWARESAS0 | √ | √ | √ | |
| RESC | √ | √ | | |
| STAC_DTSRAM | √ | √ | √ | |
| STAC_GRAM | √ | √ | √ | |
| STAC_LM0 | √ | √*2 | | |
| STAC_LM10 | √ | √ | √ | |

Note 1. The register is initialized in case of CVM Reset only. Each bit of RESF is cleared as described in **Table 8.6**.

Note 2. The registers are initialized in case of CVM reset only.

8.3.1 RESF — Reset Factor Register

This register determines the reset source.

All bits are cleared by Power On Reset, Debugger Initiated Reset, CVM Reset, or software, except it is described differently in **Table 8.6**.

Access: This register can be read in 32-bit units.

Address: FFF8 1000_H

Value after reset: 0000 0XXX_H

| | | | | | | | | | | | | | | | | |
|-------------------|----|----|----|----|----|------------|------------|----|------------|----|------------|----|------------|------------|------------|------------|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Note 1. The value differs with the reset factor.

Table 8.6 Reset Factor Register Contents (1/2)

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 11 | Reserved | When read, the value after reset is read. |
| 10 | ARESF3 | Filed BIST Execution Flag This flag is set to 1 after the Power On Reset, System Reset 1, or System Reset 2 if Field BIST is enabled. In this case the corresponding reset flag is asserted as well. This flag is only cleared by software. 0: Field BIST was not executed 1: Field BIST was executed |
| 9 | ARESF2 | ECM Application Reset Flag 0: No reset occurred 1: Reset has occurred |
| 8 | Reserved | When read, the value after reset is read. |
| 7 | ARESF0 | Software Application Reset 0 Flag 0: No reset occurred 1: Reset has occurred |
| 6 | Reserved | When read, an undefined value is returned. |
| 5 | SRESF4 | ECM System Reset Flag 0: No reset occurred 1: Reset has occurred |
| 4 | Reserved | When read, the value after reset is read. |
| 3 | SRESF2 | Software System Reset 0 Flag 0: No reset occurred 1: Reset has occurred |
| 2 | SRESF1 | CVM Reset Flag This flag is only cleared by Power On Reset, Debugger Initiated Reset, or software. 0: No reset occurred 1: Reset has occurred |

Table 8.6 Reset Factor Register Contents (2/2)

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 1 | SRESF0 | Pin Reset Flag This flag is also set by Power On Reset and Debugger Initiated Reset. This flag is only cleared by software. 0: No reset occurred 1: Reset has occurred |
| 0 | PRESF0 | Power On Reset Flag This flag is also set by Debugger Initiated Reset. This flag is only cleared by CVM Reset or software. 0: No reset occurred 1: Reset has occurred |

8.3.2 RESFC — Reset Factor Clear Register

This register clears the reset flags of the RESF register.

This register is always read as 00_H.

Access: This register can be written in 32-bit units.

Address: FFF8 1008_H

Value after reset: 0000 0000_H

| | | | | | | | | | | | | | | | | |
|-------------------|----|----|----|----|----|---------|---------|----|---------|----|---------|----|---------|---------|---------|---------|

8.3.3 SWSRESA0 — Software System Reset Request Register 0

This register is used to generate a System Reset 2.

This register is always read as 00_H.

Access: This register can be written in 32-bit units.

Address: FFF8 1100_H

Value after reset: 0000 0000_H

| | | | | | | | | | | | | | | | | |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------------|

8.3.6 STAC_DTSRAM — RAM Initialization Mode Control Register for DTS RAM

This register is used to control the RAM initialization execution of the DTS RAM. In Application Reset 1, initialization of DTS RAM is executed depending on this register.

Access: This register can be read/written in 32-bit units.

Address: FFF8 1320_H

Value after reset: 0000 0003_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

8.3.7 STAC_GRAM — RAM Initialization Mode Control Register for Global RAM

This register is used to control the RAM initialization execution of the Global RAM. In Application Reset 1, initialization of Global RAM is executed depending on this register.

Access: This register can be read/written in 32-bit units.

Address: FFF8 1420_H

Value after reset: 0000 0003_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

8.3.8 STAC_LM0 — RAM Initialization Mode Control Register for Local RAM

This register is used to control the RAM initialization execution of the Local RAM. In System Reset 1 (except CVM reset), System Reset 2, and Application Reset 1, initialization of Local RAM is executed depending on this register.

Access: This register can be read/written in 32-bit units.

Address: FFF8 1520_H

Value after reset: 0000 0003_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

8.3.9 STAC_LM10 — RAM Initialization Mode Control Register for CSIH

This register is used to control the RAM Initialization execution of the CSIH. In Application Reset 1, initialization of RAM for CSIH is executed depending on this register.

Access: This register can be read/written in 32-bit units.

Address: FFF8 1E20_H

Value after reset: 0000 0003_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 1, 0 | RZEROMD[1:0] | RAM Initialization Mode for CSIH x0: Disabled 01: Prohibited 11: Enabled |

8.4 Operation

8.4.1 Reset Categories

Power On Reset

The Power On Reset represents a Start-Up of the device during power up. This reset occurs when VCC supply voltage is under a specified level and is released when VCC supply voltage is over the specified level. In this case entire microcontroller is initialized. Power On Reset can also be triggered by Debugger.

System Reset 1

System Reset 1 is identical to the Power On Reset with the following exceptions. The Reset Factor Register of the Reset Controller and the Error Source Status Register of the Error Control Module and a part of Core Voltage Monitor registers are excluded from this reset. System Reset 1 sources are as follows.

- Pin Reset
- Core Voltage Monitor Reset
- Debugger Disconnect Reset

System Reset 2

System Reset 2 is identical to the System Reset 1 with the following exceptions. Reset Configuration register for ECM is excluded from reset. System Reset 2 sources are as follows.

- Software Reset by writing the SWSRESA0 register.
- Error Control Module Reset (The Reset Category is configured by the Reset Configuration Register)

Application Reset 1

Application Reset 1 is used for fast re-initialization of the application. This reset is basically identical to the System Reset 2 with the following exceptions. The Option bytes stored in the FLASH is not reloaded. Filed BIST is not executed too. Application Reset 1 sources are as follows.

- Software Reset by writing the SWARES0 register.
- Error Control Module Reset (The Reset Category is configured by the Reset Configuration Register)

8.4.2 Reset Sources

Power On Reset

The Power On Reset refers to a Start-Up of the device during power up. The power up condition is detected by a Power-On-Clear circuit (POC). It continuously compares the power supply voltage VCC with an internal reference voltage (V_{poc}). If VCC lowers below the internal reference voltage ($VCC < V_{poc}$), Power On Reset is generated. For details, refer to **Section 37, Electrical Characteristics**.

Pin Reset (by $\overline{\text{RESET}}$)

A dedicated Reset Input pin ($\overline{\text{RESET}}$) is available for initialization.

The associated buffer has input hysteresis. Therefore, there is no restriction for the slew rate of the reset signal as defined in the Electrical Characteristics.

The Pin Reset is active low. Its status will propagate independently from clock activity.

In case of an open reset input, the device will be initialized via the internal pull-down of the Reset Input Buffer. This ensures that the device is always in a safe state.

A Reset glitch filter is provided. For details about the filter characteristics, please refer to **Section 37, Electrical Specifications**.

In case of Power-up and Power-down, $\overline{\text{RESET}}$ should be low level. In case of Power-up, $\overline{\text{RESET}}$ must be asserted until VDD exceeds the threshold and main oscillator is stabilized. Until VCC and VDD exceed the threshold, Internal reset is maintained. After Internal reset and $\overline{\text{RESET}}$ are released, Filed BIST and RAM initialization are executed. For details on the required $\overline{\text{RESET}}$ low level period ($t_{DVDDPUR}$, $t_{DVCCPUR}$) and the threshold of VCC and VDD please refer to **Section 37, Electrical Specifications**.

In case of Pin Reset excluding power-up/down, the low level pulse width of the $\overline{\text{RESET}}$ input must be greater than the value of noise-filter characteristic (t_{WRSL}) to activate the reset. For details on the required $\overline{\text{RESET}}$ low level pulse width, please refer to **Section 37, Electrical Specifications**.

Core Voltage Monitor Reset

The Core Voltage Monitor reset can be asserted as soon as one of the core supply voltages is outside the operating range. The execution of the CVM reset can be masked as well. For details, refer to **Section 10, Core Voltage Monitor**.

The CVM operation is independent from the Pin Reset.

ECM Reset

No device failure (e.g. illegal access) will result in a reset. All failures which are detectable by the Error Control Module (ECM) generate dedicated internal reset or interrupts (FENMI or EINT) instead. The failure signals and system behavior can be configured in the ECM (see **Section 32, Error Control Module (ECM)**). Optionally the device failures can be configured to be used as a Reset Source.

The ECM Reset can generate a System Reset 2 or an Application Reset 1. The behavior can be configured by the Reset Configuration Register.

Software Reset

The device supports multiple software resets, and resets from different reset categories can be triggered.

- Software System Reset Request Register 0 (SWSRESA0) triggers a System Reset 2
- Software Application Reset Request Register 0 (SWARESAS0) triggers an Application Reset 1

Debug Initiated Reset

Transits to the internal reset state when the microcontroller is connected with the debug tool and receives the reset command from the debugger. It can trigger a Power On Reset. For details, refer to the **Section 34, On-Chip Debugging Unit (OCD)**.

Debugger Disconnect Reset

System reset 1 is generated when the input level of debug reset pin ($\overline{\text{DCUTRST}}$ pin) is changed from high to low. (e.g. disconnecting of debug tool).

8.4.3 Reset Flags

Any reset source can be identified by software in the Reset Factor Register (RESF). Each reset source will be indicated by one bit when it occurs. The bit status can be read out after the reset has been executed.

The Power On Reset flag is set by Power On Reset or Debugger Initiated Reset, and can only be cleared by a CVM Reset or by software.

The reset factor which sets or clears all reset flags except the Power On Reset flag is different for each flag. For details, see **8.3.1, RESF — Reset Factor Register**.

8.4.4 Reading Option Bytes from FLASH

Reading Option Bytes from FLASH memory is executed by Power On Reset, System Reset 1 and System Reset 2.

8.4.5 Filed BIST

Filed BIST is executed by Power On Reset, System Reset 1 and System Reset 2. In System Reset 1 (Pin reset only) and System Reset 2, Filed BIST execution can be disabled by the Field BIST Control Register (BSEQ0CTL). For details of BSEQ0CTL register, see **Section 31.6, BIST**.

8.4.6 RAM initialization

RAM initialization to 0 is basically executed by all reset categories. For System Reset 1 (Pin reset only), System Reset2 and Application Reset 1, Initialization of Local RAM can be disabled by the RAM Initialization Mode Control Register.

For Application Reset 1, Initialization of DTS RAM, Global RAM, and CSIH RAM can be disabled by the RAM Initialization Mode Control Registers corresponding to the RAMs.

8.4.7 Reset Mask function

In debug mode, System Resets 1 and 2 and Application Reset 1 can be masked by debugger setting. For details, please refer to **Section 34, On-Chip Debugging Unit (OCD)**.

Masked reset sources are shown in **Table 8.15**.

Table 8.15 Masked Reset Sources

| Reset Categories | Reset Sources |
|---------------------|-----------------------------|
| System Reset 1 | Pin Reset |
| System Reset 2 | ECM Reset (RESC0 = 0) |
| | Software Reset by SWSRESA0 |
| Application Reset 1 | ECM Reset (RESC0 = 1) |
| | Software Reset by SWARESAS0 |

8.4.8 Reset Output ($\overline{\text{RESETOUT}}$)

Any of the reset resources is generated, a reset output ($\overline{\text{RESETOUT}}$) is externally output. A reset output can be used to reset the external device at the same timing of reset generation in the microcontroller.

The figure below shows $\overline{\text{RESETOUT}}$ output operation.

Figure 8.1 P0_10 Pin ($\overline{\text{RESETOUT}}$ Signal) Operation during Reset and after Release

Section 9 Power Supply Circuit

9.1 Features

This section describes the external voltage connection and internal voltage distribution required to operate the microcontroller. The power supply circuit has a POC (Power On Clear) circuit for safe startup.

The power supply construction of this device is classified into 2 categories.

Table 9.1 List of Power Type

| Item | Type Name | P1M-E |
|---|----------------------------------|-------|
| Single power supply (with internal regulators) | embedded Voltage Regulator (eVR) | √ |
| Dual Power Supply (DPS) | DPS | √ |

9.2 External Pin List

Table 9.2 shows the list of external pins

Table 9.2 List of External Pins

| Pin Name | I/O | Range | Function | eVR | DPS |
|----------|--------|----------------|--|-----|-----|
| E0VCC | Power | 3.0 to 5.5V | I/O power supply | √ | √ |
| E1VCC | | | | | |
| E0VSS | Ground | 0V | | √ | √ |
| E1VSS | | | | | |
| VCC | Power | 3.0 to 5.5V | POC, CVM, PLL, Oscillator, Flash, Internal voltage regulator power | √ | √ |
| VCL | Output | — | Capacitor connection pin for internal voltage regulator | √ | — |
| VDD | Power | 1.20V to 1.35V | Power supply for internal | — | √ |
| VSS | Ground | 0V | | √ | √ |
| A0VCC | Power | 3.0V to 5.5V | Power supply for A/D | √ | √ |
| A1VCC | | | | | |
| A0VSS | Ground | 0V | | √ | √ |
| A1VSS | | | | | |
| A0VREFH | Input | 3.0V to 5.5V | Reference voltage for A/D | √ | √ |
| A1VREFH | | | | | |

See **Section 37, Electrical Specifications.**

Section 10 Core Voltage Monitor

10.1 Overview

10.1.1 Functional Overview

Core voltage monitor (CVM) monitors the VDD electric potential supplied to the core logic.

Deviation from operating range of the core voltage is informed by:

- Outputs a low level from the $\overline{\text{CVMOUT}}$ pin.
- Sets flags independently in the CVMF register at events (high voltage detection and low voltage detection).
- Able to reset of core voltage operation area by CVM Reset.

The CVM function is independent of the resets except Power On Reset.

All writable CVM control registers are protected by P-Bus guard.

Diagnostic function:

- High voltage error and low voltage error can be generated without influencing core voltage itself by changing reference voltage.
- The signal path to the $\overline{\text{CVMOUT}}$ pin can optionally be masked at diagnostic.
- $\overline{\text{CVMOUT}}$ pin provides read back function to check pin level.

10.1.2 Block Diagram

The block diagram of CVM for DPS is shown in **Figure 10.1**.

The block diagram of CVM for eVR is shown in **Figure 10.2**.

Figure 10.1 Block diagram of CVM for DPS

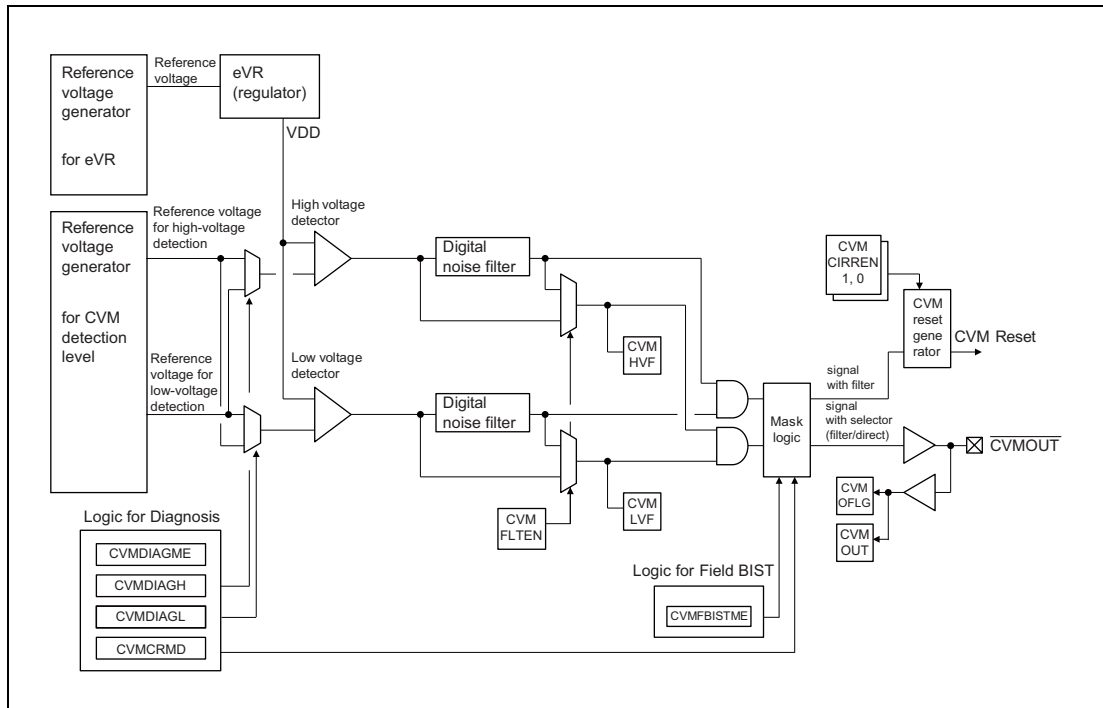

Figure 10.2 Block diagram of CVM for eVR

10.2 Input/Output Pins

I/O pin related to CVM is shown in **Table 10.1**.

Table 10.1 I/O Pins

| Pin Function Name | Direction | Description |
|-------------------|-----------|--|
| CVMOUT | Output | CVM internal voltage error detection output signal |

10.3 Registers

10.3.1 List of Registers

A register list related to CVM is shown in **Table 10.2**.

Table 10.2 List of Registers

| Address | Register Name | Description | Access Width | Value after Reset |
|------------------------|---------------|---|--------------|-------------------------------|
| FFF8 2C00 _H | CVMF | CVM Factor register | 8 | 00 _H |
| FFF8 2C04 _H | CVMDDE | CVM Detection Enable register | 8 | 03 _H |
| FFF8 2C0C _H | CVMDMASK | CVM Detection Output Mask Register | 8 | 00 _H |
| FFF8 2C10 _H | CVMDIAG | CVM DIAG mode setting register | 8 | 00 _H |
| FFF8 2C14 _H | CVMMON | CVM Monitor register | 8 | 0x _H ^{*2} |
| FFF8 2C18 _H | CVMFC | CVM Factor Clear Register | 8 | 00 _H |
| FFF8 2C1C _H | CVMDEW | CVM Detection Enable Set Register ^{*1} | 8 | 00 _H |

Note 1. Writing is permitted only once after Power On Reset.

Note 2. This initial value depends on the status of $\overline{\text{CVMOUT}}$ pin.

Register reset conditions are shown in **Table 10.3**.

Table 10.3 Register Reset Conditions

| Register Name | Reset condition | | | |
|---------------|-----------------|-----------------|----------------|---------------------|
| | Power On Reset | System Reset 1 | System Reset 2 | Application Reset 1 |
| CVMF | √ | | | |
| CVMDDE | √ | | | |
| CVMDMASK | √ | √ ^{*1} | | |
| CVMDIAG | √ | √ | | |
| CVMMON | | | | |
| CVMFC | | | | |
| CVMDEW | | | | |

Note 1. Pin Reset only.

10.3.2 CVMF — CVM Factor Register

The CVMF register indicates the state of $\overline{\text{CVMOUT}}$ pin output and the state of the detection of errors by the CVM.

This register is initialized only by Power On Reset.

Each flag of CVMF can be also cleared individually by writing “1” to the corresponding bit in CVMFC.

Access: This register can be read in 8-bit units.

Address: FFF8 2C00_H

Value after reset: 00_H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|---------|---|---|---|---|---|--------|--------|
| | CVMOFLG | — | — | — | — | — | CVMHVF | CVMLVF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 10.4 CVMF Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 7 | CVMOFLG | <u>CVMOUT Flag</u> When $\overline{\text{CVMOUT}}$ pin has changed to low level, this flag is set to 1. 0: $\overline{\text{CVMOUT}}$ pin has not changed to low level. 1: $\overline{\text{CVMOUT}}$ pin has changed to low level. |
| 6 to 2 | Reserved | When read, the value after reset is read. |
| 1 | CVMHVF | High Voltage Detection Flag 0: No high core voltage violation detected. 1: High core voltage violation occurred. |
| 0 | CVMLVF | Low Voltage Detection Flag 0: No low core voltage violation detected. 1: Low core voltage violation occurred. |

10.3.3 CVMFC — CVM Factor Clear Register

CVMFC is a register to clear the corresponding bits in CVMF register.

The read value of this register is always 00_H.

Access: This register can be written in 8-bit units.

Address: FFF8 2C18_H

Value after reset: 00_H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|----------|---|---|---|---|---|---------|---------|
| | CVMOFLGC | — | — | — | — | — | CVMHVFC | CVMLVFC |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | R | R | R | R | R | W | W |

Table 10.5 CVMFC Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 7 | CVMOFLGC | Clears $\overline{\text{CVMOU}}\overline{\text{T}}$ Flag 0: Writing 0 has no effect. 1: Writing 1 clears CVMOFLG. |
| 6 to 2 | Reserved | When writing, write the value after reset. |
| 1 | CVMHVFC | Clears High Voltage Detection Flag 0: Writing 0 has no effect. 1: Writing 1 clears CVMHVF. |
| 0 | CVMLVFC | Clears Low Voltage Detection Flag 0: Writing 0 has no effect. 1: Writing 1 clears CVMLVF. |

10.3.4 CVMDE — CVM Detection Enable Register

CVMDE is a read-only register to control CVM reset, masking of the CVM signal, and filtering of the CVM signal.

This register is initialized by Power On Reset and reflect the settings written to the corresponding bits of CVMDEW.

Access: This register can be read in 8-bit units.

Address: FFF8 2C04_H

Value after reset: 03_H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|------------|---|------------|------------|----------|-----------|---|---|
| | CVMCIRREN1 | — | CVMCIRREN0 | CVMFBISTME | CVMFLTEN | CVMDIAGME | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R |

Table 10.6 CVMDE Register Contents

| Bit Position | Bit Name | Function |
|--|------------|---|
| 7 | CVMCIRREN1 | Enables CVM Reset. CVMCIRREN1, 0 1 _B : CVM internal reset is enabled. Other than the above: CVM internal reset is disabled. |
| 6 | Reserved | When read, the value after reset is read. |
| 5 | CVMCIRREN0 | Refer to bit 7 (CVMCIRREN1). |
| 4 | CVMFBISTME | $\overline{\text{CVMOUT}}$ output and CVM Reset Mask Control during Field BIST Operation 0: Masking of $\overline{\text{CVMOUT}}$ output and CVM reset during Field BIST Operation is enabled. 1: Masking of $\overline{\text{CVMOUT}}$ output and CVM reset during Field BIST Operation is disabled. |
| CAUTION | | |
| This bit setting is valid only for the Field BIST that started up from System Reset 1. $\overline{\text{CVMOUT}}$ output and CVM Reset are not masked if the Field BIST is started by System Reset 2, regardless of the setting of this bit. | | |
| 3 | CVMFLTEN | Enables Output Filter for $\overline{\text{CVMOUT}}$ 0: Output filter for $\overline{\text{CVMOUT}}$ is enabled. 1: Output filter for $\overline{\text{CVMOUT}}$ is disabled. |
| 2 | CVMDIAGME | Enables DIAG Function 0: DIAG function of the CVM is enabled. 1: DIAG function of the CVM is disabled. |
| 1, 0 | Reserved | When read, the value after reset is read. |

10.3.5 CVMDEW — CVM Detection Enable Set Register

CVMDEW is a register to set values of CVMDE.

Writing is permitted only once after Power On Reset is released. Subsequent write operation is ignored. The read value of this register is always 00_H.

Access: This register can be written in 8-bit units.

Address: FFF8 2C1C_H

Value after reset: 00_H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|--------------|---|--------------|--------------|-----------|------------|---|---|
| | CVM CIRREN1W | — | CVM CIRREN0W | CVM FBISTMEW | CVMFLTENW | CVMDIAGMEW | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | R | W | W | W | W | R | R |

Table 10.7 CVMDEW Register Contents

| Bit Position | Bit Name | Function |
|--------------|-------------|---|
| 7 | CVMCIRREN1W | The value written in this bit is set to CVMDE.CVMCIRREN1. |
| 6 | Reserved | When writing, write the value after reset. |
| 5 | CVMCIRREN0W | The value written in this bit is set to CVMDE.CVMCIRREN0. |
| 4 | CVMFBISTMEW | The value written in this bit is set to CVMDE.CVMFBISTME. |
| 3 | CVMFLTENW | The value written in this bit is set to CVMDE.CVMFLTEN. |
| 2 | CVMDIAGMEW | The value written in this bit is set to CVMDE.CVMDIAGME. |
| 1, 0 | Reserved | When writing, write the value after reset. |

10.3.6 CVMDMASK — CVM Detection Output Mask Register

CVMDMASK is a register to mask $\overline{\text{CVMOUT}}$ output when CVMDE.CVMDIAGME = 0.

The setting of CVMDMASK is ignored when CVMDE.CVMDIAGME = 1. Writing is possible regardless of the CVMDIAGME setting.

This register is initialized by Power On Reset or System Reset 1 (Pin Reset only).

Access: This register can be read/written in 8-bit units.

Address: FFF8 2C0C_H

Value after reset: 00_H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|---|---|---|---|---|---|---|---------|
| | — | — | — | — | — | — | — | CVMCRMD |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

Table 10.8 CVMDMASK Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 7 to 1 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 0 | CVMCRMD | This bit masks $\overline{\text{CVMOUT}}$ when CVMDE.CVMDIAGME = 0. 0: $\overline{\text{CVMOUT}}$ output are not masked. 1: $\overline{\text{CVMOUT}}$ output are masked. $\overline{\text{CVMOUT}}$ becomes high level and the CVM Reset don't occur. |

NOTE

The value of CVMDE.CVMCIRREN1, 0 is "00_B" while the CVM diagnosis application is carried out after Power On Reset. Therefore CVM reset has been already masked by CVMCIRREN1, 0 even if CVMCRMD isn't set to "1".

10.3.7 CVMDIAG — CVM DIAG Mode Setting Register

CVMDIAG forces CVM comparators to output errors.

This register is valid only when CVMDE.CVMDIAGME = 0. The setting of CVMDIAG is ignored when CVMDE.CVMDIAGME = 1. Writing is possible regardless of the CVMDIAGME setting.

This register is initialized by Power On Reset and System Reset 1.

Access: This register can be read/written in 8-bit units.

Address: FFF8 2C10_H

Value after reset: 00_H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|---|---|---|---|----------|----------|---|---|
| | — | — | — | — | CVMDIAGH | CVMDIAGL | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R | R |

Table 10.9 CVMDIAG Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 7 to 4 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 3 | CVMDIAGH | This bit controls the detection level of high voltage detector. 0: CVM monitors at a reference for high-voltage detection. 1: High voltage violation is forcibly generated by changing the detection level to reference voltage for low-voltage detection. |
| 2 | CVMDIAGL | This bit controls the detection level of low voltage detector. 0: CVM monitors at a reference for low-voltage detection. 1: Low voltage violation is forcibly generated by changing the detection level to reference voltage for high-voltage detection. |
| 1, 0 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |

10.3.8 CVMMON — CVM Monitor Register

CVMMON register reflects the status of $\overline{\text{CVMOUT}}$ pin.

Access: This register can be read in 8-bit units.

Address: FFF8 2C14_H

Value after reset: 0X_H

| | | | | | | | | |
|-------------------|---|---|---|---|---|---|---|--------|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | CVMOUT |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | — |
| R/W | R | R | R | R | R | R | R | R |

Table 10.10 CVMMON Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 7 to 1 | Reserved | When read, the value after reset is read. |
| 0 | CVMOUT | $\overline{\text{CVMOUT}}$ Pin Level 0: $\overline{\text{CVMOUT}}$ Output level is at low level. 1: $\overline{\text{CVMOUT}}$ Output level is at High level. |

10.4 Operation

10.4.1 CVM Basic Function

CVM constantly monitors the VDD voltage except when VCC is not stable and Power On Reset occurs.

CVM has high and low voltage detection circuit. If it detects voltage error, it records the error to CVMF register and notifies the error to the outside via $\overline{\text{CVMOUT}}$ pin. It also generates internal reset (CVM reset) triggered by detection of voltage error.

(1) CVM detection flag

CVM sets “1” to CVMF.CVMHVF when VDD becomes higher than high voltage detection level of CVM. Similarly, CVM sets “1” to CVMF.CVMLVF when VDD becomes lower than low voltage detection level of CVM.

These flags can be cleared to “0” by writing in the corresponding bits of CVMFC (CVMHVFC for CVMHVF, CVMLVFC for CVMLVF). These flags are also cleared by Power On Reset (not cleared by other resets).

Figure 10.3 shows the operation example of CVMHVF and CVMLVF.

(2) $\overline{\text{CVMOUT}}$ pin

While VDD voltage is higher than high voltage detection level or lower than low voltage detection level of CVM, $\overline{\text{CVMOUT}}$ pin outputs a low level signal. If CVM does not detect a voltage error, the $\overline{\text{CVMOUT}}$ pin outputs a high level signal.

To avoid an unexpected operation of CVM circuit caused by instable power supply at power up, $\overline{\text{CVMOUT}}$ is fixed to low during Power On Reset period. $\overline{\text{CVMOUT}}$ outputs error detection result at all other times.

The status of $\overline{\text{CVMOUT}}$ can be read from CVMF.CVMOFLG or CVMMON.CVMOUT. CVMOFLG is set to “1” when $\overline{\text{CVMOUT}}$ pin becomes low. It is cleared to “0” when “1” is written to CVMFC.CVMOFLGC. It is also cleared by Power On Reset (not cleared by other resets).

Figure 10.3 shows the operation example of $\overline{\text{CVMOUT}}$ and CVMOFLG.

CVMMON.CVMOUT is used for self-diagnosis function. See **Section 10.4.3, CVM Diagnosis Function** for further information.

Figure 10.3 CVM Basic Operation

(3) CVM reset

If VDD voltage becomes higher than high voltage detection level or lower than low voltage detection level of CVM when CVM Reset is enable (CVMDE.CVMCIRREN1, 0 = "11_B") in advance, CVM reset occurs and the MCU is initialized. CVM reset is released since CVM detects the normal voltage.

Figure 10.4 shows the operation example of CVM reset.

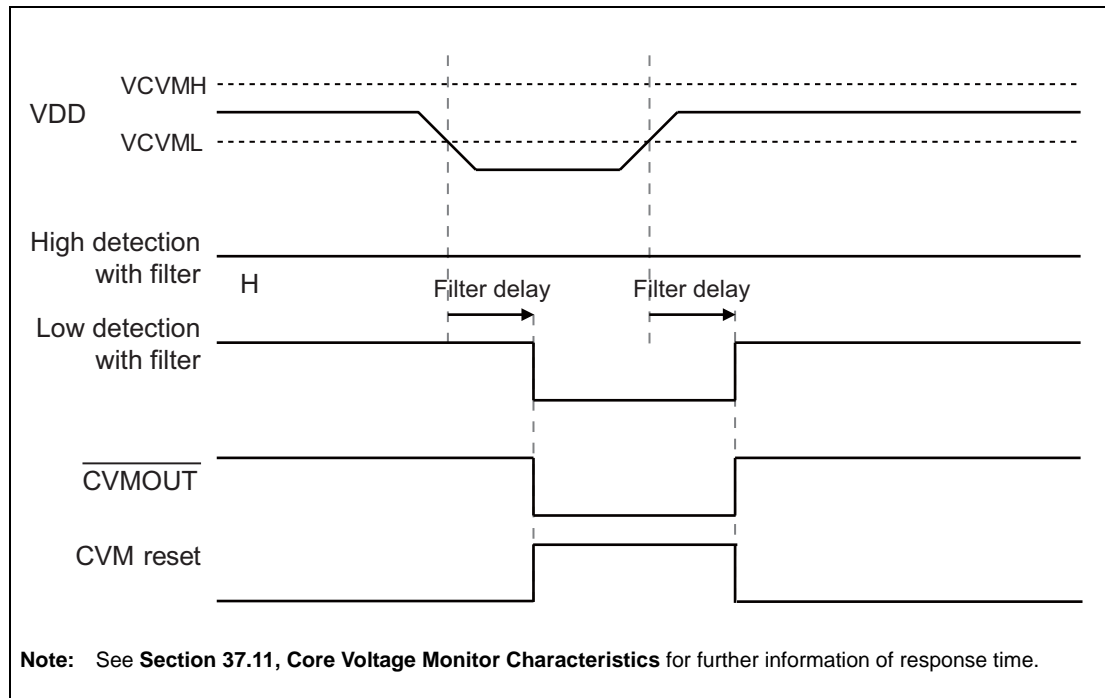

Figure 10.4 CVM Reset Operation

(4) Digital noise filter

The output signals from the CVM comparators pass through a digital noise filter to remove temporary glitches. Whether to use filtered output or to bypass the filter can be selected by CVMDE.CVMFLTEN. This setting is applied to $\overline{\text{CVMOUT}}$, CVMHVF and CVMLVF. For CVM reset, filtered signals are always used.

10.4.2 CVM Function in Field BIST operation and Serial Programming Mode (Mask of CVMOUT Pin and CVM Reset)

It is possible to mask $\overline{\text{CVMOUT}}$ output and CVM reset while Field BIST is being carried out after Power On Reset and System Reset 1 if $\text{CVMDE.CVMFBISTME} = 0$. In this case, $\overline{\text{CVMOUT}}$ is fixed to high level and a CVM reset does not occur. $\overline{\text{CVMOUT}}$ output is fixed to high level in serial programming mode as well.

10.4.3 CVM Diagnosis Function

(1) Change of CVM detection level for forcibly generating CVM error

When CVMDE.CVMDIAGME is "0", CVM detection level can be changed by CVMDIAG.CVMDIAGH or CVMDIAG.CVMDIAGL . CVM error detection signal can be intentionally generated by setting these registers even when VDD voltage is in the operating range.

(2) Mask of $\overline{\text{CVMOUT}}$ pin and CVM Reset

$\overline{\text{CVMOUT}}$ output can be masked by setting CVMDMASK.CVMCRMD to "1" if CVMDE.CVMDIAGME is "0". With this setting, $\overline{\text{CVMOUT}}$ is fixed to high level even when a CVM error is generated by CVMDIAGH or CVMDIAGL .

The value of CVMDE.CVMCIRREN1 , 0 is "00_B" while the CVM diagnosis application is carried out after Power On Reset. Therefore, CVM reset is already masked by CVMCIRREN1 , 0 even if CVMCRMD isn't set to "1".

(3) Monitor of $\overline{\text{CVMOUT}}$ pin

The status of $\overline{\text{CVMOUT}}$ pin can be monitored by CVMMON.CVMOUT . By reading this register, it can be checked whether $\overline{\text{CVMOUT}}$ is at low level when a CVM error is generated by CVMDIAGH or CVMDIAGL .

If VDD voltage is out of the operating range, the value read from the CVMMON register can't be guaranteed.

(4) The flow of CVM diagnosis application

CVMDE.CVMDIAGME is initialized to "0" by Power On Reset. Thus, the CVM diagnosis function is enabled at start-up after Power On Reset. The diagnostic function can be controlled by the user application by using CVMDMASK and CVMDIAG .

Figure 10.5 shows an example of the diagnosis application.

After diagnosis application is over, write "1" to $\text{CVMDEW.CVMDIAGMEW}^*1$ and disable CVM diagnosis function immediately. This function protects each flag against erroneous operation when VDD is out of the operating range.

Note 1. Write to the other bits of CVMDEW as well at the same time because writing to CVMDEW is permitted only once after Power On Reset.

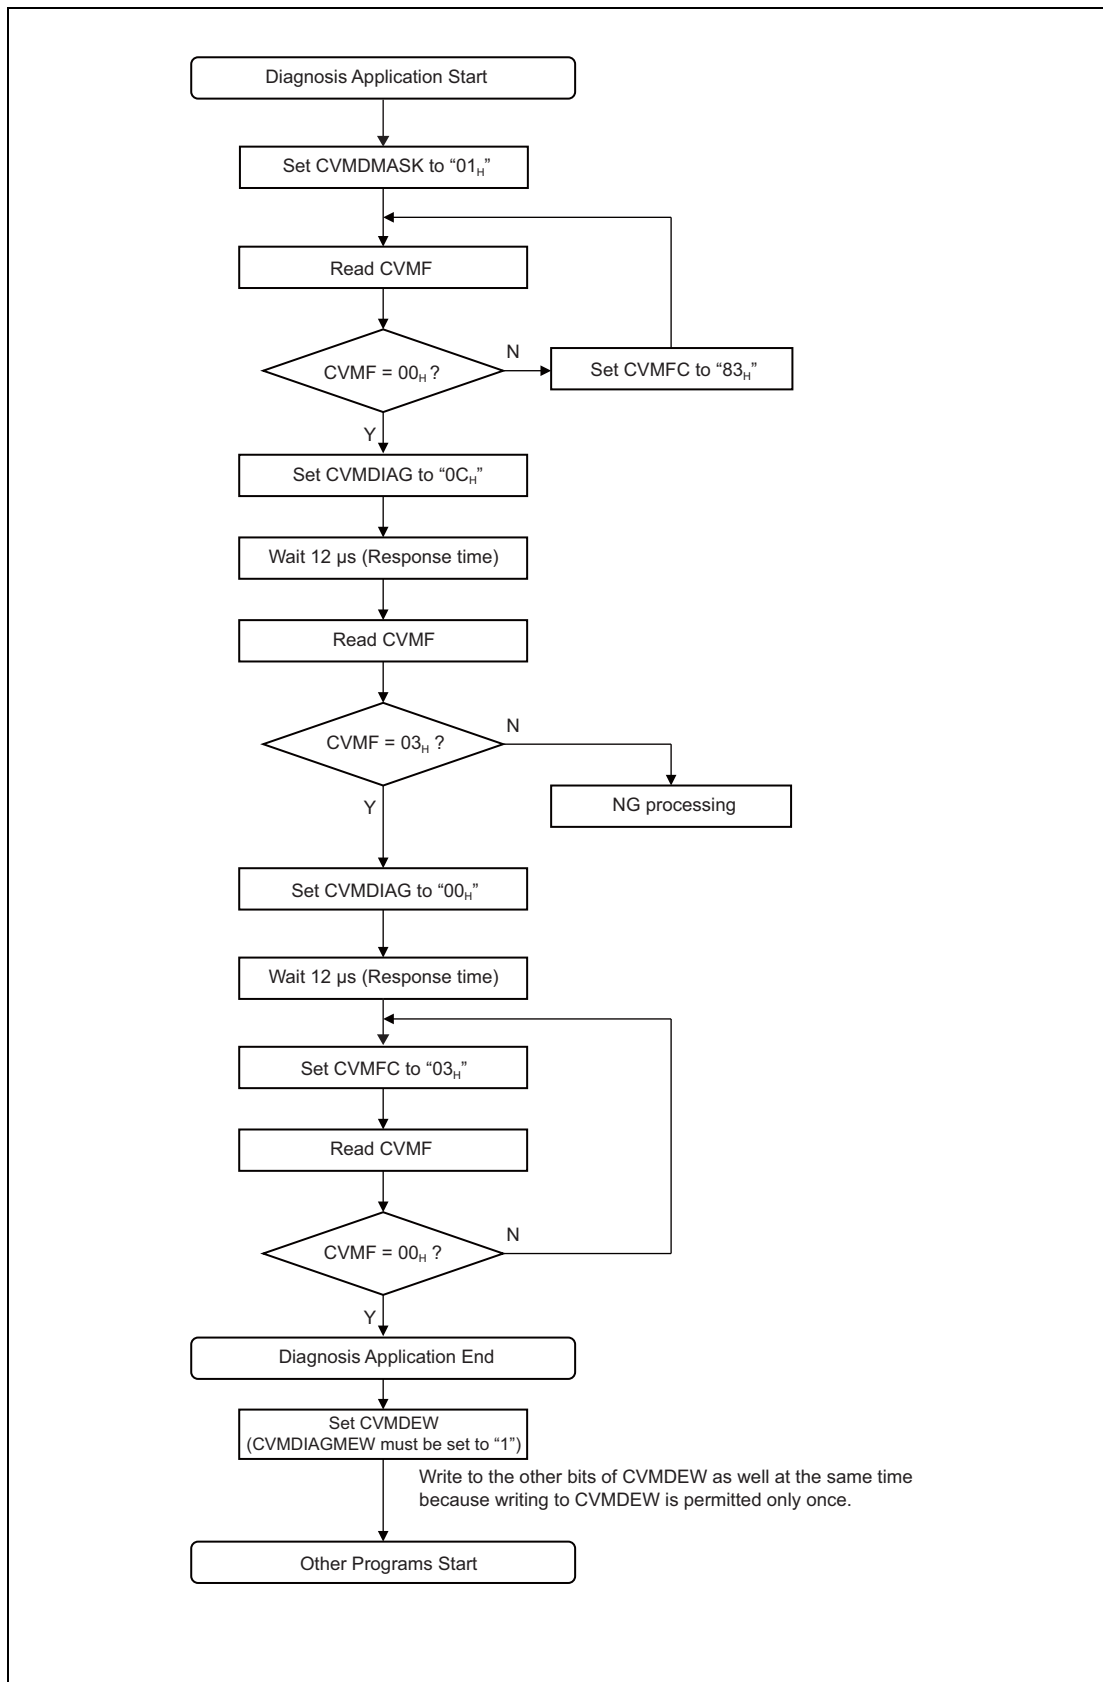

Figure 10.5 Example of Flowchart for CVM Diagnosis Application

10.5 Usage Notes

(1) Flag bits (CVMHVF, CVMLVF, CVMOFLG)

Setting 1 to CVMHVF by error detection has priority over clearing CVMHVF by CVMHVFC. Similarly, setting 1 to CVMLVF by error detection has priority over clearing CVMLVF by CVMLVFC. Furthermore, setting 1 to CVMOFLG by $\overline{\text{CVMOUT}}$ pin status has priority over clearing CVMOFLG by CVMOFLGC.

These functions protect each flag against erroneous operation when VDD is out of the operating range. When VDD is recovered to the operating range, the MCU needs to be initialized by Pin Reset or CVM Reset. Otherwise, the operation of the MCU may continue to be unstable and the flags may be unintentionally cleared.

(2) $\overline{\text{ERROROUT}}$ pin

Enable CVM Reset if you want to notify CVM error detection signal to outside of the MCU via the $\overline{\text{ERROROUT}}$ pin.

When CVM Reset occurs, $\overline{\text{ERROROUT}}$ pin becomes Hi-Z (high impedance) regardless of whether VDD is in the operating range or not.

Section 11 Temperature Sensor

The Temperature Sensor (TSN0) measures temperature by using one analog channel. TSN0 has one unit implemented.

11.1 Features of RH850/P1M-E Temperature Sensor

11.1.1 Number of Units

This product is provided with a temperature sensor with the following number of units.

Table 11.1 Number of Units

| Temperature Sensor | |
|--------------------|------|
| Number of units | 1 |
| Name | TSN0 |

11.1.2 Register Base Address

TSN0 register base addresses are listed in the following table.

The register addresses of the TSN0 are given as offsets from the base addresses.

Table 11.2 Register Base Address

| Base address Name | Base Address |
|-------------------|------------------------|
| TSN0_base | FFF9 3000 _H |

11.1.3 Clock Supply

Clock supply by and to the temperature sensor is listed in the following table.

Table 11.3 Clock Supply

| Unit Name | Unit Clock Name | Supply Clock Name |
|-----------|-----------------|------------------------------------|
| TSN0 | PCLK | Low-speed peripheral clock CLK_LSB |

11.1.4 Interrupt Request

TSN0 has no interrupt request.

11.1.5 Reset Sources

Please refer to **Section 8, Reset Controller**.

11.1.6 External Input/Output Signals

TSN0 has no external pin.

11.2 Overview

11.2.1 Functional Overview

TSN0 has the following functions and features.

- Temperature measurement
TSN0 measures temperature by using analog channel 12 (AN112) of A/D converter unit 1 (ADCG1).
Temperature measurement time (CLK_ADC = 40 MHz): 4 μ s (A/D conversion time of 1 μ s \times 4 times)
Temperature measurement time (CLK_ADC = 20 MHz): 45.2 μ s (A/D conversion time of 11.3 μ s \times 4 times)
Stabilization time: 200 μ s
- Temperature Error notification
A temperature error signal is sent to the ECM module when the temperature reaches an upper or lower limit.
- Temperature measurement modes
One-shot: A/D conversion is executed four times consecutively.
Continuous: Four consecutive virtual channels are configured for the temperature sensor and the corresponding scan group 4 is placed in multi-cycle scan mode.
- Self-diagnosis
Self-diagnosis through the insertion of high-temperature errors is supported.

11.2.2 Block Diagram

Figure 11.1 shows the block diagram of temperature sensor.

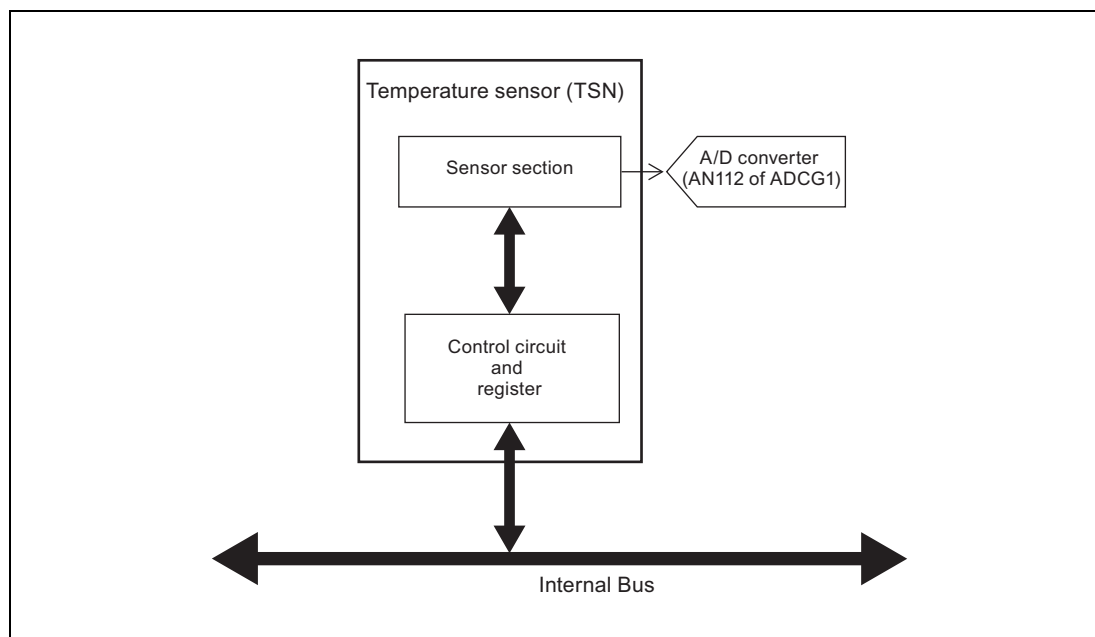

Figure 11.1 Block Diagram of Temperature Sensor

11.3 Register

11.3.1 Register List

The following table lists the registers.

For details about <TSN0_base>, see **Section 11.1.2, Register Base Address**.

Table 11.4 List of Registers

| Register Name | Symbol Name | R/W | Value after reset | Address |
|---|-------------|-----|------------------------|--------------------------------|
| Temperature sensor control register | TSN0CR | R/W | 0000 0000 _H | <TSNn_base> + 000 _H |
| Temperature sensor status register | TSN0STAT | R | 0000 0000 _H | <TSNn_base> + 004 _H |
| Temperature sensor diagnosis control register | TSN0DIAG | R/W | 0000 0000 _H | <TSNn_base> + 008 _H |
| Temperature sensor reference temperature storage register | TSNREFD | R | Undefined*1 | FFCD 019C _H |

Note 1. Fixed value is set at the time of shipping.

11.3.2 TSN0CR — Temperature Sensor Control Register

This register controls the temperature sensor. This register can be set up when the A/D converter is stopped.

Access: This register can be read/written in 32-bit units.

Address: <TSNn_base> + 000_H

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | TSNEN |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

Table 11.5 TSN0CR Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 1 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 0 | TSNEN | This bit controls the temperature sensor 0: The temperature sensor is disabled. 1: The temperature sensor is enabled. |

11.3.3 TSN0STAT — Temperature Sensor Status Register

This register indicates the status of the temperature sensor.

Access: This register can be read only in 32-bit units.

Address: <TSNn_base> + 004_H

Value after reset: 0000 0000_H

| | | | | | | | | | | | | | | | | |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 11.6 TSN0STAT Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 31 to 1 | Reserved | When read, the value after reset is read. |
| 0 | TSNST | This bit indicates the status of the temperature sensor 0: The temperature sensor is disabled. (Temperature sensor stabilization time 200 μs has not elapsed.) 1: The temperature sensor is enabled. (Temperature sensor stabilization time 200 μs has elapsed.) |

11.3.4 TSN0DIAG — Temperature Sensor Diagnosis Control Register

This register controls self-diagnosis of the temperature sensor. It can be configured when the A/D converter is stopped.

Access: This register can be read or written in 32-bit units.

Address: <TSNn_base> + 008_H

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 11.7 TSN0DIAG Register Contents

| Bit Position | Bit Name | Function |
|--------------|-------------|--|
| 31 to 1 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 0 | TSNSELFDIAG | This bit controls self-diagnosis of the temperature sensor. 0: The temperature sensor self-diagnosis is disabled. 1: The temperature sensor self-diagnosis is enabled. |

11.3.5 TSNREFD — Temperature Sensor Reference Temperature Storage Register

In this register, the measured value at the time of shipping is stored.

The reference temperature (at A1VREFH = 5.0 V, T_j = 150°C) is stored in TSNREFDH and the reference temperature (at A1VREFH = 5.0 V, T_j = 25°C) is stored in TSNREFDL.

Access: This register can be read only in 32-bit units.

Address: FFCD 019C_H

Value after reset: Undefined: (Fixed value is set at the time of shipping.)

| | | | | | | | | | | | | | | | | |
|-------------------|----|----|----|----|----------------|----|----|----|----|----|----|----|----|----|----|----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 11.8 TSNREFD Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------------|---|
| 31 to 28 | Reserved | When read, the value after reset is read. |
| 27 to 16 | TSNREFDH[11:0] | The value of the reference temperature measured at T _j = 150°C |
| 15 to 12 | Reserved | When read, the value after reset is read. |
| 11 to 0 | TSNREFDL[11:0] | The value of the reference temperature measured at T _j = 25°C |

11.4 Functions

11.4.1 Temperature Measurement

TSN0 measures temperatures by using the AN112 channel of ADCG1. The AN112 channel is set for scan group 4 of the ADCG1 and four consecutive virtual channels must be set for A/D conversion of the signal from the temperature sensor.

Refer to **Figure 11.2** for an example. The result of measurement is stored in the data register corresponding to the fourth virtual channel.

Figure 11.2 Example Setting for Temperature-Sensor-Dedicated Use of Conversion Channel AN112 of ADCG1

Set TSN0 up for measuring the temperature by making the register settings in the procedure below.

1. Set the TSN0-dedicated A/D conversion channel AN112 in four consecutive virtual channels of scan group 4.
2. Enable the temperature sensor by setting the TSNEN bit of the TSNCR register to “1”. This step can precede step 1 above.
3. Wait for TSN0 to start up. After setting the TSNEN bit of the TSNCR register to “1”, wait for 200 us before proceeding with the next step (step 4). This is the waiting time required for the temperature sensor to start up. Do not proceed with the next step until this time has elapsed. You can confirm that the sensor has started up by checking the TSNST bit of the TSNSTAT register.
4. TSN0 starts measuring temperature and a software or hardware trigger starts A/D conversion of scan group 4 of the ADCG1.
5. Check the result of measurement. The measurement of temperature is completed when A/D conversion of the fourth virtual channel is completed. The result of measuring the signal from the temperature sensor is stored in the data register corresponding to the fourth virtual channel. For conversion of the result to degrees Celsius, refer to **Section 11.5, Calculating the Temperature**.
6. When abnormal temperature notification by the temperature sensor is to be used, the upper and lower limit error bits of ADCG1 must be cleared. Since discharging proceeds in the first A/D conversion of temperature measurement, when this function is used, the ADCG1ULER upper/lower limit error register is set as if a lower-limit error has occurred. The upper/lower limit error bits of the ADCG1 must thus be cleared after temperature measurement.

CAUTION

When AN112 inputs a hold trigger of T&H group A or B during conversion, the virtual channel operation is suspended and the correct temperature measurement result cannot be obtained. Do not input a hold trigger of T&H group A or B during temperature measurement.

11.4.2 Temperature Error Notification

- TCN0 can use the ADCG1 upper-and-lower limit checking function to send a limit error signal to the ECM module when the temperature exceeds the specified upper or lower limit.
- The following settings are required to use Temperature error notification.
 1. Set the upper and lower limits of the temperature in the ADCG1ULLMTBR0 to 2 registers of ADCG1.
 2. Select the upper and lower limits table for scan group 4 in the ADCG1ULLMSR4 register of ADCG1.
 3. Set the ULIEI bit of the ADCG1SFTCR safety control register of ADCG1 to “1” to enable upper/lower limit error interrupts. Set the OWEIE, PEIE, and IDEIE bits to “0” to disable overwrite error interrupts, parity error interrupts, and ID error interrupts. Disable the ADCG1 error interrupt (INTADCG1ERR) of the interrupt controller (INTC).

11.4.3 Self-Diagnosis Function

TSN0 supports the insertion of faulty values. Setting the TSNSELFDIAG bit of the TSN0DIAG register to “1” forces the TSN0 module to generate an error. TSN0 can then diagnose its own operation by comparing the change result from the AN112 channel of ADCG1 with the expected value (0).

TSN0 is set up for self-diagnosis by the following register settings.

1. Set up A/D conversion for the temperature sensor channel. The procedure is the same as for normal operation. Refer to **Section 11.4.1, Temperature Measurement**.
2. Enable the temperature sensor. The procedure is the same as for normal operation. Refer to **Section 11.4.1, Temperature Measurement**.
3. Configure the self-diagnosis register before starting A/D conversion. That is, set the TSNSELFDIAG bit of the TSN0DIAG register to “1”. TSOOUT is fixed to the low level after this.
4. Start temperature measurement. The procedure is the same as for normal operation. Refer to **Section 11.4.1, Temperature Measurement**.
5. Check the result of measurement. The procedure is the same as for normal operation. Refer to **Section 11.4.1, Temperature Measurement**.

11.5 Calculating the Temperature

Use the following formula to convert results of temperature measurement into degrees Celsius.

$$T_{\text{current}} = \frac{150 - 25}{R_{150} - R_{25}} \times (R - R_{25}) + 25$$

$$R = \frac{A1VREFH}{5.0} \times R_{\text{current}}$$

R_{current}: Result of A/D conversion at the current temperature

T_{current}: Current temperature

R₂₅: Reference result of A/D conversion at 25 °C.

R₁₅₀: Reference result of A/D conversion at 150 °C.

R₂₅ and R₁₅₀ are stored in TSNREFD.

CAUTION

The values of R₂₅ and R₁₅₀ stored in TSNREFD are measured at A1VREFH = 5.0 V. Apply the formula after converting to the applicable voltage if A1VREFH has a different value.

Section 12 Clock Controller

The clock controller supplies clock pulses inside the chip and to the external devices. The clock controller consists of a main oscillator circuit (Main OSC), a high-speed internal oscillator (HS IntOSC), a Phase Locked Loop circuit (PLL), clock dividers and clock selectors.

12.1 Features

- Incorporates main oscillator circuit (Main OSC), which is used as a reference clock of the PLL.
- Incorporates PLL circuit to generate high speed internal clocks by multiplying the Main OSC input.
- Incorporates a high-speed internal oscillator (HS IntOSC).
- Generates clock pulses used inside the chip from HS IntOSC, Main OSC and PLL.
- A clock monitor (CLMA0 to CLMA3) is included. (See **Section 31, Functional Safety** for details.)
- The frequency divided clock set by the division circuit can be output from the EXTCLKnO (n = 0,1) pins. Furthermore, Main OSC, CLK_LSB, CLK_CPU, and CLK_IOSC can be selected with register settings.

12.1.1 External Input/Output Pins

Table 12.1 shows the pins related to the clock controller.

Table 12.1 Pins Related to the Clock Controller

| Pin Function Name | Direction | Function |
|-------------------|-----------|--|
| X1 | Input | Connects a Main OSC crystal oscillator |
| X2 | Output | Connects a Main OSC crystal oscillator |
| EXTCLK0O | Output | External clock out 0 |
| EXTCLK1O | Output | External clock out 1 |

12.2 Overview

12.2.1 Type of Clocks

Table 12.2 shows the list of clocks, **Table 12.3** shows the operation clocks of each functional module.

Table 12.2 List of Clocks

| Clock Name | Symbol | Clock Frequency (MHz) | Remarks |
|-----------------------------|----------|--|--|
| CPU clock | CLK_CPU | (CPU) 160 (Global RAM) 80 (1 wait) (CodeFlash) 80 (1 wait) | Clock source: PLL output |
| High speed peripheral clock | CLK_HSB | 80 | |
| Low speed peripheral clock | CLK_LSB | 40 | |
| Internal Oscillator clock | CLK_IOSC | 8 | High-speed internal oscillator(HS IntOSC) *1/2 |
| WDTA counter clock | WDTACKI | 8/0.25 | 1/1 or 1/32 of CLK_IOSC (Configured by FLASH option) |
| External clock out 0 | EXTCLK00 | 1/1 to 1/1023 of CLK_CPU, CLK_LSB, CLK_IOSC or Main OSC | Configured by CKSC2C and CLK2DIV. Maximum output frequency: 20 MHz |
| External clock out 1 | EXTCLK10 | 1/1 to 1/1023 of CLK_CPU, CLK_LSB, CLK_IOSC or Main OSC | Configured by CKSC3C and CLK3DIV. Maximum output frequency: 20 MHz |
| Main OSC clock | CLK_MOSC | 16 | |
| ADC clock | CLK_ADC | 40/20 | Configured by CKSC8C register |

Table 12.3 Clocks and Functional Modules

| Clock Name | Functional Module Name |
|-----------------------------|--|
| CPU clock | PE1 (Master, Checker, Local RAM, INTC1, etc.), Code Flash (1 wait), ERAM (1 wait), Global RAM (1 wait) |
| High speed peripheral clock | INTC2, DMAC, DTS, DCRA, PIC, CSIG, CSIH, SCI, FLXA, SENT, PSI5, RLIN, TAUD, TAUJ, TSG3, ENCA, TAPA, TPBA, OSTM |
| Low speed peripheral clock | Data Flash (from 4 cycle), RS-CANFD, Clock controller |
| Internal Oscillator clock | CVM (digital noise filter), CLMA (monitor clock), ECM (delay timer : CLK_IOSC/2) |
| WDTA counter clock | WDTA |
| ADC clock | ADCG, TSN |
| MainOSC clock | RS-CANFD (xin) |

12.2.2 Block Diagram

Figure 12.1 shows the block diagram of the clock controller.

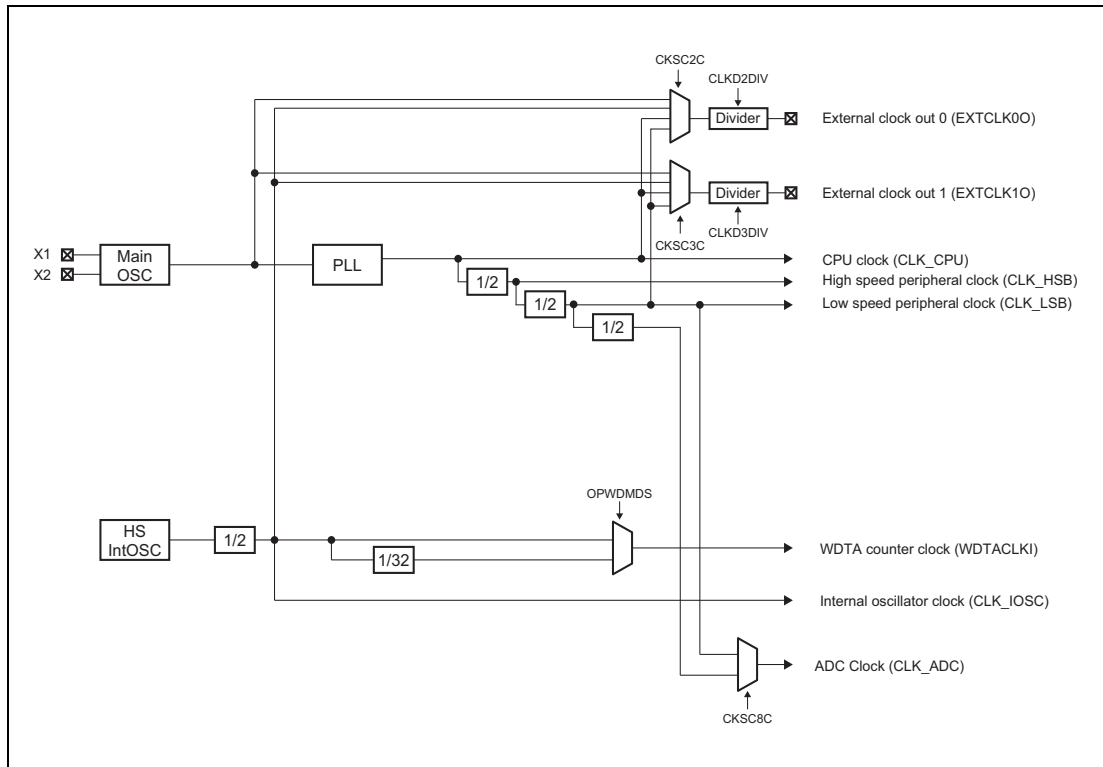

Figure 12.1 Block Diagram of Clock Controller

12.3 Register Description

12.3.1 Writing Protection to Registers

Registers can be protected from inadvertent write access due to erroneous program execution, etc. by configuration of the Slave Guards. For details, see **Section 31, Functional Safety**.

12.3.2 Register Overview

The Clock Controller is controlled and operated by the following registers:

Table 12.4 List of Registers

| Address | Register Name | Description | Access Width | Value after Reset |
|------------------------|---------------|-----------------------------------|--------------|------------------------|
| FFF8 8810 _H | CLKD2DIV | Clock divider 2 divisor register | 32 | 0000 0000 _H |
| FFF8 8814 _H | CLKD2STAT | Clock divider 2 status register | 32 | 0000 0002 _H |
| FFF8 8818 _H | CLKD3DIV | Clock divider 3 divisor register | 32 | 0000 0000 _H |
| FFF8 881C _H | CLKD3STAT | Clock divider 3 status register | 32 | 0000 0002 _H |
| FFF8 9080 _H | CKSC2C | Clock selector 2 control register | 32 | 0000 0004 _H |
| FFF8 9088 _H | CKSC2S | Clock selector 2 status register | 32 | 0000 0004 _H |
| FFF8 90C0 _H | CKSC3C | Clock selector 3 control register | 32 | 0000 0004 _H |
| FFF8 90C8 _H | CKSC3S | Clock selector 3 status register | 32 | 0000 0004 _H |
| FFF8 9110 _H | CKSC8C | Clock selector 8 control register | 32 | 0000 0002 _H |
| FFF8 9114 _H | CKSC8S | Clock selector 8 status register | 32 | 0000 0003 _H |

Table 12.5 Register Reset Conditions

| Register Name | Reset Condition | | | |
|---------------|-----------------|----------------|----------------|---------------------|
| | Power On Reset | System Reset 1 | System Reset 2 | Application Reset 1 |
| CLKD2DIV | √ | √ | √ | √ |
| CLKD2STAT | √ | √ | √ | √ |
| CLKD3DIV | √ | √ | √ | √ |
| CLKD3STAT | √ | √ | √ | √ |
| CKSC2C | √ | √ | √ | √ |
| CKSC2S | √ | √ | √ | √ |
| CKSC3C | √ | √ | √ | √ |
| CKSC3S | √ | √ | √ | √ |
| CKSC8C | √ | √ | √ | √ |
| CKSC8S | √ | √ | √ | √ |

12.3.3 CLKD2DIV — Clock Divider 2 Divisor Register

This register controls the division ratio of the external clock output 0 (EXTCLK00).

This register is initialized by the Power On Reset, the System Resets 1 and 2, and the Application Reset 1.

Access: This register can be read/write in 32-bit units.

Address: FFF8 8810_H

Value after reset: 0000 0000_H

| | | | | | | | | | | | | | | | | |
|-------------------|----|----|----|----|----|----|---------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | CLKD2DIV[9:0] | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Table 12.6 CLKD2DIV Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 10 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 9 to 0 | CLKD2DIV | Division Ratio 0: EXTCLK00 is stopped (low level). 1 to 1023: The source for the EXTCLK00 is divided by the CLKD2DIV. |

CAUTION

Set the frequency of EXTCLK00 to a value less than 20 MHz.

Do not write to the CLKD2DIV register while the setting of the CLKD2SYNC bit is 0.

12.3.4 CLKD2STAT — Clock Divider 2 Status Register

This register indicates the status of the external clock output 0 (EXTCLK00).

This register is initialized by the Power On Reset, the System Resets 1 and 2, and the Application Reset 1.

Access: This register can be read in 32-bit units.

Address: FFF8 8814_H

Value after reset: 0000 0002_H

| | | | | | | | | | | | | | | | | |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---------------|-----------------|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Table 12.7 CLKD2STAT Register Contents

| Bit Position | Bit Name | Function |
|--------------|-------------|--|
| 31 to 2 | Reserved | When read, the value after reset is read. |
| 1 | CLKD2SYNC | Divider Clock Synchronized 0: EXTCLK00 output does not correspond to the division ratio setting in CLKD2DIV. 1: EXTCLK00 output corresponds to the division ratio setting in CLKD2DIV. |
| 0 | CLKD2CLKACT | Divider Clock Active 0: EXTCLK00 is inactive (EXTCLK00 = low level). 1: EXTCLK00 is active. |

12.3.5 CLKD3DIV — Clock Divider 3 Divisor Register

This register controls the division ratio of the external clock output 1 (EXTCLK1O).

This register is initialized by the Power On Reset, the System Resets 1 and 2, and the Application Reset 1.

Access: This register can be read/write in 32-bit units.

Address: FFF8 8818_H

Value after reset: 0000 0000_H

| | | | | | | | | | | | | | | | | | |
|-------------------|----|----|----|----|----|----|---------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|---|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | |

Table 12.8 CLKD3DIV Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 10 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 9 to 0 | CLKD3DIV | Division Ratio 0: EXTCLK1O is stopped (low level). 1 to 1023: The source for the EXTCLK1O is divided by the CLKD3DIV. |

CAUTION

Set the frequency of EXTCLK1O to a value less than 20 MHz.

Do not write to the CLKD3DIV register while the setting of the CLKD3SYNC bit is 0.

12.3.6 CLKD3STAT — Clock Divider 3 Status Register

This register indicates the status of the the external clock output 1 (EXTCLK1O).

This register is initialized by the Power On Reset, the System Resets 1 and 2, and the Application Reset 1.

Access: This register can be read in 32-bit units.

Address: FFF8 881C_H

Value after reset: 0000 0002_H

| | | | | | | | | | | | | | | | | |

Table 12.9 CLKD3STAT Register Contents

| Bit Position | Bit Name | Function |
|--------------|-------------|--|
| 31 to 2 | Reserved | When read, the value after reset is read. |
| 1 | CLKD3SYNC | Divider Clock Synchronized 0: EXTCLK1O output does not correspond to the division ratio setting in CLKD3DIV. 1: EXTCLK1O output corresponds to the division ratio setting in CLKD3DIV. |
| 0 | CLKD3CLKACT | Divider Clock Active 0: EXTCLK1O is inactive (EXTCLK1O = low level). 1: EXTCLK1O is active. |

12.3.7 CKSC2C — Clock Selector 2 Control Register

This register selects the clock which drives the external clock output 0 (EXTCLK00).

This register is initialized by the Power On Reset, the System Resets 1 and 2, and the Application Reset 1.

Access: This register can be read/write in 32-bit units.

Address: FFF8 9080_H

Value after reset: 0000 0004_H

| | | | | | | | | | | | | | | | | |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|-----|-----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Table 12.10 CKSC2C Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 31 to 3 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 2 to 0 | CKSC2 | Clock Source Control These bits select the ID of a clock source for the EXTCLK00. ID = 3 _H : Main OSC ID = 4 _H : CLK_LSB ID = 5 _H : CLK_CPU ID = 6 _H : CLK_IOOSC Other than above: setting prohibited. |

CAUTION

The CKSC2C register must not be modified when the CLKD2DIV register is not 0000 0000_H or the CLKD2STAT register is not 0000 0002_H.

While CLKD2DIV = 0000 0000_H and CLKD2STAT = 0000 0002_H, EXTCLK00 output is stopped. Change the value of the register in this situation.

12.3.8 CKSC2S — Clock Selector 2 Status Register

The register indicates the state of a clock source for the external output 0 (EXTCLK00).

This register is initialized by the Power On Reset, the System Resets 1 and 2, and the Application Reset 1.

Access: This register can be read in 32-bit units.

Address: FFF8 9088_H

Value after reset: 0000 0004_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 12.11 CKSC2S Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 31 to 3 | Reserved | When read, the value after reset is read. |
| 2 to 0 | CLKACT2 | Clock Source Status Indicates the ID of the selected clock source of EXTCLK00. The value indicated by these bits shows the actual ID that is currently selected or currently waiting to be changed to another ID. ID = 3 _H : Main OSC ID = 4 _H : CLK_LSB ID = 5 _H : CLK_CPU ID = 6 _H : CLK_IOSC |

12.3.9 CKSC3C — Clock Selector 3 Control Register

This register selects the clock which drives the external clock output 1 (EXTCLK1O).

This register is initialized by the Power On Reset, the System Resets 1 and 2, and the Application Reset 1.

Access: This register can be read/write in 32-bit units.

Address: FFF8 90C0_H

Value after reset: 0000 0004_H

| | | | | | | | | | | | | | | | | |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|-----|-----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 12.12 CKSC3C Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 3 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 2 to 0 | CKSC3 | Clock Source Control These bits select the ID of a clock source for the EXTCLK1O. ID = 3 _H : Main OSC ID = 4 _H : CLK_LSB ID = 5 _H : CLK_CPU ID = 6 _H : CLK_IOSC Other than above: setting prohibited. |

CAUTION

The CKSC3C register must not be modified when the CLKD3DIV register is not 0000 0000_H or the CLKD3STAT register is not 0000 0002_H.

While CLKD3DIV = 0000 0000_H and CLKD3STAT = 0000 0002_H, EXTCLK1O output is stopped. Change the value of the register in this situation.

12.3.10 CKSC3S — Clock Selector 3 Status Register

The register indicates the state of a clock source for the external output 1 (EXTCLK1O).

This register is initialized by the Power On Reset, the System Resets 1 and 2, and the Application Reset 1.

Access: This register can be read in 32-bit units.

Address: FFF8 90C8_H

Value after reset: 0000 0004_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|---------|----|----|

Table 12.13 CKSC3S Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 3 | Reserved | When read, the value after reset is read. |
| 2 to 0 | CLKACT3 | Clock Source Status Indicates the ID of the selected clock source of EXTCLK1O. The value indicated by these bits shows the actual ID that is currently selected or currently waiting to be changed to another ID. ID = 3 _H : Main OSC ID = 4 _H : CLK_LSB ID = 5 _H : CLK_CPU ID = 6 _H : CLK_IOSOC |

12.3.11 CKSC8C — Clock Selector 8 Control Register

This register selects the clock of ADCG.

This register is initialized by the Power On Reset, the System Resets 1 and 2, and the Application Reset 1.

Access: This register can be read in 32-bit units.

Address: FFF8 9110_H

Value after reset: 0000 0002_H

| | | | | | | | | | | | | | | | | |

Table 12.14 CKSC8C Register Contents

| Bit Position | Bit Name | Function |
|--------------|--------------|--|
| 31 to 3 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 2, 1 | CKSCID8[1:0] | Clock Source Control These bits select the ID of a clock source for the ADCG. ID = 00 _B : setting prohibited ID = 01 _B : CLK_LSB (40 MHz, default) ID = 10 _B : CLK_LSB /2 (20 MHz) ID = 11 _B : setting prohibited |
| 0 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |

CAUTION

Do not change the setting of the clock selection bits while the A/D converter is in use.

12.3.12 CKSC8S — Clock Selector 8 Status Register

This register indicates the status of a clock source of ADBG.

This register is initialized by the Power On Reset, the System Resets 1 and 2, and the Application Reset 1.

Access: This register can be read in 32-bit units.

Address: FFF8 9114_H

Value after reset: 0000 0003_H

| | | | | | | | | | | | | | | | | |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|--------------|--------------|---------|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 12.15 CKSC8S Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------------|--|
| 31 to 3 | Reserved | When read, the value after reset is read. |
| 2, 1 | CLKSELID8[1:0] | Clock Source Status Indicates the ID of the selected clock source of ADBG. The value indicated by these bits shows the actual ID that is currently selected or currently waiting to be changed to another ID. ID = 00 _B : setting prohibited ID = 01 _B : CLK_LSB (40 MHz, default) ID = 10 _B : CLK_LSB /2 (20 MHz) ID = 11 _B : setting prohibited |
| 0 | CLKACT8 | Clock Active Indicates that the clock of the corresponding clock domain is active and synchronized with the selected clock. 0: Non-active 1: Active |

12.4 Operation

12.4.1 External Clock Output

The device provides 2 continuous external clock outputs that can be used as clock supply for external circuits. The clock selection can be configured by software. For details, see **Section 12.3.3, CLKD2DIV — Clock Divider 2 Divisor Register, Section 12.3.4, CLKD2STAT — Clock Divider 2 Status Register, Section 12.3.5, CLKD3DIV — Clock Divider 3 Divisor Register, Section 12.3.6, CLKD3STAT — Clock Divider 3 Status Register, Section 12.3.7, CKSC2C — Clock Selector 2 Control Register, Section 12.3.8, CKSC2S — Clock Selector 2 Status Register, Section 12.3.9, CKSC3C — Clock Selector 3 Control Register, and Section 12.3.10, CKSC3S — Clock Selector 3 Status Register.**

- Clock signals can be output from the EXTCLKnO (n = 0, 1) pins by using the clock output function.
- Output clock frequencies can be divided by the division circuit according to the register settings.
- Main OSC, CLK_LSB, CLK_CPU, and CLK_IOSC can be selected as the clock source by using register settings.

To produce an output on the EXTCLKnO pin at a specified value, follow the procedure below to make the settings to select the source clock and division ratio.

- Selecting the source clock
 1. Check the following to confirm that EXTCLKnO output is stopped.
 - $CLKDnDIV = 0000\ 0000_H$ and
 - $CLKDnSTAT = 0000\ 0002_H$
($CLKDnSTAT.CLKDnCLKACT = 0$, $CLKDnSTAT.CLKDnSYNC = 1$)
 2. Set $CKSCnC.CKSCn[2:0]$ to select the clock signal.
 3. Read the $CKSCnS$ register to confirm that the selected clock signal is active.
 - Confirm that the value of $CKSCnS.CLKACTn[2:0] =$ the value of $CKSCnC.CKSCn[2:0]$.
- Selecting the clock divisor
 1. Confirm that $CLKDnSTAT.CLKDnSYNC = 1$.
 2. Set $CLKDnDIV$ to select the EXTCLKnO output division ratio.
 3. Confirm that $CLKDnSTAT.CLKDnSYNC = 1$.
- Changing the setting of the clock selection bits
 1. Follow the above procedure for selecting the clock divisor to set $CLKDnDIV = 0000\ 0000_H$ (stopping output of clock signals).
 2. Follow the above procedure for selecting the source clock to set $CKSCnC.CKSCn[2:0]$ to select the changed clock signal.

12.5 Usage Notes

12.5.1 How to Connect a Crystal Oscillator

Figure 12.2 shows how to connect a Crystal Oscillator. When the resonator recommended by the company is used (contact us for details), external components such as a load capacitor and a damping resistor are not necessarily required for oscillation. Please evaluate the oscillation in your environment before use.

As shown in **Figure 12.2**, do not cross any other signal lines over the signal lines to the X1 and X2 pins. Induction may inhibit proper oscillation.

Figure 12.2 Connection Example of Crystal Oscillator

Section 13 Clocked Serial Interface G (CSIG)

The Clocked Serial Interface (CSI) module is a serial data link also well known as SPI, serial peripheral interface.

The CSI bus is a synchronous serial data link standard normally operating in full duplex mode via a 3-wire serial I/O.

Communication is set up in master/slave mode where the master initiates the data frame and provides the clock.

This microcontroller has one unit of CSIG.

13.1 Features of RH850/P1M-E CSIG

13.1.1 Number of Units

This microcontroller has the following number of CSIG units.

Each CSIG unit has one channel interface. "Number of channels" is used with the same meaning as "number of units" in this section.

Table 13.1 Number of Units

| Product Name | RH850/P1M-E 100 pins | RH850/P1M-E 144 pins |
|-----------------|------------------------------|-------------------------|
| Number of Units | 1 | |
| Name | CSIG _n (n = 0) | |

Note: The channel names are same as those of the corresponding units.

Table 13.2 Index

| Index | Description |
|-------|--|
| n | Throughout this section, the individual CSIG units are identified by the index "n" (n = 0): for example, CSIG _n CTL0 is the CSIG _n control register 0. |

13.1.2 Register Base Address

CSIG base addresses are listed in the following table.

CSIG register addresses are given as offsets from the base addresses throughout the section.

Table 13.3 Register Base Address

| Base Address Name | Base Address |
|-------------------|------------------------|
| <CSIG0_base> | FFD8 A000 _H |

13.1.3 Clock Supply

Clock supply by and to CSIG is listed in the following table.

Table 13.4 Clock Supply

| Unit Name | Unit Clock Name | Supply Clock Name |
|-----------|-----------------|-------------------------------------|
| CSIGn | PCLK | High-speed peripheral clock CLK_HSB |

13.1.4 Interrupt Requests

CSIG interrupt requests are listed in the following table.

Table 13.5 Interrupt Requests

| Unit Interrupt Name | Description | Interrupt Number | DMA/DTS Trigger Number |
|---------------------|------------------------------------|------------------|------------------------|
| CSIG0 | | | |
| INTCSIG0IC | CSIG transmit status interrupt | 175 | 86 |
| INTCSIG0IR | CSIG receive status interrupt | 176 | 85 |
| INTCSIG0IRE | CSIG communication error interrupt | 174 | — |

13.1.5 Reset Sources

Please refer to **Section 8, Reset Controller**.

13.1.6 External Input/Output Signals

External input/output signals of CSIG are listed below.

Table 13.6 External Input/Output Signals

| Unit Signal Name | I/O | Description | Alternative Port Pin Signal Name |
|------------------|-----|----------------------------|----------------------------------|
| CSIG0 | | | |
| CSIGTSCK | I | Serial clock signal input | CSIG0SCI |
| | O | Serial clock signal output | CSIG0SCO |
| CSIGTSI | I | Serial data input signal | CSIG0SI |
| CSIGTSO | O | Serial data output signal | CSIG0SO |
| CSIGTRYI | I | Ready/busy input signal | CSIG0RYI |
| CSIGTRYO | O | Ready/busy output signal | CSIG0RYO |

13.1.7 Data Consistency Check

The following table lists the port pins on which CSIGNSO pin functions are multiplexed and whether or not the CSIGNSO pin functions support data consistency checking. See **Section 13.5.10, Error Detection** for details on data consistency checking.

Table 13.7 Data Consistency Checking and Target Port Pins

| Unit Signal Name | Port Pin Name | Alternative Function | Data Consistency Checking |
|------------------|---------------|----------------------|---------------------------|
| CSIG0 | | | |
| CSIGTSO | P3_1*1 | ALT-OUT6 | Supported |
| | P5_1 | ALT-OUT1 | Supported |

Note 1. Available in devices with 144-pin.

13.1.8 Combinations of Pins and Ports

Combinations of CSIG pins and ports are listed in the following table.

Table 13.8 Combinations of Pins and Ports

| Function | Pin Name | Port Name | | |
|----------|-----------------------|-----------|---------|---------|
| | | Group 1 | Group 2 | Group 3 |
| CSIG0 | CSIG0RYI | P3_5 | — | — |
| | CSIG0RYO | P3_4 | — | — |
| | CSIG0SCI/ CSIG0SCO | P3_2*1 | P5_2*1 | P5_4 |
| | CSIG0SI | P3_0*1 | P5_0 | P5_0 |
| | CSIG0SO | P3_1*1 | P5_1 | P5_1 |

Note 1. Available in devices with 144-pin.

13.2 Overview

13.2.1 Functional Overview

- Three-wire serial synchronous data transfer
- Master mode and slave mode
- Built-in baud rate generator
- Transfer clock frequency is adjustable in master mode. In slave mode, transfer clock frequency is determined by input clock.
- Maximum transmission speed:
 - in master mode: 8 MHz
 - in slave mode: 6.6 MHz
- Clock phase and data phase are selectable.
- Data transfer with MSB first or data transfer with LSB first is selectable.
- Transfer data length selectable from 7 to 16 bits in 1-bit units
- EDL (Extended Data Length) function for transferring data with more than 16 bits is incorporated.
- Three selectable transfer modes:
 - transmit-only mode
 - receive-only mode
 - transmit/receive mode
- Handshake function is included.
- Built-in error detection (data consistency check, parity, overrun)
- Three different interrupt request signals (INTCSIG0IC, INTCSIG0IR, INTCSIG0IRE)
- Built-in LBM (Loop Back Mode) function for self-test

13.2.2 Functional Description

The CSIG uses three signals for communication:

- Transmission clock CSIGTCK (output in master mode, input in slave mode)
- Serial data output signal CSIGTSO
- Serial data input signal CSIGTSI

CSIGNCTL2 is used to select the mode in which the CSIG should be operated: master mode or slave mode.

Other signals are available for external control and monitoring.

- CSIGTRYO: Ready/busy output signal (handshake signal)
- CSIGTRYI: Ready/busy input signal (handshake signal)

Data transmission is bit-wise and serial, and synchronous to the transmission clock.

The following table shows the most important registers for setting up CSIG.

Table 13.9 Main Registers of CSIG

| Register | Function |
|-----------|---|
| CSIGNCTL0 | Enables/disables operating clock, data transmission, and data reception |
| CSIGNCTL1 | Controls options such as interrupt timing, extended data length, data consistency check, loop-back mode, handshake, etc. |
| CSIGNCTL2 | Selects master or slave mode and also selects the transfer clock frequency of the on-chip baud rate generator (BRG) in master mode. |
| CSIGNCFG0 | Configures the communication protocol |

13.2.3 Block Diagram

The following block diagram shows the main components of the CSIG.

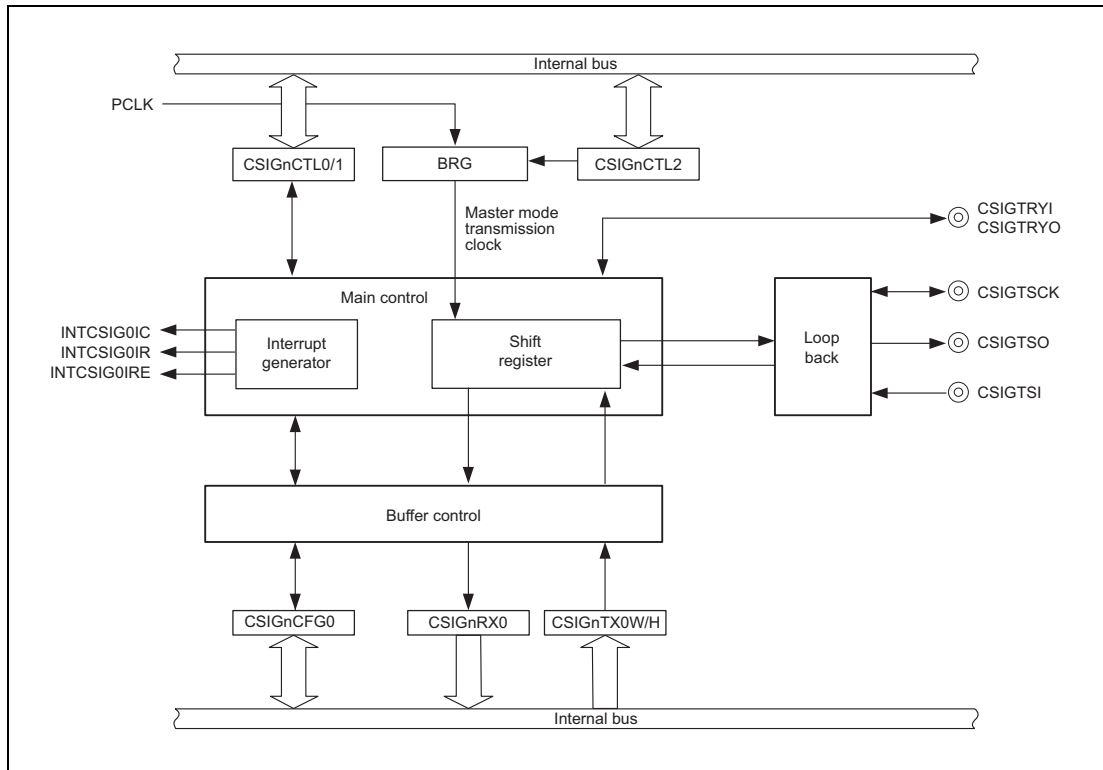

Figure 13.1 CSIG Block Diagram

In master mode, the transmission clock CSIGTSCK is generated by the built-in baud rate generator (BRG). In slave mode, the transmission clock is supplied by an external source.

13.3 Registers

13.3.1 List of Registers

CSIG registers are listed in the following table.

The base address <CSIGn_base> of the CSIGn is defined in **Section 13.1.2, Register Base Address**.

Table 13.10 Registers

| Module | Register | Symbol | Address |
|--------|--|------------|----------------------------------|
| CSIGn | CSIGn control register 0 | CSIGnCTL0 | <CSIGn_base> + 0000 _H |
| CSIGn | CSIGn control register 1 | CSIGnCTL1 | <CSIGn_base> + 0010 _H |
| CSIGn | CSIGn control register 2 | CSIGnCTL2 | <CSIGn_base> + 0014 _H |
| CSIGn | CSIGn status register 0 | CSIGnSTR0 | <CSIGn_base> + 0004 _H |
| CSIGn | CSIGn status clear register 0 | CSIGnSTCR0 | <CSIGn_base> + 0008 _H |
| CSIGn | CSIGn Rx-only mode control register 0 | CSIGnBCTL0 | <CSIGn_base> + 1000 _H |
| CSIGn | CSIGn configuration register 0 | CSIGnCFG0 | <CSIGn_base> + 1010 _H |
| CSIGn | CSIGn transmission register 0 for word access | CSIGnTX0W | <CSIGn_base> + 1004 _H |
| CSIGn | CSIGn transmission register 0 for half word access | CSIGnTX0H | <CSIGn_base> + 1008 _H |
| CSIGn | CSIGn reception register 0 | CSIGnRX0 | <CSIGn_base> + 100C _H |

13.3.2 CSIGNCTL0 — CSIGN Control Register 0

This register controls the operation clock and enables or disables transmission/reception.

Access: This register can be read/written in 8-bit units.

Address: <CSIGN_base> + 0000_H

Value after reset: 00_H This register is initialized by a reset from any source.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|----------|----------|----------|---|---|---|---|----------|
| | CSIGNPWR | CSIGNTXE | CSIGNRXE | — | — | — | — | CSIGNMBS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R | R | R | R | R/W |

Table 13.11 CSIGNCTL0 Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 7 | CSIGNPWR | Controls operation clock: 0: Stop operation clock 1: Supplies operation clock Clearing CSIGNPWR to 0 resets the internal circuits, stops operation, and sets the CSIG to standby state. Clock supply to internal circuits stops. If CSIGNPWR is cleared during communication, ongoing communication is aborted. In that case, communication settings must be made from the beginning. |
| 6 | CSIGNTXE | Enables/disables transmission: 0: Transmission disabled 1: Transmission enabled |
| 5 | CSIGNRXE | Enables/disables reception: 0: Reception disabled 1: Reception enabled |
| 4 to 1 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 0 | CSIGNMBS | To use CSIG, always write 1 to this bit. (The value after reset is "0".) |

CAUTION

When setting this register, refer to **Table 13.21, List of Cautions when Setting Registers.**

13.3.3 CSIGNCTL1 — CSIGN Control Register 1

This register specifies the interrupt timing and the interrupt delay mode. It also enables/disables extended data length control, data consistency check, loop-back mode, and handshake function.

Access: This register can be read/written in 32-bit units.

Address: <CSIGN_base> + 0010_H

Value after reset: 0000 0000_H This register is initialized by a reset from any source.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|----|----|----|----|----|----|----|----|-----------|----|----------|----|----------|----------|----------|-----------|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CSIGNCKR | CSIGNSLIT |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| | — | — | — | — | — | — | — | — | CSIGNEDLE | — | CSIGNDCS | — | CSIGNLBM | CSIGNSIT | CSIGNHSE | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R | R/W | R | R/W | R/W | R/W | R |

Table 13.12 CSIGNCTL1 Register Contents (1/2)

| Bit Position | Bit Name | Function |
|--------------|-----------|---|
| 31 to 18 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 17 | CSIGNCKR | CSIGTSCK clock inverting function 0: The default level of CSIGTSCK is high level. 1: The default level of CSIGTSCK is low level. The CSIGNCKR bit is used in combination with the CSIGNCFG0.CSIGNDAP bit. For details, refer to Section 13.3.8, CSIGNCFG0 — CSIGN Configuration Register 0 . |
| 16 | CSIGNSLIT | Selects the timing of interrupt INTCSIG0IC: 0: Normal interrupt timing (interrupt is generated after the transfer) 1: Interrupt generation when CSIGNTX0W/H is ready to store the (next data.). For details, see Section 13.4.2, INTCSIG0IC (Communication Status Interrupt) |
| 15 to 8 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 7 | CSIGNEDLE | Enables/disables extended data length (EDL) mode: 0: Extended data length mode disabled 1: Extended data length mode enabled For details, refer to Section 13.5.5.2, Data Length Selection with Extended Data Length . |
| 6 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 5 | CSIGNDCS | Enables/disables data consistency check: 0: Data consistency check disabled 1: Data consistency check enabled For details, refer to Section 13.5.10.1, Data Consistency Check . |
| 4 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 3 | CSIGNLBM | Controls loop-back mode (LBM): 0: Loop-back mode deactivated 1: Loop-back mode activated Loop-back mode can be set only in master mode. Set this bit to 0 in slave mode. For details, refer to Section 13.5.9, Loop-Back Mode . |

Table 13.12 CSIGnCTL1 Register Contents (2/2)

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 2 | CSIGnSIT | Selects interrupt delay mode: 0: No delay 1: Half clock delay for all interrupts This bit is only valid in master mode. In slave mode, no delay is generated. For details, see Section 13.4.1, Interrupt Delay . |
| 1 | CSIGnHSE | Enables or disables the handshake function: 0: Handshake function disabled 1: Handshake function enabled For details refer to Section 13.5.8, Handshake Function . |
| 0 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |

CAUTION

When setting this register, refer to **Table 13.21, List of Cautions when Setting Registers**.

13.3.4 CSIGNCTL2 — CSIGN Control Register 2

This register selects the communication clock.

Access: This register can be read/written in 16-bit units.

Address: <CSIGN_base> + 0014_H

Value after reset: E000_H This register is initialized by a reset from any source.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Note: α = 0 to 6 (value set by CSIGNPRS[2:0])

CAUTION

When setting this register, refer to **Table 13.21, List of Cautions when Setting Registers.**

13.3.5 CSIGNSTR0 — CSIGN Status Register 0

This register indicates the status of the CSIG.

Access: This register can only be read in 32-bit units.

Address: <CSIGN_base> + 0004_H

Value after reset: 0000 0010_H This register is initialized by a reset from any source.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 31 to 8 | Reserved | When read, the value after reset is read. | | | | | | | | | | | | | | | | | | | | |
| 7 | CSIGNTSF | Transfer Status Flag 0: Idle state 1: Communication is in progress or being prepared The timing to set or clear this bit is as follows: <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>Master mode</th><th>Timing to Set</th><th>Timing to Clear</th></tr> </thead> <tbody> <tr> <td>Tx only mode</td><td rowspan="2">Writing to transmit register</td><td rowspan="2">Within a half clock cycle from the last serial clock edge</td></tr> <tr> <td>Tx/Rx mode</td></tr> <tr> <td>Rx only mode</td><td>Reading from receive register</td><td></td></tr> </tbody> </table> <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>Slave mode</th><th>Timing to Set</th><th>Timing to Clear</th></tr> </thead> <tbody> <tr> <td>Tx only mode</td><td rowspan="2">Writing to transmit register</td><td rowspan="2">Within a half clock cycle from the last serial clock edge</td></tr> <tr> <td>Tx/Rx mode</td></tr> <tr> <td>Rx only mode</td><td>CSIGNTSCK input</td><td></td></tr> </tbody> </table> | Master mode | Timing to Set | Timing to Clear | Tx only mode | Writing to transmit register | Within a half clock cycle from the last serial clock edge | Tx/Rx mode | Rx only mode | Reading from receive register | | Slave mode | Timing to Set | Timing to Clear | Tx only mode | Writing to transmit register | Within a half clock cycle from the last serial clock edge | Tx/Rx mode | Rx only mode | CSIGNTSCK input | |
| Master mode | Timing to Set | Timing to Clear | | | | | | | | | | | | | | | | | | | | |
| Tx only mode | Writing to transmit register | Within a half clock cycle from the last serial clock edge | | | | | | | | | | | | | | | | | | | | |
| Tx/Rx mode | | | | | | | | | | | | | | | | | | | | | | |
| Rx only mode | Reading from receive register | | | | | | | | | | | | | | | | | | | | | |
| Slave mode | Timing to Set | Timing to Clear | | | | | | | | | | | | | | | | | | | | |
| Tx only mode | Writing to transmit register | Within a half clock cycle from the last serial clock edge | | | | | | | | | | | | | | | | | | | | |
| Tx/Rx mode | | | | | | | | | | | | | | | | | | | | | | |
| Rx only mode | CSIGNTSCK input | | | | | | | | | | | | | | | | | | | | | |
| 6 to 4 | Reserved | When read, the value after reset is read. | | | | | | | | | | | | | | | | | | | | |
| 3 | CSIGNDCE | Data Consistency Check Error Flag 0: No data consistency check error detected 1: Data consistency check error detected This bit is cleared by writing 1 to CSIGNSTR0.CSIGNDCEC. However, if setting this bit to 1 due to detection of a data consistency check error and clearing this bit to 0 by CSIGNDCEC in CSIGNSTR0 take place at the same time, setting this bit to 1 due to detection of a data consistency check error takes precedence. This bit is initialized when CSIGNPWR in CSIGNCTL0 changes from 0 to 1 or from 1 to 0. | | | | | | | | | | | | | | | | | | | | |
| 2 | Reserved | When read, the value after reset is read. | | | | | | | | | | | | | | | | | | | | |

Table 13.14 CSIGnSTR0 Register Contents (2/2)

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 1 | CSIGnPE | <p>Parity Error Flag</p> <p>0: No parity error detected 1: Parity error detected</p> <p>This bit is cleared by writing 1 to CSIGnPEC in CSIGnSTCR0. However, if setting this bit to 1 due to detection of a parity error and clearing this bit to 0 by CSIGnPEC in CSIGnSTCR0 take place at the same time, setting this bit to 1 due to detection of a parity error takes precedence. This bit is initialized when CSIGnPWR in CSIGnCTL0 changes from 0 to 1 or from 1 to 0.</p> |
| 0 | CSIGnOVE | <p>Overrun Error Flag</p> <p>0: No overrun error detected 1: Overrun error detected</p> <p>This bit is cleared by writing 1 to CSIGnOVEC in CSIGnSTCR0. However, if setting this bit to 1 due to detection of an overrun error and clearing this bit to 0 by CSIGnOVEC in CSIGnSTCR0 take place at the same time, setting this bit to 1 due to detection of an overrun error takes precedence. This bit is initialized when CSIGnPWR in CSIGnCTL0 changes from 0 to 1 or from 1 to 0.</p> |

CAUTION

When setting this register, refer to **Table 13.21, List of Cautions when Setting Registers.**

13.3.6 CSIGNSTCR0 — CSIGN Status Clear Register 0

This register clears the status flags of the CSIGNSTR0 status register.

Access: This register can be read/written in 16-bit units.
When read, the value 0000_H is always returned.

Address: <CSIGN_base> + 0008_H

Value after reset: 0000_H This register is initialized by a reset from any source.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R/W | R/W |

Table 13.15 CSIGNSTCR0 Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|---|
| 15 to 4 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 3 | CSIGNDCEC | This bit controls the data consistency check error flag clear command. 0: No operation. 1: Clears the data consistency check error flag (CSIGNSTR0.CSIGNDCE) Read value is always 0. |
| 2 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 1 | CSIGNPEC | This bit controls the parity error flag clear command. 0: No operation. Read value is always 0. 1: Clears the parity error flag (CSIGNSTR0.CSIGNPE) Read value is always 0. |
| 0 | CSIGNOVEC | This bit controls the overrun error flag clear command. 0: No operation. Read value is always 0. 1: Clears the overrun error flag (CSIGNSTR0.CSIGNOVE) Read value is always 0. |

13.3.7 CSIGNBCTL0 — CSIGN Rx-only Mode Control Register 0

This register enables/disables the data transfer in Rx-only mode.

Access: This register can be read/written in 8-bit units.

Address: <CSIGN_base> + 1000_H

Value after reset: 01_H This register is initialized by a reset from any source.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|---|---|---|---|---|---|---|----------|
| | — | — | — | — | — | — | — | CSIGNSCE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R/W |

Table 13.16 CSIGNBCTL0 Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 7 to 1 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 0 | CSIGNSCE | Disables/enables next data reception start by reading CSIGNRX0 0: Next reception disabled 1: Next reception enabled For details refer to Section 13.5.4.2, Receive-Only Mode. |

CAUTION

When setting this register, refer to **Table 13.21, List of Cautions when Setting Registers.**

13.3.8 CSIGNCFG0 — CSIGN Configuration Register 0

This register configures the communication protocol options such as data length, parity, transfer direction, clock phase, and data phase.

Access: This register can be read/written in 32-bit units.

Address: <CSIGN_base> + 1010_H

Value after reset: 0000 0000_H This register is initialized by a reset from any source.

| 15 to 0 | Reserved | When read, the value after reset is read. When writing, write the value after reset. | | | | | | | | | | | | | | | |

CAUTION

When setting this register, refer to **Table 13.21, List of Cautions when Setting Registers.**

13.3.9 CSIGNTX0W — CSIGN Transmission Register 0 for Word Access

This register stores the transmission data. This register also specifies extended data length.

Access: This register can be read/written in 32-bit units.

Address: <CSIGN_base> + 1004_H

Value after reset: 0000 0000_H This register is initialized by a reset from any source.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 13.18 CSIGNTX0W Register Contents

| Bit Position | Bit Name | Function |
|--------------|---------------|---|
| 31, 30 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 29 | CSIGNEDL | Specifies the extended data length configuration: 0: Normal operation 1: Extended data length enabled The associated data is transmitted as 16-bit data. This bit can only be set if CSIGNCTL1.CSIGNEDLE = 1. |
| 28 to 16 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 15 to 0 | CSIGNTX[15:0] | Data to be transmitted |

CAUTION

When setting this register, refer to **Table 13.21, List of Cautions when Setting Registers.**

13.3.10 CSIGNTX0H — CSIGN Transmission Register 0 for Half Word Access

This register stores the transmission data. This register is the same as bits 15 to 0 in the CSIGNTX0W register.

The setting of 16 high-order bits in CSIGNTX0W is used for data transfer.

Access: This register can be read/written in 16-bit units.

Address: <CSIGN_base> + 1008_H

Value after reset: 0000_H This register is initialized by a reset from any source.

Table 13.19 CSIGNTX0H Register Contents

| Bit Position | Bit Name | Function |
|--------------|---------------|------------------------|
| 15 to 0 | CSIGNTX[15:0] | Data to be transmitted |

CAUTION

When setting this register, refer to **Table 13.21, List of Cautions when Setting Registers.**

13.3.11 CSIGNRX0 — CSIGN Reception Register 0

This register stores the received data.

Access: This register can only be read in 16-bit units.

Address: <CSIGN_base> + 100C_H

Value after reset: 0000_H This register is initialized by a reset from any source.

Table 13.20 CSIGNRX0 Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------------|---------------|
| 15 to 0 | CSIGNRX [15:0] | Received data |

NOTE

This register stores the received data when an INTCSIG0IR interrupt is generated. Read the received data stored in this register before generation of an INTCSIG0IR interrupt. Otherwise the data is rewritten with the next received data.

CAUTION

When setting this register, refer to **Table 13.21, List of Cautions when Setting Registers.**

13.3.12 List of Caution

Table 13.21 List of Cautions when Setting Registers

| Register Name | Bit Name | Contents |
|------------------------|---|--|
| CSIGNCTL0 | CSIGNPWR | If this bit is cleared during communication, ongoing communication is aborted. After communication is aborted, it is necessary to restart the communication. |
| CSIGNCTL0 | CSIGNTXE CSIGNRXE | Do not modify any of these bits while CSIGNCTL0.CSIGNPWR = 0. (These bits can be modified at the same time as the CSIGNCTL0.CSIGNPWR bit.) Do not modify these bits while CSIGNSTR0.CSIGNTSF = 1, because the specified operation is not guaranteed if ongoing communication is aborted. |
| CSIGNCTL0 | CSIGNMBS | When writing, be sure to set to this bit to 1. (The value after reset is "0".) This bit must be modified simultaneously with CSIGNCTL0.CSIGNPWR bit. |
| CSIGNCTL1 | CSIGNCKR | Modification of this bit is only permitted while CSIGNCTL0.CSIGNPWR = 0. |
| CSIGNCTL1 | CSIGNSLIT CSIGNEDLE CSIGNDCS CSIGNHSE | Modification of these bits is only permitted while CSIGNCTL0.CSIGNPWR = 0. |
| CSIGNCTL1 | CSIGNLBM | Modification of this bit is only permitted while CSIGNCTL0.CSIGNPWR = 0. Setting of this bit is prohibited in slave mode. |
| CSIGNCTL1 | CSIGNSIT | Modification of this bit is only permitted while CSIGNCTL0.CSIGNPWR = 0. This bit is only valid in master mode. In slave mode, no delay is generated. |
| CSIGNCTL2 | CSIGNPRS[2:0] CSIGNBRS[11:0] | Modification of these bits is only permitted while CSIGNCTL0.CSIGNPWR = 0. Setting of the maximum transfer clock frequency is as follows. <ul style="list-style-type: none"> • Master mode: 8 MHz or less • Slave mode: 6.6 MHz or less |
| CSIGNSTR0 | CSIGNTSF | Writing to this bit is prohibited. Only reading this bit is enabled. |
| CSIGNSTR0 | CSIGNDCE CSIGNPE CSIGNOVE | Writing to these bits is prohibited. Only reading these bits is enabled. These bits are initialized when CSIGNCTL0.CSIGNPWR changes from 0 to 1 or from 1 to 0. |
| CSIGNBCTL0 | CSIGNSCE | To stop the next reception, this bit must be controlled at the following times. <ul style="list-style-type: none"> • When CSIGNSLIT is 0, clear this bit before reception of the last of the data (reading of that data from the CSIGNRX0 register). • When CSIGNSLIT is 1, clear this bit immediately after the second last data reception (reading of that data from the CSIGNRX0 register), up to 1 cycle of the CSIGNTSCK clock before the last CSIGNTIR (reception complete) interrupt. |
| CSIGNCFG0 | CSIGNPS[1:0] CSIGNDLS[3:0] CSIGNDIR CSIGNDAP | Modification of these bits is only permitted while CSIGNCTL0.CSIGNPWR = 0. |
| CSIGNTX0W | CSIGNEDL | This bit is valid only when CSIGNCTL1.CSIGNEDLE = 1. |
| CSIGNTX0W CSIGNTX0H | | Write access to these bits are prohibited when CSIGNCTL0.CSIGNTXE = CSIGNCTL0.CSIGNRXE = 0. |
| CSIGNRX0 | | These bits are initialized when CSIGNPWR in CSIGNCTL0 changes from 0 to 1 or from 1 to 0. It is prohibited to read these bits when CSIGNCTL0.CSIGNTXE = 0 and CSIGNCTL0.CSIGNRXE = 0. |

13.4 Interrupt Sources

CSIG can generate the following interrupts:

- INTCSIG0IC (Communication status interrupt)
- INTCSIG0IR (Reception status interrupt)
- INTCSIG0IRE (Communication error interrupt)

13.4.1 Interrupt Delay

In master mode, all interrupts generated by the master can be delayed by a half cycle of the transmission clock CSIGT_{SCK}. This function is not available in slave mode.

The delay is specified by setting bit CSIGN_{CTL1}.CSIGN_{SIT} = 1. (The setting of the CSIGN_{SIT} bit is invalid in slave mode.)

The following example illustrates the interrupt delay function, assuming a setting of CSIGN_{CTL1}.CSIGN_{SIT} = 1 (interrupt delay enabled), CSIGN_{CTL1}.CSIGN_{CKR} = 0, CSIGN_{CFG0}.CSIGN_{DAP} = 0 (normal clock and data phase), and CSIGN_{CFG0}.CSIGN_{DLS}[3:0] = 1000_B (data length 8 bits).

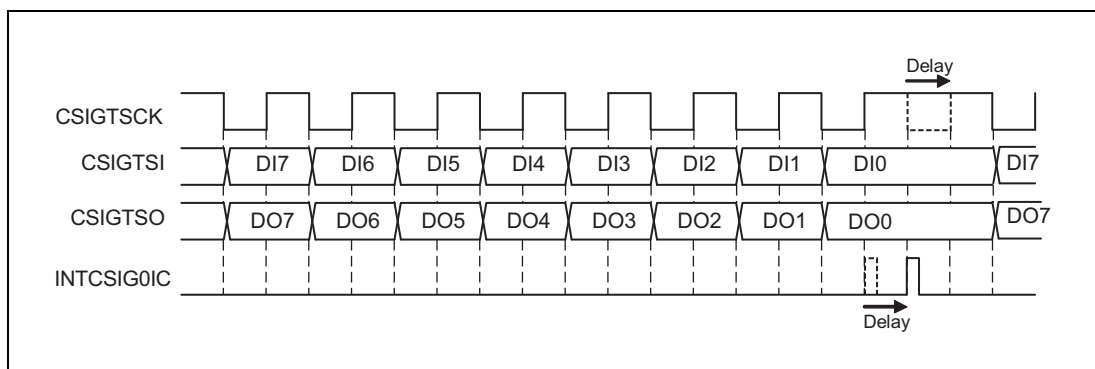

Figure 13.2 Interrupt Delay Function (CSIGN_{CTL1}.CSIGN_{SIT} = 1)

13.4.2 INTCSIG0IC (Communication Status Interrupt)

This interrupt is normally generated after every data transfer. It can be used to trigger a DMA for writing new transmission data to register CSIGNTX0W or CSIGNTX0H.

The following example assumes master mode and a setting of CSIGNCTL1.CSIGNSIT = 0 (no interrupt delay), CSIGNCTL1.CSIGNCKR = 0, CSIGNCFG0.CSIGNDAP = 0 (normal clock and data phase), CSIGNCFG0.CSIGNDLS[3:0] = 1000_B (data length 8 bits), and CSIGNCTL1.CSIGNSLIT = 0 (normal interrupt timing).

Figure 13.3 Generation of INTCSIG0IC after Communication (CSIGNCTL1.CSIGNSLIT = 0)

However, INTCSIG0IC can also be set up to occur when the CSIGNTX0W/H register is ready to store the next data. This is specified by setting CSIGNCTL1.CSIGNSLIT = 1.

This mode allows more efficient data transfers.

The effect is illustrated in the figure below.

Figure 13.4 Generation of INTCSIG0IC at the Beginning of Communication

13.4.3 INTCSIG0IR (Reception Status Interrupt)

This interrupt is generated in receive-only and transmit/receive mode after data has been received and is available in the reception register. It can be used to trigger a DMA for reading the received data from register CSIGNRX0.

The following example assumes master mode and a setting of CSIGNCTL1.CSIGNSIT = 0 (no interrupt delay), CSIGNCTL1.CSIGNCKR = 0, CSIGNCFG0.CSIGNDAP = 0 (normal clock and data phase), and CSIGNCFG0.CSIGNDLS[3:0] = 1000_B (data length 8 bits).

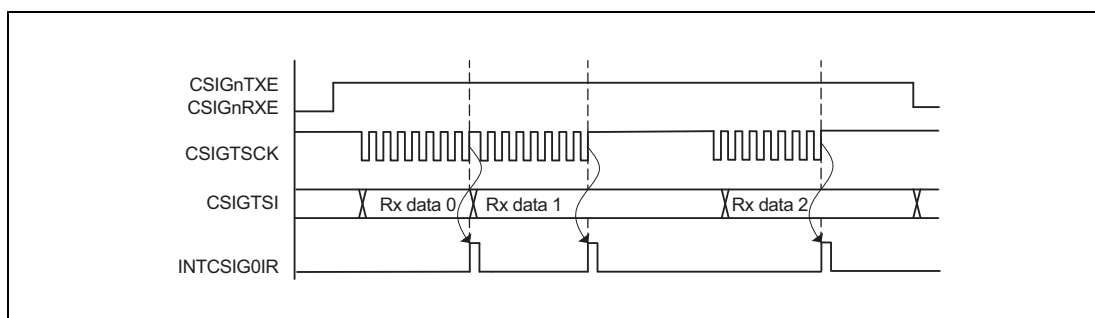

Figure 13.5 Generation of INTCSIG0IR

13.4.4 INTCSIG0IRE (Communication Error Interrupt)

This interrupt is generated whenever an error is detected.

Table 13.22 Data Error Types

| Error type | Communication Status after Error Interrupt | Remarks |
|------------------------------|--|--|
| Parity error | Interrupt is generated and communication continues | — |
| Data consistency check error | Interrupt is generated and communication continues | — |
| Overrun error* ¹ | When CSIGNCTL1.CSIGNHSE = 0 (handshake function disabled) in slave mode, communication continues even after an interrupt is generated. | When CSIGNCTL1.CSIGNHSE = 1 (handshake function enabled) in slave mode, communication stops due to handshake. No interrupt is generated and an overrun error does not occur. |

Note 1. Overrun error does not occur in master mode. In slave mode, communication cannot be stopped.

The type of error that caused the generation of INTCSIG0IRE is indicated in register CSIGNSTR0.

For details about the various error types refer to **Section 13.5.10, Error Detection**.

13.5 Operation

13.5.1 Master/Slave Mode

Whether CSIG operates in master mode or in slave mode depends on the setting of CSIGNCTL2.CSIGNPRS[2:0]. If master mode is selected, the source of the transmission clock must be selected, too.

13.5.1.1 Master Mode

In master mode, the serial communication clock is generated by the internal baud rate generator (BRG) and supplied to the slave via signal CSIGTSCCK.

Master mode is enabled by setting bits CSIGNCTL2.CSIGNPRS[2:0] to values other than 111_B. In master mode, the BRG frequency setting is enabled by setting bits CSIGNCTL2.CSIGNPRS[2:0] and bits CSIGNCTL2.CSIGNBRS[11:0].

The initial level of CSIGTSCCK depends on the CSIGTSCCK clock inversion function bit: it is high level when CSIGNCTL1.CSIGNCKR = 0, and is low level when CSIGNCTL1.CSIGNCKR = 1.

The example below shows the communication in master mode for 8-bit data, CSIGNCTL1.CSIGNCKR = 0, CSIGNCFG0.CSIGNDAP = 0, and MSB first:

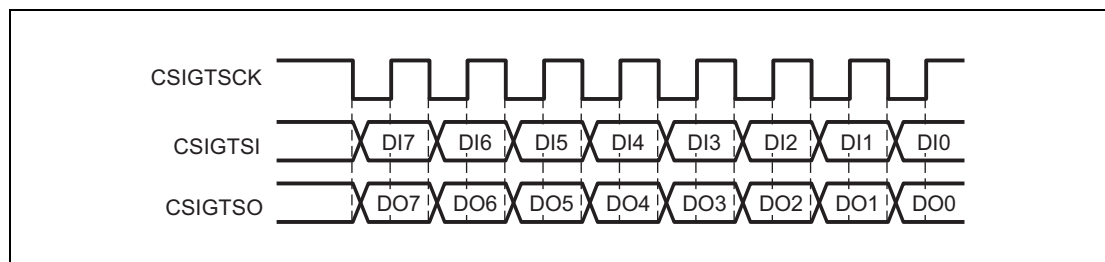

Figure 13.6 Transmit/Receive in Master Mode

13.5.1.2 Slave Mode

In slave mode, another device is the communication master. The external clock is supplied via the signal CSIGTSCK. Transmit/receive operation starts as soon as a clock signal is detected.

Slave mode is selected by setting CSIGnCTL2.CSIGnPRS[2:0] to 111_B.

NOTE

When using slave mode, disable the baud rate generator (BRG) by setting the CSIGnCTL2.CSIGnBRS[11:0] bits to 000_H.

The example below shows the communication in slave mode for 8-bit data, CSIGnCTL1.CSIGnCKR = 0, CSIGnCFG0.CSIGnDAP = 0, and MSB first:

Figure 13.7 Transmit/Receive in Slave Mode

13.5.2 Master/Slave Connections

13.5.2.1 One Master and One Slave

The following figure illustrates the connections between one master and one slave.

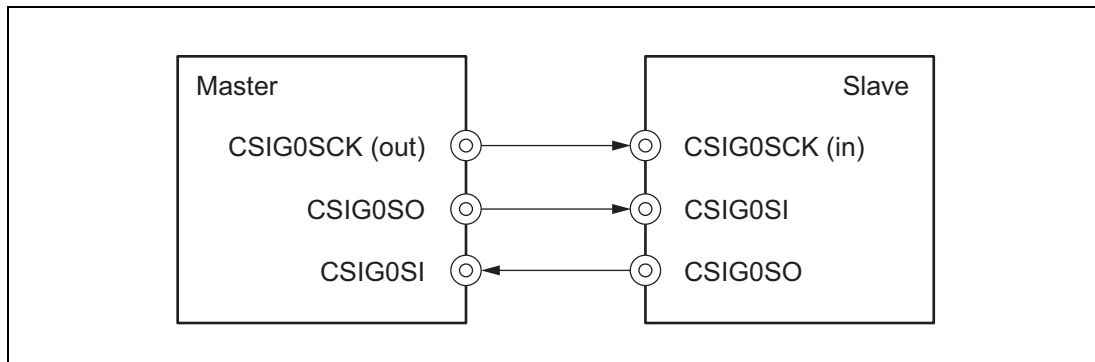

Figure 13.8 Direct Master/Slave Connection

13.5.3 Transmission Clock Selection

In master mode, the transfer clock frequency is selectable using the CSIGNPRS[2:0] and CSIGNBRS[11:0] bits in the CSIGNCTL2 register.

The following figure shows a block diagram of the BRG.

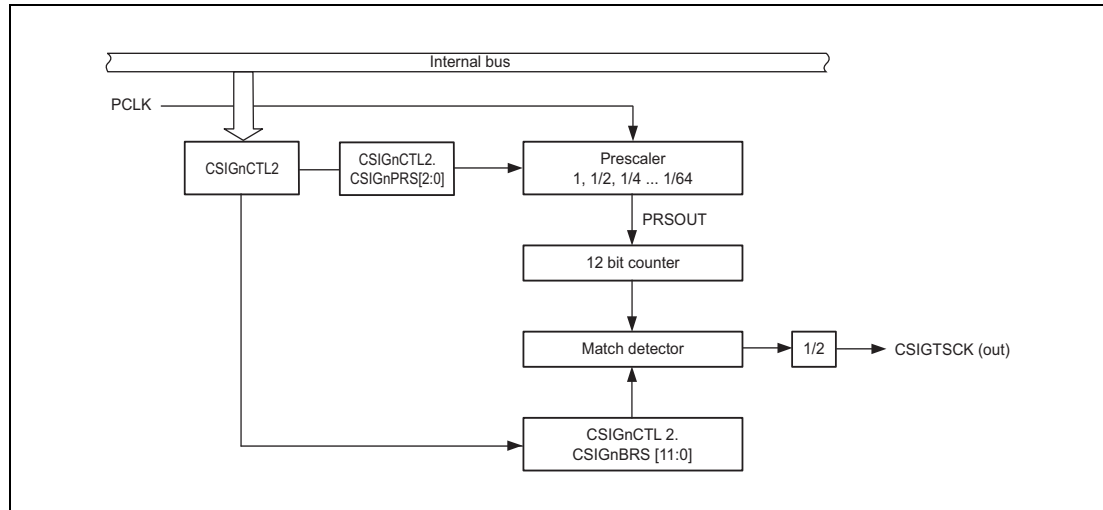

Figure 13.9 BRG Block Diagram

Clearing CSIGNCTL2.CSIGNBRS[11:0] to 000_H disables the BRG.

Calculation of transfer clock frequency

The transfer clock frequency in master mode is calculated by the following formula.

$$\text{Transfer clock frequency (CSIGTSCK)} = \text{PCLK} / (\text{PCLK's division ratio}) = \text{PCLK} / (2^\alpha \times k \times 2)$$

where:

$$\alpha = \text{CSIGNCTL2.CSIGNPRS}[2:0] = 0 \text{ to } 6$$

$$k = \text{CSIGNCTL2.CSIGNBRS}[11:0] = 1 \text{ to } 4095$$

Upper limit and lower limit of transfer clock frequency

Note the following when setting the transfer clock frequency.

- The maximum acceptable transfer clock frequency in master mode is 8 MHz.
- The maximum acceptable transfer clock frequency in slave mode is 6.66 MHz. (It must be confirmed that the transfer clock frequency of the external master is within this range.)
- The minimum transfer clock frequency in both modes is $\text{PCLK} / 524160$.

13.5.4 Data Transfer Modes

13.5.4.1 Transmit-Only Mode

Setting CSIGNCTL0.CSIGNTXE = 1 and CSIGNCTL0.CSIGNRXE = 0 puts the CSIG in transmit-only mode. Transmission starts when transmit data is written in the CSIGNTX0W or CSIGNTX0H register.

CAUTION

In case transmit-only mode has been entered after any reception mode, the data in the CSIGNRX0 buffer becomes undefined after completion of the first transmission. Consequently the reception register CSIGNRX0 has to be read before changing to transmit-only mode.

13.5.4.2 Receive-Only Mode

Setting CSIGNCTL0.CSIGNTXE = 0 and CSIGNCTL0.CSIGNRXE = 1 puts the CSIG in receive-only mode.

In master mode, reception starts when dummy data is read from the CSIGNRX0 register. Subsequent receptions are triggered by reads from the CSIGNRX0 register, as long as CSIGNBCTL0.CSIGNSCE = 1.

Moreover, CSIGNBCTL0.CSIGNSCE has to be set to 0 before reading the last received data from CSIGNRX0.

The recommended procedure is:

1. Set CSIGNBCTL0.CSIGNSCE = 1.
2. Before starting the first receive operation, read CSIGNRX0 (dummy data).
3. Wait for the reception interrupt INTCSIGOIR.
4. Read CSIGNRX0 (received data).
In case more data receptions follow at step 4, continue to read until all data is received.
Before reading the last received data from CSIGNRX0, set CSIGNBCTL0.CSIGNSCE = 0.

In slave mode, reception starts when the communication clock CSIGTSCK from the master is received. In this case, it is not necessary to read data to the CSIGNRX0 register of the slave.

NOTE

In slave mode, any previously received data must be read from the reception register CSIGNRX0 in order to avoid any overwrite situation.

13.5.4.3 Transmit/Receive Mode

Setting CSIGNCTL0.CSIGNTXE = 1 and CSIGNCTL0.CSIGNRXE = 1 puts the CSIG in transmit/receive mode.

Data transfer (transmission and reception) starts when transmit data is written to the CSIGNTX0W or CSIGNTX0H register.

13.5.5 Data Length Selection

13.5.5.1 Data Length Selection Without Extended Length

Transmission data length is selectable from 7 to 16 bits using the CSIGNDLS[3:0] bits in the CSIGNCFG0 register. The examples below show the communication with MSB first (CSIGNCFG0.CSIGNDIR = 0):

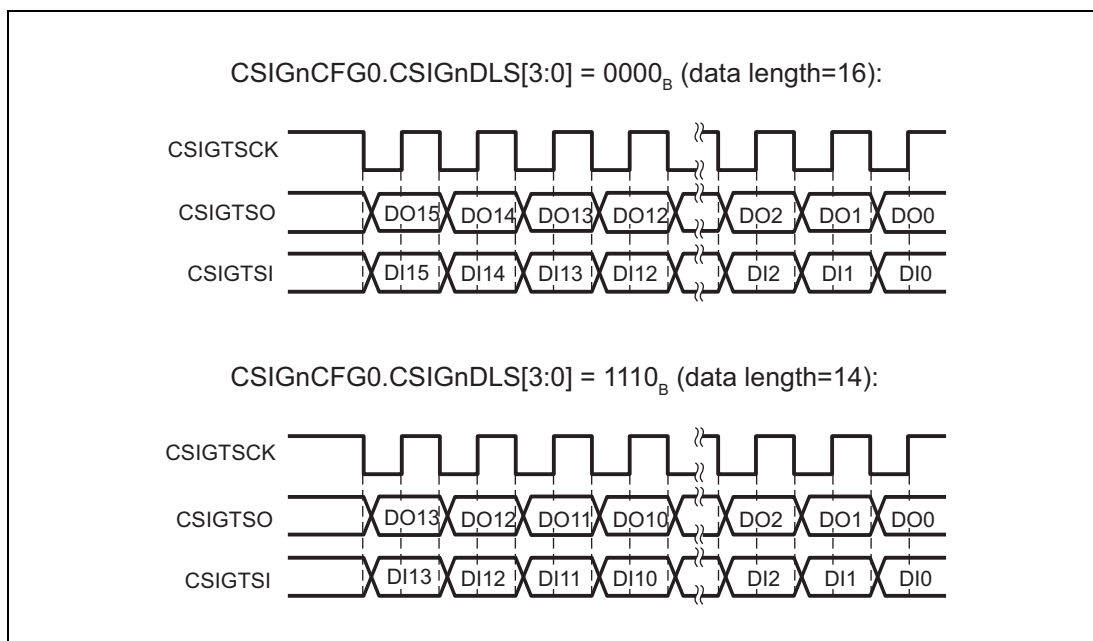

Figure 13.10 Data Length Selection Function

13.5.5.2 Data Length Selection with Extended Data Length

If the data to be sent/received exceeds 16 bits, the extended data length (EDL) feature can be used.

The EDL function is enabled by setting bit CSIGNCTL1.CSIGNEDLE to 1.

The EDL function works as follows:

- The data must be divided into 16-bit blocks and remainder. For example, 42-bit data is divided into two 16-bit blocks and 10 bits.
- The remainder bit length is set for CSIGNCFG0.CSIGNDLS[3:0] bits as “data length.”
- CSIGNTX0W.CSIGNEDL must be set to 1 to transmit 16-bit blocks. In this case, the data written to CSIGNTX0W is sent as a 16-bit data length regardless of the CSIGNCFG0.CSIGNDLS[3:0] bits.
- The transfer is complete after the data with the specified data length (the remainder with CSIGNTX0W.CSIGNEDL = 0) has been sent.

Example

Example of transmitting a 40-bit string 123456789A_H.

40 bits are split into 2 × 16 bits plus 8 bits.

- Initialize CSIGNCFG0.CSIGNDLS[3:0] = 8_D.
- To transmit 123456789A_H with MSB first, write the following sequence to CSIGNTX0W.
 - 2000 1234_H (CSIGNTX0W.CSIGNEDL = 1)
 - 2000 5678_H (CSIGNTX0W.CSIGNEDL = 1)
 - 0000 009A_H (CSIGNTX0W.CSIGNEDL = 0)

The following figure illustrates the timing.

Figure 13.11 EDL Timing Diagram

NOTES

1. A data length of less than 7 bits can be set only when EDL mode is used.
2. It is not possible to transmit two consecutive data with a data length of less than 7 bits.
3. If parity is enabled, the parity bit is added after the last bit.
4. The following describes data direction using an example below.
 - Transmit data: 123456_H
 - MSB first:
 - Set CSIGNCFG0.CSIGNDIR to 0.
 - Write CSIGNTX0W = 2000 1234_H. (EDL bit = 1)
 - Write CSIGNTX0W = 0000 0056_H. (EDL bit = 0)
 - LSB first:
 - Set CSIGNCFG0.CSIGNDIR to 1.
 - Write CSIGNTX0W = 2000 3456_H. (EDL bit = 1)
 - Write CSIGNTX0W = 0000 0012_H. (EDL bit = 0)
5. EDL mode is not available in receive-only mode of slave mode. (CSIGNCTL2.CSIGNPRS[2:0] = 111_B, CSIGNCTL0.CSIGNTXE = 0, CSIGNCTL0.CSIGNRXE = 1)

13.5.6 Serial Data Direction Selection Function

The serial data direction is selectable using the CSIGNDIR bit in the CSIGNCFG0 register. The examples below show the communication for 8-bit data (CSIGNCFG0.CSIGNDLS[3:0] = 1000_B):

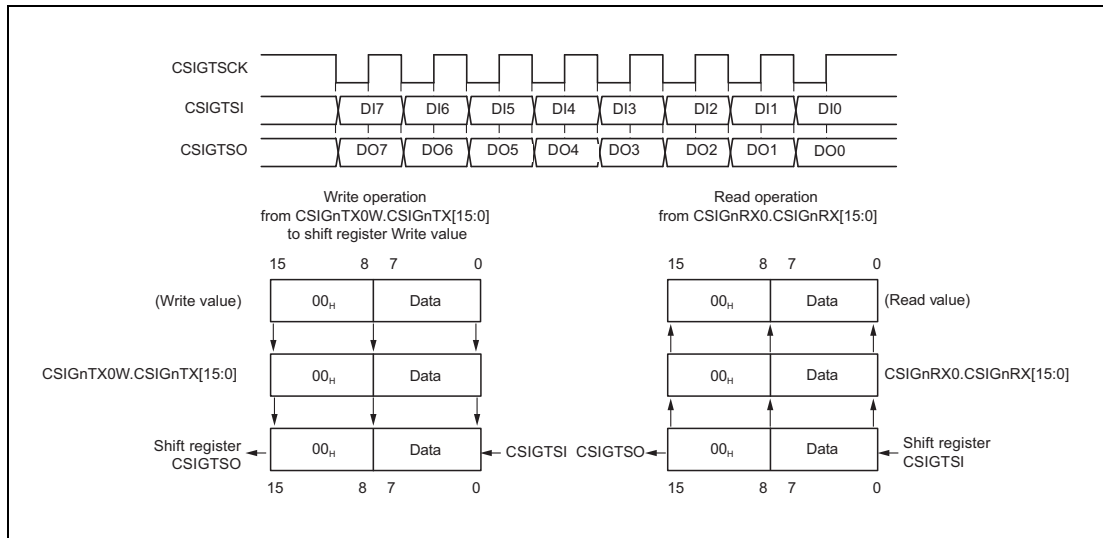

Figure 13.12 Serial Data Direction Select Function — MSB First (CSIGNDIR = 0)

Figure 13.13 Serial Data Direction Select Function — LSB First (CSIGNDIR = 1)

13.5.7 Communication Timing in Slave Mode

The following figure illustrates the communication signals and timings in slave mode.

Figure 13.14 Transmit/Receive Communication Timing in Slave Mode

1. CSIG is put into slave mode (Set CSIGnCTL2.CSIGnPRS[2:0] to 111_B)
2. The data length is 8 bits (CSIGnCFG0.CSIGnDLS[3:0] = 1000_B)
The data direction is MSB first (CSIGnCFG0.CSIGnDIR = 0)
3. CSIG is set to transmit/receive mode (CSIGnCTL0.CSIGnPWR = 1, CSIGnCTL0.CSIGnTXE = 1, CSIGnCTL0.CSIGnRXE = 1)
4. When transfer data is written to the CSIGnTX0W transmission register or CSIGnTX0H register, the transfer status flag CSIGnSTR0.CSIGnTSF is automatically set.
5. When external clock signal is detected as CSIGTSCK signal, the slave immediately transmits the data to CSIGTSO and, at the same time, captures the data transmitted from CSIGTSI.
6. The CSIGnRX0 register can be read.

13.5.8 Handshake Function

CSIG features a handshake function to synchronize the master and the slave devices. This function can be enabled/disabled by bit CSIGNCTL1.CSIGNHSE. For handshake, the CSIGTRYI and CSIGTRYO signals are used.

The timing depends on the setting of the data phase selection bit CSIGNCFG0.CSIGNDAP.

13.5.8.1 Slave Mode

If CSIGNCTL1.CSIGNHSE = 1, a low-level CSIGTRYO signal is output when the slave becomes busy. This happens when previously received data is still in the CSIGNRX0 register, and new data cannot be copied from the shift register to CSIGNRX0 (CSIGNRX0 full condition).

The following examples assume a data length of 8 bits.

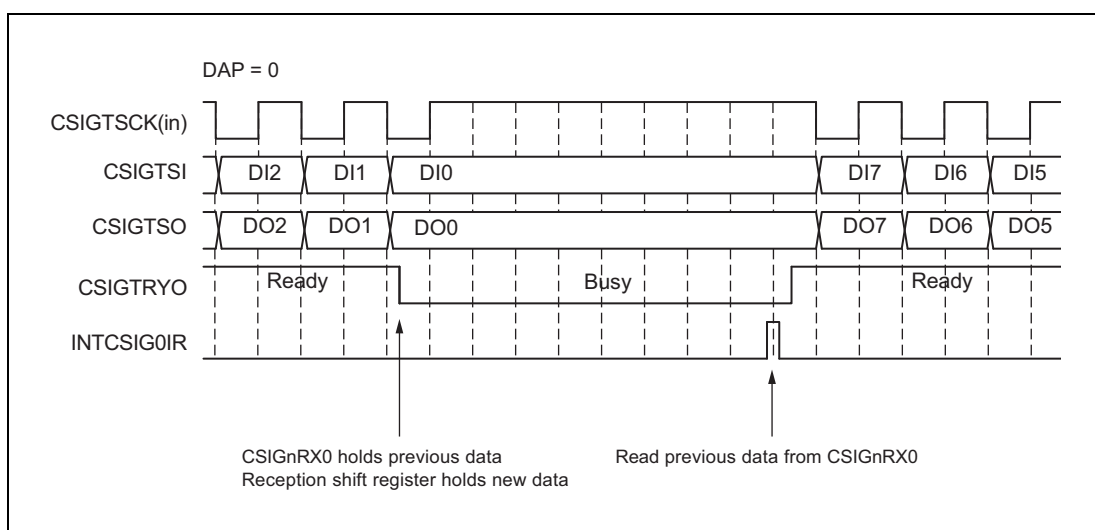

Figure 13.15 Ready/Busy Signal from Slave (CSIGNCFG0.CSIGNDAP = 0)

While the slave is busy, the master has to wait (i.e. suspend the transmission clock). The slave sets CSIGTRYO to high (“ready”) as soon as the reception register CSIGNRX0 has been read.

Figure 13.16 Ready/Busy Signal from Slave (CSIGNCFG0.CSIGNDAP = 1)

13.5.8.2 Master Mode

When the master detects low level of the CSIGTRYI while CSIGNCTL1.CSIGNHSE is 1, the subsequent transmission is put on hold, the master goes into wait state and suspends the clock at CSIGTSCK.

The CSIGTRYI level is checked at each half clock cycle of CSIGTSCK.

Figure 13.17 Master’s Reaction to CSIGTRYI (CSIGNCFG0.CSIGNDAP = 0)

If the CSIGTRYI low signal from the slave is received while data transfer is in progress, the serial clock is suspended after the transfer is complete.

The master resumes the communication as soon as CSIGTRYI becomes high (slave is “ready”).

Figure 13.18 Master’s Reaction to CSIGTRYI (CSIGNCFG0.CSIGNDAP = 1)

CAUTION

CSIGTRYI must be pulled down by the slave before the next transfer starts. Even if the signal is pulled down by the slave during the transfer, the transfer will continue until it is finished.

13.5.9 Loop-Back Mode

Loop-back mode is a special mode for self-test. This feature is only available in master mode.

When this mode is active ($\text{CSIGNCTL1.CSIGNLBM} = 1$), the transmit and receive signals are internally connected, as shown in the figures below. The signals CSIGTSCCK, CSIGTSO, and CSIGTSI are disconnected from the ports. In addition, the CSIGTSO output level is fixed to low, and CSIGTSCCK is set to the reset level (high). The rest of CSIG works as in normal operation.

In order to test the CSIG, set operating mode to loop-back mode and carry out normal transfer operations.

Table 13.23 Output Level of Pins

| Pin Name | Output Level |
|-----------------|---|
| CSIGTSCCK (out) | High level |
| CSIGTSO | Low level (independent of the last value) |
| Interrupt | Normal function |
| CSIGTRYO | Normal function (low level) |

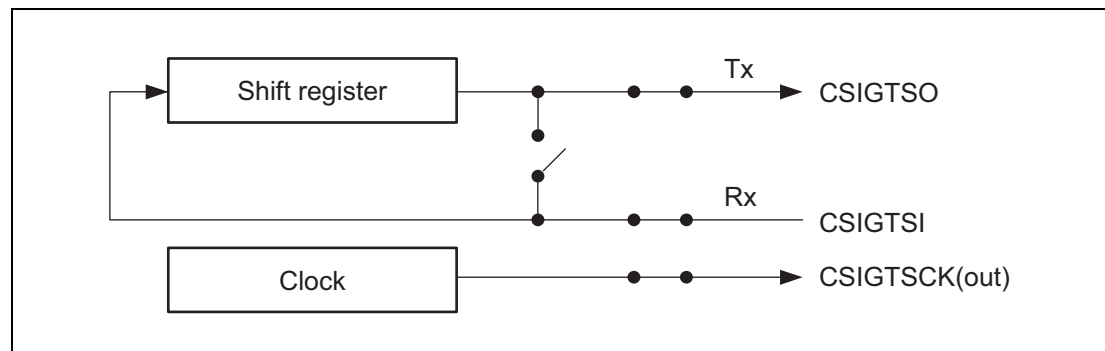

Figure 13.19 Normal Operation

Figure 13.20 Operation in Loop-Back Mode

13.5.10 Error Detection

CSIG can detect three error types:

- Data consistency check error (transmission data)
- Parity error (reception data)
- Overrun error (reception data)

The data consistency check error/parity error check function can be individually enabled or disabled.

If one of these errors is detected, the interrupt INTCSIG0IRE is generated.

13.5.10.1 Data Consistency Check

The purpose of the data consistency check is to ensure that the data physically sent to the output pin is identical to the original data that was copied to the shift register.

The data consistency check can be enabled/disabled by bit CSIGNCTL1.CSIGNDCS. (When executing a data consistency check, always set CSIGTSO to PIPCN.PIPCN_m = 1). It will not be enabled if data transmission is disabled (CSIGNCTL0.CSIGNTXE = 0).

When the data consistency check is enabled, the data transferred from CSIGNTX0W or CSIGNTX0H to the shift register is copied to a separate register. In addition, the physical levels of CSIGTSO are captured and the logical interpretation is written to a separate shift register.

After completion of the transmission, the data sent is compared with the original transmission data.

Mismatch is considered as a data consistency check error and:

- Interrupt INTCSIG0IRE is generated.
- Bit CSIGNSTR0.CSIGNDCE is set.

The data consistency check function is illustrated in the following block diagram.

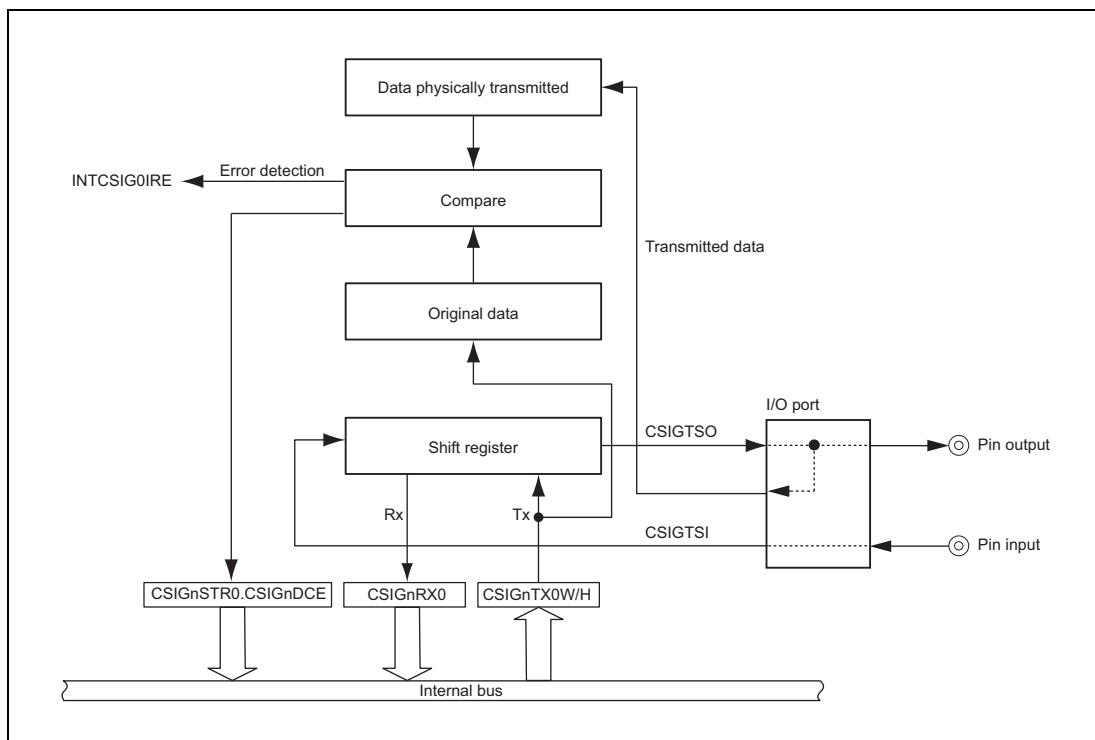

Figure 13.21 Functional Block Diagram of the Data Consistency Check

13.5.10.2 Parity Check

Parity is a common means to detect a single bit error during data transmission. CSIG can append a parity bit to the last data bit (even if extended data length is used).

The use and type of parity is specified by CSIGNCFG0.CSIGNPS[1:0].

Parity check is enabled if CSIGNCFG0.CSIGNPS[1] = 1.

The parity bit is checked after reception is complete. If a parity error occurs:

- Interrupt INTCSIG0IRE is generated
- Bit CSIGNSTR0.CSIGNPE is set

The following figure shows an example.

Data length is 8 bits. The data transmitted is 05_H and 35_H. Parity type is odd.

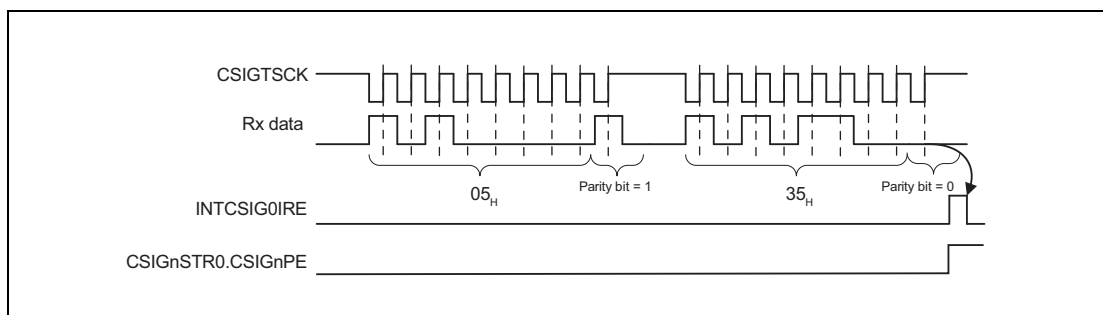

Figure 13.22 Parity Check Example

For the first 8 bits, the parity bit is 1. There is no parity error, because the total number of ones (including the parity bit) is odd.

For the second 8 bits, the parity bit is 0. This is detected as a parity error, because the total number of ones (including the parity bit) is even.

When the extended data length (EDL) feature is used, a parity bit is added after the last bit of the data.

13.5.10.3 Overrun Error

This error occurs when previously received data still resides in the reception register CSIGnRX0 because it has not been read and new data is received.

The overrun error is not generated if data reception is disabled (CSIGnCTL0.CSIGnRXE = 0).

If an overrun error occurs:

- Interrupt INTCSIG0IRE is generated.
- Bit CSIGnSTR0.CSIGnOVE is set.
- The data of the CSIGnRX0 register is overwritten and communication continues.

The following figure illustrates the overrun error detection function.

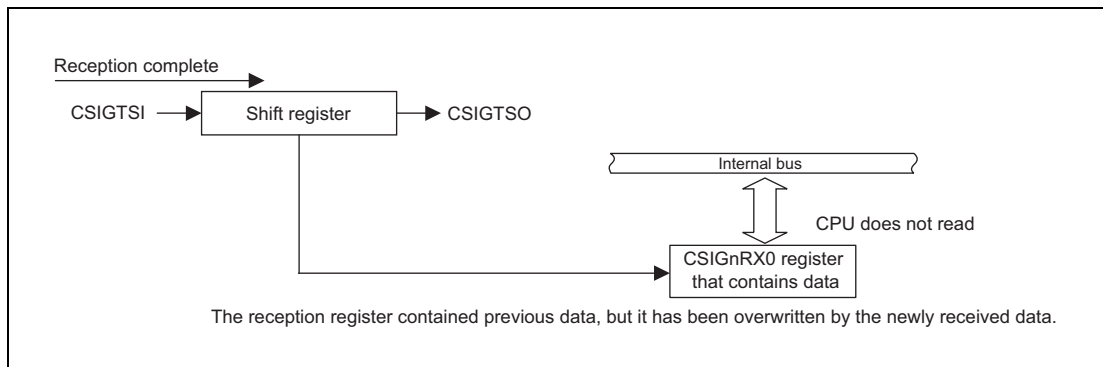

Figure 13.23 Overrun Error Detection

The following figure illustrates an example where:

- Rx data 3 is not read
- Rx data 4 is received and data is overwritten.

Thus an overrun error occurs.

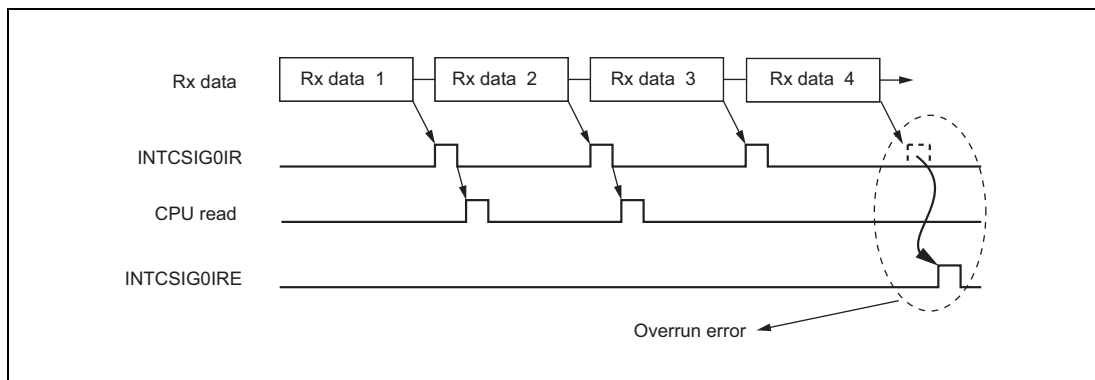

Figure 13.24 Overrun Error Detection - Example

NOTE

An Rx data overrun error can be avoided by using the handshake.

When handshake is used in slave mode, the receiver (slave) signals to the transmitter (master) that it is busy. The transmitter then waits until the receiver reads its reception register and becomes ready again.

For details see **Section 13.5.8, Handshake Function.**

13.6 Operating Procedures

13.6.1 Transmission/Reception by DMA in Master Mode

This section describes an example of performing the transmission/reception in master mode in combination with a DMA.

The following instructions are based on the assumption that:

- Transmission data length is 8 bits (CSIGnCFG0.CSIGnDLS[3:0] = 1000_B)
- MSB is transmitted first (CSIGnCFG0.CSIGnDIR = 0)
- INTCSIG0IC interrupt at the end of the transfer (CSIGnCTL1.CSIGnSLIT = 0)
- Normal clock and data phase (CSIGnCTL1.CSIGnCKR = 0, CSIGnCFG0.CSIGnDAP = 0)
- The number of data is 10 (0 to 9)

Figure 13.25 Communication in Master Mode

Procedure:

1. Set the communication protocol in the CSIGnCFG0 register. Specify interrupt timing, operating mode, etc. by setting corresponding bits in the CSIGnCTL1 register and the CSIGnCTL2 register.
2. In the CSIGnCTL0 register, set CSIGnPWR = 1 (enable clock), CSIGnTXE = 1 (enable transmission), and CSIGnRXE = 1 (enable reception).
3. Write the first transmit data to be sent to the transmission register CSIGnTX0H. Transmission starts automatically when the first data becomes available.
4. Write the second data to CSIGnTX0H. Writing the second data immediately after the first one avoids unnecessary delays between the data.

5. Each time one data block has been transmitted or received, interrupt INTCSIG0IC or INTCSIG0IR is generated. INTCSIG0IC indicates that the next data can be written to CSIGNTX0H.
6. No more write action is required after completion of transmission of data 8. Data 9 (the last data) has been written after transmission of data 7.
However, the reception register CSIGNRX0 must be read after data 8 and data 9 have been received.
7. Finally, to disable the transmit/receive operation, clear CSIGNCTL0.CSIGNTXE and CSIGNCTL0.CSIGNRXE. When no communication is taking place, set CSIGNCTL0.CSIGNPWR to "0" to minimize the power consumption of the CSIGN.

Section 14 Clocked Serial Interface H (CSIH)

The Clocked Serial Interface (CSI) module is a serial data link also well known as SPI, serial peripheral interface. The CSI bus is a synchronous serial data link standard normally operating in full duplex mode via a 3-wire serial I/O. Communication is set up in master/slave mode where the master initiates the data frame and provides the clock. Multiple slave communication is possible with additional individual chip select (slave select) lines. CSIH is implemented 4 units.

14.1 Features of RH850/P1M-E CSIH

14.1.1 Number of Units

This microcontroller has the following number of CSIH units.

Each CSIH unit has one channel interface.

Table 14.1 Number of Units

| Product Name | RH850/P1M-E 100 pins | RH850/P1M-E 144 pins |
|-----------------|-------------------------|-------------------------|
| Number of Units | 4 | |
| Name | CSIHn (n = 0 to 3) | |

Table 14.2 CSIH Unit Configurations and Channels

| Unit Name (Channel Name) CSIHn | Channels per Unit | RH850/P1M-E 100 pins (4 ch) | RH850/P1M-E 144 pins (4 ch) |
|--------------------------------------|----------------------|-----------------------------------|-----------------------------------|
| CSIH0 | 1 | | √ |
| CSIH1 | 1 | | √ |
| CSIH2 | 1 | | √ |
| CSIH3 | 1 | | √ |

Note: The channel names are same as those of the corresponding units.

The following table lists the values indicated by the index of each product.

Table 14.3 Index

| Index | Description |
|-------|---|
| n | Throughout this section, the individual CSIH units are identified by the index "n" (n = 0 to 3): for example, CSIHnCTL0 is the CSIHn control register0. |
| x | CSIHn has up to 8 chip select signals. Throughout this section, the individual chip select signals are identified by the index "x": that is, CSx denotes a specified chip select signal. For the index "x", refer to Table 14.4, Number of Chip Select Signals . |
| y | A variable used for explanation is identified by the index "y" (y=0 to 3): for example, CSIHnBRSy the baud rate setting register of CSIHn. |

The numbers of chip select signals for each of the CSIH units are listed in the following table.

Table 14.4 Number of Chip Select Signals

| Unit Name | Chip Select Index | |
|-----------|-------------------|------------------|
| | 100 pins | 144 pins |
| CSIH0 | CSx (x = 0 to 7) | CSx (x = 0 to 7) |
| CSIH1 | CSx (x = 0 to 3) | CSx (x = 0 to 7) |
| CSIH2 | CSx (x = 0 to 7) | CSx (x = 0 to 7) |
| CSIH3 | CSx (x = 0 to 7) | CSx (x = 0 to 7) |

14.1.2 Register Base Address

CSIH base addresses are listed in the following table.

CSIH register addresses are given as offsets from the base addresses throughout the section.

Table 14.5 Register Base Addresses

| Base Address Name | Base Address |
|-------------------|------------------------|
| <CSIH0_base> | FFD8 0000 _H |
| <CSIH1_base> | FFD8 2000 _H |
| <CSIH2_base> | FFD8 4000 _H |
| <CSIH3_base> | FFD8 6000 _H |

14.1.3 Clock Supply

Clock supply by and to CSIH is listed in the following table.

Table 14.6 Clock Supply

| Unit Name | Unit Clock Name | Supply Clock Name |
|-----------|-----------------|-------------------------------------|
| CSIHn | PCLK | High-speed peripheral clock CLK_HSB |

14.1.4 Interrupt Requests

CSIH interrupt requests are listed in the following table.

Table 14.7 Interrupt Requests

| Unit Interrupt Name | Description | Interrupt Number | DMA/DTS Trigger Number |
|---------------------|---|------------------|------------------------|
| CSIH0 | | | |
| INTCSIH0IRE | CSIH0 communication error interrupt | 82 | — |
| INTCSIH0IR0S | CSIH0 receive status/ CS0 receive status interrupt | 83 | 65 |
| INTCSIH0IC0S | CSIH0 communication status/ CS0 communication status interrupt | 84 | 66 |
| INTCSIH0IR1 | CSIH0 CS1 receive status interrupt | 85 | 67 |
| INTCSIH0IC1 | CSIH0 CS1 communication status interrupt | 86 | 68 |
| INTCSIH0IR2 | CSIH0 CS2 receive status interrupt | 87 | 69 |
| INTCSIH0IC2 | CSIH0 CS2 communication status interrupt | 88 | 70 |
| INTCSIH0IJC | CSIH0 job completion interrupt | 89 | 71 |
| CSIH1 | | | |
| INTCSIH1IRE | CSIH1 communication error interrupt | 90 | — |
| INTCSIH1IR0S | CSIH1 receive status/CS0 receive status interrupt | 91 | 72 |
| INTCSIH1IC0S | CSIH1 communication status/CS0 communication status interrupt | 92 | 73 |
| INTCSIH1IR1 | CSIH1 CS1 receive status interrupt | 93 | 74 |
| INTCSIH1IC1 | CSIH1 CS1 communication status interrupt | 94 | 75 |
| INTCSIH1IR2 | CSIH1 CS2 receive status interrupt | 95 | 76 |
| INTCSIH1IC2 | CSIH1 CS2 communication status interrupt | 96 | 77 |
| INTCSIH1IJC | CSIH1 job completion interrupt | 97 | 78 |
| CSIH2 | | | |
| INTCSIH2IRE | CSIH2 communication error interrupt | 98 | — |
| INTCSIH2IR | CSIH2 receive status interrupt | 99 | 79 |
| INTCSIH2IC | CSIH2 communication status interrupt | 100 | 80 |
| INTCSIH2IJC | CSIH2 job completion interrupt | 101 | 81 |
| CSIH3 | | | |
| INTCSIH3IRE | CSIH3 communication error interrupt | 102 | — |
| INTCSIH3IR | CSIH3 receive status interrupt | 103 | 82 |
| INTCSIH3IC | CSIH3 communication status interrupt | 104 | 83 |
| INTCSIH3IJC | CSIH3 job completion interrupt | 105 | 84 |

14.1.5 Reset Sources

Please refer to **Section 8, Reset Controller**.

14.1.6 External Input/Output Signals

External input/output signals of CSIH are listed below.

Table 14.8 External Input/Output Signals

| Unit Signal Name | I/O | Description | Alternative Port Pin Signal |
|------------------------------|-----|----------------------------|------------------------------|
| CSIH0 | | | |
| CSIHTSCK | I | Serial clock signal input | CSIH0SCI |
| | O | Serial clock signal output | CSIH0SCO |
| CSIHTSI | I | Serial data input signal | CSIH0SI |
| $\overline{\text{CSIHTSSI}}$ | I | Slave select input signal | $\overline{\text{CSIH0SSI}}$ |
| CSIHTRYI | I | Ready/busy input signal | CSIH0RYI |
| CSIHTSO | O | Serial data output signal | CSIH0SO |
| CSIHTRYO | O | Ready/busy output signal | CSIH0RYO |
| CSIHTCSS[7:0]* ¹ | O | Chip select signal | CSIH0CSS[7:0]* ¹ |
| CSIH1 | | | |
| CSIHTSCK | I | Serial clock signal input | CSIH1SCI |
| | O | Serial clock signal output | CSIH1SCO |
| CSIHTSI | I | Serial data input signal | CSIH1SI |
| $\overline{\text{CSIHTSSI}}$ | I | Slave select input signal | $\overline{\text{CSIH1SSI}}$ |
| CSIHTRYI | I | Ready/busy input signal | CSIH1RYI |
| CSIHTSO | O | Serial data output signal | CSIH1SO |
| CSIHTRYO | O | Ready/busy output signal | CSIH1RYO |
| CSIHTCSS[7:0]* ¹ | O | Chip select signal | CSIH1CSS[7:0]* ¹ |
| CSIH2 | | | |
| CSIHTSCK | I | Serial clock signal input | CSIH2SCI |
| | O | Serial clock signal output | CSIH2SCO |
| CSIHTSI | I | Serial data input signal | CSIH2SI |
| $\overline{\text{CSIHTSSI}}$ | I | Slave select input signal | $\overline{\text{CSIH2SSI}}$ |
| CSIHTRYI | I | Ready/busy input signal | CSIH2RYI |
| CSIHTSO | O | Serial data output signal | CSIH2SO |
| CSIHTRYO | O | Ready/busy output signal | CSIH2RYO |
| CSIHTCSS[7:0]* ¹ | O | Chip select signal | CSIH2CSS[7:0]* ¹ |
| CSIH3 | | | |
| CSIHTSCK | I | Serial clock signal input | CSIH3SCI |
| | O | Serial clock signal output | CSIH3SCO |
| CSIHTSI | I | Serial data input signal | CSIH3SI |
| $\overline{\text{CSIHTSSI}}$ | I | Slave select input signal | $\overline{\text{CSIH3SSI}}$ |
| CSIHTRYI | I | Ready/busy input signal | CSIH3RYI |
| CSIHTSO | O | Serial data output signal | CSIH3SO |
| CSIHTRYO | O | Ready/busy output signal | CSIH3RYO |
| CSIHTCSS[7:0]* ¹ | O | Chip select signal | CSIH3CSS[7:0]* ¹ |

Note 1. For the number of chip select signals, refer to **Table 14.4, Number of Chip Select Signals**.

14.1.7 Data Consistency Check

The following table lists the port pins on which CSIHnSO pin functions are multiplexed and whether or not the CSIHnSO pin functions support data consistency checking. Refer to **Section 14.5.12, Error Detection** for details on data consistency checking.

Table 14.9 Data Consistency Checking and Port Pins

| Unit Signal Name | Port Pin Name | Alternative Function | Data Consistency Checking |
|------------------|---------------|----------------------|---------------------------|
| CSIH0 | | | |
| CSIHTSO | P2_5 | ALT-OUT6 | Supported |
| | P2_12*1 | ALT-OUT6 | Supported |
| | P3_0*1 | ALT-OUT5 | Supported |
| | P3_7 | ALT-OUT1 | Supported |
| CSIH1 | | | |
| CSIHTSO | P2_8 | ALT-OUT3 | Supported |
| | P4_0 | ALT-OUT1 | Supported |
| CSIH2 | | | |
| CSIHTSO | P1_3 | ALT-OUT4 | Supported |
| | P2_1 | ALT-OUT2 | Supported |
| | P4_5 | ALT-OUT1 | Supported |
| | P5_14 | ALT-OUT5 | Not supported |
| CSIH3 | | | |
| CSIHTSO | P1_3 | ALT-OUT6 | Supported |
| | P2_5 | ALT-OUT4 | Supported |

Note 1. Available for 144-pin devices.

14.1.8 Combinations of Pins and Ports

Combinations of CSIH pins and ports are listed in the following table.

Table 14.10 Combinations of pins and ports (1/2)

| Function | Pin Name | Port Name | | | |
|----------|-----------------------|--|---------|--------------------|---------------------|
| | | Group 1 | Group 2 | Group 3 | Group 4 |
| CSIH0 | CSIH0CSS0 | P3_12 | | | |
| | CSIH0CSS1 | P3_13 | | | |
| | CSIH0CSS2 | P2_4 / P2_14* ¹ | | | |
| | CSIH0CSS3 | P2_5 / P2_13* ¹ | | | |

Note 1. Available in devices with 144-pin.

14.2 Overview

14.2.1 Functional Overview

- Three-wire serial synchronous data transfer
- Master mode and slave mode selectable
- Supports multiple slaves configuration and RCB (Recessive Configuration for Broadcasting) thanks to eight configurable chip select output signals
- Slave select input signal ($\overline{\text{CSIHTSSI}}$) is available.
- Built-in baud rate generator
- Transfer clock frequency is adjustable in master mode, and in slave mode, it is determined by input clock.
- Maximum transfer clock frequency:
 - in master mode: 10 MHz
 - in slave mode: 6.66 MHz
- Phase of clock and data selectable
- Data transfer with MSB or LSB first selectable
- Transfer data length selectable from 2 to 16 bits in 1-bit units
- Provided with on-chip EDL (Extended Data Length) function for transferring data with more than 16 bits.
- Three selectable transfer modes:
 - transmit-only mode
 - receive-only mode
 - transmit/receive mode
- Built-in handshake function
- Provided with on-chip error detection function (data consistency check, parity, timeout, overflow, and overrun).
- Supporting job concept
- 128 words I/O buffer memory
- Direct access mode and memory mode (FIFO, dual buffer, transmit-only buffer) is selectable.
- Four different interrupt request signals (INTCSIHnIC, INTCSIHnIR, INTCSIHnIRE, INTCSIHnJC)
- Provided with on-chip LBM (Loop Back Mode) function for self-test.
- CPU-controlled high-priority communication function
- Enforced chip select idle setting
- Provided with RCB (Recessive Configuration for Broadcasting) bit for broadcasting.

14.2.2 Functional Overview Description

The CSIH uses three signals for communication:

- Transmission clock CSIH_TSCK (output in master mode, input in slave mode)
- Data output signal CSIH_TSO
- Data input signal CSIH_TSI

Additional signals are available for external control and monitoring:

- $\overline{\text{CSIH}}\text{TSSI}$: Slave select input signal
- CSIH_TRYO: Ready/busy output signal (handshake signal)
- CSIH_TRYI: Ready/busy input signal (handshake signal)
- CSIH_TCSS[7:0]: Chip select signals

Data transmission is bit-wise and serial, and synchronous to the transmission clock.

The following table shows the most important registers for setting up the CSIH.

Table 14.11 Main Registers of CSIH

| Register | Function |
|------------|--|
| CSIHnCTL0 | Enables/disables serial clock, and permits/ prohibits data transmission and data reception. Defines end-of-job behavior and enables/disables buffering (bypass of the buffer). |
| CSIHnCTL1 | Controls options such as interrupt timing, extended data length, job feature, data consistency check, loop-back mode, handshake, etc. |
| CSIHnCTL2 | Selects master mode or slave mode, and selects transfer clock frequency for the on-chip baud rate generator (BRG) in master mode. |
| CSIHnBRSy | Sets transfer clock frequency for each chip select signal. |
| CSIHnMCTL0 | Selects memory mode and specifies the time-out value. |
| CSIHnMCTL1 | Controls the memory in FIFO mode. |
| CSIHnMCTL2 | Controls the memory in dual buffer mode. |
| CSIHnCFGx | Registers to configure the communication protocol for each chip select signal. |

14.2.3 Block Diagram

The following block diagram shows the main components of the CSIH.

Figure 14.1 CSIH Block Diagram

In master mode, the transmission clock CSIHnTSCk is generated by the built-in baud rate generator (BRG). In slave mode, the transmission clock is supplied by an external source.

The built-in memory can be configured as FIFO, dual buffer (separate transmit and receive buffers), or transmit-only buffer. It can also be bypassed for data transmission and reception without buffering.

The loop back circuit disconnects the CSIH completely from the ports and supports internal self-test.

NOTE

This chapter describes the following modes:

- The “operating mode” is either master mode or and slave mode. In this context, only a master can control and communicate with several slaves (for details, see **Section 14.5.1, Operating Modes (Master/Slave)**).
- The “job mode” is related to the AUTOSAR job concept (for details, see **Section 14.5.3.3, Job Concept**).
- The “memory mode” accords with the various configurations of the associated buffer memory (for details, see **Section 14.5.6, CSIH Buffer Memory**).
- The “data transfer mode” specifies the type of communication – transmit-only, receive only, or transmit/receive (for details, see **Section 14.5.7, Data Transfer Modes**).

14.3 Registers

14.3.1 List of Registers

CSIH registers are listed in the following table.

The base addresses <CSIH_base> of the CSIHn is defined in **Section 14.1.2, Register Base Address**.

Table 14.12 List of Registers

| Module | Register Name | Symbol | Address |
|--------|---|------------|----------------------------------|
| CSIHn | CSIHn control register 0 | CSIHnCTL0 | <CSIHn_base> + 0000 _H |
| CSIHn | CSIHn control register 1 | CSIHnCTL1 | <CSIHn_base> + 0010 _H |
| CSIHn | CSIHn control register 2 | CSIHnCTL2 | <CSIHn_base> + 0014 _H |
| CSIHn | CSIHn status register 0 | CSIHnSTR0 | <CSIHn_base> + 0004 _H |
| CSIHn | CSIHn status clear register 0 | CSIHnSTCR0 | <CSIHn_base> + 0008 _H |
| CSIHn | CSIHn memory control register 0 | CSIHnMCTL0 | <CSIHn_base> + 1040 _H |
| CSIHn | CSIHn memory control register 1 | CSIHnMCTL1 | <CSIHn_base> + 1000 _H |
| CSIHn | CSIHn memory control register 2 | CSIHnMCTL2 | <CSIHn_base> + 1004 _H |
| CSIHn | CSIHn memory read/write pointer register 0 | CSIHnMRWP0 | <CSIHn_base> + 1018 _H |
| CSIHn | CSIHn configuration register 0 | CSIHnCFG0 | <CSIHn_base> + 1044 _H |
| CSIHn | CSIHn configuration register 1 | CSIHnCFG1 | <CSIHn_base> + 1048 _H |
| CSIHn | CSIHn configuration register 2 | CSIHnCFG2 | <CSIHn_base> + 104C _H |
| CSIHn | CSIHn configuration register 3 | CSIHnCFG3 | <CSIHn_base> + 1050 _H |
| CSIHn | CSIHn configuration register 4 | CSIHnCFG4 | <CSIHn_base> + 1054 _H |
| CSIHn | CSIHn configuration register 5 | CSIHnCFG5 | <CSIHn_base> + 1058 _H |
| CSIHn | CSIHn configuration register 6 | CSIHnCFG6 | <CSIHn_base> + 105C _H |
| CSIHn | CSIHn configuration register 7 | CSIHnCFG7 | <CSIHn_base> + 1060 _H |
| CSIHn | CSIHn transmit data register 0 for word access | CSIHnTX0W | <CSIHn_base> + 1008 _H |
| CSIHn | CSIHn transmit data register 0 for half word access | CSIHnTX0H | <CSIHn_base> + 100C _H |
| CSIHn | CSIHn receive data register 0 for word access | CSIHnRX0W | <CSIHn_base> + 1010 _H |
| CSIHn | CSIHn receive data register 0 for half word access | CSIHnRX0H | <CSIHn_base> + 1014 _H |
| CSIHn | CSIHn baud rate setting register 0 | CSIHnBRS0 | <CSIHn_base> + 1068 _H |
| CSIHn | CSIHn baud rate setting register 1 | CSIHnBRS1 | <CSIHn_base> + 106C _H |
| CSIHn | CSIHn baud rate setting register 2 | CSIHnBRS2 | <CSIHn_base> + 1070 _H |
| CSIHn | CSIHn baud rate setting register 3 | CSIHnBRS3 | <CSIHn_base> + 1074 _H |
| CSIH | CSIH DMA select register* ¹ | SELCSIHDMA | <CSIH0_base> + E000 _H |

Note 1. Supported only for CSIH0 and CSIH1.

14.3.2 CSIHnCTL0 — CSIHn Control Register 0

This register controls the operation clock, enables/disables transmission/reception, and enables/disables the memory usage for transmission and/or reception. It forces the stop of communication at the end of the current job.

Access: This register can be read/written in 8- or 1-bit units.

Address: <CSIHn_base> + 0000_H

Value after reset: 00_H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|----------|----------|----------|---|---|---|-----------|----------|
| | CSIHnPWR | CSIHnTXE | CSIHnRXE | — | — | — | CSIHnJOBE | CSIHnMBS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R | R | R | R/W | R/W |

Table 14.13 CSIHnCTL0 Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|--|
| 7 | CSIHnPWR | Controls the operation clock. 0: Stops operation clock. 1: Supplies operation clock. Clearing CSIHnPWR to 0 resets the internal circuits, stops operation, and sets CSIH to standby state. Clock supply to internal circuits stops. If CSIHnPWR is cleared to 0 during communication, ongoing communication is immediately aborted. In this case, communication settings must be made from the beginning. |
| 6 | CSIHnTXE | Permits or prohibits transmission. 0: Prohibits transmission. 1: Permits transmission. |
| 5 | CSIHnRXE | Permits or prohibits reception. 0: Prohibits reception. 1: Permits reception. |
| 4 to 2 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 1 | CSIHnJOBE | Stops communication at the end of the current job. (Communication ends when data is written to the transmit buffer while CSIHnTXOW.CSIHnEOJ = 1 (job completion).) 0: Communication stop is not requested. 1: Stops communication. This bit can be used to abort an ongoing job. This bit is cleared to 0 automatically. Even if this bit is set to 1, the read value is always 0. In FIFO mode, the pointer must be cleared by setting CSIHnSTCR0.CSIHnPCT = 1 before the next communication is started |
| 0 | CSIHnMBS | Bypasses the memory for transmission and/or reception data. 0: Memory mode CSIH memory is used for transmission and/or reception data. 1: Direct access mode CSIH memory is bypassed. |

CAUTION

When setting this register, refer to **Table 14.34, Notes on Setting Registers**.

14.3.3 CSIHnCTL1 — CSIHn Control Register 1

This register specifies the interrupt timing and the interrupt delay mode. It also enables/disables extended data length control, data consistency check, loop-back mode, handshake functionality, and job mode. It selects the active output level of each chip select signal and the behavior of the chip select signals after the transfer of the final data.

Access: This register can be read/written in 32-bit units.

Address: <CSIHn_base> + 0010_H

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|----------|-----------|------------|-----------|-----------|-----------|------------|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | CSIHn PHE | CSIHn CKR | CSIHn SLIT |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | CSIHn CSL7 | CSIHn CSL6 | CSIHn CSL5 | CSIHn CSL4 | CSIHn CSL3 | CSIHn CSL2 | CSIHn CSL1 | CSIHn CSL0 | CSIHn EDLE | CSIHn JE | CSIHn DCS | CSIHn CSRI | CSIHn LBM | CSIHn SIT | CSIHn HSE | CSIHn SSE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 14.14 CSIHnCTL1 Register Contents (1/2)

| Bit Position | Bit Name | Function |
|--------------|---------------|--|
| 31 to 19 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 18 | CSIHnPHE | Sets the CPU-controlled priority-based communication function. 0: The CPU-controlled high-priority communication function is disabled. 1: The CPU-controlled high-priority communication function is enabled. To enable the CPU-controlled high-priority communication function, set this bit to 1 and set CSIHnJE = 1. This bit can only be set in transmit-only buffer mode. |
| 17 | CSIHnCKR | CSIHnTSCK clock inversion function 0: The default level of CSIHnTSCK is high 1: The default level of CSIHnTSCK is low For details, see Section 14.3.11, CSIHnCFGx — CSIHn Configuration Register x . |
| 16 | CSIHnSLIT | Selects the timing of interrupt INTCSIHnIC. 0: Normal interrupt timing (interrupt is generated after the transfer) 1: As soon as the contents of the CSIHnTX0W/H register are transferred to the shift register, an interrupt is generated (this function is activated only in direct access mode and transmit-only buffer mode). For details, see Section 14.4.3, INTCSIHnIC (Communication Status Interrupt) . |
| 15 to 8 | CSIHnCSL[7:0] | Selects the active output level of chip select signal x (CSIHnCSSx). (x = 0 to 7) 0: Chip select signal is active low. 1: Chip select signal is active high. For details, see Section 14.5.3, Chip Selection (CS) Features . |
| 7 | CSIHnEDLE | Enables/disables extended data length (EDL) mode. 0: Disables extended data length mode. 1: Enables extended data length mode. For details, see Section 14.5.8.2, Data Length Greater than 16 Bits . |

Table 14.14 CSIHnCTL1 Register Contents (2/2)

| Bit Position | Bit Name | Function |
|--------------|-----------|---|
| 6 | CSIHnJE | <p>Enables/disables job mode.</p> <p>0: Disables job mode. 1: Enables job mode.</p> <p>For details, see Section 14.5.3.3, Job Concept. The CSIHnCTL0.CSIHnJOBE, CSIHnTX0W.CSIHnEOJ, and CSIHnTX0W.CSIHnCIRE bits are enabled only when CSIHnJE = 1. Setting this bit in slave mode is prohibited. In addition, to enable the CPU-controlled high-priority communication function, set this bit to 1 as well as CSIHnPHE = 1.</p> |
| 5 | CSIHnDCS | <p>Enables/disables data consistency check.</p> <p>0: Disables data consistency check. 1: Enables data consistency check.</p> <p>For details, see Section 14.5.12.1, Data Consistency Check.</p> |
| 4 | CSIHnCSRI | <p>Defines chip select signal behavior after last data transfer.</p> <p>0: Chip select signal holds the active level. 1: Chip select signal returns to the inactive level.</p> <p>The last data is judged at the following times.</p> <ul style="list-style-type: none"> • INTCSIHnIC interrupt output timing when the next writing is not made at the end of communication in FIFO mode • INTCSIHnIC interrupt output timing while CSIHnCTL1.CSIHnSLIT is set to 0 in direct access mode |
| 3 | CSIHnLBM | <p>Controls loop-back mode (LBM).</p> <p>0: Deactivates loop-back mode. 1: Activates loop-back mode.</p> <p>For details, see Section 14.5.13, Loop-Back Mode.</p> |
| 2 | CSIHnSIT | <p>Selects interrupt delay mode.</p> <p>0: No delay is generated. 1: Half clock delay is generated for all interrupts.</p> <p>This bit is only valid in master mode. In slave mode, no delay is generated. For details, see Section 14.4.2, Interrupt Delay.</p> |
| 1 | CSIHnHSE | <p>Enables/disables the handshake function.</p> <p>0: Disables the handshake function. 1: Enables the handshake function.</p> <p>For details, refer to Section 14.5.11, Handshake Function.</p> |
| 0 | CSIHnSSE | <p>Enables/disables the slave select function.</p> <p>0: Input signal CSIHTSSI is disabled. 1: Input signal CSIHTSSI is enabled.</p> <p>If the slave select function is not used, this bit must be set to 0 (see also Section 14.5.2, Master/Slave Connections).</p> |

Details about CSIHnCTL1.CSIHnSSE are shown in the following tables.

Table 14.15 Operation of the Slave Select Function during Reception

| CSIHnCTL0.CSIHnRXE | CSIHnCTL1.CSIHnSSE | CSIHTSSI | Receive Operation |
|--------------------|--------------------|----------|-------------------------|
| 0 | — | — | Reception is prohibited |
| 1 | 0 | — | Possible |
| 1 | 1 | 0 | Possible |
| 1 | 1 | 1 | Disabled |

Table 14.16 Operation of the Slave Select Function during Transmission

| CSIHnCTL0. CSIHnTXE | CSIHnCTL1. CSIHnSSE | $\overline{\text{CSIHTSSI}}$ | Transmit Operation |
|------------------------|------------------------|------------------------------|----------------------------|
| 0 | — | — | Transmission is prohibited |
| 1 | 0 | — | Possible |
| 1 | 1 | 0 | Possible |
| 1 | 1 | 1 | Disabled |

CAUTION

When setting this register, refer to **Table 14.34, Notes on Setting Registers.**

14.3.4 CSIHnCTL2 — CSIHn Control Register 2

This register selects operating mode and the reference clock value, and specifies the transfer clock frequency.

For details, see **Section 14.5.5, Transmission Clock Selection**.

Access: This register can be read/written in 16-bit units.

Address: <CSIHn_base> + 0014_H

Value after reset: E000_H

| 1 | 0 | 1 | PCLK/32 (Master mode) | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 1 | 1 | 0 | PCLK/64 (Master mode) | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 1 | 1 | 1 | External clock via CSIHnTSCK(in) (Slave mode) | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 12 to 0 | Reserved | When read, the value after reset is read. When writing, write the value after reset. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

In master mode, the following bits are used to set the transfer clock frequency:

- CSIHnCTL2.CSIHnPRS[2:0],
- CSIHnCFGx.CSIHnBRSS[1:0], and
- CSIHnBRSy.CSIHnBRS[11:0]

In addition, any of the four different transfer clock frequency settings that are specified by the CSIHnBRSy.CSIHnBRS[11:0] bits is selected for each chip select signal. To select the transfer clock frequency setting for each chip select signal, use the CSIHnCFGx.CSIHnBRSS[1:0] bits.

The following table shows the relationship between CSIHnCFGx.CSIHnBRSS[1:0] and CSIHnBRSSy.CSIHnBRS[11:0].

Table 14.18 Relationship Between CSIHnCFGx.CSIHnBRSS[1:0] and CSIHnBRSSy.CSIHnBRS[11:0]

| CSIHnCFGx (x = 0 to 7) CSIHnBRSS1, CSIHnBRSS0 | Transfer Clock Frequency Setting Bit to be Selected |
|---|---|
| 00 | CSIHnBRS0.CSIHnBRS[11:0] |
| 01 | CSIHnBRS1.CSIHnBRS[11:0] |
| 10 | CSIHnBRS2.CSIHnBRS[11:0] |
| 11 | CSIHnBRS3.CSIHnBRS[11:0] |

The following table shows the relationship between the transfer clock frequency setting (CSIHnBRSSy[11:0]) and the transfer clock frequency selected by the CSIHnBRSS[1:0] bits when the CSIHnPRS[2:0] bit value is α .

Table 14.19 Relationship Between CSIHnBRSSy[11:0] and Transfer Clock Frequency

| CSIHnBRSS[11:0] | Transfer Clock Frequency |
|-----------------|--|
| 0 | BRG stopped |
| 1 | $PCLK / (2^\alpha \times 1 \times 2)$ |
| 2 | $PCLK / (2^\alpha \times 2 \times 2)$ |
| 3 | $PCLK / (2^\alpha \times 3 \times 2)$ |
| 4 | $PCLK / (2^\alpha \times 4 \times 2)$ |
| ... | ... |
| 4095 | $PCLK / (2^\alpha \times 4095 \times 2)$ |

When time-out errors are being used in slave mode, the clock selected by this setting is used. When the clock is being used in slave mode, although the CSIHnPRS[2:0] bits are set to 111_B, this has the same effect on the prescaler as the CSIHnPRS[2:0] bits are being set to 000_B. Set the CSIHnBRSSy.CSIHnBRS[11:0] bits to a value other than 000_H to use time-out errors.

CAUTION

When setting this register, refer to **Table 14.34, Notes on Setting Registers**.

14.3.5 CSIHnSTR0 — CSIHn Status Register 0

This register indicates the status of CSIH.

Access: This register can only be read in 32-bit units.

Address: <CSIHn_base> + 0004_H

Value after reset: 0000 0010_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 14.20 CSIHnSTR0 Register Contents (1/3)

| Bit Position | Bit Name | Function | | | | | | | | | | |
|----------------------|--|--|---------------|-------------|-----------------|--|-----|--|-----------------|--|----------------------|-----------|
| 31 to 24 | CSIHnSRP[7:0] | Indicates the number of received data in FIFO mode. <table border="1"> <thead> <tr> <th>CSIHnSRP[7:0]</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>00_H</td> <td>Number of received data packets (0 to 128)</td> </tr> <tr> <td>...</td> <td></td> </tr> <tr> <td>80_H</td> <td></td> </tr> <tr> <td>Other than the above</td> <td>Undefined</td> </tr> </tbody> </table> <p>These bits are cleared by CSIHnSTCR0.CSIHnPCT. In direct access mode, dual buffer mode, or transmit-only buffer mode, this value is fixed to 00_H. In direct access mode, this bit is fixed to 0 because there is no pointer. In buffer mode, this bit is fixed to 0 because the number of data is managed by CSIHnMCTL2.CSIHnND[7:0].</p> | CSIHnSRP[7:0] | Description | 00 _H | Number of received data packets (0 to 128) | ... | | 80 _H | | Other than the above | Undefined |
| CSIHnSRP[7:0] | Description | | | | | | | | | | | |
| 00 _H | Number of received data packets (0 to 128) | | | | | | | | | | | |
| ... | | | | | | | | | | | | |
| 80 _H | | | | | | | | | | | | |
| Other than the above | Undefined | | | | | | | | | | | |
| 23 to 16 | CSIHnSPF[7:0] | Indicates the number of untransmitted data in FIFO mode. (The number of data written by the CPU is the number of transmission data.) <table border="1"> <thead> <tr> <th>CSIHnSPF[7:0]</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>00_H</td> <td>Number of untransmitted data (0 to 128)</td> </tr> <tr> <td>...</td> <td></td> </tr> <tr> <td>80_H</td> <td></td> </tr> <tr> <td>Other than the above</td> <td>Undefined</td> </tr> </tbody> </table> <p>These bits are cleared by CSIHnSTCR0.CSIHnPCT. In direct access mode, dual buffer mode, or transmit-only buffer mode, this value is fixed to 00_H. In direct access mode, this bit is fixed to 0 because there is no pointer. In buffer mode, this bit is fixed to 0 because the number of data is managed by CSIHnMCTL2.CSIHnND[7:0].</p> | CSIHnSPF[7:0] | Description | 00 _H | Number of untransmitted data (0 to 128) | ... | | 80 _H | | Other than the above | Undefined |
| CSIHnSPF[7:0] | Description | | | | | | | | | | | |
| 00 _H | Number of untransmitted data (0 to 128) | | | | | | | | | | | |
| ... | | | | | | | | | | | | |
| 80 _H | | | | | | | | | | | | |
| Other than the above | Undefined | | | | | | | | | | | |

Table 14.20 CSIHnSTR0 Register Contents (2/3)

| Bit Position | Bit Name | Function | | | | | | | | | | | | | | |
|-----------------------|--|--|---|-----------------|--|-----------------|-------------------------------|---|--------------------|--|----------------------------------|---|-----------------------|-------------------|--------------------------|--|
| 15 | CSIHnTMOE | <p>Time-out error flag in FIFO mode. Indicates whether a time-out error was detected in FIFO mode. 0: No time out error is detected. 1: A time out error is detected. For details, see Section 14.5.12.3, Time-Out Error. This bit is cleared by CSIHnSTCR0.CSIHnTMOEC. However, if this bit is set to 1 by the detection of timeout error and cleared to 0 by CSIHnSTCR0.CSIHnTMOEC simultaneously, When setting to 1 by time-out error detection and clearing to 0 by CSIHnSTCR0.CSIHnTMOEC occur simultaneously, setting to 1 takes precedence over clearing to 0. This bit is initialized when CSIHnCTL0.CSIHnPWR changes from 0 to 1 or from 1 to 0.</p> | | | | | | | | | | | | | | |
| 14 | CSIHnOFE | <p>Overflow error flag in FIFO mode. Indicates whether an overflow error was detected in FIFO mode. 0: No overflow error is detected. 1: An overflow error is detected. For details, see Section 14.5.12.4, Overflow Error. This bit is cleared by CSIHnSTCR0.CSIHnOFEC. However, if this bit is set to 1 by the detection of overflow error and cleared to 0 by CSIHnSTCR0.CSIHnOFEC simultaneously, When setting to 1 by overflow error detection and clearing to 0 by CSIHnSTCR0.CSIHnOFEC occur simultaneously, setting to 1 takes precedence over clearing to 0. This bit is initialized when CSIHnCTL0.CSIHnPWR changes from 0 to 1 or from 1 to 0. When CSIHnCTL0.CSIHnPWR = 0, if transmission data (129) is written to CSIHnTX0W or CSIHnTX0H, an overflow error occurs.</p> | | | | | | | | | | | | | | |
| 13 to 9 | Reserved | When read, the value after reset is read. | | | | | | | | | | | | | | |
| 8 | CSIHnHPST | <p>Communication priority indication flag 0: Indicates low-priority communication is in progress. 1: Indicates high-priority communication is in progress. This bit always reads 0 if CPU-controlled high-priority communication is disabled (CSIHnPHE = 0).</p> | | | | | | | | | | | | | | |
| 7 | CSIHnTSF | <p>Transfer status flag. 0: Idle state 1: Communication is in progress or being prepared. The timing to set or clear this bit is as follows:</p> <table border="1" style="margin-left: 20px;"> <thead> <tr> <th rowspan="2">Master Mode</th> <th colspan="2">Timing to Set</th> <th rowspan="2">Timing to Clear</th> </tr> <tr> <th>Direct Access Mode, FIFO Mode</th> <th>Dual Buffer Mode, Transmit-only Buffer Mode</th> </tr> </thead> <tbody> <tr> <td>Transmit-only mode</td> <td rowspan="3">Data is written to a transmit register (CSIHnTX0W/CSIHnTX0H)</td> <td rowspan="3">Bit CSIHnMCTL2. | 6 | Reserved | When read, the value after reset is read. | | | | | | | | | | | | | | |

Table 14.20 CSIHnSTR0 Register Contents (3/3)

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 5 | CSIHnFLF | A flag indicating that the buffer is full in FIFO mode. 0: FIFO buffer is not full. 1: FIFO buffer is full. This bit is cleared by CSIHnSTCR0.CSIHnPCT. The FIFO buffer might be filled with untransmitted data or received data. |
| 4 | CSIHnEMF | A flag indicating that the buffer is empty in FIFO mode. 0: FIFO buffer is not empty. 1: FIFO buffer is empty. This bit is set to 1 by CSIHnSTCR0.CSIHnPCT. This bit is set to 1 when CSIHnSTR0.CSIHnSRP[7:0] + CSIHnSTR0.CSIHnSPF[7:0] = 00 _H . |
| 3 | CSIHnDCE | Data consistency check error flag. 0: No data consistency check error is detected. 1: Data consistency check error is detected. This bit is cleared by writing 1 to CSIHnSTCR0.CSIHnDCEC. However, if this bit is set to 1 by the detection of a data consistency check error and cleared to 0 by CSIHnSTCR0.CSIHnDCEC simultaneously, setting to 1 due to the detection of a data consistency check error is prioritized. This bit is initialized when CSIHnCTL0.CSIHnPWR changes from 0 to 1 or from 1 to 0. |
| 2 | Reserved | When read, the value after reset is read. |
| 1 | CSIHnPE | Parity error flag 0: No parity error is detected. 1: Parity error is detected. This bit is cleared by writing 1 to CSIHnSTCR0.CSIHnPEC. However, if this bit is set to 1 by the detection of parity error and cleared to 0 by CSIHnSTCR0.CSIHnPEC simultaneously, setting to 1 due to the detection of a parity error is prioritized. This bit is initialized when CSIHnCTL0.CSIHnPWR changes from 0 to 1 or from 1 to 0. |
| 0 | CSIHnOVE | Overrun error flag (Fixed to 0 in dual buffer mode). 0: No overrun error is detected. 1: Overrun error is detected. This bit is cleared by writing 1 to CSIHnSTCR0.CSIHnOVEC. However, if this bit is set to 1 by the detection of overrun error and cleared to 0 by CSIHnSTCR0.CSIHnOVEC simultaneously, setting to 1 due to the detection of an overrun error is prioritized. This bit is initialized when CSIHnCTL0.CSIHnPWR changes from 0 to 1 or from 1 to 0. |

Table 14.21 Behaviors in Various Memory Modes

| Bit Name | Bit Position | Direct Access Mode | FIFO Mode | Transmit-only Buffer Mode | Dual Buffer Mode |
|---------------|--------------|---|---|--|------------------|
| CSIHnSRP[7:0] | 31 to 24 | Fixed to 0 | Number of received data | Fixed to 0 | Fixed to 0 |

| CSIHnOVE | 0 | 0: No error is detected. 1: An error is detected. | 0: No error is detected. 1: An error is detected. | 0: No error is detected. 1: An error is detected. | Fixed to 0 |

CAUTION

When setting this register, refer to **Table 14.34, Notes on Setting Registers.**

14.3.6 CSIHnSTCR0 — CSIHn Status Clear Register 0

This register clears the status flags of the CSIHnSTR0 status register.

Access: This register can be read/written in 16-bit units.
When read, the value 0000_H is always returned.

Address: <CSIHn_base> + 0008_H

Value after reset: 0000_H

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| | CSIHnSTR0.CSIHnTSF | | | | | | | | | | | |
| 7 to 4 | Reserved | When read, the value after reset is read. When writing, write the value after reset. | | | | | | | | | | |
| 3 | CSIHnDCEC | Controls the data consistency check error flag clear command. 0: No operation. 1: Clears the data consistency check error flag (CSIHnSTR0.CSIHnDCE). The read value is always 0. | | | | | | | | | | |
| 2 | Reserved | When read, the value after reset is read. When writing, write the value after reset. | | | | | | | | | | |
| 1 | CSIHnPEC | Controls the parity error flag clear command. 0: No operation. 1: Clears the parity error flag (CSIHnSTR0.CSIHnPE). The read value is always 0. | | | | | | | | | | |
| 0 | CSIHnOVEC | Controls the overrun error flag clear command. 0: No operation. 1: Clears the overrun error flag (CSIHnSTR0.CSIHnOVE). The read value is always 0. | | | | | | | | | | |

CAUTION

For the setting of this register, refer to **Table 14.34, Notes on Setting Registers**.

14.3.7 CSIHnMCTL0 — CSIHn Memory Control Register 0

This register selects the memory mode and the time-out setting.

Access: This register can be read/written in 16-bit units.

Address: <CSIHn_base> + 1040_H

Value after reset: 001F_H

CAUTION

When setting this register, refer to **Table 14.34, Notes on Setting Registers**.

14.3.8 CSIHnMCTL1 — CSIHn Memory Control Register 1

This register selects the conditions to generate the interrupt requests, INTCSIHnIC and INTCSIHnIR in FIFO mode.

Access: This register can be read/written in 32-bit units.

Address: <CSIHn_base> + 1000_H

Value after reset: 0000 0000_H

| | | | | | | | | | | | | | | | | |

Table 14.24 CSIHnMCTL1 Register Contents

| Bit position | Bit name | Function |
|--------------|---------------|--|
| 31 to 23 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 22 to 16 | CSIHnFES[6:0] | Selects the conditions to generate the INTCSIHnIC interrupt (transmit data empty) in FIFO mode. When the number of untransmitted data to be transmitted in FIFO (checked by the CSIHnSTR0.CSIHnSPF[7:0] bit) and CSIHnMCTL1.CSIHnFES[6:0] match, the INTCSIHnIC interrupt request is generated. |
| 15 to 7 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 6 to 0 | CSIHnFFS[6:0] | Selects the conditions to generate the INTCSIHnIR interrupt (receive data full) in FIFO mode. When the number of received data in FIFO (checked by the CSIHnSTR0.CSIHnSRP[7:0] bit) and (128 - CSIHnMCTL1.CSIHnFFS[6:0]) match, the INTCSIHnIR interrupt request is generated. |

CAUTION

When setting this register, refer to **Table 14.34, Notes on Setting Registers.**

14.3.9 CSIHnMCTL2 — CSIHn Memory Control Register 2

This register controls the operation of the memory in dual buffer or transmit-only buffer mode and triggers to start communication in these buffer modes.

Access: This register can be read/written in 32-bit units.

Address: <CSIHn_base> + 1004_H

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

After the data transfer, the value increments automatically.

CAUTION

In direct access mode, these bits are not incremented.

CAUTION

When setting this register, refer to **Table 14.34, Notes on Setting Registers**.

14.3.10 CSIHnMRWP0 — CSIHn Memory Read/Write Pointer Register 0

This register sets the pointers for reading from and writing to the dual or transmit-only buffer.

Access: This register can be read/written in 32-bit units.

Address: <CSIHn_base> + 1018_H

Value after reset: 0000 0000_H

These bits are automatically incremented when the transmission data is written or read.

When CSIHnTRWA[6:0] is 7F_H and received data is read, CSIHnTRWA[6:0] is 00_H.

These bits are cleared when CSIHnSTCR0.CSIHnPCT is set to 1.

In direct access mode, these bits are not incremented.

In FIFO mode, these bits indicate the read/write address of transmission data.

CAUTION

When setting this register, refer to **Table 14.34, Notes on Setting Registers.**

14.3.11 CSIHnCFGx — CSIHn Configuration Register x

These eight registers configure the chip select signal CSIHnCSSx baud rate, parity, data length, recessive configuration for broadcasting, serial data direction, clock phase, data phase, idle enforcement configuration, idle time, hold time, inter-data time and setup for each chip select signal, CSIHnCSSx.

Slave mode

In slave mode, the transmission protocol setting of the CSIHnCFG0 register is effective.

- CSIHnPSx[1:0]: parity usage
- CSIHnDLSx[3:0]: data length selection
- CSIHnDIRx: data direction
- CSIHnCKPx, CSIHnDAPx: clock and data phase

In slave mode, set all bits other than above in the CSIHnCFG0 register, and the CSIHnCFG1 to CSIHnCFG7 registers to 0.

Access: This register can be read/written in 32-bit units.

Address: CSIHnCFG0: <CSIHn_base> + 1044_H
 CSIHnCFG1: <CSIHn_base> + 1048_H
 CSIHnCFG2: <CSIHn_base> + 104C_H
 CSIHnCFG3: <CSIHn_base> + 1050_H
 CSIHnCFG4: <CSIHn_base> + 1054_H
 CSIHnCFG5: <CSIHn_base> + 1058_H
 CSIHnCFG6: <CSIHn_base> + 105C_H
 CSIHnCFG7: <CSIHn_base> + 1060_H

These bits are only available in master mode.

CAUTION

When setting this register, refer to **Table 14.34, Notes on Setting Registers.**

14.3.12 CSIHnTX0W — CSIHn Transmit Data Register 0 for Word Access

This register stores transmission data. In addition, it specifies the communication interrupt request, the end-of-job, the extended data length, and the chip select activation.

Access: This register can be read/written in 32-bit units.

Address: <CSIHn_base> + 1008_H

Value after reset: X0XX XXXX_H

Table 14.28 CSIHnTX0W Register Contents (1/2)

| Bit position | Bit name | Function |
|--------------|-----------|--|
| 31 | CSIHnCIRE | <p>Enables the communication interrupt request INTCSIHnIC in dual buffer or transmit-only buffer mode, or the job completion interrupt request INTCSIHnJC in FIFO mode.</p> <p>0: No interrupt is requested. 1: An interrupt is requested. Generates interrupt INTCSIHnIC or INTCSIHnJC after transmission. For details, see Section 14.4.3, INTCSIHnIC (Communication Status Interrupt) and Section 14.4.6, INTCSIHnJC (Job Completion Interrupt).</p> <p>CAUTION</p> <p>This bit is only valid when job mode is enabled (CSIHnCTL1.CSIHnJE = 1).</p> |
| 30 | CSIHnEOJ | <p>Specifies the end of a job.</p> <p>0: Indicates that it is not end-of-job data. The job continues. 1: Indicates end-of-job data.</p> <p>CAUTION</p> <p>This bit is only valid when job mode is enabled (CSIHnCTL1.CSIHnJE = 1). This bit must be set to 0 in slave mode.</p> |
| 29 | CSIHnEDL | <p>Specifies whether the associated data requires the extended data length (EDL) option.</p> <p>0: Normal operation 1: Enables the extended data length. The associated data is transmitted as a 16-bit packet. No inter-data time or idle time will be inserted after the data is transmitted. If CSIHnCTL1.CSIHnEDLE = 1 and CSIHnTX0W.CSIHnEDL = 1, the same CS must be selected for subsequent data. If CS is modified for the subsequent data, the correct operation is not guaranteed.</p> <p>CAUTION</p> <p>This bit is only available if CSIHnCTL1.CSIHnEDLE = 1.</p> |
| 28 to 24 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |

Table 14.28 CSIHnTX0W Register Contents (2/2)

| Bit position | Bit name | Function |
|--------------|---------------|---|
| 23 to 16 | CSIHnCS[7:0] | <p>Activates one or more chip select signals.</p> <p>0: Activates chip select signal x for the associated transmission. 1: Deactivates chip select signal x for the associated transmission. Setting CSIHnTX0W.CSIHnCS[7:0] = FF_H is prohibited.</p> <p>CAUTION</p> <p>If several chip select signals are enabled for broadcasting, the configuration of one with CSIHnCFGx.CSIHnRCBx = 0 (dominant) is used. In this case, all dominant chip select signals must be set to precisely the same value. In slave mode, set the CSIHnCS[7:0] bit to FE_H.</p> |
| 15 to 0 | CSIHnTX[15:0] | Stores the transmission data. |

CAUTION

When setting this register, refer to **Table 14.34, Notes on Setting Registers.**

14.3.13 CSIHnTX0H — CSIHn Transmit Data Register 0 for Half Word Access

This register stores the transmission data. This register is the same as bits 15 to 0 of register CSIHnTX0W.

The settings specified by the upper 16 bits of CSIHnTX0W are applied to the transmission. Set transmit data to CSIHnTX0W before using this register because the value of CSIHnTX0W is undefined after the reset.

Access: This register can be read/written in 16-bit units.

Address: <CSIHn_base> + 100C_H

Value after reset: Undefined

Table 14.29 CSIHnTX0H Register Contents

| Bit position | Bit name | Function |
|--------------|---------------|-------------------------------|
| 15 to 0 | CSIHnTX[15:0] | Stores the transmission data. |

CAUTION

When setting this register, refer to **Table 14.34, Notes on Setting Registers.**

14.3.14 CSIHnRX0W — CSIHn Receive Data Register 0 for Word Access

This register stores the received data.

Access: This register can only be read in 32-bit units.

Address: <CSIHn_base> + 1010_H

Value after reset: 0XXX XXXX_H

| | | | | | | | | | | | | | | | | |

Table 14.30 CSIHnRX0W Register Contents

| Bit position | Bit name | Function |
|--------------|--------------------------|--|
| 31 to 26 | Reserved | When read, the value after reset is read. |
| 25 | CSIHnRPE | Indicates whether a reception data parity error was detected. 0: No parity error was detected on the associated reception data. 1: A parity error was detected on the associated reception data. |
| 24 | CSIHnTDCE | Indicates whether a transmission data consistency check error was detected. 0: No consistency check error was detected on the associated transmission data. 1: A consistency check error was detected on the associated transmission data. |
| 23 to 16 | CSIHnCSx (x = 7 to 0) | Indicates which chip select signal was activated. 0: Chip select signal x is active for the associated reception. 1: Chip select signal x is inactive for the associated reception. |
| 15 to 0 | CSIHnRX[15:0] | Stores the received data. |

NOTE

This register stores the received data when an INTCSIHnIR interrupt is generated. Read the received data stored in this register before generation of an INTCSIHnIR interrupt. Otherwise the data is rewritten with the next received data.

CAUTION

When setting this register, refer to **Table 14.34, Notes on Setting Registers**.

14.3.15 CSIHnRX0H — CSIHn Receive Data Register 0 for Half Word Access

This register stores the received data. This register is the same as bits 15 to 0 of register CSIHnRX0W.

Access: This register can be read only in 16-bit units.

Address: <CSIHn_base> + 1014_H

Value after reset: Undefined

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Table 14.31 CSIHnRX0H Register Contents

| Bit position | Bit name | Function |
|--------------|---------------|---------------------------|
| 15 to 0 | CSIHnRX[15:0] | Stores the received data. |

NOTE

This register stores the received data when an INTCSIHnIR interrupt is generated. Read the received data stored in this register before generation of an INTCSIHnIR interrupt. Otherwise the data is rewritten with the next received data.

CAUTION

When setting this register, refer to **Table 14.34, Notes on Setting Registers.**

14.3.16 CSIHnBRSy — CSIHn Baud Rate Setting Register y (y = 0 to 3)

This register sets the transfer clock frequency for each chip select signal.

With CSIHnCFG0-7.CSIHnBRSSx[1:0] bits, one of the four types of transfer clock frequency settings can be selected for each chip select signal. For details of transfer clock frequency settings, see **Section 14.5.5, Transmission Clock Selection**.

Access: This register can be read/written in 16-bit units.

Address: CSIHnBRS0: <CSIHn_base> + 1068_H
 CSIHnBRS1: <CSIHn_base> + 106C_H
 CSIHnBRS2: <CSIHn_base> + 1070_H
 CSIHnBRS3: <CSIHn_base> + 1074_H

Value after reset: 0000_H

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Bit Position | Bit Name | Function |
|--------------|--------------------|---|
| 15 to 12 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 11 to 0 | CSIHnBRS [11:0] | 0: BRG stopped 1: PCLK / (2 ^α × 1 × 2) 2: PCLK / (2 ^α × 2 × 2) 3: PCLK / (2 ^α × 3 × 2) 4: PCLK / (2 ^α × 4 × 2) . . . 4095: PCLK / (2 ^α × 4095 × 2) α is the value of CSIHnCTL2.CSIHnPRS[2:0]. |

CAUTION

When setting this register, refer to **Table 14.34, Notes on Setting Registers**.

14.3.17 SELCSIHDMA — CSIH DMA Select Register

This register controls the generation condition for the interrupt and the DMA/DTS trigger.

Access: This register can be read/written in 8-bit units.

Address: <CSIH0_base> + E000_H

Value after reset: 00_H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|---|---|---|---|-----------|-----------|-----------|-----------|
| | — | — | — | — | SELCSI1DR | SELCSI1DC | SELCSI0DR | SELCSI0DC |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W |

Table 14.33 SELCSIHDMA Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|--|
| 7 to 4 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 3 | SELCSI1DR | Controls the generation condition for the INTCSIH1IR0S interrupt and the DMA/DTS trigger. 0: INTCSIH1IR0S interrupt and DMA/DTS trigger can be generated regardless the CS0 setting. 1: INTCSIH1IR0S interrupt and DMA/DTS trigger can be generated only when CS0 is active. |
| 2 | SELCSI1DC | Controls the generation condition for the INTCSIH1IC0S interrupt and the DMA/DTS trigger. 0: INTCSIH1IC0S interrupt and DMA/DTS trigger can be generated regardless the CS0 setting. 1: INTCSIH1IC0S interrupt and DMA/DTS trigger can be generated only when CS0 is active. |
| 1 | SELCSI0DR | Controls the generation condition for the INTCSIH0IR0S interrupt and the DMA/DTS trigger. 0: INTCSIH0IR0S interrupt and DMA/DTS trigger can be generated regardless the CS0 setting. 1: INTCSIH0IR0S interrupt and DMA/DTS trigger can be generated only when CS0 is active. |
| 0 | SELCSI0DC | Controls the generation condition for the INTCSIH0IC0S interrupt and the DMA/DTS trigger. 0: INTCSIH0IC0S interrupt and DMA/DTS trigger can be generated regardless the CS0 setting. 1: INTCSIH0IC0S interrupt and DMA/DTS trigger can be generated only when CS0 is active. |

Figure 14.2 shows a functional overview of the CSIH_n (n = 0, 1) that is connected to the DMA/DTS and the interrupt controller.

Figure 14.2 Block Diagram Showing the Connection of the Interrupt Controller, DMA/DTC, and CSIH_n (n = 0, 1)

14.3.18 List of Cautions

Table 14.34 Notes on Setting Registers (1/3)

| Register Name | Bit Name | Content |
|---------------|--|--|
| CSIHnCTL0 | CSIHnPWR | If this bit is cleared during communication, ongoing communication is aborted. After the communication is aborted, the communication must be restarted. |
| CSIHnCTL0 | CSIHnTXE CSIHnRXE | Do not modify any of these bits while CSIHnCTL0.CSIHnPWR = 0. (These bits can be modified at the same time as the CSIHnCTL0.CSIHnPWR bit.) Do not modify these bits while CSIHnSTR0.CSIHnTSF = 1, because the specified operation is not guaranteed if ongoing communication is aborted. |
| CSIHnCTL0 | CSIHnJOB | Do not modify this bit while CSIHnCTL0.CSIHnPWR = 0. This bit is only valid when CSIHnCTL1.CSIHnJE = 1. Setting this bit is prohibited in slave mode. |
| CSIHnCTL0 | CSIHnMBS | Do not modify this bit while CSIHnCTL0.CSIHnPWR = 0. (This bit can be modified at the same time as the CSIHnCTL0.CSIHnPWR bit.) Modification of this bit is only allowed while CSIHnSTR0.CSIHnTSF = 0. Do not modify of "FIFO mode <-> Direct access mode" while CSIHnCTL0.CSIHnPWR = 1. When the CPU-controlled high-priority communication function is enabled, the operation is the same as that in direct access mode regardless of the CSIHnMBS bit setting. |
| CSIHnCTL1 | CSIHnCKR | Modification of this bit is only allowed while CSIHnCTL0.CSIHnPWR = 0. If CS is not used, use this bit instead of the CSIHnCFGx.CSIHnCKPx bit and set CSIHnCFGx.CSIHnCKPx to 0. This bit must be used in slave mode. |
| CSIHnCTL1 | CSIHnSLIT CSIHnCSL[7:0] CSIHnEDLE CSIHnDCS CSIHnCSRI CSIHnHSE | Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0. |
| CSIHnCTL1 | CSIHnPHE CSIHnJE CSIHnLBM | Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0. Setting of this bit is prohibited in slave mode. |
| CSIHnCTL1 | CSIHnSSE | Modification of this bit is only permitted while CSIHnCTL0.CSIHnPWR = 0. Setting this bit to 1 is prohibited in master mode. |
| CSIHnCTL1 | CSIHnSIT | Modification of this bit is only permitted while CSIHnCTL0.CSIHnPWR = 0. This bit is only valid in master mode. In slave mode, no delay is generated. |
| CSIHnCTL2 | CSIHnPRS[2:0] | Modification of this bit is only permitted while CSIHnCTL0.CSIHnPWR = 0. Setting of the maximum transfer clock frequency is shown below. <ul style="list-style-type: none"> • Master mode: 10 MHz • Slave mode: 6.66 MHz |
| CSIHnSTR0 | CSIHnSRP[7:0] CSIHnSPF[7:0] CSIHnFLF CSIHnEMF CSIHnTSF | Writing to these bits is prohibited, and only reading is permitted. |
| CSIHnSTR0 | CSIHnTMOE CSIHnOFFE CSIHnDCE CSIHnPE CSIHnOVE | Writing to these bits is prohibited, and only reading is permitted. These bits are initialized when CSIHnCTL0.CSIHnPWR = 0 → 1 or CSIHnCTL0.CSIHnPWR = 1 → 0. |
| CSIHnSTCR0 | CSIHnPCT | Setting this bit to 1 during data transfer stops the transfer, and the interface waits for the next transfer. Setting this bit to 1 during waiting time (setup time, hold time, idle time, or inter-data time), insertion of the waiting time is cancelled and the interface waits for the next transfer. |
| CSIHnMCTL0 | CSIHnMMS[1:0] | Modification of these bits is only allowed while CSIHnCTL0.CSIHnPWR = 0 and CSIHnCTL0.CSIHnMBS = 0. |

Table 14.34 Notes on Setting Registers (2/3)

| Register Name | Bit Name | Content |
|-------------------------|---|--|
| CSIHnMCTL0 | CSIHnTO[4:0] | Modification of these bits is only allowed while CSIHnCTL0.CSIHnPWR = 0. Set these bits to 0 in master mode. Set these bits to 0 in direct access, dual buffer, and transmit-only buffer mode. |
| CSIHnMCTL1 | CSIHnFES[6:0] CSIHnFFS[6:0] | Writing to these bits while communication is ongoing is permitted. |
| CSIHnMCTL2 | CSIHnBTST CSIHnND[7:0] CSIHnSOP[6:0] | Writing these bits is prohibited when CSIHnCTL0.CSIHnPWR = 0. Writing these bits is prohibited when CSIHnCTL0.CSIHnTXE = CSIHnCTL0.CSIHnRXE = 0. Writing these bits is prohibited when CSIHnSTR0.CSIHnTSF = 1. Writing these bits is prohibited in direct access or FIFO mode. |
| CSIHnMRWP0 | CSIHnRRA[6:0] | Writing to these bits while communication is ongoing is permitted. Writing these bits is prohibited in direct access or FIFO mode. When writing is required in transmit-only buffer mode, set "0000 _H " to these bits. |
| CSIHnMRWP0 | CSIHnTRWA[6:0] | Writing to these bits while communication is ongoing is permitted. Writing these bits is prohibited in direct access or FIFO mode. |
| CSIHnCFGx x = 0 to 7 | CSIHnBRSSx[1:0] CSIHnRCBx CSIHnIDLx CSIHnIDx[2:0] CSIHnHDx[3:0] CSIHnINx[3:0] CSIHnSPx[3:0] | Modification of these bits is only allowed while CSIHnCTL0.CSIHnPWR = 0. These bits must be set to 0 in slave mode. |
| CSIHnCFGx x = 0 to 7 | CSIHnPSx[1:0] CSIHnDLSx[3:0] CSIHnDIRx CSIHnDAPx | Modification of these bits is only allowed while CSIHnCTL0.CSIHnPWR = 0. In slave mode, the CSIHnCFG0 setting is used for the configuration. Therefore, all the bits in CSIHnCFG1 to CSIHnCFG7 must be set to 0. |
| CSIHnCFGx x = 0 to 7 | CSIHnCKPx | Modification of this bit is only allowed while CSIHnCTL0.CSIHnPWR = 0. Set this bit to 0 as CSIHnCTL1.CSIHnCKR must be used in slave mode. If CS is not used, use the CSIHnCTL1.CSIHnCKR bit instead of this bit, and clear this bit to 0. |
| CSIHnTX0W | CSIHnEOJ CSIHnCIRE | These bits are only valid when CSIHnCTL1.CSIHnJE = 1. While CSIHnCTL1.CSIHnJE = 0, the value of this bit is ignored even if 1 is read. Set these bits to 0 in slave mode. |
| CSIHnTX0W | CSIHnEDL | This bit is only valid when CSIHnCTL1.CSIHnEDLE = 1. While CSIHnCTL1.CSIHnEDLE = 0, the value of this bit is ignored even if 1 is read. |
| CSIHnTX0W | CSIHnCS[7:0] | In master mode, setting these bits to "FF _H " is prohibited. In slave mode, setting these bits to "FE _H " is prohibited. |
| CSIHnTX0W CSIHnTX0H | | Reading these bits while communication is ongoing is prohibited in FIFO mode. While CSIHnCTL0.CSIHnPWR = 0 in FIFO mode, reading these bits is prohibited. While CSIHnCTL0.CSIHnTXE = CSIHnCTL0.CSIHnRXE = 0, writing to these bits are prohibited in direct access mode. |
| CSIHnRX0W | | These bits are initialized when CSIHnCTL0.CSIHnPWR = 0 → 1 or CSIHnCTL0.CSIHnPWR = 1 → 0. While CSIHnCTL0.CSIHnPWR = 0, reading and writing these bits is prohibited in FIFO mode. While CSIHnCTL0.CSIHnPWR = 1, writing these bits is prohibited and only reading these bits is permitted in FIFO mode. While CSIHnCTL0.CSIHnPWR = 0, reading and writing these bits is permitted except for FIFO mode (transmit-only buffer mode, dual buffer mode, and direct access mode). While CSIHnCTL0.CSIHnPWR = 1, writing these bits is prohibited and only reading these bits is permitted except for FIFO mode (transmit-only buffer mode, dual buffer mode, and direct access mode). |

Table 14.34 Notes on Setting Registers (3/3)

| Register Name | Bit Name | Content |
|-------------------------|----------|--|
| CSIHnRX0H | | <p>These bits are initialized when CSIHnCTL0.CSIHnPWR = 0 → 1 or CSIHnCTL0.CSIHnPWR = 1 → 0.</p> <p>While CSIHnCTL0.CSIHnPWR = 0, reading and writing these bits is prohibited in FIFO mode.</p> <p>While CSIHnCTL0.CSIHnPWR = 1, writing these bits is prohibited and only reading these bits is permitted in FIFO mode.</p> <p>Writing these bits is prohibited and only reading these bits is permitted in spite of the value of CSIHnCTL0.CSIHnPWR except for FIFO mode (transmit-only buffer mode, dual buffer mode, and direct access mode).</p> |
| CSIHnBRSy y = 0 to 3 | | Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0. |

14.4 Interrupt Sources

CSIH can generate the following interrupt requests:

- INTCSIHnIC (communication status interrupt)
- INTCSIHnIR (reception status interrupt)
- INTCSIHnIRE (communication error interrupt)
- INTCSIHnIJC (job completion interrupt)

14.4.1 Overview

The error interrupt INTCSIHnIRE is generated when an error is detected. The generation of the other interrupts depends on the memory mode, the job mode, and – in case of the job completion interrupt INTCSIHnIJC – also the operating mode.

The job completion interrupt INTCSIHnIJC is only generated when job mode is enabled (CSIHnCTL1.CSIHnJE = 1). It is not available in slave mode.

The following table gives an overview.

Table 14.35 Interrupt Generation

| Memory mode | Interrupt | Interrupt Source | |
|----------------------|---------------|--|---|
| | | Job Mode Disabled CSIHnCTL1.CSIHnJE = 0 | Job Mode Enabled CSIHnCTL1.CSIHnJE = 1 |
| FIFO | INTCSIHnIC | Tx data empty*1 | Tx data empty*1 Excluding job abort*4 |
| | INTCSIHnIR | Rx data full*2 and CSIHnCTL0.CSIHnRXE = 1 | Rx data full*2 and CSIHnCTL0.CSIHnRXE = 1 |
| | INTCSIHnIRE | Error detected | Error detected |
| | INTCSIHnIJC*3 | Not applicable | CSIHnTX0W.CSIHnCIRE = 1 (When Tx data is not empty), or job abort*4 |
| Transmit-only buffer | INTCSIHnIC | End of communication | CSIHnTX0W.CSIHnCIRE = 1 and (CSIHnCTL0.CSIHnJOBE = 0 or CSIHnTX0W.CSIHnEOJ = 0) |
| | INTCSIHnIR | Data received and CSIHnCTL0.CSIHnRXE = 1 | Data received and CSIHnCTL0.CSIHnRXE = 1 |
| | INTCSIHnIRE | Error detected | Error detected |
| | INTCSIHnIJC*3 | Not applicable | Job abort*4 |
| Dual buffer | INTCSIHnIC | End of communication | CSIHnTX0W.CSIHnCIRE = 1 and (CSIHnCTL0.CSIHnJOBE = 0 or CSIHnTX0W.CSIHnEOJ = 0) |
| | INTCSIHnIR | End of communication and CSIHnCTL0.CSIHnRXE = 1 | Data received and CSIHnCTL0.CSIHnRXE = 1 |
| | INTCSIHnIRE | Error detected | Error detected |
| | INTCSIHnIJC*3 | Not applicable | Job abort*4 |
| Direct access | INTCSIHnIC | One data transfer | One data transfer (Excluding job abort*4) |
| | INTCSIHnIR | Data received and CSIHnCTL0.CSIHnRXE = 1 | Data received and CSIHnCTL0.CSIHnRXE = 1 |
| | INTCSIHnIRE | Error detected | Error detected |
| | INTCSIHnIJC*3 | Not applicable | Job abort*4 |

Note 1. "Tx data empty" refers to the FIFO fill level, defined by CSIHnMCTL1.CSIHnFES[6:0].

- Note 2. "Rx data full" refers to the FIFO fill level, defined by CSIHnMCTL1.CSIHnFFS[6:0].
- Note 3. INTCSIHnJC is not available in slave mode.
- Note 4. Job abort condition: CSIHnTX0W.CSIHnEOJ = 1 and CSIHnCTL0.CSIHnJOBE = 1
Same operation as direct access mode is performed during high-priority communication in transmit-only buffer mode.

14.4.2 Interrupt Delay

In master mode, all interrupts generated by the master can be delayed by half a cycle of the transmission clock, CSIHTSCK. This is not possible in slave mode.

The delay is specified by setting CSIHnCTL1.CSIHnSIT = 1 (the setting of the CSIGNSIT bit is invalid in slave mode).

The following example illustrates the interrupt delay function, assuming a setting of CSIHnCTL1.CSIHnSIT = 1 (interrupt delay enabled), CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0 (clock and data phase), and CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B (data length 8 bits).

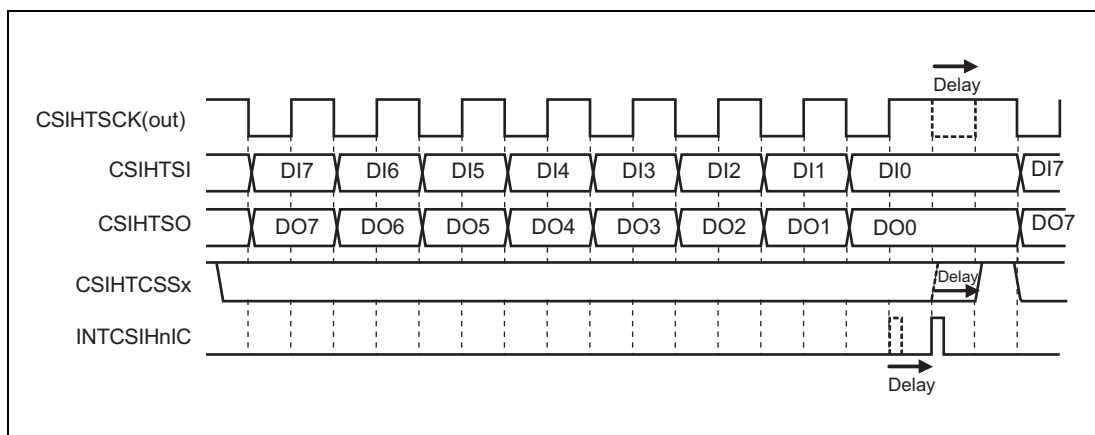

Figure 14.3 Interrupt Delay Function (CSIHnCTL1.CSIHnSIT = 1)

Setting CSIHnCTL1.CSIHnSIT = 1 adds a half cycle delay to the transmission clock. This also delays the end of the present chip select signal (CSIHTCSSx).

14.4.3 INTCSIHnIC (Communication Status Interrupt)

Depending on the memory mode and the job mode, this interrupt is generated according to the conditions shown in the following table.

Table 14.36 INTCSIHnIC Interrupt Generation

| Memory Mode | Cause of Interrupt | |
|-----------------------------------|--|--|
| | Job Mode Disabled CSIHnCTL1.CSIHnJE = 0 | Job Mode Enabled CSIHnCTL1.CSIHnJE = 1 |
| FIFO | This interrupt is generated when transmit data FIFO is nearly empty and the application has to add new data to continue transmission. INTCSIHnIC is generated, if the number of data to be transmitted remaining in the FIFO (CSIHnSTR0.CSIHnSPF[7:0]) equals CSIHnMTCL1.CSIHnFES[6:0]. | In the same way as when JE = 0, this interrupt is generated when the number of transmission data CSIHnSTR0.CSIHnSPF[7:0] remaining in the FIFO equals the CSIHnMCTL1.CSIHnFES[6:0] value, but this interrupt is not generated when job is aborted. |
| Transmit-only buffer, dual buffer | Generated at the end of communication. (Specified by the CSIHnMTCL2.CSIHnND[7:0] bit) | Generated when data with CSIHnTX0W.CSIHnCIRE = 1 is transmitted. Note that if data with CSIHnTX0W.CSIHnCIRE = 1 and job abort* ¹ are transmitted, the INTCSIHnJC interrupt is generated instead of INTCSIHnIC. |
| Direct access | Generated after every data transfer. | Generated after every data transfer, except when the communication was aborted. |

Note 1. Job abort condition: CSIHnTX0W.CSIHnEOJ = 1 and CSIHnCTL0.CSIHnJOBE = 1.
Same operation as direct access mode is performed during high-priority communication in transmit-only buffer mode.

14.4.3.1 INTCSIHnIC in Direct Access Mode

The examples below show the INTCSIHnIC behavior in direct access mode.

The examples assume:

- Master mode
- Direct access mode
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B)
- Normal INTCSIHnIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)

Figure 14.4 Generation of INTCSIHnIC after Transfer (CSIHnCTL1.CSIHnSLIT = 0)

If job mode is enabled (CSIHnCTL1.CSIHnJE = 1) and a job ends because data is transmitted with CSIHnTX0W.CSIHnEOJ= 1 and communication stop is requested (CSIHnCTL0.CSIHnJOBE = 1), then INTCSIHnIC is replaced by the job completion interrupt INTCSIHnIC.

INTCSIHnIC can also be set up to occur as soon as the CSIHnTX0W/H register ready to store the next data. This is specified by setting CSIHnCTL1.CSIHnSLIT = 1.

The effect is illustrated in the figure below.

Figure 14.5 Immediate Generation of INTCSIHnIC (CSIHnCTL1.CSIHnSLIT = 1)

Thus, the new data can be written in advance.

NOTE

Same operation as direct access mode is performed during high-priority communication in transmit-only buffer mode.

14.4.3.2 INTCSIHnIC in FIFO Mode

The example below shows the INTCSIHnIC behavior in FIFO mode.

The example assumes:

- Master mode
- FIFO mode
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock and data phase
(CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B)

Figure 14.6 Generation of INTCSIHnIC in FIFO Memory Mode

The condition for “FIFO empty” is specified in CSIHnMCTL1.CSIHnFES[6:0]. In the example of the diagram above, the number of untransmitted data in FIFO is set to 3. CSIHnSTR0.CSIHnSPF[7:0] indicates the number of untransmitted data. When both match, the interrupt INTCSIHnIC occurs.

14.4.3.3 INTCSIHnIC in Job Mode

The example below shows the INTCSIHnIC behavior in job mode.

The example assumes:

- Master mode
- Job mode enabled (CSIHnCTL1.CSIHnJE = 1)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B)
- Normal INTCSIHnIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)

Figure 14.7 Generation of INTCSIHnIC in Job Mode

The rules for generating INTCSIHnIC in job mode are shown in the following table.

Table 14.37 Generation of INTCSIHnIC in Job Mode

| CSIHnTX0W.CSIHnEOJ | CSIHnTX0W.CSIHnCIRE | INTCSIHnIC |
|--------------------|---------------------|--|
| 0 | 0 | Not generated |
| 0 | 1 | Generated |
| 1 | 0 | Not generated |
| 1 | 1 | CSIHnCTL0.CSIHnJOBE = 0: Generated CSIHnCTL0.CSIHnJOBE = 1: Not generated, replaced by interrupt INTCSIHnJC |

14.4.4 INTCSIHnIR (Receive Status Interrupt)

Depending on the memory mode and the job mode, this interrupt is generated according to the conditions below.

Table 14.38 INTCSIHnIR Interrupt Generation

| Memory Mode | Cause of Interrupt | |
|-------------------------------------|---|--|
| | CSIHnCTL0.CSIHnRXE = 1 | |
| | Job Mode Disabled CSIHnCTL1.CSIHnJE = 0 | Job Mode Enabled CSIHnCTL1.CSIHnJE = 1 |
| FIFO | This interrupt occurs when the FIFO buffer is almost full with received data while CSIHnCTL0.CSIHnRXE = 1, notifying the application that the FIFO must be emptied. INTCSIHnIR is generated, if the number of received data in the FIFO (CSIHnSTR0.CSIHnSRP[7:0]) equals (128-CSIHnMCTL1.CSIHnFFS[6:0]) | |
| Dual buffer | An interrupt is generated at the end of communication (specified by CSIHnMCTL2.CSIHnND[7:0]) while CSIHnCTL0.CSIHnRXE = 1. | An interrupt is generated after every data transfer. |
| Transmit-only buffer, Direct access | An interrupt is generated after every data transfer. | |

14.4.4.1 INTCSIHnIR in Direct Access Mode

The example below shows the INTCSIHnIR behavior in direct access mode.

The example below assumes:

- Master mode
- Direct access mode
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B)

Figure 14.8 Generation of INTCSIHnIR in Direct Access Mode

14.4.4.2 INTCSIHnIR in Dual Buffer Mode

The example below shows the INTCSIHnIR behavior in dual buffer mode.

The example assumes:

- Master mode
- Dual buffer mode
- No interrupt delay ($\text{CSIHnCTL1.CSIHnSIT} = 0$)
- Normal clock and data phase ($\text{CSIHnCFGx.CSIHnCKPx} = 0$, $\text{CSIHnCFGx.CSIHnDAPx} = 0$)
- Data length 8 bits ($\text{CSIHnCFGx.CSIHnDLSx}[3:0] = 1000_{\text{B}}$)

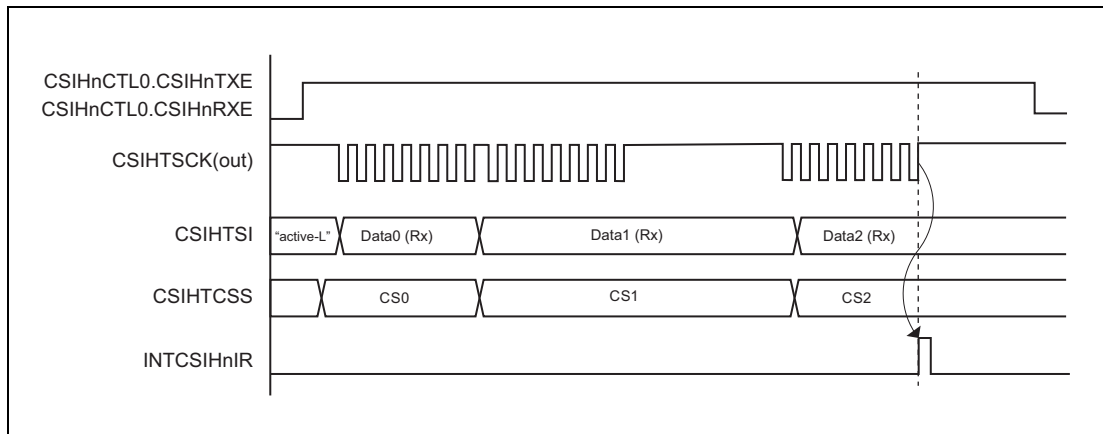

Figure 14.9 Generation of INTCSIHnIR in Dual Buffer Mode

14.4.5 INTCSIHnIRE (Communication Error Interrupt)

This interrupt is generated whenever an error is detected.

For details about interrupt generation timing, see **Section 14.5.12, Error Detection**.

Table 14.39 Data Error Types

| Error Type | Communication Status after Error Interrupt | Note |
|------------------------------|--|---|
| FIFO overflow error | Communication continues even if an interrupt is generated. | Data that has not been written to the FIFO buffer and the data overflowed is lost, but communication started before the error is continued. |
| Parity error | Communication continues even if an interrupt is generated. | — |
| Data consistency check error | Communication continues even if an interrupt is generated. | — |
| Time-out error | Communication continues even if an interrupt is generated. | — |
| Overrun error | (Error occurrence condition 1) An interrupt is generated when the CPU reads the CSIHnRX0W/H register while no receive data is present in FIFO mode, but communication continues. | — |
| | (Error occurrence condition 2) When CSIHnCTL1.CSIHnHSE = 0 (handshake function disabled) in slave mode | When CSIHnCTL1.CSIHnHSE = 1 (handshake function enabled) in slave mode, communication stops due to handshake and no overrun error occurs. |
| | [1] An interrupt is generated when reception is completed while the previous receive data remains in the CSIHnRX0W/H register in direct access mode or transmit-only buffer mode, but communication continues. | |
| | [2] An interrupt is generated when reception is completed while the FIFO buffer is filled with received data in FIFO mode, but communication continues. | |

The type of error that caused the generation of INTCSIHnIRE is flagged in register CSIHnSTR0.

Additionally a parity error flag and a data consistency check error flag are attached to the received data in CSIHnRX0W.

For details about the various error types, see **Section 14.5.12, Error Detection**.

14.4.6 INTCSIHnIJC (Job Completion Interrupt)

This interrupt supports the handling of jobs, see **Section 14.5.3.3, Job Concept**. This interrupt is only available in master mode.

Job mode is enabled by setting $CSIHnCTL1.CSIHnJE = 1$. When $CSIHnCTL1.CSIHnJE = 0$, INTCSIHnIJC is not generated.

Depending on the memory mode, this interrupt is generated according to the condition shown in the following table.

Table 14.40 INTCSIHnIJC Interrupt Generation

| Memory Mode | Cause of Interrupt | |
|----------------------|--|---|
| | Job Mode Disabled $CSIHnCTL1.CSIHnJE = 0$ | Job Mode Enabled $CSIHnCTL1.CSIHnJE = 1$ |
| FIFO | Not applicable | <ul style="list-style-type: none"> Indicates that communication stopped at the end of job after job abort*¹ is triggered. When FIFO empty is not detected, INTCSIHnIJC is generated when $CSIHnCIRE = 1$. |
| Transmit-only buffer | | <ul style="list-style-type: none"> Indicates that communication stopped at the end of job after job abort*¹ was triggered. |
| Dual buffer | | |
| Direct access | | |

Note 1. Job abort condition: $CSIHnTX0W.CSIHnEOJ = 1$ and $CSIHnCTL0.CSIHnJOBE = 1$

14.5 Operation

14.5.1 Operating Modes (Master/Slave)

Whether CSIH operates in the master or slave mode determines the source of the serial clock.

14.5.1.1 Master mode

In master mode, the serial transmission clock is generated by the internal built-in baud rate generator (BRG) and supplied to the slave(s) via CSIH_TSCK signal.

Master mode is enabled by setting CSIH_nCTL2.CSIH_nPRS[2:0] to any value but 111_B. In master mode, the BRG frequency can be specified by setting the CSIH_nCTL2.CSIH_nPRS[2:0] bits in combination with the CSIH_nBRSy.CSIH_nBRS[11:0] bits.

(1) Chip select signals

In master mode, one or more chip select signals can be used. If several slaves are connected to the master, the chip select signals can be used to select one or more slaves. Only the selected slave is then enabled for communication.

The communication protocol as well as additional parameters are stored separately for each chip select signal. This makes it possible to adapt the data transfer individually to the requirements of each slave. For details see **Section 14.5.3, Chip Selection (CS) Features**.

(2) Clock defaults

The default level of CSIH_TSCK depends on the clock phase selection bit: It is high when CSIH_nCTL1.CSIH_nCKR = 0, and is low when CSIH_nCTL1.CSIH_nCKR = 1.

The example below shows communication in master mode for 8-bit data, with CSIH_nCTL1.CSIH_nCKR = 0, CSIH_nCFGx.CSIH_nCKPx = 0, and CSIH_nCFGx.CSIH_nDAPx = 0, and MSB first.

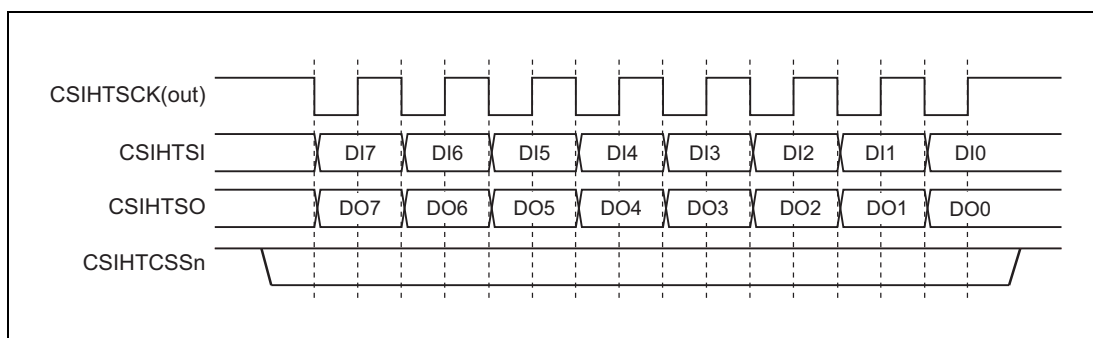

Figure 14.10 Transmission/Reception in Master Mode

14.5.1.2 Slave Mode

In slave mode, another device is the communication master and supplies the transmission clock. Usual transmit operation or receive operation starts immediately after a clock signal is detected.

Slave mode is selected by setting the CSIHnCTL2.CSIHnPRS[2:0] bits to 111_B.

In slave mode, the transmission protocol setting by the CSIHnCFG0 register is enabled (setting of the CSIHnCFG1-CSIHnCFG7 register is disabled).

- CSIHnPSx[1:0]: parity usage
- CSIHnDLSx[3:0]: data length selection
- CSIHnDIRx: data direction
- CSIHnCKPx,CSIHnDAPx: clock and data phase

NOTE

When using slave mode, disable the baud rate generator (BRG) by setting bits CSIHnBRSy.CSIHnBRS[11:0] to 000_H. Set the CSIHnBRSy.CSIHnBRS[11:0] bits to a value other than 000_H to use time-out errors.

Figure 14.11 Transmission/Reception in Slave Mode

14.5.2 Master/Slave Connections

14.5.2.1 One Master and One Slave

The following figure illustrates the connections between one master and one slave.

Figure 14.12 Direct Master/Slave Connection

14.5.2.2 One Master and Multiple Slaves

The following figure illustrates the connections between one master and multiple slaves. In this example, the master supplies one chip select (CS) signal to each of the slaves. This signal is connected to the slave select input $\overline{\text{CSIHTSSI}}$ of the slave.

The $\overline{\text{CSIHTSSI}}$ signal can be enabled or disabled by using the $\text{CSIHnCTL1.CSIHnSSE}$ bit.

Figure 14.13 One Master to Multiple Slaves Connection

By default, the chip select level is active low. That means, a slave is selected (enabled) as a CSH slave when its $\overline{\text{CSIHTSSI}}$ signal is at a low level. However, to adapt the CS to other devices, the output level of each chip select signal can also be programmed to be active high.

If a slave is not selected, it will neither receive nor transmit data. In addition, when transmit-only mode or transmit/receive mode is set ($\text{CSIHnCTL0.CSIHnTXE} = 1$), the CSIHTSO output of the slaves that are not selected is disabled and set to input mode in order to avoid interference with the output of the selected slave.

14.5.3 Chip Selection (CS) Features

The chip select signal, CSIHnCSSx can be used by the master to select one or more slaves for communication.

14.5.3.1 Configuration Registers

The parameters for each chip select signal CSIHnCSSx are defined in the corresponding configuration register CSIHnCFGx. The parameters include the communication protocol and additional CS parameters.

The communication protocol specifies:

- Data length: The number of bits to be transmitted or received. (CSIHnCFGx.CSIHnDLSx[3:0])
- Transfer direction: MSB or LSB first. (CSIHnCFGx.CSIHnDIRx)
- Parity usage: Odd, even, 0 parity or none. (CSIHnCFGx.CSIHnPSx[1:0])
- Clock phase and data phase. (CSIHnCFGx.CSIHnCKPx, CSIHnCFGx.CSIHnDAPx)

Additional parameters for each chip select signal that are only available in master mode are:

- Selection of prescaler of baud rate generator individually for each chip select signal (CSIHnCFGx.CSIHnBRSSx[1:0])
- Categorizes chip select signals into “dominant” and “recessive”. The priority applies if two or more chip select signals with different configurations are simultaneously activated for message broadcasting. In this case, the configuration specified for dominant chip select signals is used. (CSIHnCFGx.CSIHnRCBx)

The principle is also called “Recessive Configuration for Broadcasting” (RCB).

CAUTION

When specifying multiple chip select signals as dominant, be sure to configure the same settings for all dominant signals.

- Chip select timing:
 - Setup time T_{setup} : The time from “CS active” to “First data output”. (CSIHnCFGx.CSIHnSPx[3:0])
 - Inter-data time T_{inter} : The time between one data and the next data while the same CS signal is active. (CSIHnCFGx.CSIHnINx[3:0])
 - Hold time T_{hold} : The time from “the end of last data bit” to “CS inactive”. (CSIHnCFGx.CSIHnHDx[3:0])
 - Idle time T_{idle} : Inactive time after terminating a CS signal or after every data transfer to the same CSx. (CSIHnCFGx.CSIHnIDx[2:0])

The CS timings of the setup time, the inter-data time, the hold time, and the idle time are illustrated in the figure below. When the CSIHnCFGx.CSIHnIDLx bit is set to 1, idle time is inserted into each transfer regardless of the CS signal.

Figure 14.14 provides an example of a waveform when the default active low setting is specified for the CSIHnCTL1 and CSIHnCTL2 signals (CSIHnCTL1.CSIHnCSL1 bit = 0, CSIHnCTL1.CSIHnCSL2 bit = 0). The active level can be specified individually for each CS.

Figure 14.14 Chip Select Timings

Note that each CS signal can have a different value for the setup time, inter-data time, hold time, and idle time.

A particular chip select signal is activated by setting the appropriate bit in the transmission register CSIHnTX0W.CSIHnCSx.

CSIHnRX0W.CSIHnCSx in the reception register indicates the chip select signal associated with the received data.

CAUTION

When high-priority communication function using CPU control is enabled (CSIHnCTL1.CSIHnPHE = 1), idle state is inserted when low-priority communication mode changes to high-priority communication mode and when high-priority communication mode changes to low-priority communication mode regardless of the CSIHnCFGx.CSIHnIDLx bit setting.

14.5.3.2 CS Example

The following figure shows an example of two consecutive data transmissions.

The first communication uses CS0 to communicate with one slave. The second enables CS0 and CS1 to broadcast a message to two slaves. The priority of CS0 is set to “recessive: low priority” and the priority of CS1 to “dominant: high priority”.

Therefore, the second communication is performed by using the dominant CS1 setting.

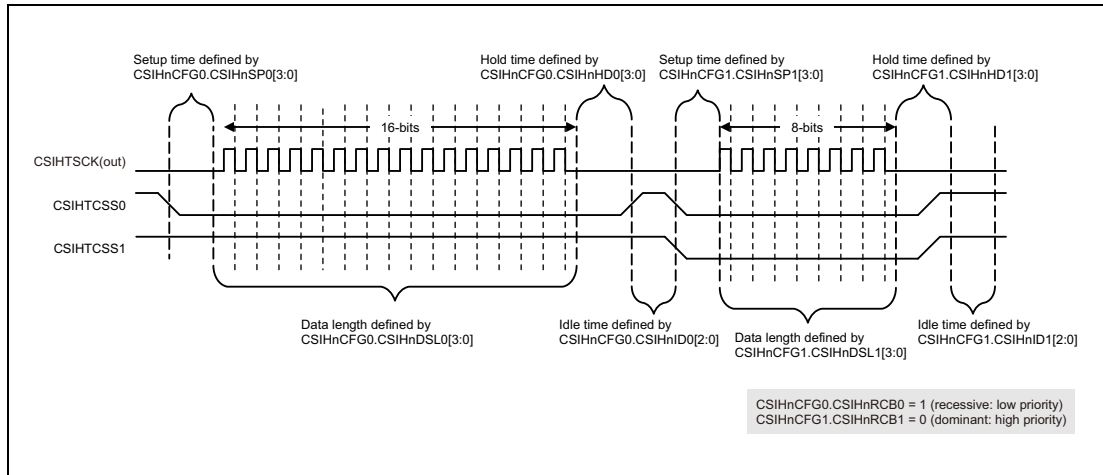

Figure 14.15 Chip Select and RCB Example

14.5.3.3 Job Concept

In CSIH, a job consists of the number of data that are transferred.

Job mode enable

The job mode can only be enabled in master mode. The job mode is enabled and disabled by CSIHnCTL1.CSIHnJE, while the CSIH is disabled by CSIHnCTL0.CSIHnPWR = 0.

Figure 14.16 Job Examples

A job ends by transmitting data with CSIHnTX0W.CSIHnEOJ = 1.

Communication can be specified to stop when a job is finished. This is done by setting CSIHnCTL0.CSIHnJOB. When CSIHnJOB is set, the communication continues until data is transmitted, for which the CSIHnEOJ bit was set. After this data is transmitted, the communication is stopped and the job completion interrupt INTCSIHnIJC is generated.

14.5.4 Chip Select Timing Details

14.5.4.1 Changing the Clock Phase

The serial clock level specified by $CSIHnCFGx.CSIHnCKPx$ may be changed when communication is disabled. The minimum value of an idle time is one transmission clock ($CSIHTSCK(out)$) cycle.

If the idle time is set to 0.5 transmission clock periods (in $CSIHnCFGx.CSIHnIDx[2:0]$) and two consecutive data are transmitted with different $CSIHnCFGx.CSIHnCKPx$ configuration, the idle time is automatically extended to one $CSIHTSCK(out)$ cycle.

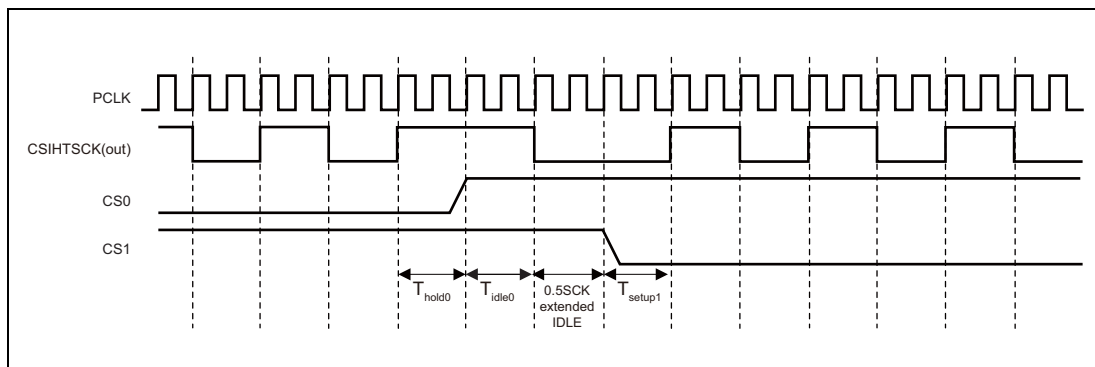

Figure 14.17 Clock Phase Timing with $PCLK/4$, $T_{hold0} = T_{setup1} = 0.5CSIHTSCK$, $T_{idle0} = 0.5CSIHTSCK$, $CSIHnCFG0.CSIHnCKP0 = 0$ (CSIHTCSS0) → $CSIHnCFG1.CSIHnCKP1 = 1$ (CSIHTCSS1)

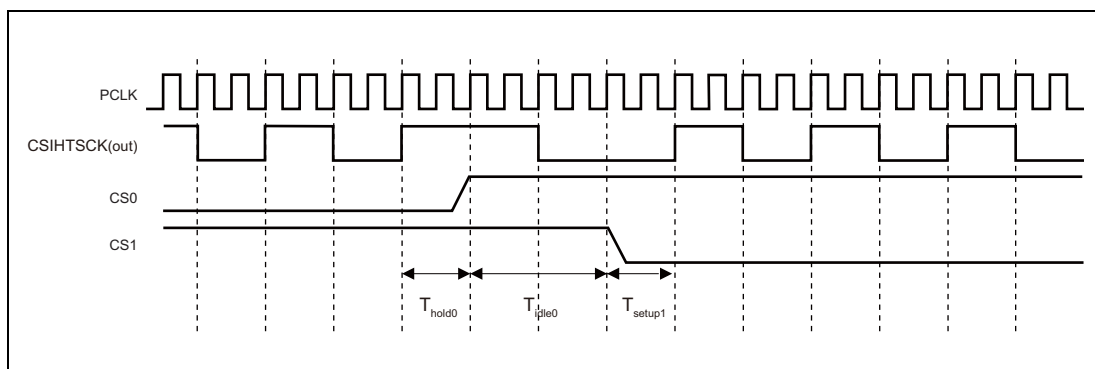

Figure 14.18 Clock Phase Timing with $PCLK/4$, $T_{hold0} = T_{setup1} = 0.5CSIHTSCK$, $T_{idle0} = 1CSIHTSCK$, $CSIHnCFG0.CSIHnCKP0 = 0$ (CSIHTCSS0) → $CSIHnCFG1.CSIHnCKP1 = 1$ (CSIHTCSS1)

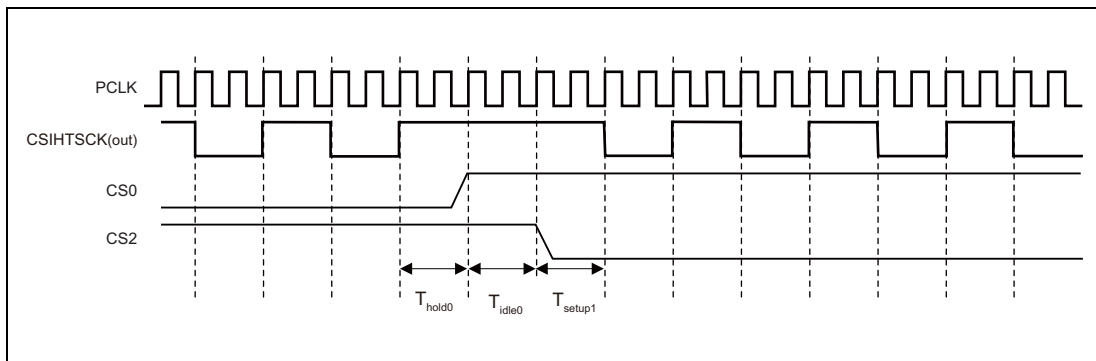

Figure 14.19 Clock Phase Timing with PCLK/4, $T_{hold0} = T_{setup1} = 0.5CSIHTSCK$, $T_{idle0} = 0.5CSIHTSCK$, CSIHnCFG0.CSIHnCKP0 = 0 (CSIHTCSS0) → CSIHnCFG2.CSIHnCKP2 = 0 (CSIHTCSS2)

14.5.4.2 Changing the Data Phase

The CSIHnCFGx.CSIHnDAPx bit defines the phase of the data bits relative to the clock.

The relation between the setting of the CSIHnCFGx.CSIHnDAPx bit and the hold and setup times is as follows:

The hold time period is a period from the last edge of the serial clock (CSIHTSCK) until CSIHnCSS[7:0] becomes inactive level regardless of the CSIHnCFGx.CSIHnDAPx setting.

The setup time period is a period from the time when CSIHnCSS[7:0] becomes active level until transmission data (CSIHTSO) is output.

For this reason, there is a time difference of 0.5 CSIHTSCK cycles until the serial clock (CSIHTSCK) edge is output depending on the CSIHnCFGx.CSIHnDAPx setting.

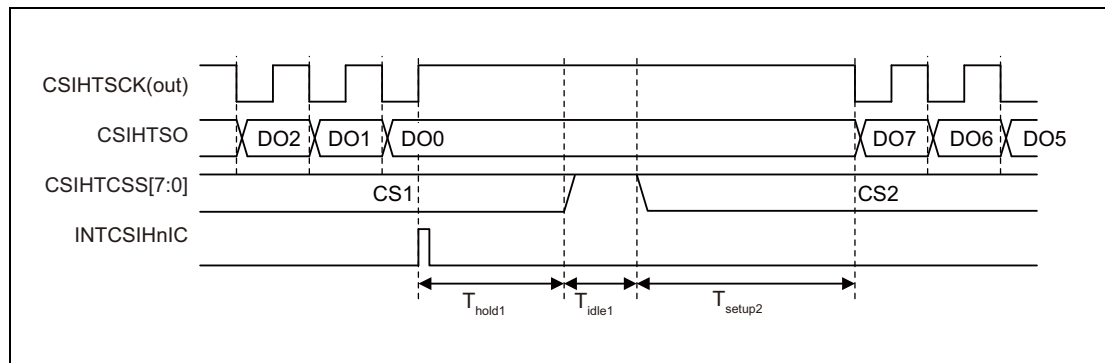

Figure 14.20 Data Phase Timing with CSIHnCFG1.CSIHnCKP1 = 0, CSIHnCFG1.CSIHnDAP1 = 0 and CSIHnCFG2.CSIHnCKP2 = 0, CSIHnCFG2.CSIHnDAP2 = 0

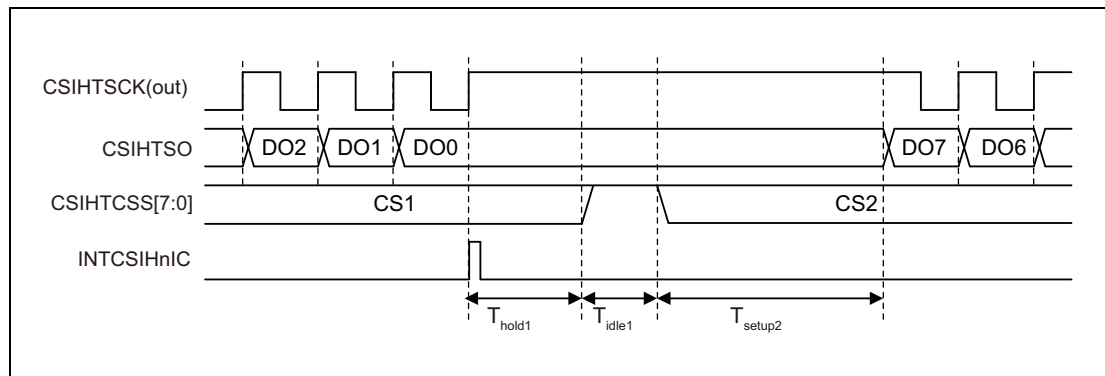

Figure 14.21 Data Phase Timing with CSIHnCFG1.CSIHnCKP1 = 1, CSIHnCFG1.CSIHnDAP1 = 0 and CSIHnCFG2.CSIHnCKP2 = 0, CSIHnCFG2.CSIHnDAP2 = 1

14.5.5 Transmission Clock Selection

In master mode, the transfer clock frequency is selectable using the following bits:

- CSIHnCTL2.CSIHnPRS[2:0]
- CSIHnBRSy.CSIHnBRS[11:0] (y = 0-3)
- CSIHnCFGx.CSIHnBRSSx[1:0] (x = 0 to 7)

The transfer clock frequency of the transmit clock CSIHnTSCk is determined by the CSIHnCTL2.CSIHnPRS[2:0] and CSIHnBRSy.CSIHnBRS [11:0] settings. One among four baud rates, CSIHnBRS3 to CSIHnBRS0, is selected for each chip select signal by the CSIHnCFGx.CSIHnBRSSx[1:0] setting.

The following figure shows a block diagram of the baud rate generator.

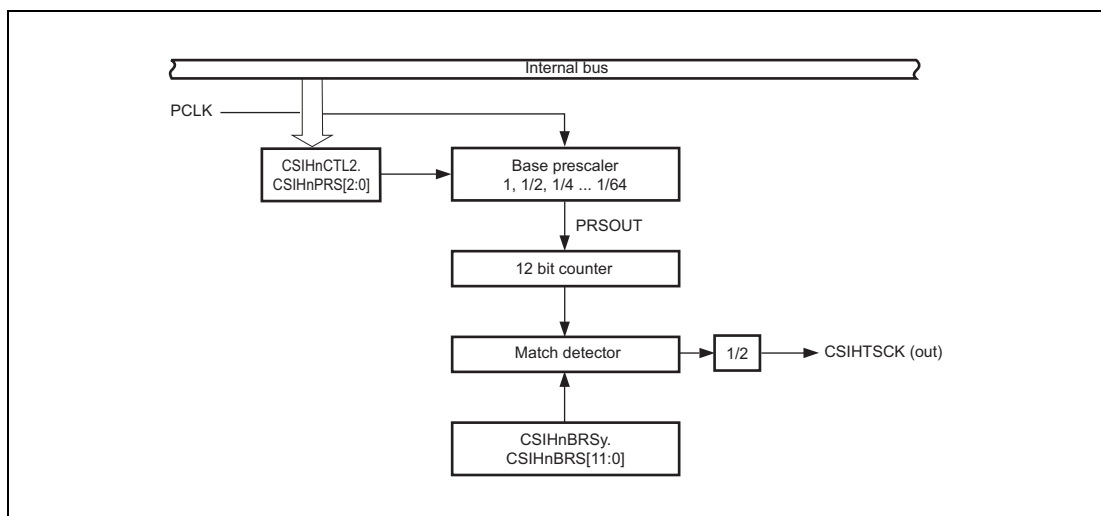

Figure 14.22 Baud Rate Generator Block Diagram

Setting CSIHnBRSy.CSIHnBRS[11:0] to 000_H disables the baud rate generator, and thus all CSIHnTSCk are stopped.

Transfer clock frequency calculation

The transfer clock frequency in master mode is calculated by the following formula.

$$\text{Transfer clock frequency (CSIHnTSCk)} = \text{PCLK} / (\text{PCLK's division ratio}) = \text{PCLK} / (2^\alpha \times k \times 2)$$

where:

$$\alpha = \text{CSIHnCTL2.CSIHnPRS}[2:0] = 0 \text{ to } 6$$

$$k = \text{CSIHnBRS0.CSIHnBRS0}[11:0] = 1 \text{ to } 4095$$

(when CSIHnCFGx.CSIHnBRSSx[1:0] = 0)

$$\text{CSIHnBRS1.CSIHnBRS1}[11:0] = 1 \text{ to } 4095$$

(when CSIHnCFGx.CSIHnBRSSx[1:0] = 1)

$$\text{CSIHnBRS2.CSIHnBRS2}[11:0] = 1 \text{ to } 4095$$

(when CSIHnCFGx.CSIHnBRSSx[1:0] = 2)

$$\text{CSIHnBRS3.CSIHnBRS3}[11:0] = 1 \text{ to } 4095$$

(when CSIHnCFGx.CSIHnBRSSx[1:0] = 3)

Transfer clock frequency limits

When setting the transfer clock frequency, please note the followings:

- Minimum transfer clock frequency = $PCLK / 524160$ (both master mode and slave mode)
- Maximum transfer clock frequency is as follows:
 - Master mode: 10.0 MHz
 - Slave mode: 6.66 MHz

14.5.6 CSIH Buffer Memory

The CSIH has a configurable RAM that can be used for buffered I/O. The size is 128 words. One word is comprised of 32-bit data and 7-bit ECC.

The following configurations are available:

| Mode | CSIHnCTL0. CSIHnMBS | CSIHnMCTL0. CSIHnMMS[1:0] |
|---------------------------|------------------------|------------------------------|
| FIFO mode | 0 | 00 _B |
| Dual buffer mode | | 01 _B |
| Transmit-only buffer mode | | 10 _B |
| Direct access mode | 1 | X |

14.5.6.1 FIFO Mode

In FIFO mode, data can be written to the CSIHnTX0W register without waiting for completion of the transmission, and data can be received without reading the CSIHnRX0W register immediately, provided that the FIFO is not full.

Transmission and reception occur simultaneously - one data is transmitted, one data is received. That means, received data overwrites the transmitted data in the FIFO.

The CSIH automatically updates the respective FIFO memory pointers when data is written to or read from the FIFO memory or transmitted from or received to the FIFO memory.

Table 14.41 FIFO Mode

| Pointer Description | Control Bits*1 | Range |
|--|---------------------------|--|
| Number of untransmitted words | CSIHnSTR0.CSIHnSPF[7:0] | 0 to 128 |
| Number of words received and stored in the FIFO | CSIHnSTR0.CSIHnSRP[7:0] | 0 to 128 |
| Address of transmission data to be written or read | CSIHnMRWP0.CSIHnTRWA[6:0] | 0000 _H to 01FC _H |
| Address of receive data to be read | CSIHnMRWP0.CSIHnRRA[6:0] | 0000 _H to 01FC _H |
| Transmission address | CSIHnMCTL2.CSIHnSOP[6:0] | 0000 _H to 01FC _H |

Note 1. The value is automatically updated each time data is written, read, transmitted, or received.

The CSIH status register contains two FIFO status flags:

- CSIHnSTR0.CSIHnFLF: FIFO full
- CSIHnSTR0.CSIHnEMF: FIFO empty

When this mode is started, bit CSIHnSTCR0.CSIHnPCT must be set. This sets only CSIHnSTR0.CSIHnEMF, but not reset).

All FIFO pointers and FIFO flags except CSIHnSTR0.CSIHnEMF are reset and CSIHnSTR0.CSIHnEMF is set.

14.5.6.2 Dual Buffer Mode

In this mode, the memory is divided into two parts of equal size – this means the lower-order 64 words for transmit data and the higher-order 64 words for received data. In dual buffer mode, the respective buffer pointers indicate the values shown in the following table.

Table 14.42 Dual Buffer Mode

| Pointer Description | Pointer* ¹ | Range |
|---|---------------------------|--|
| Address of data to be written to or read from transmit buffer | CSIHnMRWP0.CSIHnTRWA[6:0] | 0000 _H to 00FC _H |
| Address of data to be read from receive buffer | CSIHnMRWP0.CSIHnRRA[6:0] | 0000 _H to 00FC _H |
| Number of transmission data remaining in transmit buffer | CSIHnMCTL2.CSIHnND[6:0] | 0 to 64 |
| Transmission address | CSIHnMCTL2.CSIHnSOP[6:0] | 0000 _H to 00FC _H |

Note 1. Pointers are automatically incremented each time data is written or read.

14.5.6.3 Transmit-Only Buffer Mode

In this mode, the entire memory is used to save transmission data.

Received data must be read directly from CSIHnRX0W/H.

In transmit-only buffer mode, the respective buffer pointer indicates the values shown in the following table.

Table 14.43 Transmit-Only Buffer Mode

| Pointer Description | Pointer* ¹ | Range |
|---|---------------------------|--|
| Address of data to be written to or read from transmit buffer | CSIHnMRWP0.CSIHnTRWA[6:0] | 0000 _H to 01FC _H |
| Number of transmission data remaining in transmit buffer | CSIHnMCTL2.CSIHnND[6:0] | 0 to 128 |
| Transmission address | CSIHnMCTL2.CSIHnSOP[6:0] | 0000 _H to 01FC _H |

Note 1. Pointers are automatically incremented each time data is written or read.

14.5.6.4 Direct Access Mode

In direct access mode, the CSIH memory is completely bypassed:

- Transmission data provided by the CPU to the transmission register CSIHnTX0W or CSIHnTX0H is directly copied to the shift register.
- Reception data is directly copied from the shift register to the reception register CSIHnRX0W or CSIHnRX0H.

14.5.7 Data Transfer Modes

14.5.7.1 Transmit-Only Mode

Setting $\text{CSIHnCTL0.CSIHnTXE} = 1$ and $\text{CSIHnCTL0.CSIHnRXE} = 0$ puts the CSIH in transmit-only mode. Start of transmission depends on the memory mode:

- In case of FIFO or direct access mode, transmission starts when transmit data is written to the CSIHnTX0W or CSIHnTX0H register.
- In case of dual buffer or transmit-only buffer mode, transmission starts when the $\text{CSIHnMCTL2.CSIHnBTST}$ bit is set.

14.5.7.2 Receive-Only Mode

Setting $\text{CSIHnCTL0.CSIHnTXE} = 0$ and $\text{CSIHnCTL0.CSIHnRXE} = 1$ puts the CSIH in receive-only mode.

In master mode, start of reception depends on the memory mode:

- In case of FIFO or direct access mode, reception starts when dummy data is written in the CSIHnTX0W or CSIHnTX0H register.

In slave mode, reception starts as soon as the CSIHTSCK transmission clock is received from the master. It is not necessary to write data to the CSIHnTX0W or CSIHnTX0H register of the slave.

- In dual-buffer mode or transmit-only buffer mode, reception starts when the $\text{CSIHnMCTL2.CSIHnBTST}$ bit is set.

14.5.7.3 Transmit/Receive Mode

Setting $\text{CSIHnCTL0.CSIHnTXE} = 1$ and $\text{CSIHnCTL0.CSIHnRXE} = 1$ puts the CSIH in transmit/receive mode.

Start of communication (transmission and reception) depends on the memory mode:

- In case of FIFO or direct access mode, communication starts when transmit data is written to the CSIHnTX0W or CSIHnTX0H register.
- In case of dual buffer or transmit-only buffer mode, communication starts when the $\text{CSIHnMCTL2.CSIHnBTST}$ bit is set.

14.5.7.4 Summary

The following table summarizes this section. It shows how data transfer is started in the various memory, operating, and transfer modes.

Table 14.44 Start of Data Transfer

| Memory and Operating Mode | | Transfer Mode | |
|-----------------------------------|--------|---|---|
| | | Transmit-only Transmit/Receive | Receive-only |
| FIFO, direct access | Master | Writing to the CSIHnTX0W register or the CSIHnTX0H register | Writing to the CSIHnTX0W register or the CSIHnTX0H register |
| | Slave | Clock supplied from the master | Clock supplied from the master |
| Transmit-only buffer, dual buffer | Master | $\text{CSIHnMCTL2.CSIHnBTST} = 1$ | $\text{CSIHnMCTL2.CSIHnBTST} = 1$ |
| | Slave | Incoming clock from the master | Incoming clock from the master |

14.5.8 Data Length Selection

14.5.8.1 Data Length Between 2 and 16 bits

The length of a data packet is selectable for each chip select signal from 2 to 16 bits using $\text{CSIHnCFGx.CSIHnDLSx}[3:0]$. The examples below show the communication with MSB first ($\text{CSIHnCFGx.CSIHnDIRx} = 0$).

Data length = 16 bits ($\text{CSIHnCFGx.CSIHnDLSx}[3:0] = 0000_{\text{B}}$)

Figure 14.23 16-Bit Data Length, MSB First

Data length = 14 bits ($\text{CSIHnCFGx.CSIHnDLSx}[3:0] = 1110_{\text{B}}$):

Figure 14.24 14-Bit Data Length, MSB First

14.5.8.2 Data Length Greater than 16 Bits

To transmit/receive data exceeding 16 bits, the extended data length (EDL) feature can be used.

The EDL feature is enabled by setting the CSIHnCTL1.CSIHnEDLE to 1.

The EDL feature works as follows:

- The data must be broken into 16-bit blocks plus remainder. For example, 42-bit data would be broken into two 16-bit blocks plus 10 bits.
- The remainder bit length is set in CSIHnCFGx.CSIHnDLSx[3:0] as “data length.”
- For transmitting the 16-bit blocks, CSIHnTX0W.CSIHnEDL must be set to 1. In this case, the data written to CSIHnTX0W is transmitted as a 16-bit data length regardless of the CSIHnCFGx.CSIHnDLSx[3:0] bit setting.
- The transfer is complete after a block with the specified data length (the remainder of data specified with CSIHnTX0W.CSIHnEDL = 0) has been transmitted.

Example

Example for transmitting 40-bit data (123456789A_H) to CS0:

40 bits are split into two 16-bit blocks and 8 bits.

- Initialize to CSIHnCFG0.CSIHnDLS0[3:0] = 8_H.
- To transmit 123456789A_H with MSB first, write the following sequence to CSIHnTX0W:
 - 20FE 1234_H (CSIHnTX0W.CSIHnEDL = 1)
 - 20FE 5678_H (CSIHnTX0W.CSIHnEDL = 1)
 - 00FE 009A_H (CSIHnTX0W.CSIHnEDL = 0)

The following figure illustrates the timing.

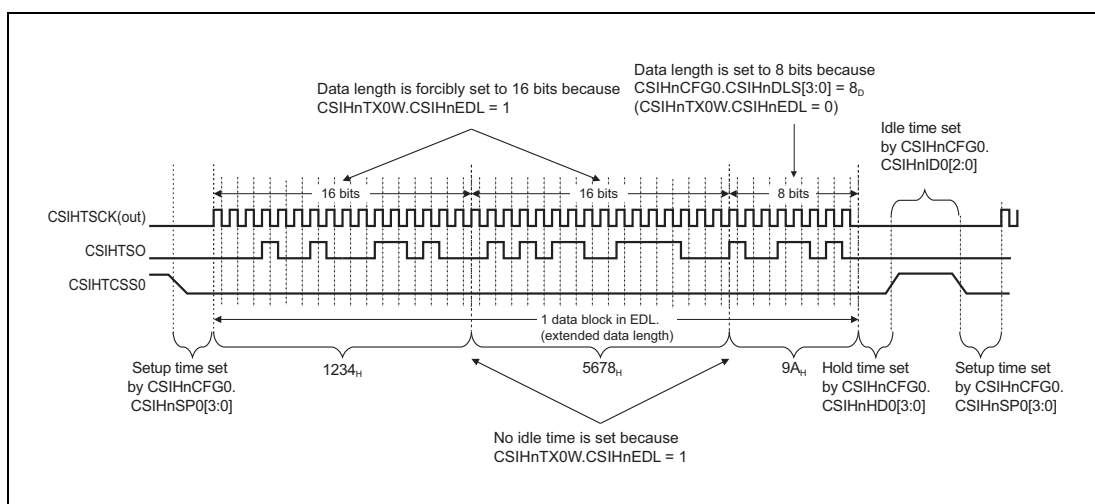

Figure 14.25 EDL Timing Diagram

NOTES

1. Data lengths settings lower than 7 bits are only permitted in combination with EDL mode.
 2. It is not possible to transmit two consecutive data with a data length of less than 7 bits.
 3. If parity is enabled, the parity bit is added after the last bit.
 4. When the extended data length (EDL) feature is used, use the same chip select signal.
 5. If CSIHnTX0W.CSIHnEOJ and CSIHnTX0W.CSIHnEDL are set to 1 at the same time while CSIHnCTL1.CSIHnJE = 1 and CSIHnCTL1.CSIHnEDLE = 1, correct operation is not guaranteed.
 6. Examples for consider the data direction, pay attention to the following example:
 - Data to be transmitted: 123456_H
 - MSB first:
 - Set CSIHnCFGx.CSIHnDIRx = 0
 - Write CSIHnTX0W = 20FE 1234_H (EDL bit = 1)
 - Write CSIHnTX0W = 00FE 0056_H (EDL bit = 0)
 - LSB first:
 - Set CSIHnCFGx.CSIHnDIRx = 1
 - Write CSIHnTX0W = 20FE 3456_H (EDL bit = 1)
 - Write CSIHnTX0W = 00FE 0012_H (EDL bit = 0)
 7. EDL mode cannot be used in receive-only mode of slave mode.
(CSIHnCTL2.CSIHnPRS[2:0] = 111_B, CSIHnCTL0.CSIHnTXE = 0, CSIHnCTL0.CSIHnRXE = 1)
-

14.5.9 Serial Data Direction Selection

The serial data direction is selectable for each chip select signal by using the CSIHnDIRx bit in the CSIHnCFGx register.

The examples below show communication for a data length of 8 bit (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).

Figure 14.26 Serial Data Direction Select Function - MSB First (CSIHnDIRx = 0)

Figure 14.27 Serial Data Direction Select Function - LSB First (CSIHnDIRx = 1)

14.5.10 Slave Select (SS) Function

The SS (slave select) function enables communication between one master and multiple slaves.

In master mode, the master device outputs the slave select signal (CSIHTCSSx) to a slave.

Communication by a device in slave mode is enabled when the slave input select signal ($\overline{\text{CSIHTSSI}}$) is at the low level.

Refer to the **Section 14.5.2, Master/Slave Connections**, for examples of connections using the SS function.

14.5.10.1 Communication Timing Using SS Function

The following figure illustrates the communication signal and timings using the SS function.

In slave mode, the data transfer configuration is determined by the CSIHnCFG0 register.

Figure 14.28 Transmission/Reception Timing of Communication Using SS Function

- (1) CSIH enters slave mode by setting CSIHnCTL2.CSIHnPRS[2:0] = 111_B. CSIHnCFG0.CSIHnCKP0 and CSIHnCFG0.CSIHnDAP0 are 0.
- (2) The data length is 8 bits (CSIHnCFG0.CSIHnDLS0[3:0] = 1000_B). The data direction is MSB first (CSIHnCFG0.CSIHnDIR0 = 0).
- (3) Transmit/receive mode is set. (CSIHnCTL0.CSIHnTXE = 1, CSIHnCTL0.CSIHnPWR = 1). Communication start is permitted.
- (4) The transfer status flag CSIHnSTR0.CSIHnTSF is automatically set in direct access mode or FIFO mode when transfer data is written to the CSIHnTX0W or CSIHnTX0H transmission register.
- (5) As long as signal $\overline{\text{CSIHTSSI}}$ is high, transmission/reception is not started, even if an external transmission clock CSIHTSCK is supplied. Input to CSIHTSI is ignored.
- (6) Changing $\overline{\text{CSIHTSSI}}$ to low level indicates that CSIHTSO is enabled and ready for transmission.
- (7) As soon as the external clock signal CSIHTSCK appears, the slave transmits data to CSIHTSO and simultaneously captures data from CSIHTSI.
- (8) Interrupt INTCSIHnIR indicates that the reception is complete. The CSIHnRX0W/H register can be read.

14.5.10.2 CSIHTSSO Operation

| CSIHnPWR | CSIHnTXE | CSIHnRXE | CSIHnSSE | CHISTSSO |
|----------|----------|----------|----------|----------------------------------|
| 0 | — | — | — | H |
| 1 | — | — | 0 | H |
| | 0 | — | 1 | H |
| | 1 | — | 1 | Reversed value of CSIHTSSI level |

The CSIHTSSO pin is a signal to control the I/O function of the chip's SO pin in case of using the SS function.

The CSIHTSSO pin is enabled when the CSIHTSSO pin is "High" (the chip's SO pin is being driven).

The CSIHTSSO pin is disabled when the CSIHTSSO pin is "Low" (the chip's SO pin is not being driven).

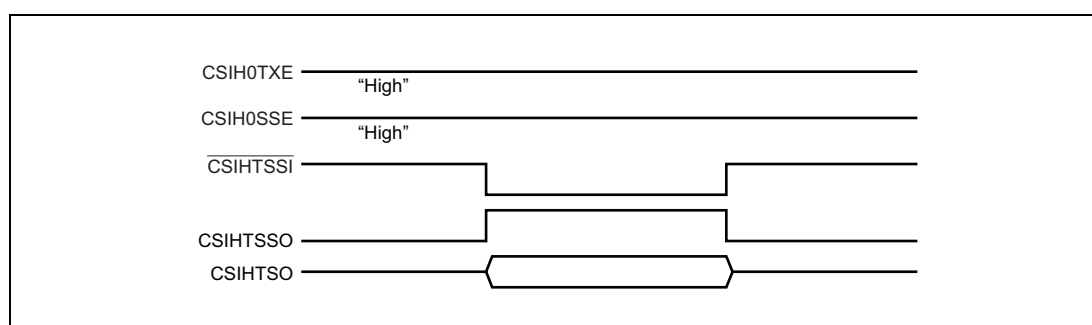

Figure 14.29 Operation of CSIHTSSO

CAUTION

If $\overline{\text{CSIHTSSI}}$ pin is changed during communication ($\text{CSIHnSTR0.CSIHnTSF} = 1$), current communication is not guaranteed.

14.5.11 Handshake Function

CSIH features a handshake function to synchronize the master and the slave devices. This function can be enabled/disabled by bit CSIHnCTL1.CSIHnHSE. For handshake, the signals CSIHTRYI and CSIHTRYO are used.

The timing of transitions to the busy state depends on the setting of the data phase selection bit, CSIHnCFGx.CSIHnDAPx.

14.5.11.1 Slave Mode

When the slave becomes busy while CSIHnCTL1.CSIHnHSE = 1, the CSIHTRYO signal outputs low level 0. This state is produced in the following two cases:

1. When the next transmission data is not ready:
When the slave is set to transmit-only mode or transmit/receive mode (CSIHnCTL0.CSIHnTXE = 1), CSIHTRYO outputs low level (busy state) in the following conditions.

Table 14.45 Memory Mode and Transmission State of Slave

| Memory Mode | Transmission State of Slave |
|---------------------------|--|
| Direct access mode | No next transfer data |
| FIFO mode | No next transfer data (CSIHnSTR0.CSIHnEMF = 1) |
| Dual buffer mode | CSIHnMCTL2.CSIHnBTST is not set to 1 |
| Transmit-only buffer mode | |

The example below describes the waveform in case of an eight-bit data length.

Figure 14.30 Busy Signal from the Slave (FIFO Mode; CSIHnCFGx.CSIHnDAPx = 0)

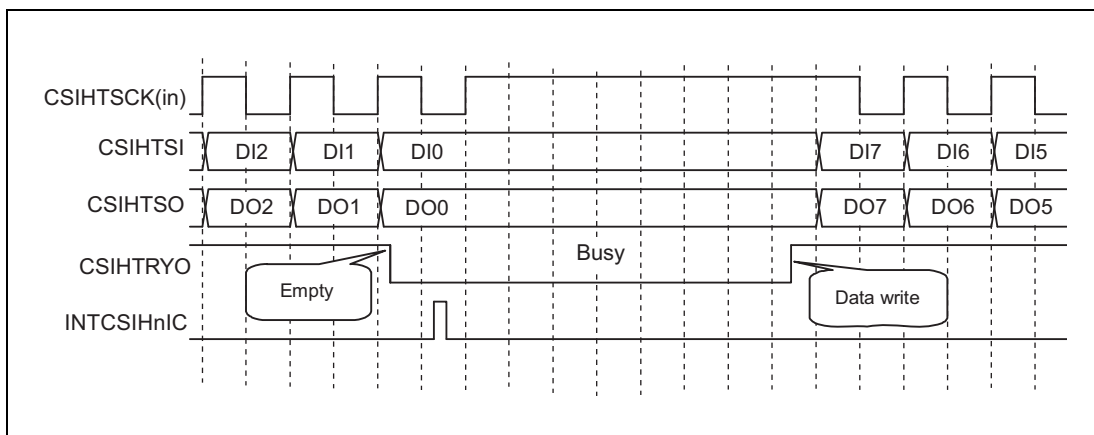

Figure 14.31 Busy Signal from the Slave (FIFO Mode; CSIHnCFGx.CSIHnDAPx = 1)

2. When the receive register is full:

Because the previously received data is still in the CSIHnRX0W or CSIHnRX0H register while the slave is in receive-only or transmit/receive mode (CSIHnCTL0.CSIHnRXE = 1), new data cannot be copied from the shift register to CSIHnRX0W or CSIHnRX0H (CSIHnRX0W or CSIHnRX0H full condition).

When CSIHnCTL0.CSIHnRXE = 1, CSIHTRYO outputs low level (busy state) in the following conditions.

Table 14.46 Memory Mode and Reception State of Slave

| Memory Mode | Reception State of Slave |
|---------------------------|---|
| Direct access mode | CSIHnRX0W or CSIHnRX0H is full |
| FIFO mode | Receive data remaining in the buffer (CSIHnSTR0.CSIHnFLF = 1) |
| Dual buffer mode | No applicable state |
| Transmit-only buffer mode | CSIHnRX0W or CSIHnRX0H is full |

The example below describes the waveform in case of an eight-bit data length.

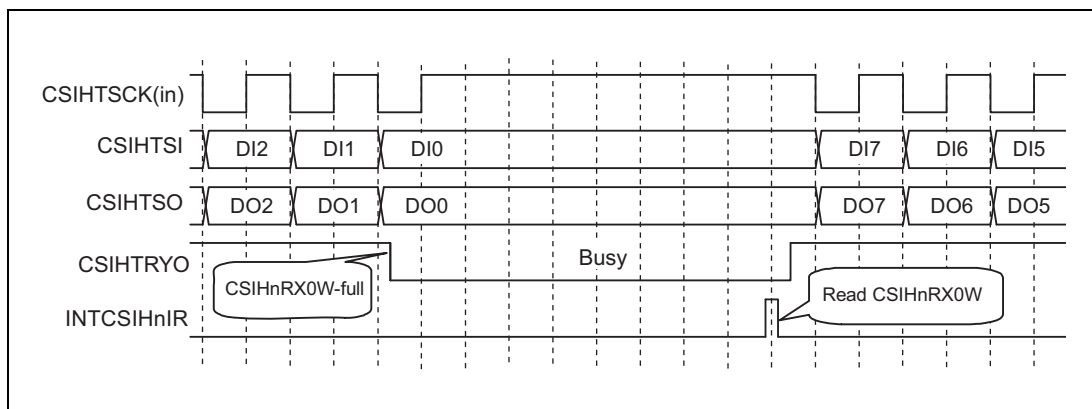

Figure 14.32 Busy Signal from the Slave (Direct Access Mode; CSIHnCFGx.CSIHnDAPx = 0)

Figure 14.33 Busy Signal from the Slave (CSIHnCFGx.CSIHnDAPx = 1)

14.5.11.2 Master Mode

When the master detects $CSIHTRYI = 0$ while $CSIHnCTL1.CSIHnHSE = 1$, the subsequent transfers are put on hold, the master goes into wait state and suspends the $CSIHTSCK$ clock.

The $CSIHTRYI$ level is checked at each half clock cycle of $CSIHTSCK$.

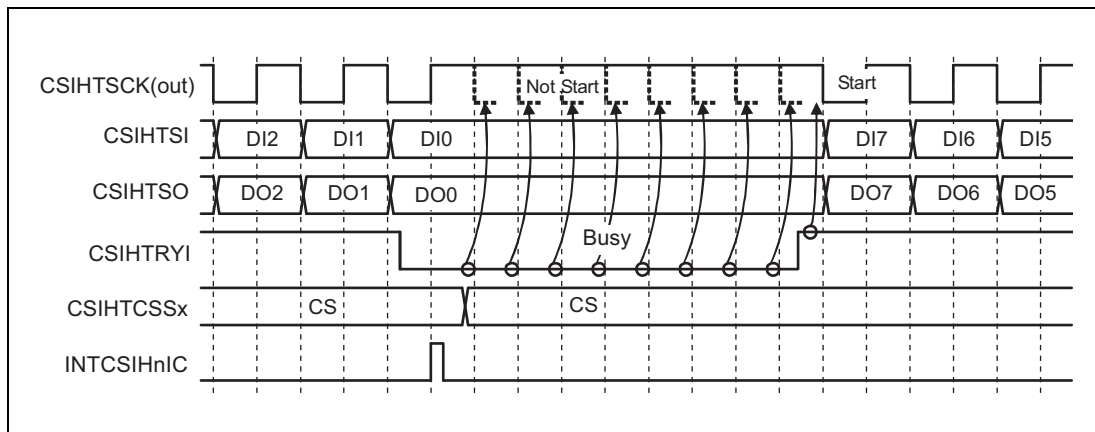

Figure 14.34 Master’s Reaction to CSIHTRYI (CSIHnCFGx.CSIHnDAPx = 0)

$CSIHTRYI$ must be pulled down by the slave before the next transfer starts. When the slave changes the $CSIHTRYI$ signal to low level during data transfer, the serial clock from the master stops at the completion of data transfer.

The master resumes the communication as soon as $CSIHTRYI$ becomes high level (the slave is “ready”).

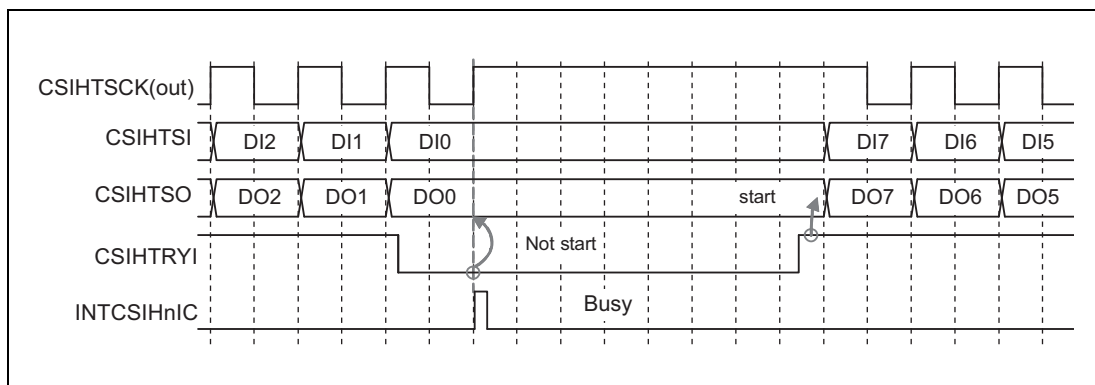

Figure 14.35 Master’s Reaction to CSIHTRYI (CSIHnCFGx.CSIHnDAPx = 1)

CAUTIONS

1. If multiple slaves are connected, the master must detect only the $CSIHTRYI$ signal from the slave it has selected for communication.
2. Even when the $CSIHTRYI$ pin of the master detects the $CSIHTRYO$ signal of the slave during data transfer, communication is not in wait status until data transfer finishes.

14.5.12 Error Detection

CSIH can detect five error types:

- Data consistency check error (transmission data)
- Parity error (received data)
- Overrun error (received data)
- Time-out error (in FIFO mode)
- Overflow error (in FIFO mode)

Check for parity, data consistency check and time-out errors can be enabled or disabled individually.

If any of these errors are detected, the interrupt request INTCSIHnIRE is generated and the corresponding flags are set.

14.5.12.1 Data Consistency Check

The purpose of the data consistency check is to ensure that the data physically transmitted as output signal is identical to the original data that was copied to the shift register.

The data consistency check can be enabled/disabled by the CSIHnCTL1.CSIHnDCS bit. When executing a data consistency check, always set CSIHnTXSO to PIPn.PIPn_m = 1. It will not be enabled if data transmission is disabled (CSIHnCTL0.CSIHnTXE = 0).

When the data consistency check is active, the data transferred from CSIHnTX0W or CSIHnTX0H to the shift register is copied to a separate register. In addition, the physical levels of CSIHnTXSO are read back into a separate shift register.

After completion of the transmission, the transmitted data is compared with the original transmission data.

Mismatch is considered as a data consistency check error and:

- Interrupt INTCSIHnIRE is generated.
- The CSIHnSTR0.CSIHnDCE bit is set.

Additionally, CSIHnRX0W.CSIHnTDCE of data that contains the error is set.

The data consistency check function is illustrated in the following block diagram.

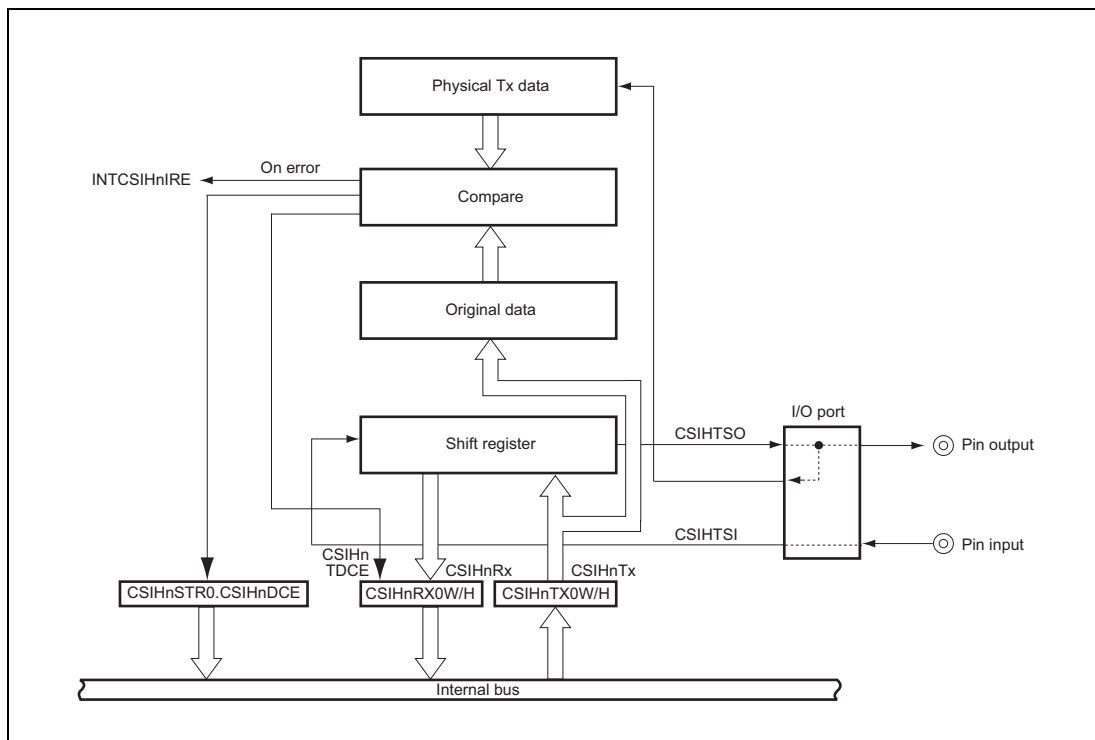

Figure 14.36 Block Diagram of Data Consistency Check Function

14.5.12.2 Parity Check

CSIH can append a parity bit to the last data bit (even if extended data length is used).

The use and type of parity is specified in $\text{CSIHnCFGx.CSIHnPSx}[1:0]$.

Parity check is enabled if $\text{CSIHnCFGx.CSIHnPSx}[1] = 1$.

The parity bit is checked after a reception is complete. If an parity error occurs, the following happen:

- Interrupt INTCSIHnIRE is generated.
- The CSIHnSTR0.CSIHnPE bit is set.

Additionally, $\text{CSIHnRX0W.CSIHnRPE}$ of data that contains the error is set.

The figure below shows an example.

- Data length is 8 bits.
- The data to be transmitted is 05_{H} and 35_{H} .
- Data direction is LSB first.
- Parity type is odd.

Figure 14.37 Parity Check Example

The parity bit of the first data is 1. There is no parity error, because the total number of ones (including the parity bit) is odd.

The parity bit of the second data is 0. This is detected as a parity error, because the total number of ones (including the parity bit) is even.

If the EDL (extended data length) function is used, the parity bit is added after the last bit of the data.

14.5.12.3 Time-Out Error

Time-out errors can be checked only in slave FIFO mode of the slave.

This error occurs if neither of the following occurred within a certain period of time:

- Received data in FIFO is read
- FIFO receives data from CSIHTSI

The time-out time is defined in `CSIHnMCTL0.CSIHnTO[4:0]` in units of "8 x transmission clock `CSIHTSCK`". A time-out error occurs when the specified time is exceeded (the time-out time is not detected when `CSIHnMCTL0.CSIHnTO[4:0] = 00000B`).

A dedicated time-out counter is set by the `CSIHnCTL2.CSIHnPRS[2:0]` and `CSIHnBRSy.CSIHnBRS[11:0]` bits.

The `CSIHnBRSy.CSIHnBRS[11:0]` bits is left as set at `000H`, the dedicated time-out counter does not operate.

The dedicated time-out counter measures the time between the last and the next read operation.

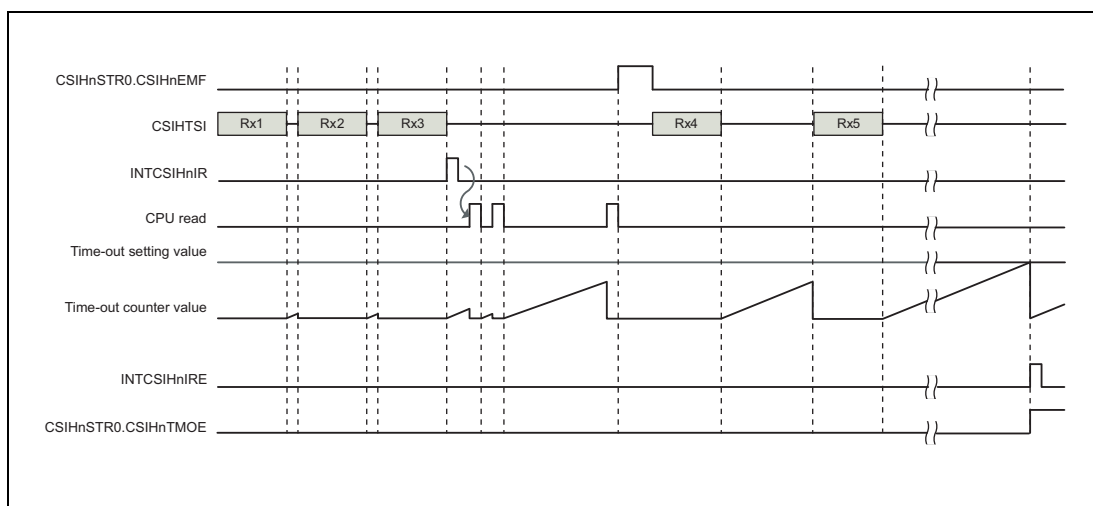

Figure 14.38 Time-Out Check Functional Timing Diagram

The start timing of the time-out counter is as follows:

- When reception is completed
- The CPU reads the received data.
(The counter does not start if the buffer is empty.)
- When a time-out error is detected

After a time-out error is detected, if data is still available in FIFO, the time-out counter restarts.

If the value set by bit `CSIHnMCTL0.CSIHnTO[4:0]` is reached again, the `INTCSIHnIRE` interrupt is output again.

The timeout counter continues to count as long as receive data is not read. To stop the counter, read all received data or set `CSIHnSTCR0.CSIHnPCT` to 1. Note that the pointer is cleared if you set the `CSIHnSTCR0.CSIHnPCT`.

The counter is reset at the following timing:

- Data is read once.

- New data is received.
- A timeout error is detected.
- The CSIHnSTCR0.CSIHnPCT bit is set to 1.

If a timeout error occurs, the following occur:

- Interrupt INTCSIHnIRE is generated.
- The CSIHnSTR0.CSIHnTMOE bit is set.

14.5.12.4 Overflow Error

An overflow error occurs in FIFO mode. It occurs when transmission data is written to the CSIHnTX0W register while the FIFO buffer is filled with received data.

Example

100 data have been transmitted. That is, the FIFO contains 100 received data. The application starts to read the received data.

While the read operation is in progress, the application begins to write another set of 50 transmission data to the FIFO.

However, only 10 received data have been read up to now and 90 data are still in the FIFO.

In this case, only 38 buffers are available for new transmission data. When the CPU tries to write the 39th data, an overflow error occurs.

This is illustrated in the following figure.

Figure 14.39 FIFO Overview

Data after 39 are discarded. The figure below shows the overflow timing.

Figure 14.40 FIFO Overflow Timing

In case of overflow error:

- Interrupt INTCSIHnIRE is generated.
- The CSIHnSTR0.CSIHnOFE bit is set.

14.5.12.5 Overrun Error

An overrun error occurs. in direct access, transmit-only buffer, and FIFO modes. It does not occur in dual buffer mode. The overrun error does not occur if data reception is disabled (CSIHnCTL0.CSIHnRXE = 0).

An overrun error occurs under the two conditions below.

(Error occurrence condition 1)

- When the CPU reads the CSIHnRX0W/H register with no receive data remaining in FIFO mode

(Error occurrence condition 2)

- When CSIHnCTL1.CSIHnHSE = 0 (handshake function disabled) in slave mode
 - When reception is completed with the previous receive data remaining in the CSIHnRX0W/H register in direct access mode or transmit-only buffer mode
 - When reception is completed while the FIFO buffer is full of receive data in FIFO mode

(1) Direct access/transmit-only buffer

In direct access and transmit-only buffer modes, this error occurs when newly received data cannot be transferred from the shift register to the reception register CSIHnRX0W/H without overwriting it. This happens when CSIHnRX0W/H was not read and therefore contains previously received data.

The following figure illustrates the overrun error detection function.

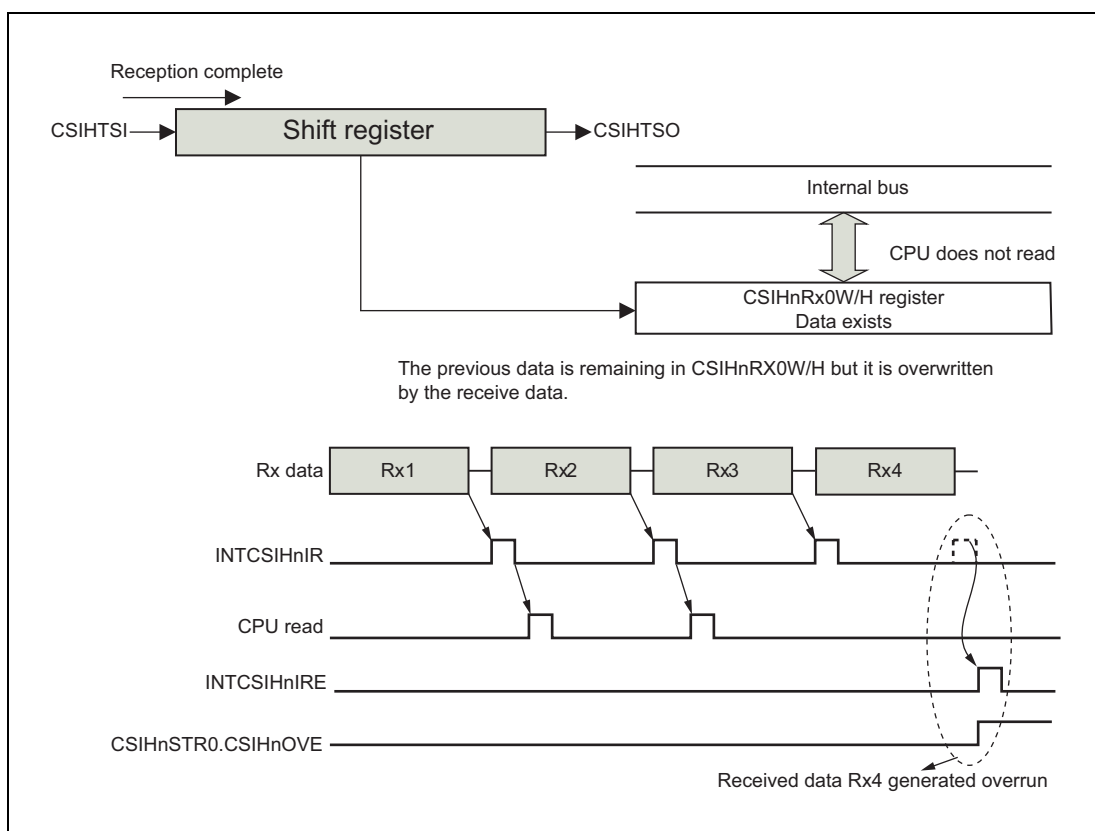

Figure 14.41 Overrun Error Detection in Direct Access and Transmit-Only Buffer Modes

NOTE

An overrun error can be avoided in slave mode by using the handshake function. When handshake is used in slave mode, the receiver (slave) signals to the transmitter (master) that it is busy. The transmitter then waits until the receiver reads its reception register and becomes ready again.

(2) FIFO mode

In FIFO mode, this error occurs if:

1. New data is received while the FIFO is full and the old data in the buffer is overwritten.

Figure 14.42 Overrun Error Detection in FIFO Mode (FIFO Full)

NOTE

An overrun error can be avoided in slave mode by using the handshake function. When handshake is used in slave mode, the receiver (slave) signals to the transmitter (master) that it is busy. The transmitter then waits until the receiver reads its reception register and becomes ready again.

2. The CPU attempts to read non-existent receive data.

Figure 14.43 Overrun Error Detection in FIFO Mode (No Data)

In case of overrun error:

- Interrupt INTCSIHnIRE is generated.
- The CSIHnSTR0.CSIHnOVE bit is set.
- Receive data is overwritten and communication continues.
(The CPU can read received data after reception is completed.)

For details, see **Section 14.5.11, Handshake Function**.

14.5.13 Loop-Back Mode

Loop-back mode is a special mode for self-test. This feature is only available in master mode.

When this mode is active (CSIHnCTL1.CSIHnLBM = 1), CSIHTCSSx is fixed to the inactive level (the active level is defined by the CSIHnCTL1.CSIH0CSLx value). The transmit and receive signals are internally connected, as shown in the figures below. The signals CSIHTSCK, CSIHTSO, and CSIHTSI are disconnected from the ports. In addition, the CSIHTSO output level is fixed to low, and CSIHTSCK is set to high level regardless of the CSIHnCFGx.CSIHnCKPx value.

In order to test CSIH, put it in loop-back mode and carry out normal transfer operations. Then check that the received data is the same as the transmitted data. The loopback test does not affect connected devices.

Table 14.47 Pin Output Level when Loopback Mode is Used

| Pin Name | Output Level |
|---------------|---|
| CSIHTSCK(out) | High level |
| CSIHTCSS[7:0] | Inactive level |
| CSIHTSO | Low level (independent of the previous value) |
| Interrupt | Normal function |
| CSIHTRYO | Normal function (low level) |

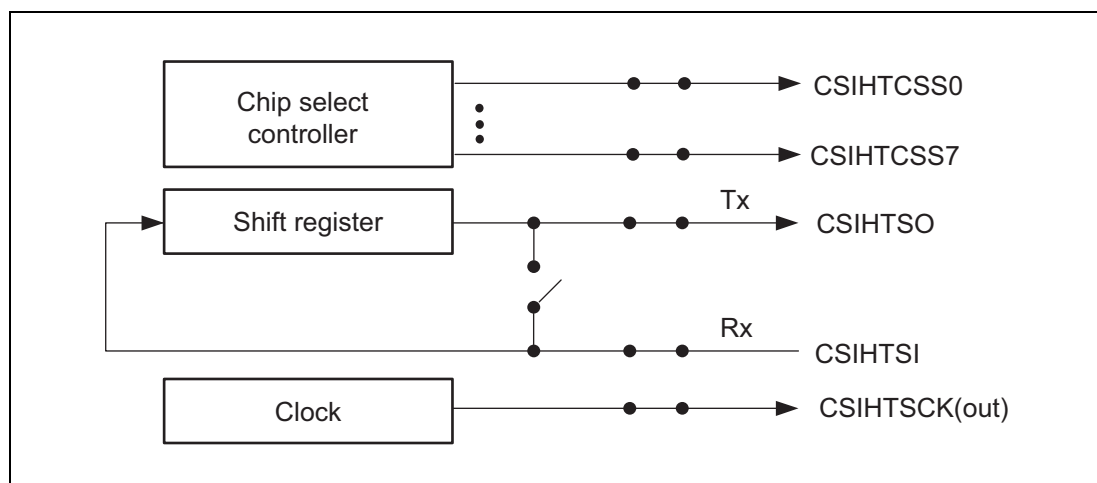

Figure 14.44 Normal Operation

Figure 14.45 Loopback Mode Operation

14.5.14 CPU-Controlled High Priority Communication Function

CSIH has a function to abort low priority communication to perform high priority communication if it receives a high-priority communication request from the CPU while low-priority communication is being used. This function supports transmit-only buffer mode as low priority communication and only direct access mode as high-priority communication.

To enable this function, set $CSIHnCTL1.CSIHnPHE = 1$ and $CSIHnCTL1.CSIHnJE = 1$.

The following figure illustrates CPU-controlled high-priority communication.

Figure 14.46 Example of CPU-Controlled High-Priority Communication

- (1) By setting $CSIHnCTL0.CSIHnJOBE = 1$ during low-priority communication, start of high-priority communication following end-of-job data is notified, and the internal signal flag is set.
- (2) When end-of-job data is detected, the current low-priority communication is aborted and the $INTCSIHnIJC$ interrupt occurs. An internal signal, the JOB completion flag is cleared due to the communication abort, and memory mode is automatically switched to direct access mode for the subsequent high-priority communication.
- (3) The CPU detects the interrupt and starts communication by writing the first transmission data of high-priority communication to $CSIHnTX0W$ or $CSIHnTX0H$.
- (4) When end-of-job data is detected, communication is aborted. At this time, because the internal signal end-of-job flag is set to 0, the CSIH determines that the next communication is low-priority and switches memory mode to transmit-only buffer mode automatically, and then resumes the aborted low-priority communication.
- (5) Same as (1) above.
- (6) Same as (2) above.
- (7) The CPU detects an interrupt and starts communication by writing the first transmission data of high-priority communication to $CSIHnTX0W$ or $CSIHnTX0H$. The CPU sets $CSIHnCTL0.CSIHnJOBE = 1$ again to notify that the next communication is high-priority.
- (8) When end-of-job data is detected, communication is aborted and the $INTCSIHnIJC$ interrupt is generated. At this time, the CPU determines that the subsequent communication is also high-priority because the internal signal end-of-job flag is 1, and waits for communication to start.
- (9) Same as (3) above.

(10) Same as (4) above.

CAUTION

Memory mode is switched automatically when communication is changed from low priority to high priority (from transmit-only buffer mode to direct access mode) and from high priority to low priority (from direct access mode to transmit-only buffer mode).

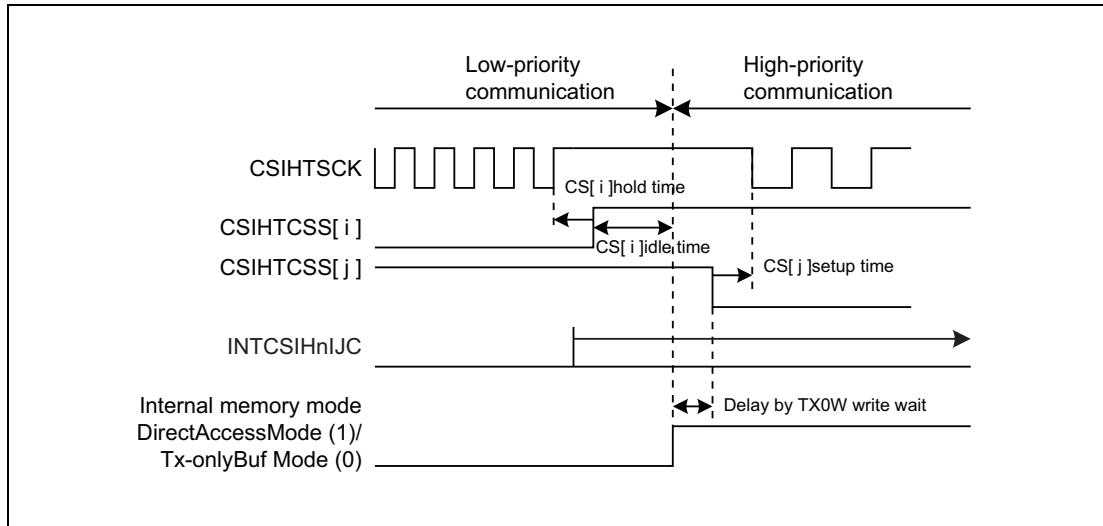

Figure 14.47 Transition from Low-Priority Mode to High-Priority Mode

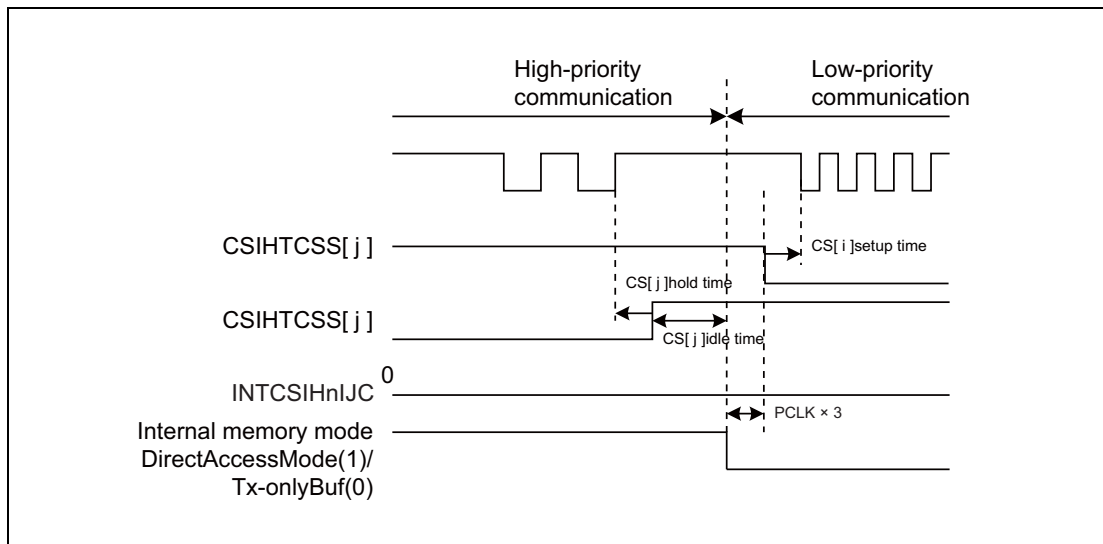

Figure 14.48 Transition from High-Priority Mode to Low-Priority Mode

To correctly switch low-priority communication mode and high-priority communication mode, do not write communication data or manipulate the CSIHnCTL0.CSIHnJOBE bit during the setting prohibited time period.

CSIHnTX0W register write prohibited time period:

- A time period from CSIHnJOBE bit setting for transition to high-priority communication mode until an INTCSIHnJC interrupt is detected

- A time period from the last end-of-job data write of high-priority communication until (CSIHnHPST state = 0) is detected

CSIHnJOBE register write prohibited time period:

- A time period from CSIHnJOBE bit setting for transition to high-priority communication mode until an INTCSIHnIJC interrupt is detected

There is no setting prohibited time period of the CSIHnJOBE bit during the high-priority communication mode. It is also possible to set the CSIHnJOBE bit before writing communication data. For example, when it has been made clear in advance that multiple job data are sent and received in high-priority communication mode, the CSIHnJOBE bit can be set before the first transmission data is written.

CAUTION

If the CSIHnJOBE bit is set immediately before the last high-priority communication ends, operation differs depending on the timing for internally detecting the CSIHnJOBE bit setting.

If the setting of the CSIHnJOBE bit is detected before communication of the last bit is completed, high-priority communication mode continues.

When the CSIHnJOBE bit setting is detected after communication of the last bit has been completed, low-priority communication mode is restored and then end-of-job data of low-priority communication is detected and mode changes again to high-priority communication mode.

14.5.15 Enforced Chip Select Idle Setting

CSIHn units can insert an idle state between the two consecutive transfer data by the setting of CSIHnCFGx.CSIHnIDLx. Detail is as follows.

1. When CSIHnCFGx.CSIHnIDLx = 0
 - If the next CSIHnCSSx is the same as the previous one, an idle state is not inserted and an inter-data time is inserted.
 - If the next CSIHnCSSx is different from the previous one, an idle state is inserted.
2. When CSIHnCFGx.CSIHnIDLx = 1
 - An idle state is always inserted even if a next CSIHnCSSx is not different from the previous one.

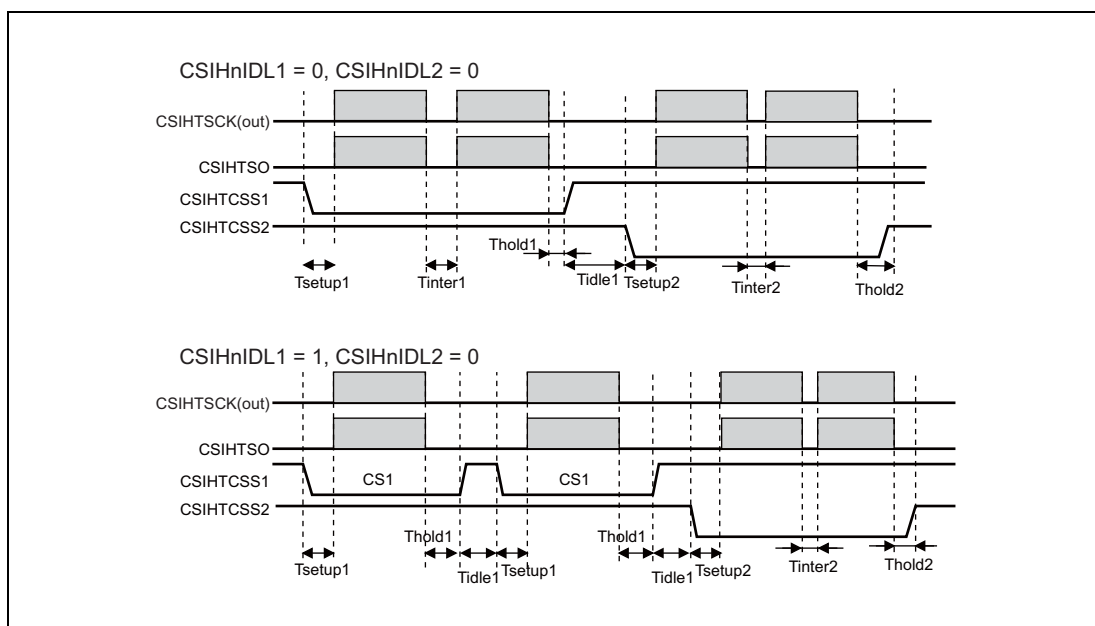

Figure 14.49 Enforced Chip Select Idle Setting Example

CAUTION

If the CPU-controlled high priority communication function is enabled (CSIHnCTL1.CSIHnPHE = 1), when the mode is switched from low priority communication to high priority communication or from high priority communication to low priority communication, an IDLE state is inserted regardless of the setting of CSIHnCFGx.CSIHnIDLx bit.

14.6 Operating Procedures

The examples and procedures below are described according to the memory mode in the following order:

- Direct access mode
- Transmit-only buffer mode
- Dual buffer mode
- FIFO mode

14.6.1 Procedures in Direct Access Mode

Two examples for a master are provided, one with job mode disabled, and the other with job mode enabled.

14.6.1.1 Transmit/Receive in Master Mode when Job Mode is Disabled

The procedures below is based on the assumption that:

- The transmission data length is 8-bits ($\text{CSIHnCFGx.CSIHnDLSx}[3:0] = 1000_{\text{B}}$).
- Transmission direction is MSB first ($\text{CSIHnCFGx.CSIHnDIRx} = 0$).
- Normal clock and data phase ($\text{CSIHnCFGx.CSIHnCKPx} = 0$, $\text{CSIHnCFGx.CSIHnDAPx} = 0$).
- No interrupt delay ($\text{CSIHnCTL1.CSIHnSIT} = 0$).
- Job mode is disabled ($\text{CSIHnCTL1.CSIHnJE} = 0$).
- Normal INTCSIHnIC interrupt timing ($\text{CSIHnCTL1.CSIHnSLIT} = 0$).
- Direct access mode ($\text{CSIHnCTL0.CSIHnMBS} = 1$).

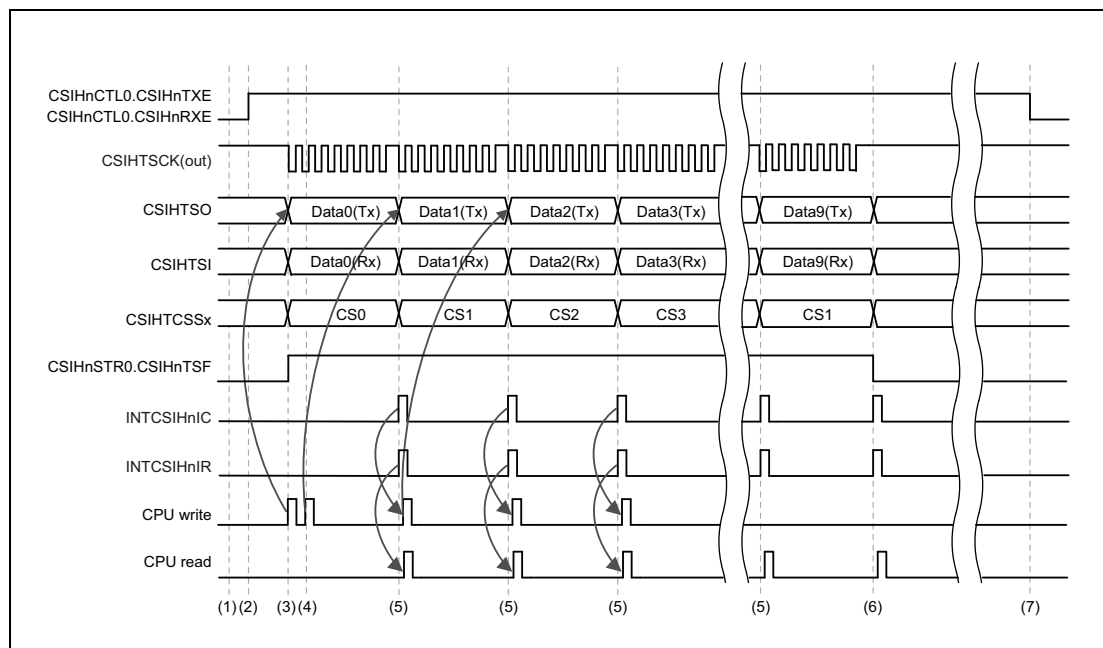

Figure 14.50 Master in Direct Access Mode, $\text{CSIHnCTL1.CSIHnJE} = 0$

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CS0 to CS3.
Specify the transfer mode and job mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), CSIHnRXE = 1 (permits reception), and CSIHnMBS = 1 (selects direct access mode).
3. Write the first transmission data to the transmission register CSIHnTX0W. Within the same write operation, activate CS0. Transmission starts automatically when the first data becomes available.
4. Write the second data to CSIHnTX0W. If required, you can change the CS to address a different device. Writing the second data immediately after the first one avoids unnecessary delays between data.
5. Each time data is transmitted and received, INTCSIHnIC and INTCSIHnIR interrupts are generated.
 - INTCSIHnIC indicates that the next data can be written to CSIHnTX0W.
 - INTCSIHnIR indicates that the reception register, CSIHnRX0W must be read.
6. No more write action is required after completion of transmission of data 8. Data 9 (the last data) has been written when a successful transmission interrupt of data 7 was generated. However, reception register CSIHnRX0W must be read after completion of writing data 8 and 9.
7. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When communication is not performed, set CSIHnCTL0.CSIHnPWR = 0 to minimize the power consumption of CSIHn.

14.6.1.2 Transmit/Receive in Master Mode when Job Mode is Enabled

The procedure below is based on the assumption that:

- The transmission data length is 8-bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- Transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- Normal INTCSIHnIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Direct access mode (CSIHnCTL0.CSIHnMBS = 1)
- Two jobs, each of them transmits three data.

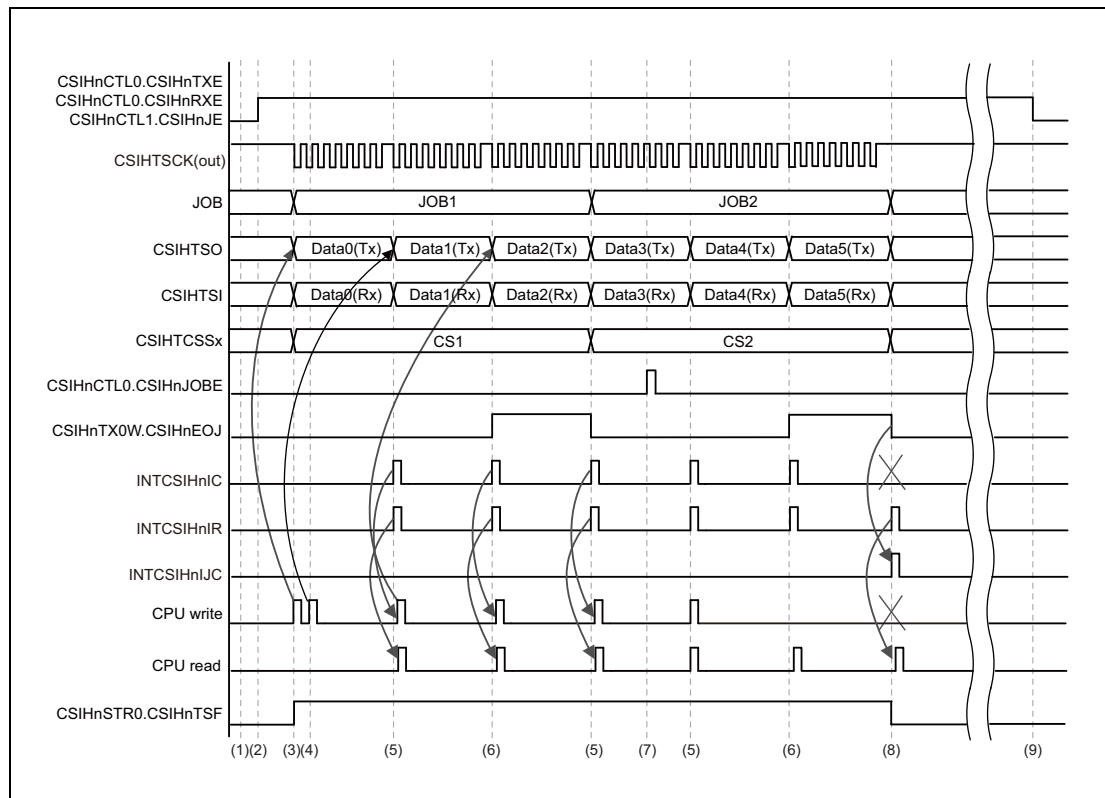

Figure 14.51 Master in Direct Access Mode, CSIHnCTL1.CSIHnJE = 1

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CS1 and CS2.
Specify the transfer mode and job mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), CSIHnRXE = 1 (permits the reception), and CSIHnMBS = 1 (selects direct access mode).
3. Write the first transmission data to the transmission register CSIHnTX0W. Transmission starts automatically when the first data becomes available.
The CSIHnSTR0.CSIHnTSF flag indicates that communication is in progress.
4. Write the second data to CSIHnTX0W. Writing the second data immediately after the first one avoids unnecessary delays between data.
5. Each time data is transmitted and received, INTCSIHnIC and INTCSIHnIR interrupts are generated.
 - INTCSIHnIC indicates that the next data can be written to CSIHnTX0W.
 - INTCSIHnIR indicates that the reception register CSIHnRX0W must be read.
6. Setting CSIHnTX0W.CSIHnEOJ = 1 indicates that the last data of the current job is transmitted.
7. By setting CSIHnCTL0.CSIHnJOB2 = 1, communication is forced to stop at the end of the current job (JOB2).
8. After the forced stop of communication, the interrupt request INTCSIHnIC is replaced by INTCSIHnIJC. INTCSIHnIR is generated as usual.
The interrupt request INTCSIHnIJC indicates that the communication was forcibly stopped at the end of the current job.
The interrupt request INTCSIHnIC is not generated. Additionally, the transmission data available in the CSIHnTX0W register is not transmitted.
9. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When communication is not performed, set CSIHnCTL0.CSIHnPWR = 0 to minimize the power consumption of CSIHn.

To start another transmission without stopping communication, perform steps 3 and later.

14.6.2 Procedures in Transmit-Only Buffer Mode

Two examples for a master is provided, one with job mode disabled, and the other one with job mode enabled.

14.6.2.1 Transmit/Receive in Master Mode when Job Mode is Disabled

The procedure below is based on the assumption that:

- The transmission data length is 8-bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- Number of data: 9 (CSIHnMCTL2.CSIHnND[7:0] = 09_H).
- The transfer start address is 10_H (CSIHnMCTL2.CSIHnSOP[6:0] = 10_H).
- Normal INTCSIHnIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Transmit-only buffer mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 10_B)

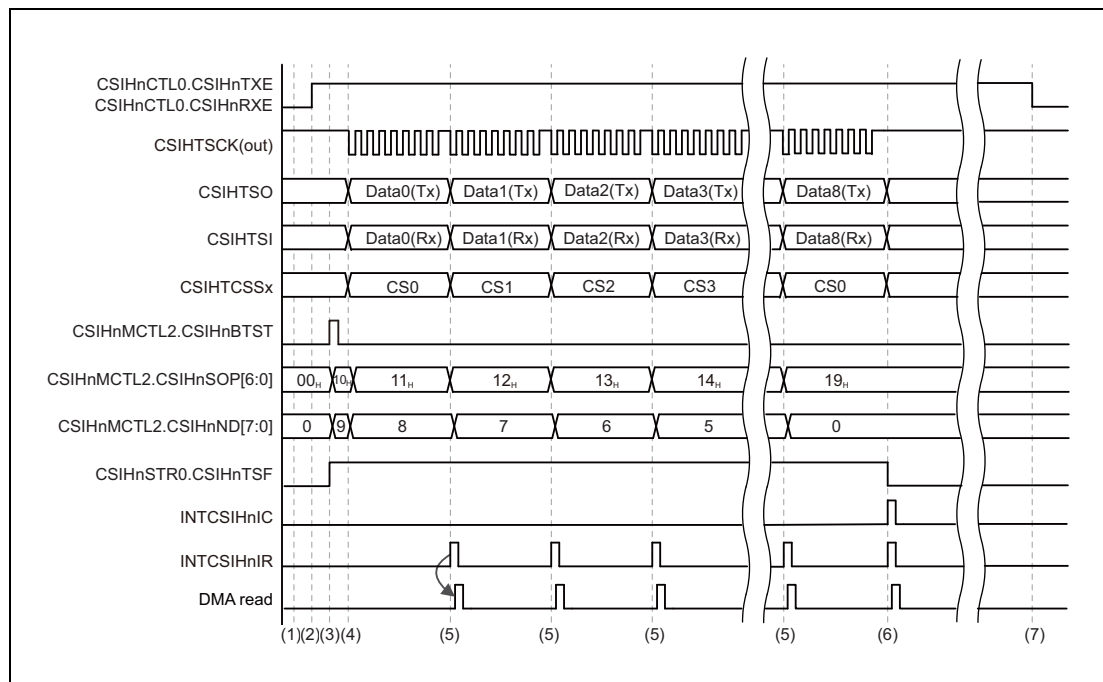

Figure 14.52 Master in Transmit-Only Buffer Mode, CSIHnCTL1.CSIHnJE = 0

NOTE

The procedure of writing the data into the buffer is not described here.

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CSIHnCSS0 to CSIHnCSS3.
Specify the transfer and operating modes by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
Set the memory mode by CSIHnMCTL0.CSIHnMMS[1:0].
Set CSIHnMCTL0.CSIHnMMS[1:0] to 10_B (transmit-only buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission) and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Configure the transmission pointer and the number of data by setting the CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0] bits. Start the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission/reception is started. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission.
5. An interrupt request INTCSIHnIR is generated each time a piece of data is received. INTCSIHnIR indicates that the reception register, CSIHnRX0W must be read.
6. When all transmissions are completed, the interrupt request, INTCSIHnIC is generated.
7. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When communication is not performed, set CSIHnCTL0.CSIHnPWR = 0 to minimize the power consumption of CSIHn.

14.6.2.2 Transmit/Receive in Master Mode when Job Mode is Enabled

The procedure below is based on the assumption that:

- The transmission data length is 8-bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- Number of data: 8 (CSIHnMCTL2.CSIHnND[7:0] = 08_H).
- The transfer start address is 10_H (CSIHnMCTL2.CSIHnSOP[6:0] = 10_H).
- Normal INTCSIHnIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Transmit-only buffer mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 10_B)

Figure 14.53 Master in Transmit-Only Buffer Mode, CSIHnCTL1.CSIHnJE = 1

NOTE

The procedure of writing the data into the buffer is not described here.

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CS1, CS3, and CS7.
Specify the transfer mode and job mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
Set the memory mode by CSIHnMCTL0.CSIHnMMS[1:0].
Set CSIHnMCTL0.CSIHnMMS[1:0] to 10_B (transmit-only buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Configure the transmission pointer and the number of data by setting the CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0] bits. Start the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission is started. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission.
5. An interrupt request INTCSIHnIR is generated each time a piece of data is received. INTCSIHnIR indicates that the reception register CSIHnRX0W must be read.
6. The CSIHnTX0W.CSIHnEOJ = 1 setting indicates that the last data of the current job is transmitted.
7. The interrupt request INTCSIHnIC is generated. INTCSIHnIC indicates that the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was transmitted with CSIHnTX0W.CSIHnCIRE = 1.
8. The INTCSIHnIC interrupt request is not generated because the last data of the current job (CSIHnTX0W.CHABnEOJ = 1) was transmitted with CSIHnTX0W.CSIHnCIRE = 0.
9. By setting CSIHnCTL0.CSIHnJOB3 = 1, communication is forced to stop at the end of JOB3.
10. After the forced stop of communication, interrupt requests INTCSIHnIJC and INTCSIHnIR are generated at the end of job3.
The INTCSIHnIJC interrupt request indicates a forced stop of communication at the end of the current job.
The INTCSIHnIC interrupt request is not generated because the INTCSIHnIJC interrupt request is generated instead of the INTCSIHnIC interrupt request. Additionally, the transmission data available in the CSIHnTX0W register is not transmitted.
11. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When communication is not performed, set CSIHnCTL0.CSIHnPWR = 0 to minimize the power consumption of CSIHn.

14.6.3 Procedures in Dual Buffer Mode

The following examples are provided: those with job mode enabled and disabled during master mode, and one with job mode disabled during slave mode.

14.6.3.1 Transmit/Receive in Master Mode when Job Mode is Disabled

The procedure below is based on the assumption that:

- The transmission data length is 8-bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CHIHnCFGx.CSIHnDIRx = 0).
- Normal clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- Number of data: 9 (CSIHnMCTL2.CSIHnND[7:0] = 09_H).
- The transfer start address is 10_H (CSIHnMCTL2.CSIHnSOP[6:0] = 10_H).
- Normal INTCSIHnIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Dual buffer mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 01_B)

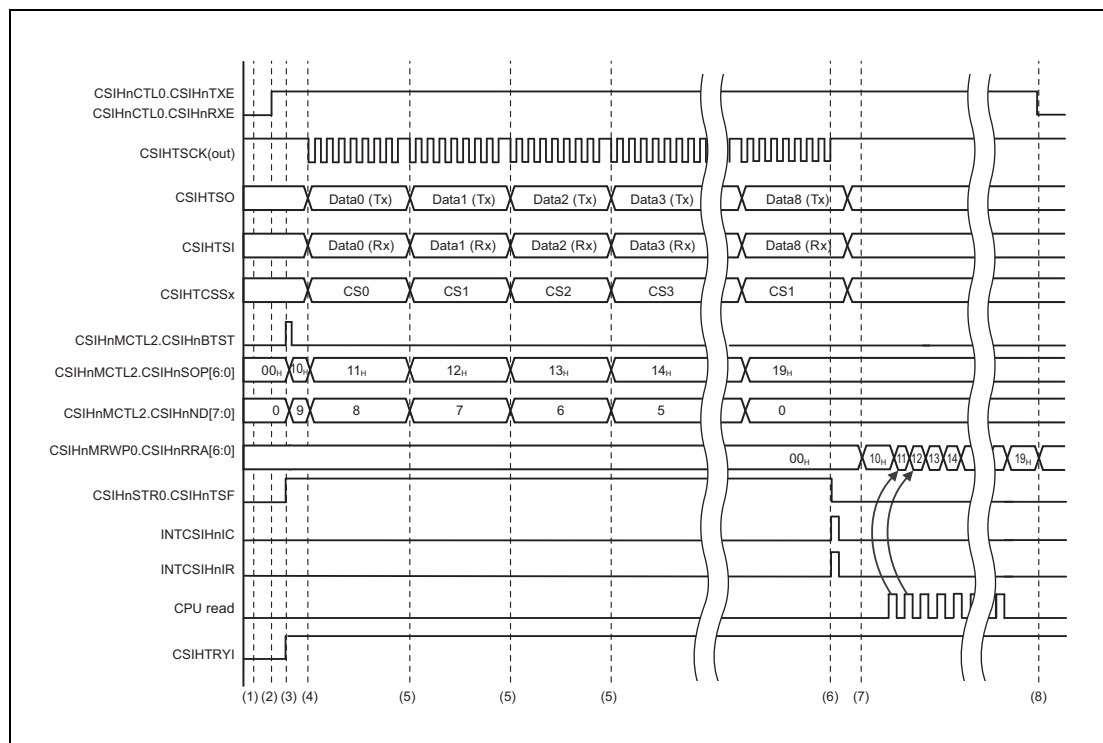

Figure 14.54 Master in Dual Buffer Mode, CSIHnCTL1.CSIHnJE = 0

NOTE

The procedure of writing the data into the buffer is not described here.

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. The example uses chip select signals CSIHnCSS0 to CSIHnCSS3.
Specify the transfer and operating modes by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
Set the memory mode by CSIHnMCTL0.CSIHnMMS[1:0].
Set CSIHnMCTL0.CSIHnMMS[1:0] to 01_B (dual buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits the reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Configure communication by setting the CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0] bits. Start the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission is started. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission.
5. This is repeated until the last data is transmitted/received. The interrupt requests INTCSIHnIC and INTCSIHnIR are not generated.
6. When the last data is transmitted and received, interrupt requests INTCSIHnIC and INTCSIHnIR are generated.
The CPU starts to read the received data from the receive buffer.
7. The start address of the read access is specified in CSIHnMRWP0.CSIHnRRA[6:0] (CSIHnMRWP0.CSIHnRRA[6:0] is set to 10_H by the software in this figure). These bits are incremented each time a piece of data is read.
8. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When communication is not performed, set CSIHnCTL0.CSIHnPWR = 0 to minimize the power consumption of CSIHn.

14.6.3.2 Transmit/Receive in Master Mode when Job Mode is Enabled

The procedure below is based on the assumption that:

- The transmission data length is 8-bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- Number of data: 8 (CSIHnMCTL2.CSIHnND[7:0] = 08_H).
- The transfer start address is 00_H (CSIHnMCTL2.CSIHnSOP[6:0] = 00_H).
- Normal INTCSIHnIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Dual buffer mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 01_B)

Figure 14.55 Master in Dual Buffer Mode, CSIHnCTL1.CSIHnJE = 1

NOTE

The procedure of writing the data into the buffer is not described here.

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. The example uses chip select signals CS0 to CS7.
Specify the transfer and operating modes by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
Set the memory mode by CSIHnMCTL0.CSIHnMMS[1:0].
Set CSIHnMCTL0.CSIHnMMS[1:0] to 01_B (dual buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Configure communication by setting the CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0] bits. Start the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission is started. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented, and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission. This is repeated until the last data is transmitted/received.
5. An interrupt request INTCSIHnIR is generated each time a piece of data is received.
The INTCSIHnIC interrupt request is not generated because the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was transmitted with CSIHnTX0W.CSIHnCIRE = 0.
6. CSIHnTX0W.CSIHnEOJ = 1 indicates that the last data of the current job is transmitted.
7. The INTCSIHnIC interrupt request is generated. INTCSIHnIC indicates that the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was transmitted with CSIHnTX0W.CSIHnCIRE = 1.
8. By setting CSIHnCTL0.CSIHnJOB3 = 1, communication is forced to stop at the end of JOB3.
9. After the forced stop of communication, interrupt requests INTCSIHnIJC and INTCSIHnIR are generated at the end of JOB3.
The INTCSIHnIJC interrupt request indicates a forced stop of communication at the end of the current job.
The INTCSIHnIC interrupt request is not generated because the INTCSIHnIJC interrupt request is generated instead. Additionally, the transmission data available in register CSIHnTX0W is not transmitted.
10. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When communication is not performed, set CSIHnCTL0.CSIHnPWR = 0 to minimize the power consumption of CSIHn.

14.6.3.3 Transmit/Receive in Slave Mode when Job Mode is Disabled

The procedure below is based on the assumption that:

- The transmission data length is 8-bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock and data phase (CSIHnCTL1.CSIHnCKR = 0, CSIHnCFG0.CSIHnDAP0 = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- Number of data: 9 (CSIHnMCTL2.CSIHnND[7:0] = 09_H).
- The transfer start address is 10_H (CSIHnMCTL2.CSIHnSOP[6:0] = 10_H).
- Normal INTCSIHnIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Dual buffer mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 01_B)
- The handshake function is enabled. (CSIHnCTL1.CSIHnHSE = 1)

Figure 14.56 Slave in Dual Buffer Mode, CSIHnCTL1.CSIHnJE = 0

NOTE

The procedure of writing the data into the buffer is not described here.

Procedure:

1. Configure the communication protocol in register CSIHnCFG0.
Specify the transfer and operating modes by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
Set the memory mode by CSIHnMCTL0.CSIHnMMS[1:0]
Set CSIHnMCTL0.CSIHnMMS[1:0] to 01_B (dual buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Specify the transfer start address by setting the CSIHnMCTL2.CSIHnSOP[6:0] bits and the number of data by setting the CSIHnMCTL2.CSIHnND[7:0] bits.
Start the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission is started when the input clock is received from the master. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission.
5. This is repeated until the last data is transmitted/received.
The interrupt requests INTCSIHnIC and INTCSIHnIR are not generated because transmission data is sent from the buffer, and received data is stored in the buffer.
6. When the last data is transmitted and received, interrupt requests INTCSIHnIC and INTCSIHnIR are generated.
The CPU starts to read the received data that is stored in the receive buffer.
7. The start address of the read access is specified in CSIHnMRWP0.CSIHnRRA[6:0] (CSIHnMRWP0.CSIHnRRA[6:0] is set to 10_H by the software in this figure). These bits are incremented each time a piece of data is read.
8. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When communication is not performed, set CSIHnCTL0.CSIHnPWR = 0 to minimize the power consumption of CSIHn.

14.6.4 Procedures in FIFO Mode

Two examples for a master is provided, one with job mode disabled, the other one with job mode enabled.

14.6.4.1 Transmit/Receive in Master Mode when Job Mode is Disabled

The procedure below is based on the assumption that:

- The transmission data length is 8-bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- Normal INTCSIHnIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- FIFO mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 00_B)

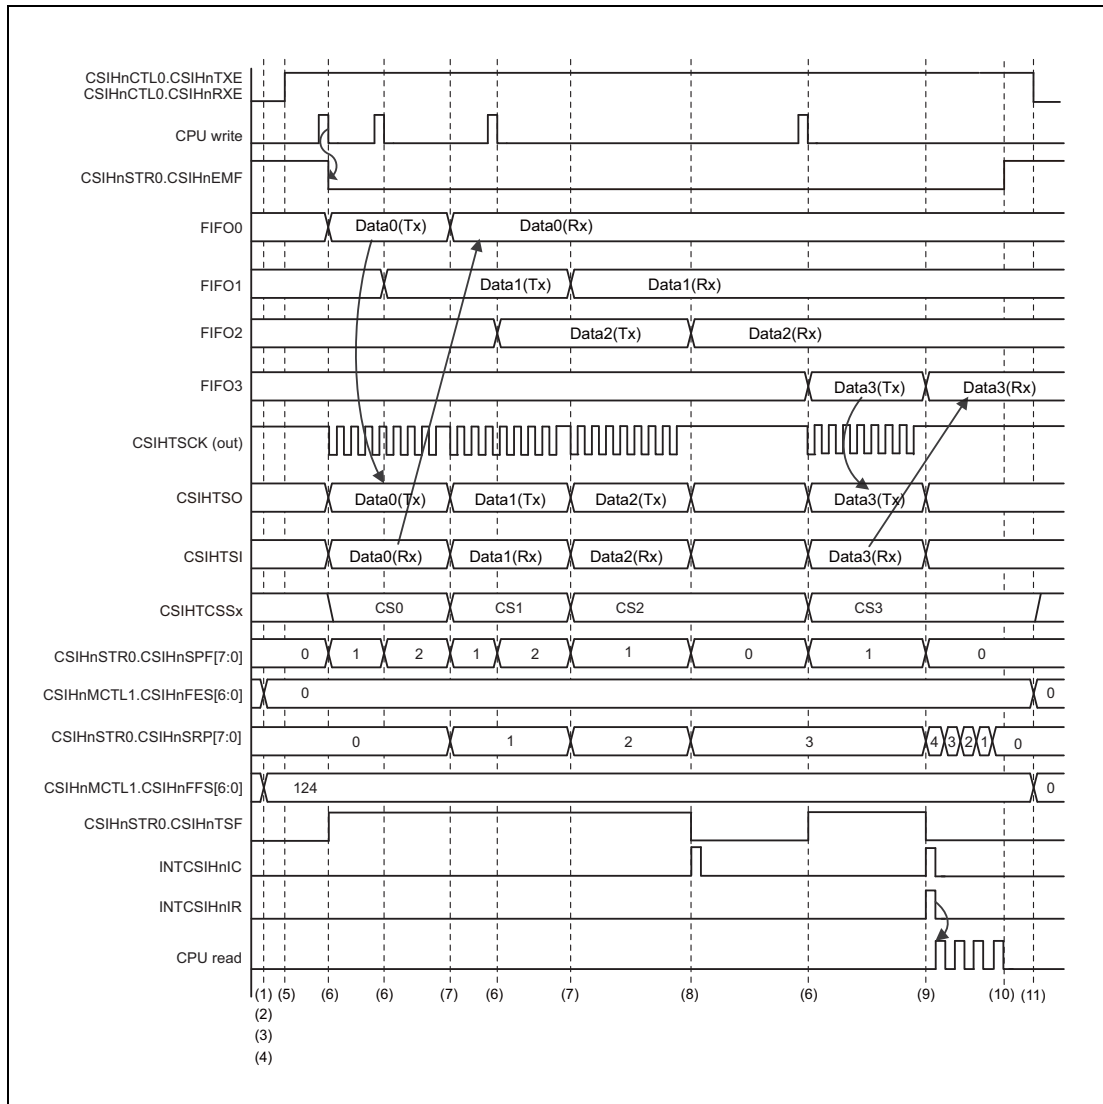

Figure 14.57 Master in FIFO Mode, CSIHnCTL1.CSIHnJE = 0

Procedure:

1. Configure the communications protocol in the CSIHnCFGx register, specify the job mode and master mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2, and select FIFO mode by setting CSIHnMCTL0.CSIHnMMS[1:0] to 00_B. These examples use chip select signals CSIHnCSS0 to CSIHnCSS3.
2. Set CSIHnSTCR0.CSIHnPCT to 1 to clear all buffer pointers.
3. Make sure that CSIHnSTR0.CSIHnFLF is set to 0, CSIHnSTR0.CSIHnEMF is set to 1, and CSIHnSTR0.CSIHnSPF[7:0] is set to 00_H respectively.
4. With CSIHnMCTL1.CSIHnFES[6:0], specify the conditions for the INTCSIHnIC interrupt output. With CSIHnFFS[6:0] in the same register, specify the conditions for the INTCSIHnIR interrupt output.
5. Set CSIHnCTL0.CSIHnPWR is set to 1 (enables the clock), CSIHnTXE is set to 1 (permits transmission), and CSIHnRXE is set to 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
6. Write the transmission data to the transmission register CSIHnTX0W. When the transmission data becomes available, transmission starts automatically.
Make sure that CSIHnSTR0.CSIHnEMF is set to 0.
7. The current transmission is completed. The interrupt request, INTCSIHnIC is not generated because CSIHnFES[6:0] is not CSIHnSPF[7:0].
8. The interrupt request, INTCSIHnIC is generated because CSIHnFES[6:0] is CSIHnSPF[7:0].
9. When CSIHnFFS[6:0] becomes 128-CSIHnSRP[7:0], the interrupt request, INTCSIHnIR is generated. Since CSIHnFES[6:0] = CSIHnSPF[7:0], an interrupt request INTCSIHnIC is generated. After the interrupt is generated, the CPU starts reading the received data stored in the receive buffer.
10. When the CPU has read the received data stored in the receive buffer, CSIHnSTR0.CSIHnEMF is set to 1 and the FIFO buffer becomes empty.
11. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize the power consumption of the CSIHn.

14.6.4.2 Transmit/Receive in Mater Mode when Job Mode is Enabled

The procedure below is based on the assumption that:

- The transmission data length is 8-bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0)
- Normal clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- JOB1 consists of four data, JOB2 consists of three data, and JOB3 consists of five data.
- Normal INTCSIHnIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- FIFO mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 00_B)

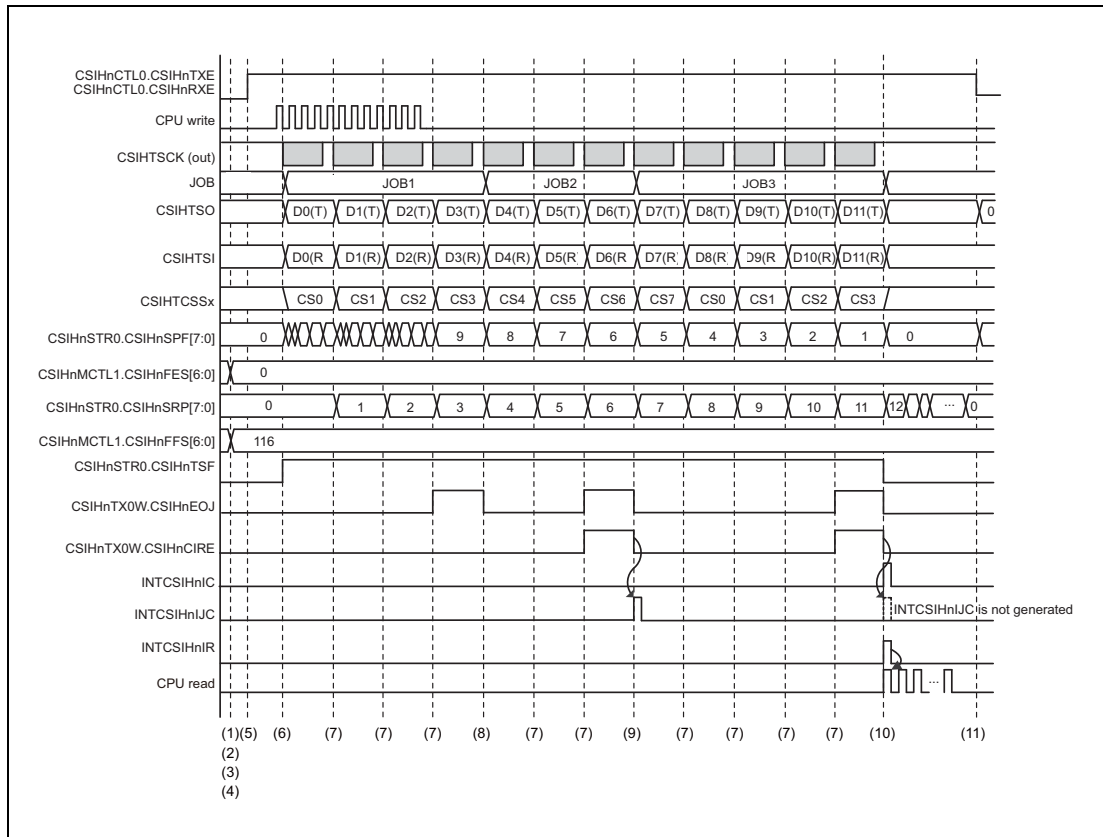

Figure 14.58 Master in FIFO Mode, CSIHnCTL1.CSIHnJE = 1

Procedure:

1. Set communication protocol in the CSIHnCFGx register, set job mode disable and master mode by corresponding bits in the CSIHnCTL1 and CSIHnCTL2 registers, and specify FIFO mode by setting CSIHnMCTL0.CSIHnMMS[1:0] = 00_B. These examples use chip select signals CS0 to CS7.
2. Set CSIHnSTCR0.CSIHnPCT to 1 to clear all buffer pointers.
3. Make sure that CSIHnSTR0.CSIHnFLF is set to 0, CSIHnSTR0.CSIHnEMF is set to 1, and CSIHnSTR0.CSIHnSPF[7:0] is set to 00_H respectively.
4. With CSIHnMCTL1.CSIHnFES[6:0], specify the conditions for generating an interrupt request INTCSIHnIC. With CSIHnMCTL1.CSIHnFFS[6:0], specify the conditions for generating an interrupt request INTCSIHnIR.
5. Set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception) in the CSIHnCTL0 register. The CSIHnCTL0.CSIHnMBS bit must be cleared.
6. Write the transmission data to the transmission register CSIHnTX0W. When the transmission data becomes available, transmission starts automatically.
Make sure that CSIHnSTR0.CSIHnEMF is set to 0.
7. The current transmission is completed. The interrupt request, INTCSIHnIC is not generated because CSIHnFES[6:0] is not CSIHnSPF[7:0]
8. An interrupt request INTCSIHnIJC is not generated because the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was transmitted with CSIHnTX0W.CSIHnCIRE = 0.
9. An interrupt request INTCSIHnIJC is generated because the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was transmitted with CSIHnTX0W.CSIHnCIRE = 1.
10. Since CSIHnSTR0.CSIHnSPF[7:0] = CSIHnMCTL1.CSIHnFES[6:0], an interrupt request INTCSIHnIC is generated. Interrupt request INTCSIHnIJC is not generated because interrupt request INTCSIHnIC is generated instead. When CSIHnMCTL0.CSIHnFFS[6:0] becomes 128-CSIHnSTR0.CSIHnSRP[7:0], an interrupt request, INTCSIHnIR is generated. After the INTCSIHnIR interrupt is generated, the CPU starts reading the received data stored in the receive buffer.
11. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize the power consumption of the CSIHn.

Section 15 Serial Communication Interface 3 (SCI3)

The serial communication interface 3 (SCI3: Serial Communication Interface 3) can handle two methods of serial communications: asynchronous and clock synchronous serial communications. Asynchronous serial data communications can be carried out with standard asynchronous communication LSIs such as Universal Asynchronous Receiver/Transmitter (UART) or Asynchronous Communication Interface Adapter (ACIA). Asynchronous mode is equipped with a serial communications function between multiple processors (multi-processor communications function).

15.1 Features of RH850/P1M-E SCI3

15.1.1 Number of Units and Channels

This microcontroller has the following number of SCI3 units.

Each unit has one channel SCI3. "Number of channels" is used with the same meaning as "number of units" in this section.

Table 15.1 Number of Units

| Product Name | RH850/P1M-E 100 pins | RH850/P1M-E 144 pins |
|-----------------|-------------------------|-------------------------|
| Number of Units | 3 | 3 |
| Name | SCI3n (n = 0 to 2) | SCI3n (n = 0 to 2) |

Table 15.2 SCI3 Unit Configurations and Channels

| Unit Name SCI3n | Channels per Unit | RH850/P1M-E 100 pins (3ch) | RH850/P1M-E 144 pins (3ch) |
|--------------------|----------------------|----------------------------------|----------------------------------|
| SCI30 | 1 | √ | √ |
| SCI31 | 1 | √ | √ |
| SCI32 | 1 | √ | √ |

Note: The channel name is the same as the unit name.

Table 15.3 Index

| Index | Meaning |
|-------|---|
| n | Throughout this section, the individual SCI3 units are identified by the index "n" (n = 0 to 2): for example, SCI3nSMR is the serial mode register. |

15.1.2 Register Base Address

SCI3 base addresses are listed in the following table.

SCI3 register addresses are given as offsets from these base addresses.

Table 15.4 Register Base Address

| Base Address Name | Base Address |
|-------------------|------------------------|
| <SCI30_base> | FFDF 0000 _H |
| <SCI31_base> | FFDF 1000 _H |
| <SCI32_base> | FFDF 2000 _H |

15.1.3 Clock Supply

Clock supply by and to SCI3 is listed in the following table.

Table 15.5 Clock Supply

| Unit Name | Unit Clock Name | Supply Clock Name |
|-----------|-----------------|-------------------------------------|
| SCI3n | PCLK | High-speed peripheral clock CLK_HSB |

15.1.4 Interrupt Request

SCI3 interrupt requests are listed in the following table.

Table 15.6 Interrupt Request

| Unit Interrupt Signal | Description | Interrupt Number | DMA/DTS Trigger Number |
|-----------------------|---------------------|------------------|------------------------|
| SCI30 | | | |
| INTSCI30ERI | Receive error | 106 | — |
| INTSCI30RXI | Receive data full | 107 | 87 |
| INTSCI30TXI | Transmit data empty | 108 | 88 |
| INTSCI30TEI | End of transmission | 109 | — |
| SCI31 | | | |
| INTSCI31ERI | Receive error | 110 | — |
| INTSCI31RXI | Receive data full | 111 | 89 |
| INTSCI31TXI | Transmit data empty | 112 | 90 |
| INTSCI31TEI | End of transmission | 113 | — |
| SCI32 | | | |
| INTSCI32ERI | Receive error | 218 | — |
| INTSCI32RXI | Receive data full | 219 | 91 |
| INTSCI32TXI | Transmit data empty | 220 | 92 |
| INTSCI32TEI | End of transmission | 221 | — |

15.1.5 Reset Sources

Please refer to **Section 8, Reset Controller**.

15.1.6 External Input/Output Signals

External input/output signals of SCI3 are listed below.

Table 15.7 External Input/Output Signals

| Unit Signal Name | I/O | Description | Alternative Port Pin Signal |
|------------------|-----|---------------------------|-----------------------------|
| SCI30 | | | |
| SCI0SCK | I | SCI30 serial clock input | SCI30SCI |
| | O | SCI30 serial clock output | SCI30SCO |
| SCI0RxD | I | SCI30 data input signal | SCI30RX |
| SCI0TxD | O | SCI30 data output signal | SCI30TX |
| SCI31 | | | |
| SCI1SCK | I | SCI31 serial clock input | SCI31SCI |
| | O | SCI31 serial clock output | SCI31SCO |
| SCI1RxD | I | SCI31 data input signal | SCI31RX |
| SCI1TxD | O | SCI31 data output signal | SCI31TX |
| SCI32 | | | |
| SCI2SCK | I | SCI32 serial clock input | SCI32SCI |
| | O | SCI32 serial clock output | SCI32SCO |
| SCI2RxD | I | SCI32 data input signal | SCI32RX |
| SCI2TxD | O | SCI32 data output signal | SCI32TX |

15.1.7 Combination of Pins and Ports

Combinations of SCI3 pins and ports are listed in the following table.

Table 15.8 Combinations of Pins and Ports

| Function | Pin Name | Port Name | | | | | |
|----------|------------------------|--------------------|-------------------------------|---------|---------|--------------------|---------|
| | | Group 1 | Group 2 | Group 3 | Group 4 | Group 5 | Group 6 |
| SCI30 | SCI30RX | P0_2 | P2_5 | P3_7 | P4_5 | P5_0 | P5_0 |
| | SCI30TX | P0_3 ^{*1} | P2_6 | P3_12 | P4_6 | P5_1 | P5_1 |
| | SCI30SCI / SCI30SCO | P0_4 ^{*1} | P2_7 | P3_13 | P4_2 | P5_2 ^{*1} | P5_4 |
| SCI31 | SCI31RX | P2_8 | P5_5 | — | — | — | — |
| | SCI31TX | P2_9 | P5_6 | — | — | — | — |
| | SCI31SCI / SCI31SCO | P3_5 | P5_7 ^{*1} / P0_13 | — | — | — | — |
| SCI32 | SCI32RX | P3_4 | P5_8 ^{*1} / P0_2 | — | — | — | — |
| | SCI32TX | P3_3 | P5_9 | — | — | — | — |
| | SCI32SCI / SCI32SCO | P3_9 | P5_10 | — | — | — | — |

Note 1. Available in devices with 144-pin.

15.2 Outline of Functions

- The serial data communication mode can be configured for asynchronous communications or clock synchronous communications.
- Full-duplex communications are available. The independent transmitter unit and receiver unit allow simultaneous transmission and reception. Both the transmitter and the receiver have a double-buffered structure, enabling continuous data transmission and reception.
- An arbitrary bit rate is selectable with the on-chip baud rate generator. An external clock is also selectable as a transmission/reception clock source.
- LSB-first or MSB-first transfer is selectable (except for asynchronous 7-bit data.)
- Interrupt sources: 4 types consisting of transmit-end, transmit-data-empty, receive-data-full, and receive-error. Transmit-data-empty and receive-data-full interrupt sources can activate the DMAC.
- The bit rate modulation function can reduce errors averagely (even in a high bit rate) by correcting the output of the on-chip baud rate generator (except for the maximum speed in clock synchronous mode).
- The pin level of serial input data can be checked.
- On-chip 6-bit divider (PSC)

15.2.1 Serial Communication Modes

Asynchronous mode

- Data length: 7 bits or 8 bits selectable
- Stop bit length: 1 bit or 2 bits selectable
- Parity: Even parity, odd parity, or none selectable
- Receive error detection: Parity error, overrun error, and framing error
- Break detection: A break can be detected by reading a register when a framing error occurs

Clock synchronous mode

- Data length: 8 bits
- Receive error detection: Overrun error

15.2.2 Block Diagram

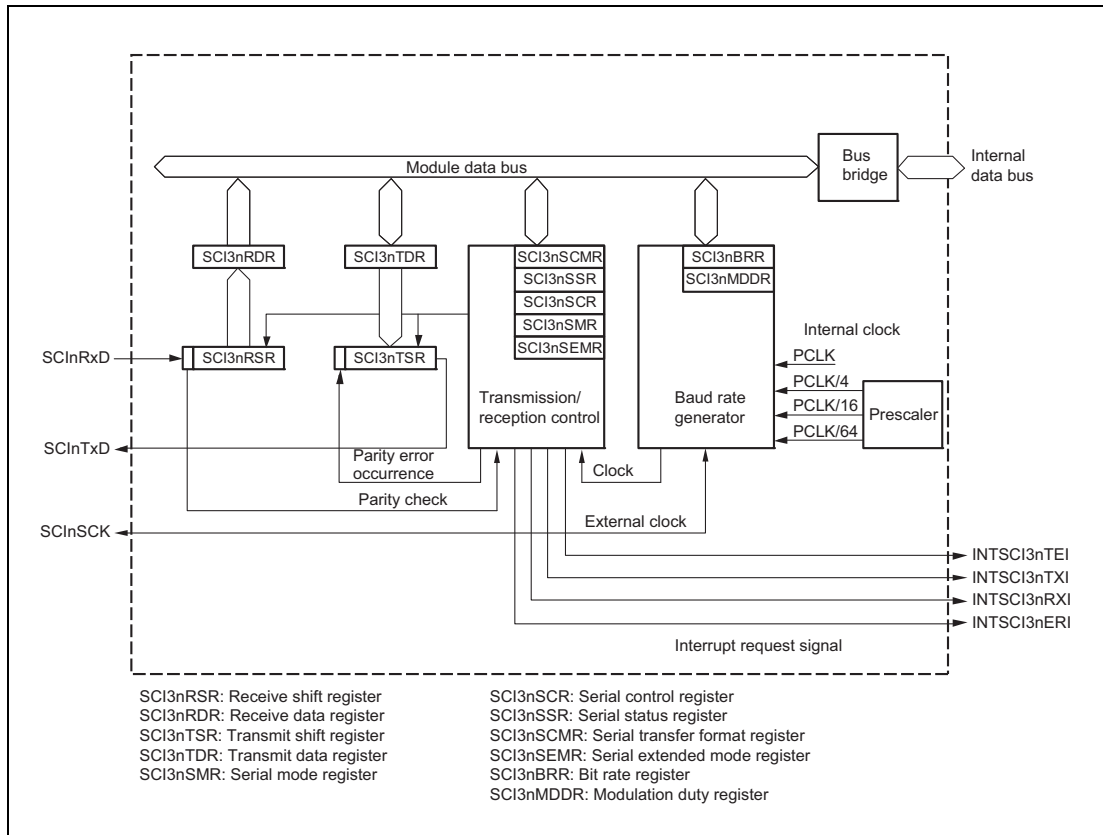

Figure 15.1 SCI3 Block Diagram

15.3 Register Descriptions

The SCI3 has the following registers. Some registers have limitations in read/write by the CPU.

For <SCI3n_base>, refer to **Section 15.1.2, Register Base Address**.

CAUTION

SCI3nBRR and SCI3nMDDR are allocated to the same address (relative address 4). The SCI3nMDDRS bit in SCI3nSEMR is used to switch these registers.

Table 15.9 Register Configuration

| Register Name | Symbol*1 | Value after Reset | Address | Access Size |
|---|------------------------|-------------------|----------------------------------|-------------|
| Receive shift register | SCI3nRSR | — | — | — |
| Serial mode register | SCI3nSMR | 00 _H | <SCI3n_base> + 0000 _H | 8 |
| Bit rate register / Modulation duty register | SCI3nBRR/ SCI3nMDDR | FF _H | <SCI3n_base> + 0004 _H | 8 |
| Serial control register | SCI3nSCR | 00 _H | <SCI3n_base> + 0008 _H | 8 |
| Transmit data register | SCI3nTDR | FF _H | <SCI3n_base> + 000C _H | 8 |
| Transmit shift register | SCI3nTSR | — | — | — |
| Serial status register | SCI3nSSR | 84 _H | <SCI3n_base> + 0010 _H | 8 |
| Receive data register | SCI3nRDR | 00 _H | <SCI3n_base> + 0014 _H | 8 |
| Serial transfer format register | SCI3nSCMR | F2 _H | <SCI3n_base> + 0018 _H | 8 |
| Serial extended mode register | SCI3nSEMR | 04 _H | <SCI3n_base> + 001C _H | 8 |

Note 1. n = 0 to 2

Relative addresses $4n + 1$, $4n + 2$, and $4n + 3$ ($n = 0$ to 2) are reserved areas. These areas are always read as 0. Writing is invalid.

15.3.1 SCI3nRSR — Receive Shift Register

SCI3nRSR is a shift register which is used to receive serial data input from the SCI3nRxD pin and convert it to parallel data. When one frame of data has been received, it is automatically transferred to SCI3nRDR. SCI3nRSR cannot be directly accessed by the CPU.

15.3.2 SCI3nRDR — Receive Data Register

SCI3nRDR is an 8-bit register to store receive data. The value of SCI3nRDR after a reset is 00_H. When one frame of data has been received, it is transferred from SCI3nRSR to this register allowing SCI3nRSR to receive the next data. SCI3nRSR and SCI3nRDR function as a double-buffer, allowing continuous receive operations. Be sure to check that the RDRF flag in SCI3nSSR is set to 1 before reading SCI3nRDR. SCI3nRDR cannot be written from the CPU.

When the data length is 7 bits, receive data is stored in bits 0 to 6 and bit 7 is fixed to 0 regardless of the SINV bit in SCI3nSCMR.

15.3.3 SCI3nTDR — Transmit Data Register

SCI3nTDR is an 8-bit register to store transmit data. The value of SCI3nTDR after a reset is FF_H. When SCI3nTSR empty is detected, the transmit data written to SCI3nTDR is transferred to SCI3nTSR and transmission starts. The double-buffered structure of SCI3nTDR and SCI3nTSR allows continuous serial transmission. If the next transmit data has been written to SCI3nTDR when one frame of data is sent, the transmit data is transferred to SCI3nTSR to continue transmission. SCI3nTDR can always be read and written by the CPU. Be sure to check that the TDRE flag in SCI3nSSR is set to 1 before writing transmit data to SCI3nTDR.

15.3.4 SCI3nTSR — Transmit Shift Register

SCI3nTSR is a shift register to transmit serial data. To perform serial data transmission, transmit data written to SCI3nTDR is automatically transferred to SCI3nTSR, and is then sent to the SCI3nTxD pin. SCI3nTSR cannot be directly accessed by the CPU.

15.3.5 SCI3nSMR — Serial Mode Register

SCI3nSMR is a register used to select the communication format and the clock source for the on-chip baud rate generator.

Access: This register can be read/written in 8-bit units.

Address: <SCI3n_base> + 0000_H

Value after reset: 00_H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|-------|-------|-------|-------|-------|-------|-------|-------|
| | CM | CHR | PE | PM | STOP | MP | CKS1 | CKS0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 |

Note 1. Writable only when TE = RE = 0.

Table 15.10 SCI3nSMR Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 7 | CM | Communication Mode 0: Asynchronous mode 1: Clock synchronous mode |
| 6 | CHR | Character Length (Valid only in asynchronous mode) 0: Selects 8 bits as the data length. 1: Selects 7 bits as the data length. It is fixed to LSB-first and the MSB (bit 7) in SCI3nTDR is not sent in transmission. In clock synchronous mode, a data length of 8 bits is always used. |
| 5 | PE | Parity Enable (Valid only in asynchronous mode) When this bit is set to 1, a parity bit is added to transmit data and the parity bit is checked in reception. Regardless of the setting of this bit, no parity bit is added or checked in the multi-processor format. |
| 4 | PM | Parity Mode (Valid only when PE = 1 in asynchronous mode) 0: Selects even parity. 1: Selects odd parity. When even parity is set, parity bit is added so that the total number of 1-bits in the transmit/receive character plus the parity bit is even. Similarly, when odd parity is set, parity bit is added so that the total number of 1-bits in the transmit/receive character plus the parity bit is odd. |
| 3 | STOP | Stop Bit Length (Valid only in asynchronous mode) 0: 1 stop bit for transmission 1: 2 stop bits for transmission In reception, only the first stop bit is checked regardless of the setting of this bit. If the second stop bit is 0, it is treated as the start bit of the next transmission frame. |
| 2 | MP | Multi-Processor Mode (Valid only in asynchronous mode) When this bit is set to 1, the multi-processor communication function is enabled. In multi-processor mode, settings of the PE and PM bits are invalid. |
| 1, 0 | CKS[1:0] | Clock Select 1, 0 These bits select the clock source for the on-chip baud rate generator. 00: PCLK clock ($\alpha = 0$) 01: PCLK/4 clock ($\alpha = 1$) 10: PCLK/16 clock ($\alpha = 2$) 11: PCLK/64 clock ($\alpha = 3$) For the relation between the setting of these bits and the baud rate, see Section 15.3.10, SCI3nBRR — Bit Rate Register . The character α is the decimal notation of the value of α in Section 15.3.10, SCI3nBRR — Bit Rate Register . |

15.3.6 SCI3nSCR — Serial Control Register

SCI3nSCR is a register used for the transmission/reception control, interrupt control, and transmission/reception clock source selection listed below. For interrupt requests, see **Section 15.8, Interrupt Sources**.

Access: This register can be read/written in 8-bit units.

Address: <SCI3n_base> + 0008_H

Value after reset: 00_H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|-----|-----|-------|-------|------|------|-------|-------|
| | TIE | RIE | TE | RE | MPIE | TEIE | CKE1 | CKE0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W*1 | R/W*1 | R/W | R/W | R/W*2 | R/W*2 |

Note 1. While the CM bit in SCI3nSMR is 1, a value of 1 can be written only when TE = 0 and RE = 0. After the TE or RE bit is set to 1, only 0 can be written to TE and RE. While the CM bit in SCI3nSMR is 0, writing is enabled at any timing.

Note 2. Writable only when TE = 0 and RE = 0. Also, writable at the same time when TE = 0 and RE = 0 are written.

Table 15.11 SCI3nSCR Register Contents (1/2)

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 7 | TIE | Transmit Interrupt Enable When this bit is set to 1, INTSCI3nTXI interrupt request is enabled. INTSCI3nTXI interrupt request can be cancelled by reading 1 from the TDRE flag and then clearing the flag to 0, or clearing the TIE bit. |
| 6 | RIE | Receive Interrupt Enable When this bit is set to 1, INTSCI3nRXI and INTSCI3nERI interrupt requests are enabled. INTSCI3nRXI and INTSCI3nERI interrupt requests can be cancelled by reading 1 from the RDRF, FER, PER, or ORER flag and then clearing the flag to 0, or clearing the RIE bit. |
| 5 | TE | Transmit Enable When this bit is set to 1, transmission is enabled. In this state, serial transmission is started by writing transmit data to SCI3nTDR and clearing the TDRE flag in SCI3nSSR to 0. Be sure to configure SCI3nSMR before setting the TE bit to 1 to determine the transmission format. When this bit is set to 0 to disable transmission, the TDRE flag in SCI3nSSR is fixed to 1. |
| 4 | RE | Receive Enable When this bit is set to 1, reception is enabled. In this state, serial reception is started by detecting a start bit in asynchronous mode or the input of synchronous clock in clock synchronous mode. Be sure to configure SCI3nSMR before setting the RE bit to 1 to determine the reception format. Even if reception is disabled by clearing this bit, the RDRF, FER, PER, or ORER flags are not affected and the previous value is retained. |
| 3 | MPIE | Multiprocessor Interrupt Enable (Valid only when MP in SCI3nSMR = 1 in asynchronous mode) When this bit is set to 1 and the data with the multi-processor bit set to 0 is received, the data is not read and setting the RDRF, FER, and ORER flags in SCI3nSSR to 1 is disabled. When the data with the multi-processor bit set to 1 is received, this bit is automatically cleared to 0, and normal reception is resumed. For details, see Section 15.5, Multi-Processor Communication Function . When the receive data includes MPB = 0 in SCI3nSSR, the receive data is not transferred from SCI3nRSR to SCI3nRDR, a receive error is not detected, and setting the RDRF, FER, and ORER flags in SCI3nSSR to 1 is disabled. When the receive data includes MPB = 1 in SCI3nSSR, the MPB bit in SCI3nSSR is set to 1, the MPIE bit is automatically cleared to 0, the INTSCI3nRXI and INTSCI3nERI interrupt requests are enabled (if the RIE bit in SCI3nSCR is set to 1), and setting the FER and ORER flags to 1 is enabled. |

Table 15.11 SCI3nSCR Register Contents (2/2)

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 2 | TEIE | Transmit End Interrupt Enable When this bit is set to 1, INTSCI3nTEI interrupt request is enabled. INTSCI3nTEI interrupt request can be cancelled by reading 1 from the TDRE flag and then clearing the flag to 0 to clear the TEND flag to 0, or clearing the TEIE bit. |
| 1, 0 | CKE[1:0] | Clock Enable 1, 0 These bits select the clock source and the SCInSCK pin function. For asynchronous mode 00: On-chip baud rate generator (The SCInSCK pin functions as an input/output port.) 01: On-chip baud rate generator (The clock with the same frequency as the bit rate is output from the SCInSCK pin.) 1X: Setting prohibited For clock synchronous mode 0X: Internal clock (The SCInSCK pin functions as a clock output pin.) 1X: External clock (The SCInSCK pin functions as a clock input pin.) |

Note: X: Don't care

15.3.7 SCI3nSSR — Serial Status Register

SCI3nSSR consists of SCI3 status flags and multi-processor transmit/receive bits.
The TDRE, RDRF, ORER, PER, and FER flags can be cleared only.

Access: This register can be read/written in 8-bit units.

Address: <SCI3n_base> + 0010_H

Value after reset: 84_H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|---------|---------|---------|---------|---------|------|-----|------|
| | TDRE | RDRF | ORER | FER | PER | TEND | MPB | MPBT |
| Value after reset | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |
| R/W | R/(W)*1 | R/(W)*1 | R/(W)*1 | R/(W)*1 | R/(W)*1 | R | R | R/W |

Note 1. Only 0 can be written to clear the flag.

Table 15.12 SCI3nSSR Register Contents (1/2)

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 7 | TDRE | Transmit Data Register Empty Indicates whether or not transmit data exists in SCI3nTDR. [Setting conditions] <ul style="list-style-type: none"> When the TE bit in SCI3nSCR is 0 When the data in SCI3nTDR has been transferred to SCI3nTSR so that new data can be written to SCI3nTDR [Clearing condition] <ul style="list-style-type: none"> Writing 0 to TDRE after reading TDRE = 1 When transmit data is written to SCI3nTDR while TE = 1 |
| 6 | RDRF | Receive Data Register Full Indicates whether or not receive data exists in SCI3nRDR [Setting condition] <ul style="list-style-type: none"> When reception finishes successfully and the receive data is transferred from SCI3nRSR to SCI3nRDR [Clearing conditions] <ul style="list-style-type: none"> Writing 0 to RDRF after reading RDRF = 1 When data is read from SCI3nRDR Even when the RE bit in SCI3nSCR is cleared, the RDRF flag is not affected and the previous value is retained. Note that completing the reception of the next data with the RDRF flag set to 1 will cause an overrun error, resulting in the loss of the receive data. |
| 5 | ORER | Overrun Error Indicates that an overrun error has occurred during reception and the reception abended. [Setting condition] <ul style="list-style-type: none"> When the next data is received while RDRF = 1 In SCI3nRDR, data received prior to the overrun error is retained, but data received after the overrun error occurrence is lost. When the ORER flag is set to 1, subsequent serial reception cannot be continued. In clock synchronous mode, serial transmission also cannot be continued. [Clearing condition] <ul style="list-style-type: none"> Writing 0 to ORER after reading ORER = 1 Even when the RE bit in SCI3nSCR is cleared, the ORER flag is not affected and the previous value is retained. |

Table 15.12 SCI3nSSR Register Contents (2/2)

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 4 | FER | <p>Framing Error</p> <p>Indicates that a framing error has occurred during reception in asynchronous mode and the reception abended.</p> <p>[Setting condition]</p> <ul style="list-style-type: none"> When the stop bit is 0 In 2-stop-bit mode, only whether the first stop bit is 1 is checked but the second stop bit is not checked. Although the receive data that existed when a framing error has occurred is transferred to SCI3nRDR, the RDRF flag is not set. In addition, while the FER flag is set to 1, the subsequent receive data is not transferred to SCI3nRDR. <p>[Clearing condition]</p> <ul style="list-style-type: none"> Writing 0 to FER after reading FER = 1 Even when the RE bit in SCI3nSCR is cleared to 0, the FER flag is not affected and the previous value is retained. |
| 3 | PER | <p>Parity Error</p> <p>Indicates that a parity error has occurred during reception in asynchronous mode and the reception abended.</p> <p>[Setting condition]</p> <ul style="list-style-type: none"> Although the receive data that existed when a parity error has occurred is transferred to SCI3nRDR, the RDRF flag is not set. In addition, while the PER flag is set to 1, the subsequent receive data is not transferred to SCI3nRDR. <p>[Clearing condition]</p> <ul style="list-style-type: none"> Writing 0 to PER after reading PER = 1 Even when the RE bit in SCI3nSCR is cleared to 0, the PER flag is not affected and the previous value is retained. |
| 2 | TEND | <p>Transmit End</p> <p>Indicates that a transmission is completed.</p> <p>[Setting conditions]</p> <ul style="list-style-type: none"> When the TE bit in SCI3nSCR is 0 When the TDRE flag is 1 while the last bit of a transmit character is being transmitted <p>[Clearing condition]</p> <ul style="list-style-type: none"> Writing 0 to the TDRE flag after reading TDRE = 1 When transmit data is written to SCI3nTDR while TE = 1 |
| 1 | MPB | <p>Multi-processor Bit</p> <p>Holds the value of the multi-processor bit in the receive frame.</p> |
| 0 | MPBT | <p>Multi-processor Bit Transfer</p> <p>Sets the value of the multi-processor bit to be added to the transmit frame.</p> |

15.3.8 SCI3nSCMR — Serial Transfer Format Register

SCI3nSCMR is a register to select the communication format which can be commonly configured for both asynchronous mode and clock synchronous mode.

Access: This register can be read/written in 8-bit units.

Address: <SCI3n_base> + 0018_H

Value after reset: F2_H

| | | | | | | | | |
|-------------------|---|---|---|---|-------|-------|---|---|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | SDIR | SINV | — | — |
| Value after reset | 1 | 1 | 1 | 1 | 0 | 0 | 1 | 0 |
| R/W | R | R | R | R | R/W*1 | R/W*1 | R | R |

Note 1. Writable only when TE = 0 and RE = 0.

Table 15.13 SCI3nSCMR Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 7 to 4 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 3 | SDIR | Serial Data Transfer Direction (Valid in asynchronous mode and clock synchronous mode) This bit is used to select the direction of serial/parallel conversion. 0: Transfer with LSB-first 1: Transfer with MSB-first This bit is valid only when the transfer format is 8-bit data. For 7-bit data, LSB-first transfer is used. |
| 2 | SINV | Serial Data Invert (Valid in asynchronous mode and clock synchronous mode) This bit is used to invert the transmit/receive data logic level. The SINV bit does not affect the logic level of the start bit, stop bit, parity bit, and multi-processor bit. To invert the parity bit, invert the PM bit in SCI3nSMR. 0: SCI3nTDR data is transmitted as it is, and receive data is stored in SCI3nRDR as it is. 1: SCI3nTDR data is inverted and transmitted, and receive data is inverted and stored in SCI3nRDR. |
| 1 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 0 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |

15.3.9 SCI3nSEMR — Serial Extended Mode Register

SCI3nSEMR is a register to select a 1-bit period.

Access: This register can be read/written in 8-bit units.

Address: <SCI3n_base> + 001C_H

Value after reset: 04_H

| | | | | | | | | |
|-------------------|-------|-------|---|---|-------|--------|---|---|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | BRME | MDDRS | — | — | ABCS | RXDMON | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |
| R/W | R/W*1 | R/W*1 | R | R | R/W*1 | R | R | R |

Note 1. Writable only when TE = 0 and RE = 0.

Table 15.14 SCI3nSEMR Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 7 | BRME | Bit Rate Modulation Enable When this bit is set to 1, the bit rate modulation function is enabled. |
| 6 | MDDRS | Modulation Duty Register Select This bit is used to select an accessible register. 0: SCI3nBRR is accessible. 1: SCI3nMDDR is accessible. |
| 5, 4 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 3 | ABCS | Asynchronous Reference Clock Select (Valid only in asynchronous mode) This bit is used to select the reference clock for 1-bit period. 0: Operates on the reference clock with a frequency of 16 times the transfer rate. 1: Operates on the reference clock with a frequency of 8 times the transfer rate (double-speed operation). |
| 2 | RXDMON | Serial Input Data Monitor This bit indicates the SCInRxD pin state. 0: SCInRxD pin state is low level. 1: SCInRxD pin state is high level. |
| 1, 0 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |

15.3.10 SCI3nBRR — Bit Rate Register

SCI3nBRR is an 8-bit register to adjust the bit rate. Since each SCI3 channel has an independent baud rate generator, different bit rates can be set for each channel. **Table 15.16** shows the relationship between the setting (N) in SCI3nBRR and the bit rate (B) in normal asynchronous mode and clock synchronous mode. The value of SCI3nBRR after reset is FF_H. SCI3nBRR is allocated at the same address as SCI3nMDDR and is selected when MDDRS in SCI3nSEMR is 0. This register is writable only when TE = 0 and RE = 0.

Access: This register can be read/written in 8-bit units.

Address: <SCI3n_base> + 0004_H

Value after reset: FF_H

Table 15.15 SCI3nBRR Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 7 to 0 | BRR | Baud rate generator setting (0 ≤ N ≤ 255) |

Table 15.16 Relationship between Setting N in SCI3nBRR and Bit Rate B

| Mode | ABCS Setting | Bit Rate | Mean Error |
|-------------------|--------------|---|--|
| Asynchronous | 0 | $B = \frac{PCLK \times 10^6}{64 \times 2^{2\alpha-1} \times (N+1)}$ | $Error(\%) = \left\{ \frac{PCLK \times 10^6}{B \times 64 \times 2^{2\alpha-1} \times (N+1)} - 1 \right\} \times 100$ |
| | 1 | $B = \frac{PCLK \times 10^6}{32 \times 2^{2\alpha-1} \times (N+1)}$ | $Error(\%) = \left\{ \frac{PCLK \times 10^6}{B \times 32 \times 2^{2\alpha-1} \times (N+1)} - 1 \right\} \times 100$ |
| Clock synchronous | — | $B = \frac{PCLK \times 10^6}{8 \times 2^{2\alpha-1} \times (N+1)}$ | |

Note: B: Bit rate (bps)
 N: SCI3nBRR setting value for baud rate generator (0 ≤ N ≤ 255)
 PCLK: Operating frequency (MHz)
 α: Determined by the SCI3nSMR setting value as shown in the following table.

| SCI3nSMR Setting Value | | α |
|------------------------|------|---|
| CKS1 | CKS0 | |
| 0 | 0 | 0 |
| 0 | 1 | 1 |
| 1 | 0 | 2 |
| 1 | 1 | 3 |

Table 15.17 lists sample N settings of the SCI3nBRR register in asynchronous mode. **Table 15.18** shows the maximum configurable bit rates.

Table 15.17 Examples of BRR Settings for Bit Rates (Asynchronous Mode) (80 MHz)

| PCLK (MHz) | α | N | Baud Rate | |
|------------|----------|-----|--------------------|--------------------|

15.3.11 SCI3nMDDR — Modulation Duty Register

SCI3nMDDR is a register to correct the bit rate adjusted by SCI3nBRR. The value of SCI3nMDDR after a reset is FF_H. When the BRME bit in SCI3nSEMR is set to 1, the bit rate generated by the on-chip baud rate generator is corrected to SCI3nMDDR/256 on average. **Table 15.22** shows the relationship between the SCI3nMDDR setting and the bit rate B. SCI3nMDDR is allocated at the same address as SCI3nBRR and is selected when MDDRS in SCI3nSEMR is 1. This register is writable only when TE = 0 and RE = 0. Bit 7 is fixed to 1.

Access: This register can be read/written in 8-bit units.

Address: <SCI3n_base> + 0004_H

Value after reset: FF_H

| | | | | | | | | |
|-------------------|------|-----|-----|-----|-----|-----|-----|-----|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | MDDR | | | | | | | |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 15.21 SCI3nMDDR Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 7 to 0 | MDDR | Baud rate generator setting value (128 ≤ MDDR ≤ 255) |

Table 15.22 Relationship between SCI3nMDDR Setting Value and Bit Rate B when Bit Rate Modulation Function Is Used

| Mode | ABCS Setting | Bit Rate | Mean Error |
|-------------------|--------------|---|---|
| Asynchronous | 0 | $B = \frac{PCLK \times 10^6}{64 \times 2^{2\alpha-1} \times (256/MDDR) \times (N+1)}$ | $\text{Error(\%)} = \left\{ \frac{PCLK \times 10^6}{B \times 64 \times 2^{2\alpha-1} \times (256/MDDR) \times (N+1)} - 1 \right\} \times 100$ |
| | 1 | $B = \frac{PCLK \times 10^6}{32 \times 2^{2\alpha-1} \times (256/MDDR) \times (N+1)}$ | $\text{Error(\%)} = \left\{ \frac{PCLK \times 10^6}{B \times 32 \times 2^{2\alpha-1} \times (256/MDDR) \times (N+1)} - 1 \right\} \times 100$ |
| Clock synchronous | — | $B = \frac{PCLK \times 10^6}{8 \times 2^{2\alpha-1} \times (256/MDDR) \times (N+1)}$ | |

Note: B: Bit rate (bps)
 N: SCI3nBRR setting value of baud rate generator (0 ≤ N ≤ 255)
 PCLK: Operating frequency (MHz)
 α: See **Table 15.16, Relationship between Setting N in SCI3nBRR and Bit Rate B.**

15.4 Operation in Asynchronous Mode

Figure 15.2 shows the general format for asynchronous serial communications. One frame consists of a start bit (low level), transmit/receive data, a parity bit, and stop bits (high level). In asynchronous serial communications, the communication line is usually held in the mark state (high level). The SCI3 monitors the communication line, and when the SCI3 detects the space state (low level), it recognizes a start bit and starts serial communications. Inside the SCI3, the transmitter and the receiver are independent, enabling full-duplex communications. Both the transmitter and the receiver have a double-buffered structure so that data can be read or written during transmission or reception, enabling continuous data transmission and reception.

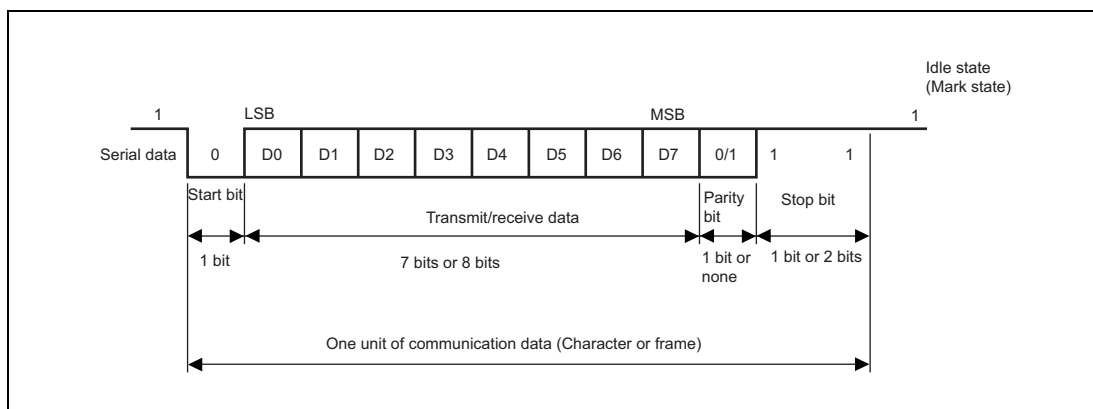

Figure 15.2 Data Format in Asynchronous Serial Communications (Example with 8-Bit Data, Parity, Two Stop Bits)

15.4.1 Transmission/Reception Format

Table 15.23 lists the transmission/reception formats that can be configured in asynchronous mode. Any of 12 transmission/reception formats can be selected according to the SCI3nSMR setting. For details of the multi-processor bit, see **Section 15.5, Multi-Processor Communication Function**.

Table 15.23 Serial Transmission/Reception Formats (Asynchronous Mode)

| SMR Setting | | | | Serial Transmission/Reception Format and Frame Length | | | | | | | | | | | | |
|-------------|----|----|------|---|------------|---|---|---|---|---|---|------|------|------|------|--|
| CHR | PE | MP | STOP | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | |
| 0 | 0 | 0 | 0 | S | 8-bit data | | | | | | | | STOP | | | |
| 0 | 0 | 0 | 1 | S | 8-bit data | | | | | | | | STOP | STOP | | |
| 0 | 1 | 0 | 0 | S | 8-bit data | | | | | | | | P | STOP | | |
| 0 | 1 | 0 | 1 | S | 8-bit data | | | | | | | | P | STOP | STOP | |
| 1 | 0 | 0 | 0 | S | 7-bit data | | | | | | | STOP | | | | |
| 1 | 0 | 0 | 1 | S | 7-bit data | | | | | | | STOP | STOP | | | |
| 1 | 1 | 0 | 0 | S | 7-bit data | | | | | | | P | STOP | | | |
| 1 | 1 | 0 | 1 | S | 7-bit data | | | | | | | P | STOP | STOP | | |
| 0 | — | 1 | 0 | S | 8-bit data | | | | | | | | MPB | STOP | | |
| 0 | — | 1 | 1 | S | 8-bit data | | | | | | | | MPB | STOP | STOP | |
| 1 | — | 1 | 0 | S | 7-bit data | | | | | | | MPB | STOP | | | |
| 1 | — | 1 | 1 | S | 7-bit data | | | | | | | MPB | STOP | STOP | | |

Note: S: Start bit
 STOP: Stop bit
 P: Parity bit
 MPB: Multi-processor bit

15.4.2 Receive Data Sampling Timing and Reception Margin

In asynchronous mode, the SCI3 operates on a reference clock with a frequency of 16 times (8 times for the double-speed mode) the bit rate. In reception, the SCI3 samples the falling edge of the beginning of the start bit (low level) using the reference clock and performs internal synchronization. As shown in **Figure 15.3**, data is latched at the middle of each bit by sampling receive data at the rising edge of the eighth pulse (fourth pulse for the double-speed mode) of the reference clock.

Thus the reception margin in asynchronous mode is determined by formula (1) below.

$$M = \left| \left(0.5 - \frac{1}{2N} \right) - (L - 0.5)F - \frac{|D - 0.5|}{N}(1 + F) \right| \times 100[\%] \dots \text{formula(1)}$$

- M: Reception margin
- N: Ratio of bit rate to clock (N = 16 when ABCS in SCI3nSEMR = 0, N = 8 when ABCS = 1)
- D: Duty cycle of clock (D = 0.5 to 1.0)
- L: Frame length (L = 9 to 12)
- F: Absolute value of clock frequency deviation

Assuming that F (absolute value of clock frequency deviation) = 0, D (duty cycle of clock) = 0.5, and N = 16 in formula (1), the reception margin is obtained by the formula below.

$$M = \left\{ 0.5 - \frac{1}{(2 \times 16)} \right\} \times 100[\%] = 46.875\%$$

However, this is only the calculated value, and a margin of 20% to 30% should be allowed in system design.

When the bit rate modulation function is used, the reference clock frequency is corrected on average.

Figure 15.3 Receive Data Sampling Timing in Asynchronous Mode

15.4.3 Clock

An internal clock generated by the on-chip baud rate generator can be selected as the SCI3's transmission/reception clock according to the settings of the CM bit in SCI3nSMR and the CKE1 and CKE0 bits in SCI3nSCR. When the SCI3 is operated on an internal clock, the clock can be output from the SCInSCK pin.

For details of clock synchronous mode, see **Section 15.6, Operation in Clock Synchronous Mode**.

In asynchronous mode, the frequency of the clock output is equal to the bit rate and the phase is such that the rising edge of the clock comes at the center of the transmit data, as shown in **Figure 15.4**.

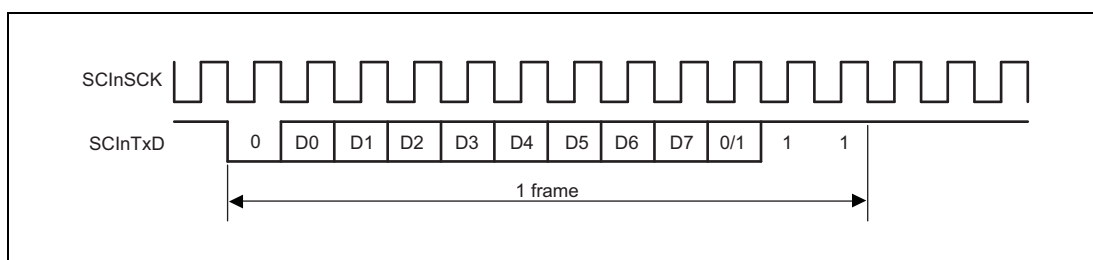

Figure 15.4 Phase Relationship between Output Clock and Transmit Data (Asynchronous Mode)

15.4.4 Double-Speed Operation

In addition to the operation described in **Section 15.4.3, Clock**, double-speed operation is enabled by the setting of the ABCS bit in SCI3nSEMR.

In double-speed operation, the same operation on a clock with a frequency of 16 times the bit rate in normal operation can be conducted on a clock with a frequency of 8 times the bit rate, meaning that the SCI3 operates on a double transfer rate using the same reference clock.

15.4.5 SCI3 Initialization (Asynchronous Mode)

Before transmitting and receiving data, clear the TE and RE bits in SCI3nSCR and then initialize the SCI3 according to the sample flowchart in **Figure 15.5**. Before changing the operating mode or transfer format, be sure to clear the TE and RE bits to 0. Note that clearing the TE bit to 0 sets the TDRE flag to 1, but clearing the RE bit to 0 initializes neither the RDRF, PER, FER, and ORER flags nor SCI3nRDR.

Figure 15.5 Sample Flowchart for SCI3 Initialization

15.4.6 Serial Data Transmission (Asynchronous Mode)

Figure 15.6 shows an example of operation for data transmission in asynchronous mode. In data transmission, the SCI3 operates as described below.

1. When transmit data is written to SCI3nTDR, the TDRE flag is automatically cleared to 0. The SCI3 monitors the TDRE flag in SCI3nSSR. When the flag is cleared, the SCI3 recognizes that data has been written to SCI3nTDR and transfers data from SCI3nTDR to SCI3nTSR. When writing transmit data to SCI3nTDR at a trigger of INTSCI3nTXI interrupt request, set the TIE bit to 1 and then set the TE bit to 1 or set both TIE and TE bits simultaneously with one instruction to generate a INTSCI3nTXI interrupt request for starting data transfer.
2. Transmission starts after data is transferred from SCI3nTDR to SCI3nTSR and the TDRE flag is set to 1. If the TIE bit in SCI3nSCR is set to 1 at this time, a INTSCI3nTXI interrupt request is generated. Continuous transmission is enabled by writing the next transmit data to SCI3nTDR in this INTSCI3nTXI interrupt processing routine before transmission of the previously transferred data is completed. When an INTSCI3nTEI interrupt request is used, the TIE bit is cleared to 0 after the last transmit data has been written to SCI3nTDR, and the TEIE bit is set to 1.
3. Data is sent from the SCInTxD pin in the following order: start bit, transmit data, parity bit or multi-processor bit (may be omitted depending on the format), and stop bit.
4. The TDRE flag is checked when the stop bit is output.
5. When the TDRE flag is 0, the next transmit data is transferred from SCI3nTDR to SCI3nTSR. After the stop bit has been sent, transmission of the next frame starts.
6. When the TDRE flag is 1, the TEND flag in SCI3nSSR is set to 1, the stop bit is sent, and then 1 is output to enter the mark state. If the TEIE bit in SCI3nSCR is set to 1 at this time, a INTSCI3nTEI interrupt request is generated.

Figure 15.7 shows a sample flowchart for data transmission. **Figure 15.8** shows a sample flowchart for stopping the SCI3 after data transmission.

Note about the operation when transmission is enabled in asynchronous mode:

When the setting of the TE bit is changed from 0 to 1, a high level (preamble) is output for one frame. If transmit data is written to SCI3nTDR while the preamble is being output, that data will be transferred from SCI3nTDR to SCI3nTSR after preamble output is complete.

Figure 15.6 Example of Operation for Transmission in Asynchronous Mode (Example with 8-Bit Data, Parity, One Stop Bit)

Figure 15.7 Example of Serial Transmission Flowchart

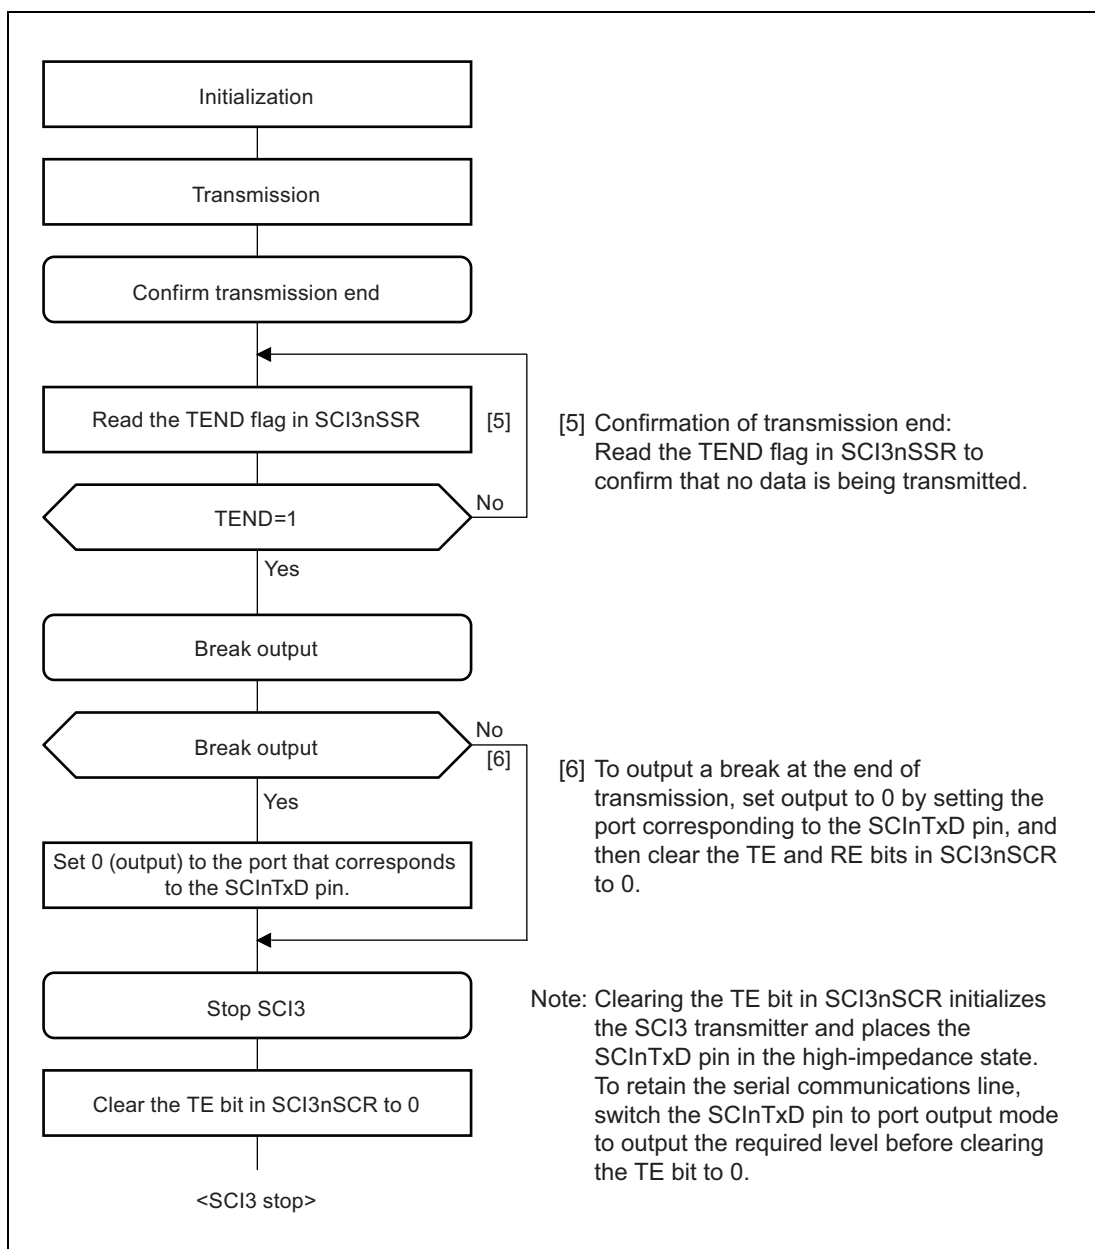

Figure 15.8 Example Flowchart for Stopping the SCI3 after Serial Transmission

15.4.7 Serial Data Reception (Asynchronous Mode)

Figure 15.9 shows an example of the operation for data reception in asynchronous mode. In data reception, the SCI3 operates as described below.

1. SCI3 monitors the communications line and upon detection of a start bit, it performs internal synchronization, stores receive data in SCI3nRSR, and checks the parity bit and the stop bit.
2. When an overrun error occurs (the next data has been received with the RDRF flag in SCI3nSSR set to 1), the ORER flag in SCI3nSSR is set to 1. If the RIE bit in SCI3nSCR is set to 1 at this time, an INTSCI3nERI interrupt request is generated. Receive data is not transferred to SCI3nRDR. The RDRF flag retains the state of being set to 1.
3. When a parity error is detected, the PER flag in SCI3nSSR is set to 1 and receive data is transferred to SCI3nRDR. If the RIE bit in SCI3nSCR is set to 1 at this time, an INTSCI3nERI interrupt request is generated.
4. When a framing error (when the stop bit is 0) is detected, the FER flag in SCI3nSSR is set to 1 and receive data is transferred to SCI3nRDR. If the RIE bit in SCI3nSCR is set to 1 at this time, an INTSCI3nERI interrupt request is generated.
5. When reception finishes successfully, the RDRF flag in SCI3nSSR is set to 1 and receive data is transferred to SCI3nRDR. If the RIE bit in SCI3nSCR is set to 1 at this time, an INTSCI3nRXI interrupt request is generated. Continuous reception is enabled by reading the receive data transferred to SCI3nRDR in this INTSCI3nRXI interrupt processing routine before reception of the next receive data is completed. Reading SCI3nRDR automatically clears the RDRF flag to 0.

Figure 15.9 Example of Operation for Reception in Asynchronous Mode (Example with 8-Bit Data, Parity, One Stop Bit)

Table 15.24 lists the states of the SCI3nSSR status flags and receive data handling when a receive error is detected. When a receive error is detected, the RDRF flag retains the status before receiving the data. Subsequent data reception is disabled while a receive error flag is set to 1. Accordingly, clear the ORER, FER, PER, and RDRF flags before continuing data reception. **Figure 15.10** shows a sample flowchart for data reception.

Table 15.24 SCI3nSSR Status Flags and Receive Data Handling

| SCI3nSSR Status Flags | | | | Receive Data | Receive Status |
|-----------------------|------|-----|-----|-------------------------|--|
| RDRF ^{*1} | ORER | FER | PER | | |
| 1 | 0 | 0 | 0 | Transferred to SCI3nRDR | Successful reception |
| 0 | 0 | 1 | 0 | Transferred to SCI3nRDR | Framing error |
| 0 | 0 | 0 | 1 | Transferred to SCI3nRDR | Parity error |
| 0 | 0 | 1 | 1 | Transferred to SCI3nRDR | Framing error + parity error |
| 1* | 1 | 0 | 0 | Lost | Overrun error |
| 1* | 1 | 1 | 0 | Lost | Overrun error + framing error |
| 1* | 1 | 0 | 1 | Lost | Overrun error + parity error |
| 1* | 1 | 1 | 1 | Lost | Overrun error + framing error + parity error |

Note 1. In the case of an overrun error, the RDRF flag retains the state before the data reception.

Note: "+" indicates that two or more receive statuses occur simultaneously in a single reception operation.

Figure 15.10 Example of Serial Reception Flowchart (1)

Figure 15.11 Example of Serial Reception Flowchart (2)

15.5 Multi-Processor Communication Function

15.5.1 Overview and Sample Connection

Using the multi-processor communication function allows data transmission and reception by sharing a communication line between multiple processors by using asynchronous serial communication in which the multi-processor bit is added. In multi-processor communication, a unique ID code is allocated to each receiving station. Serial communication cycles consist of an ID transmission cycle to specify the receiving station and a data transmission cycle to transmit data to the specified receiving station. The multi-processor bit is used to distinguish the ID transmission cycle from the data transmission cycle. When the multi-processor bit is set to 1, it indicates the ID transmission cycle. When the multi-processor bit is set to 0, it indicates the data transmission cycle. **Figure 15.12** shows an example of communication between processors by using the multi-processor format. First, a transmitting station sends communication data in which the multi-processor bit (= 1) is added to the ID code of the receiving station. Next, the transmitting station sends communication data in which the multi-processor bit (= 0) is added to the transmit data. Upon receiving the communication data in which the multi-processor bit is set to 1, the receiving station compares the received ID with the ID of the receiving station itself. When these IDs match, the receiving station receives communication data that is subsequently transmitted. If these IDs do not match, the receiving station skips communication data until it receives communication data in which the multi-processor bit is set to 1.

To support this function, the SCI3 provides the MPIE bit in SCI3nSCR. When the MPIE bit is set to 1, transfer of receive data from SCI3nRSR to SCI3nRDR, detection of a receive error, and setting the RDRF, FER, and ORER flags in SCI3nSSR are disabled until data in which the multi-processor bit is set to 1 is received. Upon receiving a character in which the multi-processor bit is set to 1, the MPB bit in SCI3nSSR is set to 1 and the MPIE bit is automatically cleared to 0, thus returning to a normal reception operation. When the RIE bit in SCI3nSCR is set to 1 at this time, an INTSCI3nRXI interrupt request is generated. While the MPIE bit is cleared to 0, reception operation is conducted regardless of the multi-processor bit value. The multi-processor bit is stored in the MPB bit in SCI3nSSR.

When the multi-processor format is specified, specification of the parity bit is disabled. Apart from this, there is no difference from the operation in the normal asynchronous mode. A clock that is used for multi-processor communications is also the same as the clock used in the normal asynchronous mode.

Figure 15.12 Example of Communication Using the Multi-Processor Format (Example of Transmission of Data AA_H to Receiving Station A)

15.5.2 Multi-Processor Serial Data Transmission

Figure 15.13 shows a sample flowchart of multi-processor data processing. In the ID transmission cycle, send the ID with the MPBT bit in SCI3nSSR set to 1. In the data transmission cycle, send data with the MPBT bit in SCI3nSSR cleared to 0. Other operations are the same as operations in asynchronous mode.

Figure 15.13 Example of Multi-Processor Serial Transmission Flowchart

15.5.3 Multi-Processor Serial Data Reception

Figure 15.15 shows a sample flowchart of multi-processor data reception. When the MPIE bit in SCI3nSCR is set to 1, reading the communication data is skipped until communication data in which the multi-processor bit is set to 1 is received. When communication data in which the multi-processor bit is set to 1 is received, the receive data is transferred to SCI3nRDR. At this time, an INTSCI3nRXI interrupt request is generated. Other operations are the same as operations in asynchronous mode.

Figure 15.14 shows an example of operation for reception.

CAUTION

Do not write data to SCI3nSCR when communication data in which the multi-processor bit is set to 1 is received. The MPIE bit may not become the desired state.

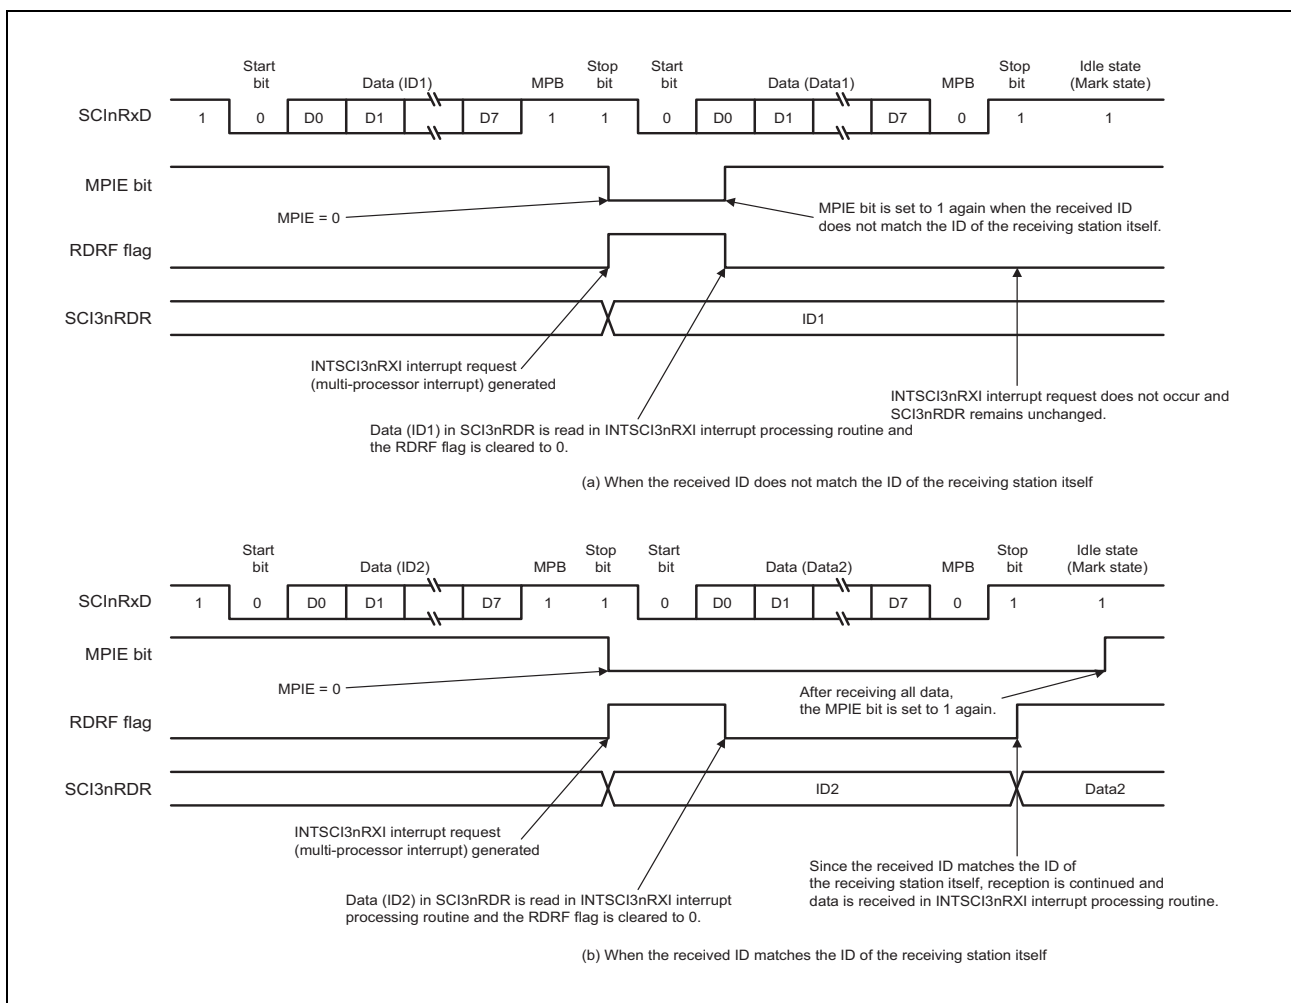

Figure 15.14 Example of SCI3 Reception (8-Bit Data, Multi-Processor Bit, One Stop Bit)

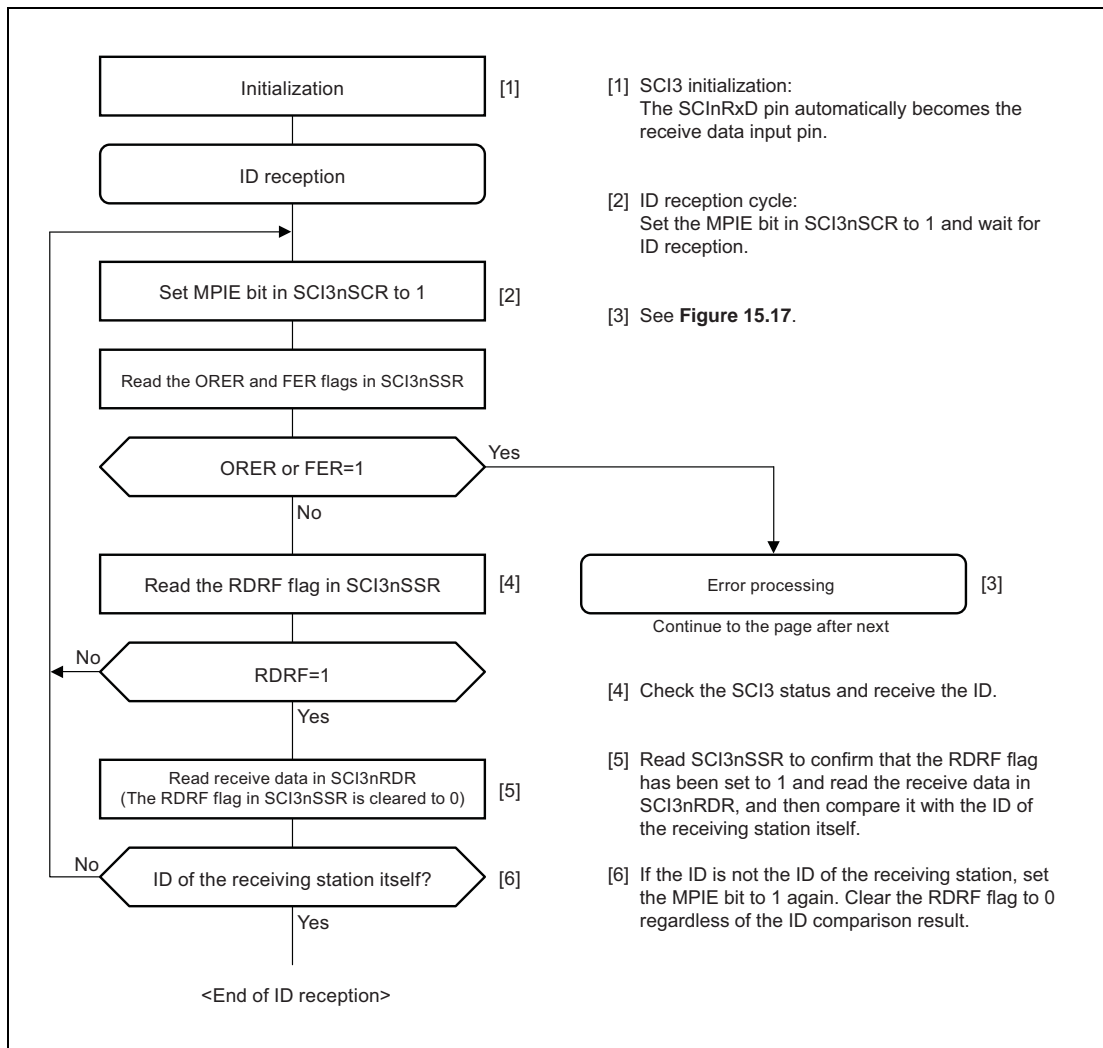

Figure 15.15 Example of Multi-Processor Serial Reception Flowchart (1)

Figure 15.16 Example of Multi-Processor Serial Reception Flowchart (2)

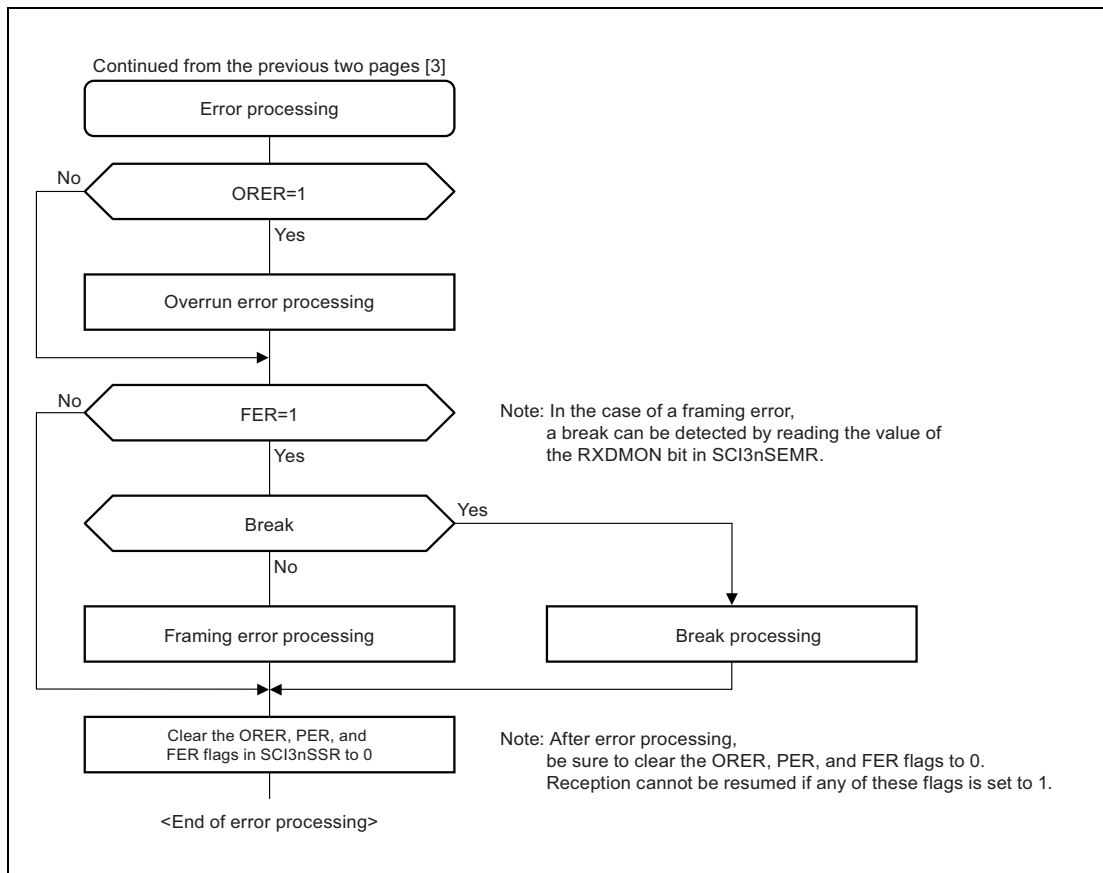

Figure 15.17 Example of Multi-Processor Serial Reception Flowchart (3)

15.6 Operation in Clock Synchronous Mode

Figure 15.18 shows the data format for clock synchronous serial data communication. In clock synchronous mode, data is transmitted or received in synchronization with clock pulses. One character in transfer data consists of 8-bit data. In data transmission with the synchronization clock output, the SCI3 outputs data from one falling edge to the next falling edge of the synchronization clock. In data transmission with the synchronization clock input, the SCI3 outputs the first data (bit 0) after starting transfer immediately after clearing the TDRE bit in SCI3nSSR to 0, and then outputs the next bit data after 2 to 3 PCLK clock cycles from the rising edge of the synchronization clock. In data reception, the SCI3 receives data in synchronization with the rising edge of the synchronization clock. After 8-bit data is output, the communication line holds the last-bit output state. In clock synchronous mode, neither parity bit nor multi-processor bit can be added. The transmitter and the receiver are independent in the SCI3, enabling full-duplex communication by using a common clock. Both the transmitter and the receiver have a double-buffered structure so that the next transmit data can be written during transmission or the previous receive data can be read during reception, enabling continuous data transfer.

Figure 15.18 Data Format in Clock Synchronous Mode (LSB-First)

15.6.1 Clock

An internal clock generated by the on-chip baud rate generator or an external synchronous clock that is input from the SCInSCK pin can be selected by the setting of the CKE1 and CKE0 bits in SCI3nSCR. When operating the SCI3 on the internal clock, a synchronous clock is output from the SCInSCK pin. Eight pulses of the synchronous clock are output during transfer of one character, and the clock is held high while no data is transferred.

15.6.2 SCI3 Initialization (Clock Synchronous Mode)

Before transmitting and receiving data, clear the TE and RE bits in SCI3nSCR to 0 and then initialize the SCI3 according to the sample flowchart in **Figure 15.19**. To switch the operation between transmission, reception, and transmission/reception, clear the TE and RE bits to 0 and then set these bits to the desired value. Before changing the transfer format, be sure to clear the TE and RE bits to 0. Note that clearing the TE bit to 0 sets the TDRE flag to 1, but clearing the RE bit to 0 initializes neither the RDRF, PER, FER, and ORER flags nor SCI3nRDR.

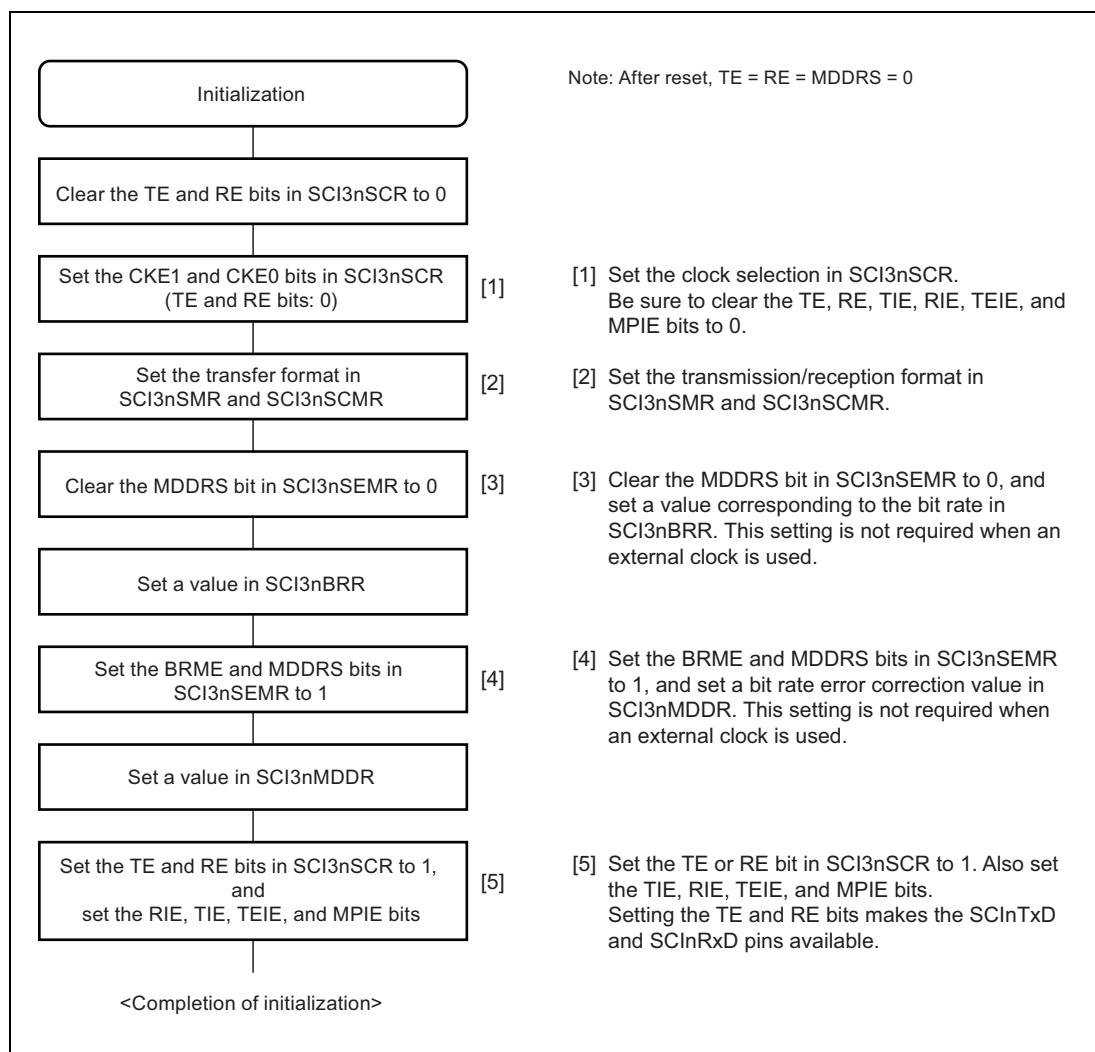

Figure 15.19 Example of SCI3 Initialization Flowchart

15.6.3 Serial Data Transmission (Clock Synchronous Mode)

Figure 15.20 shows an example of the operation for serial transmission in clock synchronous mode. In serial data transmission, the SCI3 operates as described below.

1. When transmit data is written to SCI3nTDR, the TDRE flag is automatically cleared to 0. The SCI3 monitors the TDRE flag in SCI3nSSR. When the flag is cleared, the SCI3 recognizes that data has been written to SCI3nTDR and transfers data from SCI3nTDR to SCI3nTSR, starting output of the first bit when the synchronization clock is input. To write transmit data to SCI3nTDR at a trigger of INTSCI3nTXI interrupt request, set the TIE bit to 1 and then set the TE bit to 1 or set both TIE and TE bits simultaneously with one instruction to generate a INTSCI3nTXI interrupt request for starting data transfer.
2. Transmission starts after data is transferred from SCI3nTDR to SCI3nTSR, and the TDRE flag is set to 1. When the TIE bit in SCI3nSCR is set to 1 at this time, a INTSCI3nTXI interrupt request is generated. Continuous transmission is enabled by writing the next transmit data to SCI3nTDR in this INTSCI3nTXI interrupt processing routine before the transmission of the previously transferred data is completed. When a INTSCI3nTEI interrupt request is used, the TIE bit is cleared to 0 after the last transmit data has been written to SCI3nTDR, and the TEIE bit is set to 1.
3. 8-bit data is output from the SCInTxD pin in synchronization with the output clock (when clock output mode has been specified) or in synchronization with the input clock (when external clock has been specified).
4. The SCI3 checks the TDRE flag when the last bit is output.
5. When the TDRE flag is 0, the next transmit data is transferred from SCI3nTDR to SCI3nTSR, and serial transmission of the next frame starts.
6. When the TDRE flag is 1, the TEND flag in SCI3nSSR is set to 1 and the SCInSCK pin retains the output state of the last bit. If the TEIE bit in SCI3nSCR is set to 1 at this time, a INTSCI3nTEI interrupt request is generated. The SCInSCK pin is held high.

Figure 15.21 shows a sample flowchart of serial data transmission. Also, **Figure 15.22** shows a sample flowchart for stopping the SCI3 after data transmission. Transmission will not start even if the TDRE flag is cleared while a receive error flag (ORER) is set to 1. Be sure to clear the receive error flags to 0 before starting transmission. Note that clearing the RE bit to 0 does not clear the receive error flags.

Figure 15.20 Example of Operation for Transmission in Clock Synchronous Mode

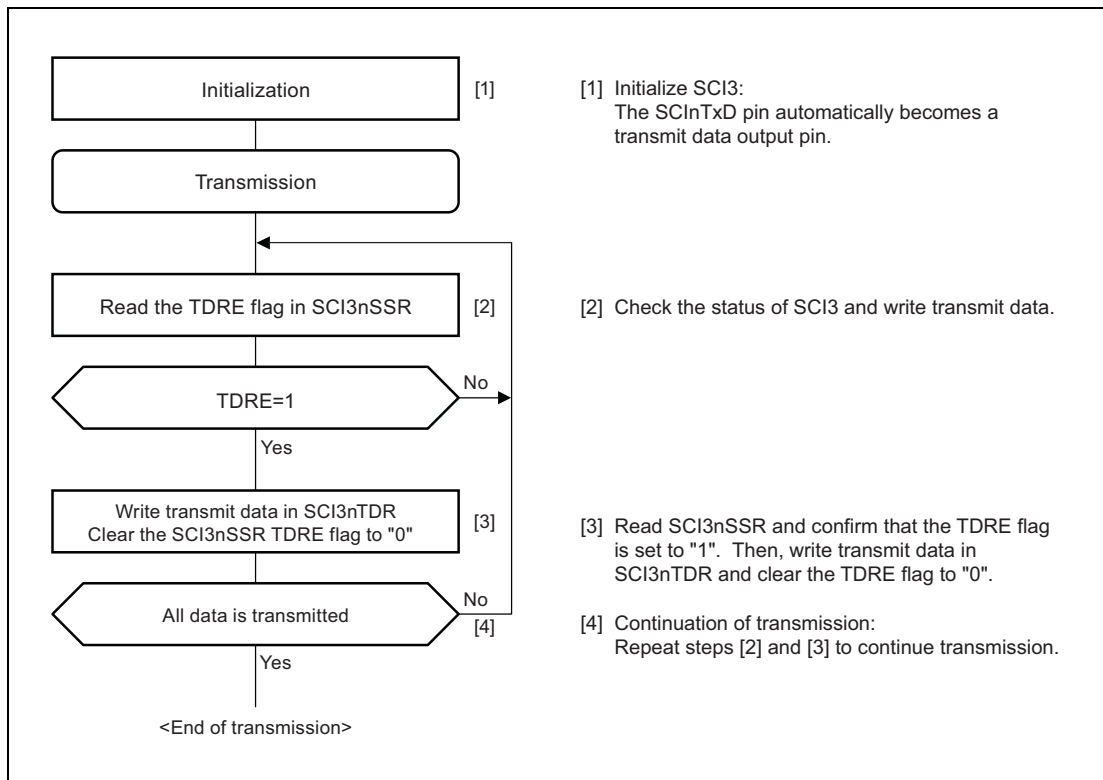

Figure 15.21 Example of Serial Transmission Flowchart

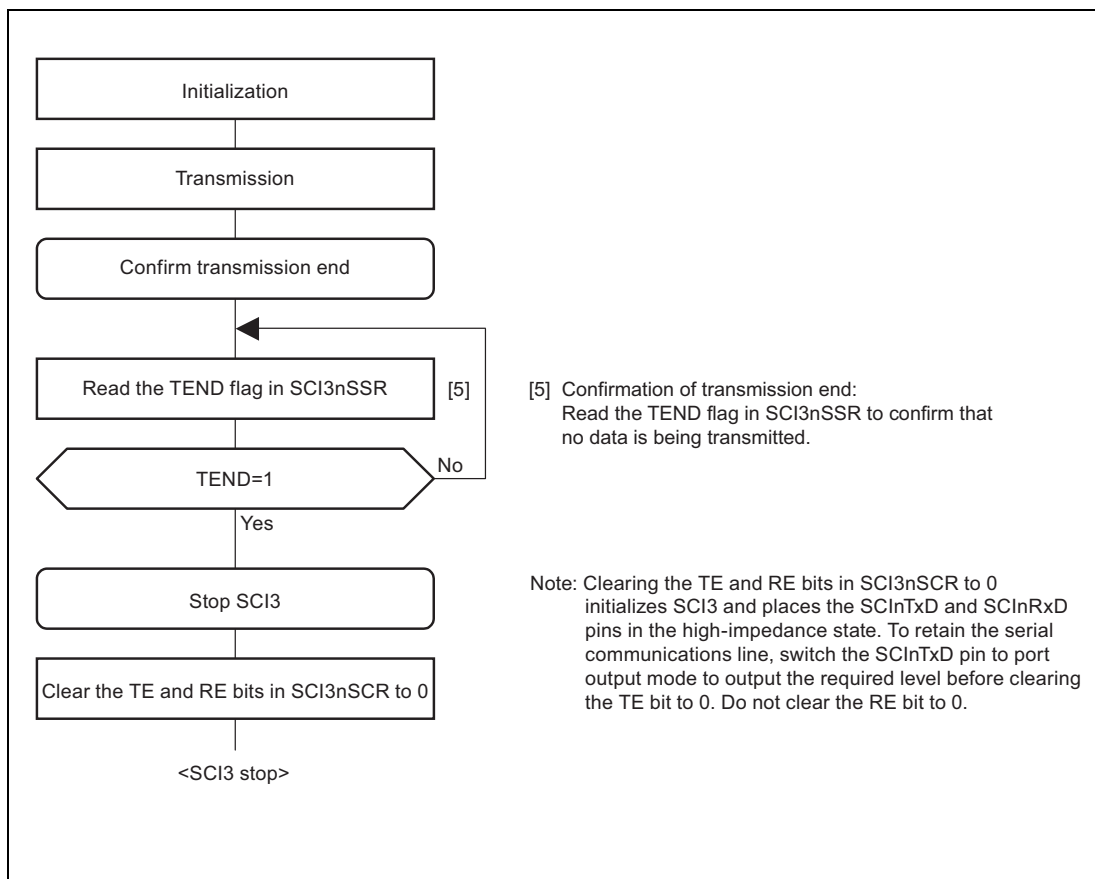

Figure 15.22 Example Flowchart for Stopping the SCI3 after Serial Transmission

15.6.4 Serial Data Reception (Clock Synchronous Mode)

Figure 15.23 shows an example of SCI3 operation for serial reception in clock synchronous mode. In serial data reception, the SCI3 operates as described below.

1. The SCI3 performs internal initialization and starts receiving data in synchronization with a synchronization clock input or output, and stores receive data in SCI3nRSR.
2. When an overrun error occurs (the reception of the next data is completed with the RDRF flag in SCI3nSSR set to 1), the ORER flag in SCI3nSSR is set to 1. If the RIE bit in SCI3nSCR is set to 1 at this time, an INTSCI3nERI interrupt request is generated. Receive data is not transferred to SCI3nRDR. The RDRF flag retains the state of being set to 1.
3. When data has been successfully received, the RDRF flag in SCI3nSSR is set to 1 and the receive data is transferred to SCI3nRDR. When the RIE bit in SCI3nSCR is set to 1 at this time, an INTSCI3nRXI interrupt request is generated. Continuous reception is enabled by reading the receive data transferred to SCI3nRDR in this INTSCI3nRXI interrupt processing routine before reception of the next data is completed. Reading SCI3nRDR automatically clears the RDRF flag to 0.

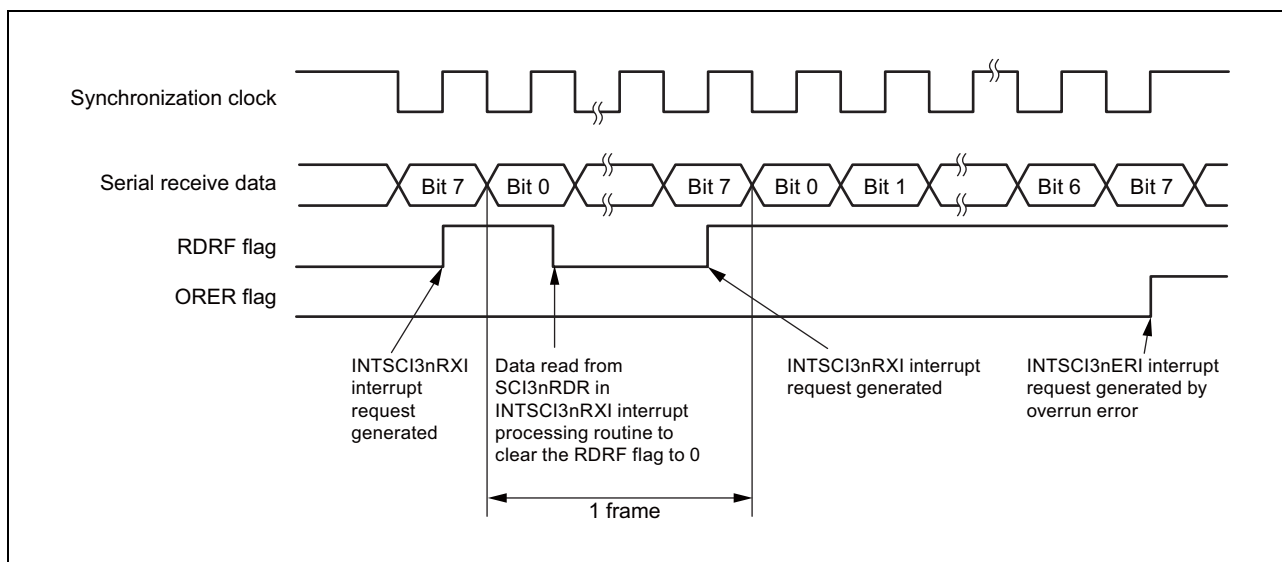

Figure 15.23 Example of SCI3 Operation for Reception

Subsequent transmission and reception are disabled with a receive error flag set to 1. Therefore, be sure to clear the ORER, FER, PER, and RDRF flags to 0 before continuing reception. **Figure 15.24** shows an example of flowchart for data reception.

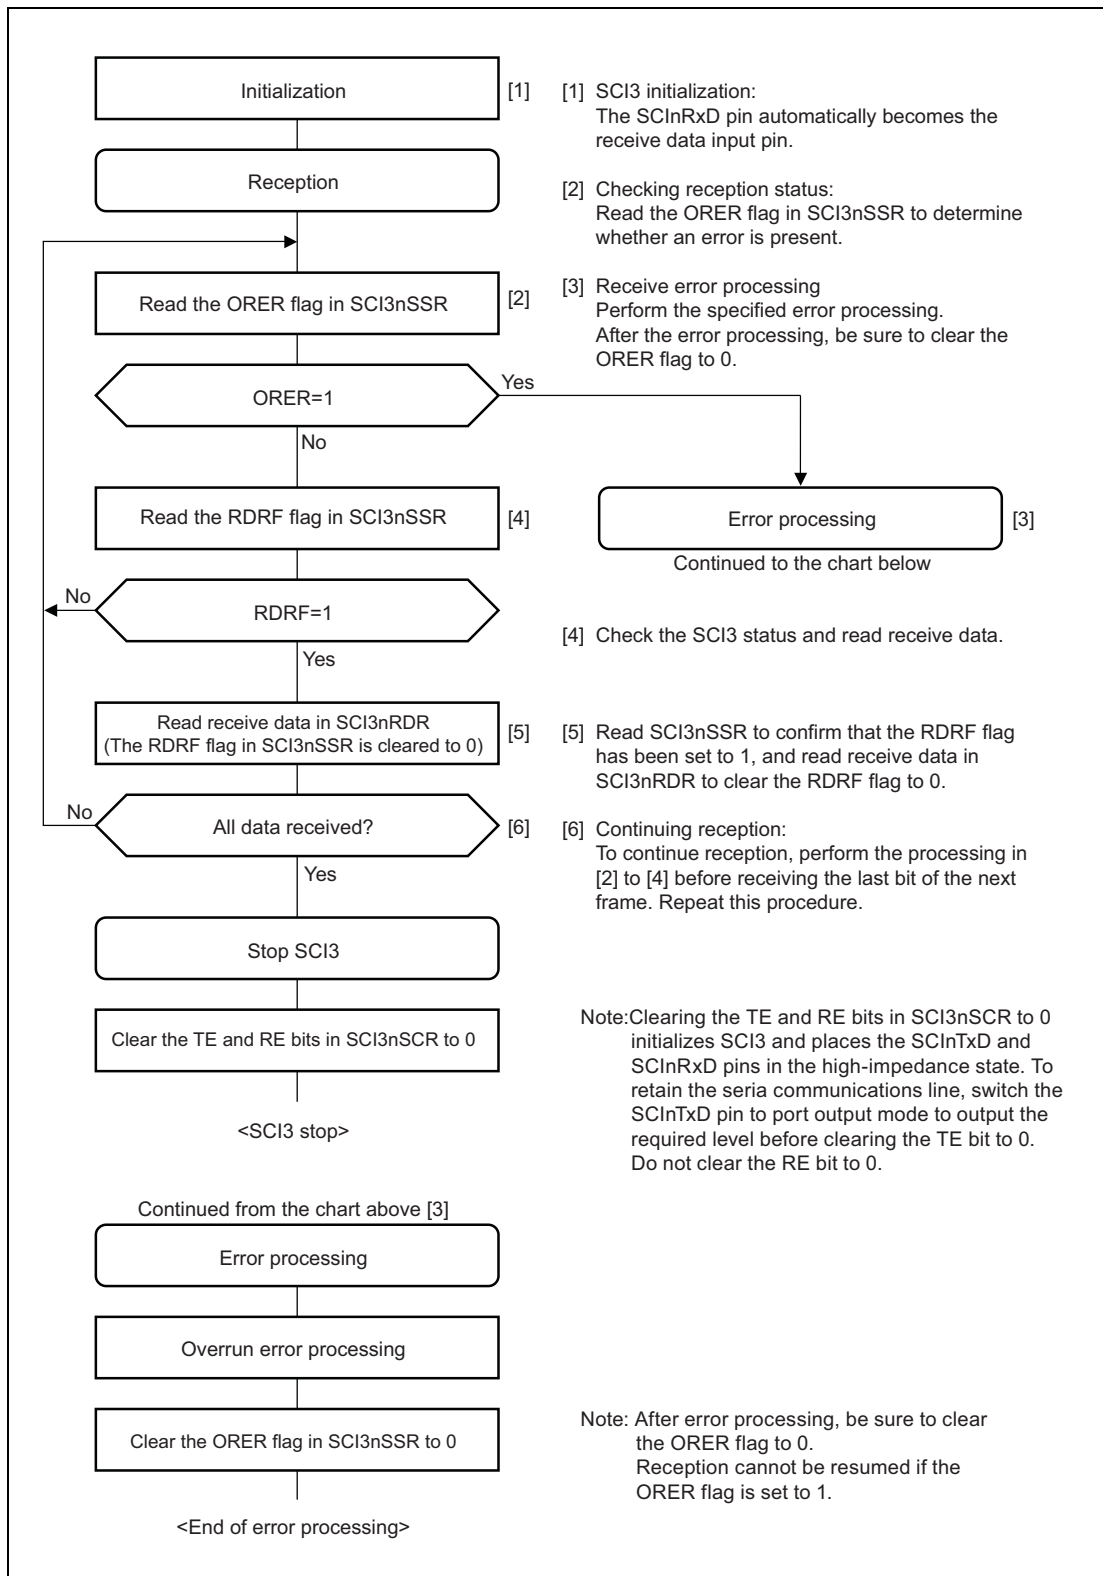

Figure 15.24 Example of Serial Reception Flowchart

15.6.5 Simultaneous Serial Data Transmission and Reception (Clock Synchronous Mode)

Figure 15.25 shows a sample flowchart for simultaneous data transmit and receive operations. After the SCI3 is initialized, perform the following procedure for simultaneous data transmit and receive operations.

1. To switch from transmit mode to simultaneous transmit and receive mode, check that the SCI3 has finished transmission and the TDRE and TEND flags are set to 1. Then clear the TE bit to 0 and then set the TE and RE bits to 1 with a single instruction.
2. To switch from receive mode to simultaneous transmit and receive mode, check that the SCI3 has finished reception and clear the RE bit to 0. Then check that the RDRF and error flags (ORER, FER, and PER) are cleared to 0 and then set the TE and RE bits to 1 with a single instruction.

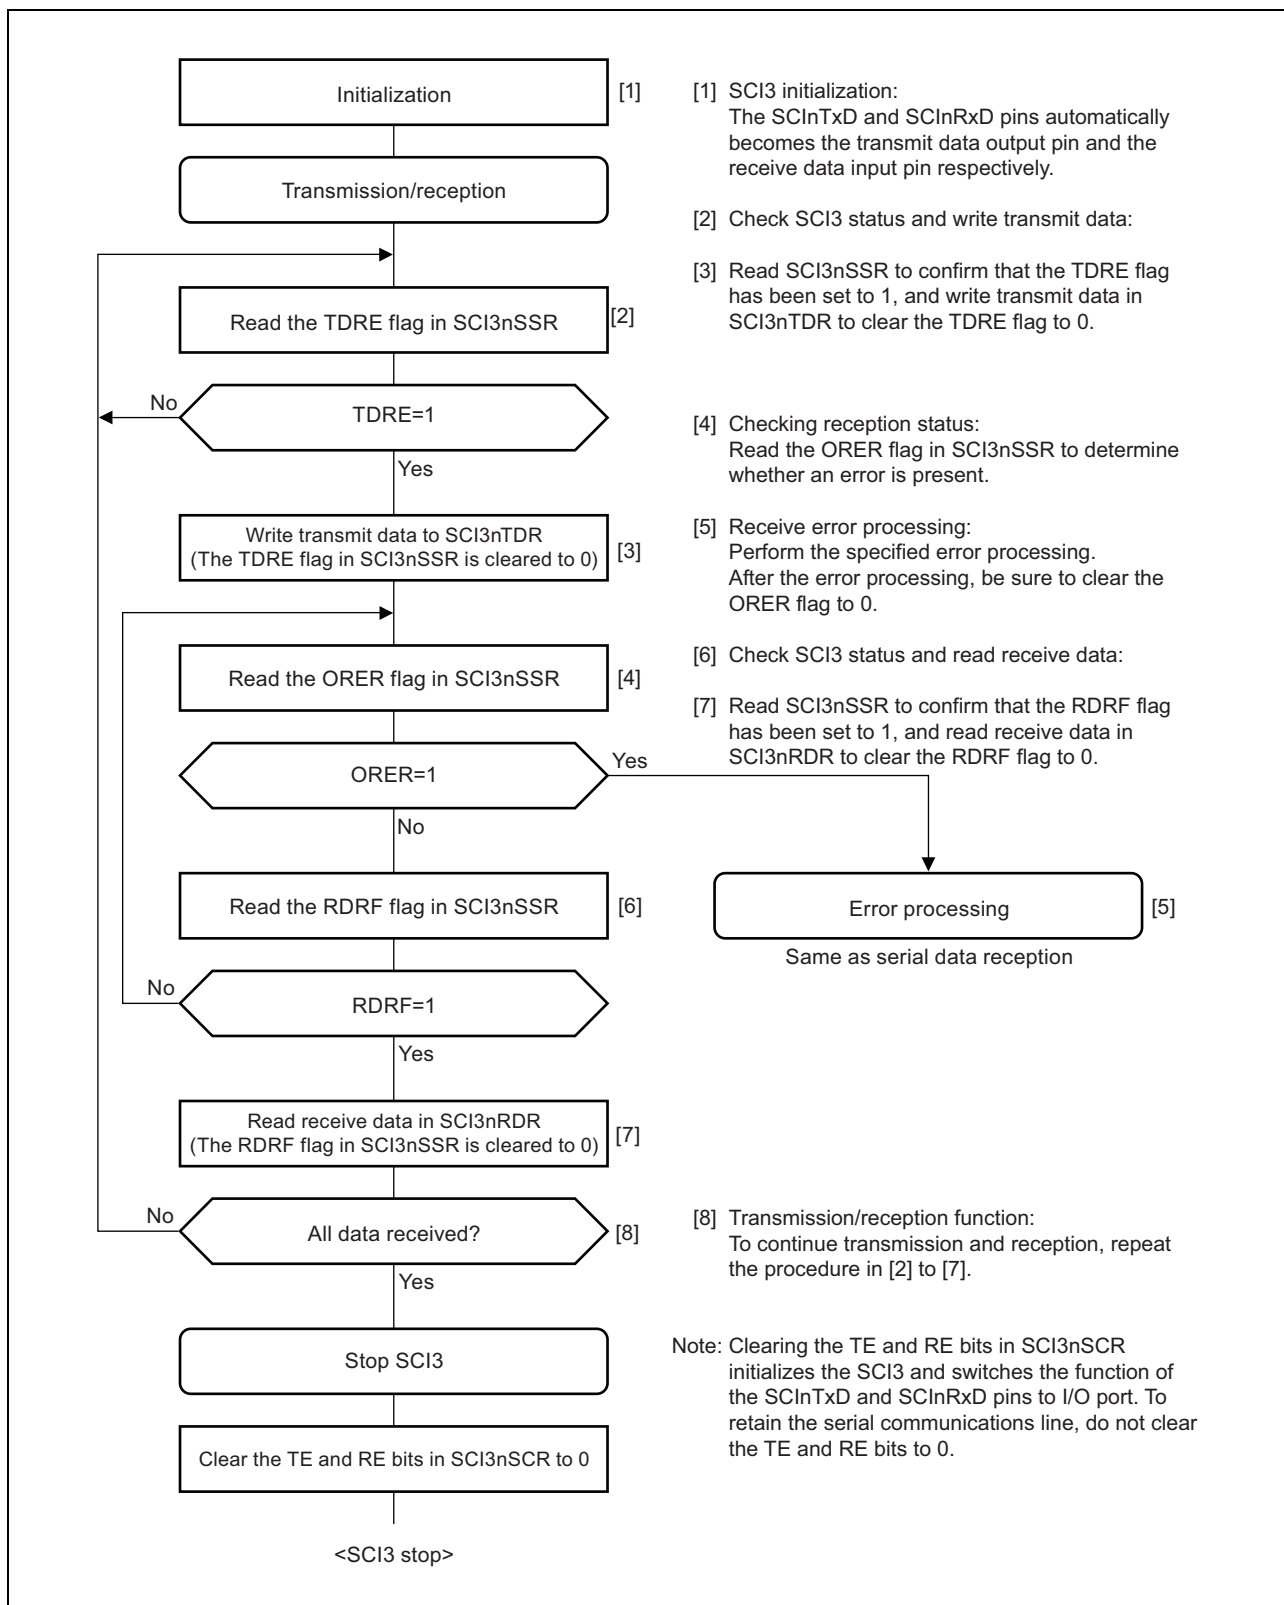

Figure 15.25 Example of Simultaneous Serial Transmission and Reception Flowchart

15.7 Bit Rate Modulation Function

The bit rate modulation function corrects a bit rate by averagely enabling the internal clocks specified by the CKS1 and CKS0 bits in SCI3nSMR for the number specified by SCI3nMDDR out of 256 clocks.

Figure 15.26 shows an example of asynchronous mode in which PCLK clock is selected with the CKS1 and CKS0 bits, SCI3nBRR is set to 0, and SCI3nMDDR is set to 160. In this example, the reference clock cycle is corrected to 256/160 on average and the bit rate is corrected to 160/256. Note that the pulse widths of the internal reference clock expand or contract for the amount of the selected internal clocks because there is a deviation in the enabling of the internal clocks.

Do not use this function with the maximum speed settings (CKS1 and CKS0 bits = 0 in SCI3nSMR, CKE1 bit = 0 in SCI3nSCR, and SCI3nBRR = 0) for clock synchronous mode.

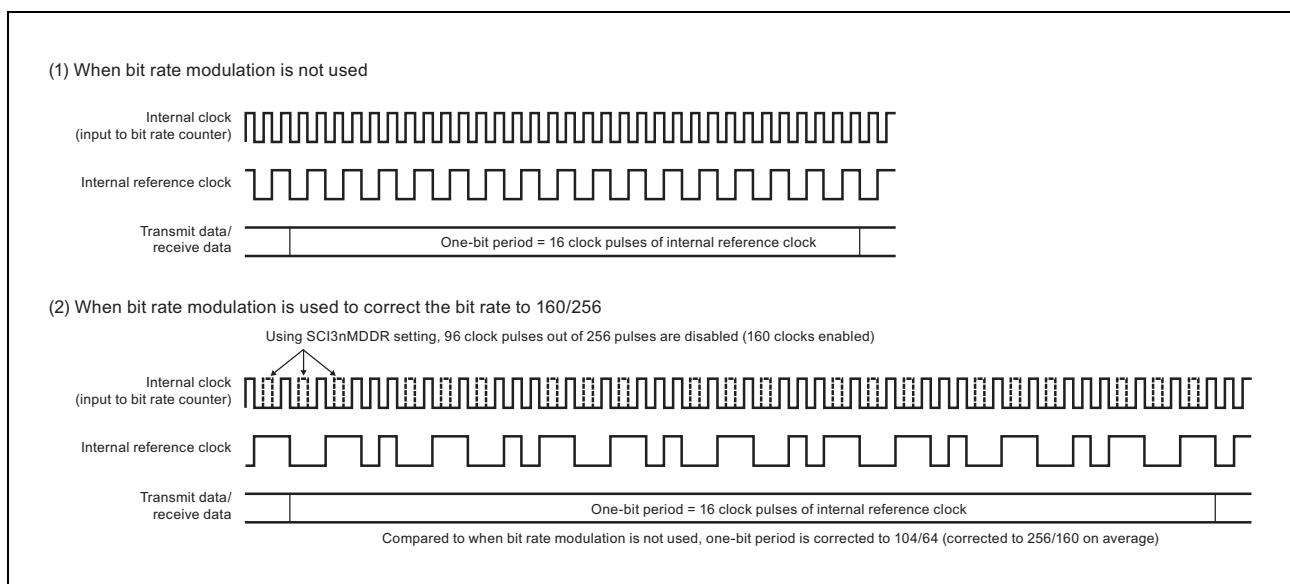

Figure 15.26 Example of Internal Reference Clock when the Bit Rate Modulation Function is Used

15.8 Interrupt Sources

Table 15.25 lists interrupt sources. Each interrupt source outputs an individual interrupt request signal. These interrupt sources can be enabled independently with the enable bit in SCI3nSCR.

A INTSCI3nTXI interrupt request is generated when the TDRE flag in SCI3nSSR is set to 1. A INTSCI3nTEI interrupt request is generated when the TEND flag in SCI3nSSR is set to 1. A INTSCI3nTXI interrupt request can activate the DMAC to handle data transfer. The TDRE flag is automatically cleared to 0 when data is transferred using the DMAC.

CAUTION

The TDRE flag and TEND flag cannot be cleared to 0 when the TE bit in SCI3nSCR is 0. The TEND flag is the level interrupt request flag for the INTSCI3nTEI interrupt. Therefore, when the TE bit is 0, do not set the TEIE bit in SCI3nSCR to 1.

An INTSCI3nRXI interrupt request is generated when the RDRF flag in SCI3nSSR is set to 1. An INTSCI3nERI interrupt is generated when any of the ORER, PER, and FER flags in SCI3nSSR is set to 1. An INTSCI3nRXI interrupt request can activate the DMAC to handle data transfer. The RDRF flag is automatically cleared to 0 when data is transferred using the DMAC.

A INTSCI3nTEI interrupt request is generated when the TEND flag is set to 1 with the TEIE bit set to 1.

CAUTION

If a INTSCI3nTEI interrupt request and a INTSCI3nTXI interrupt request are generated at the same time, the INTSCI3nTXI interrupt request is accepted first. Note that clearing the TDRE flag to 0 at this time in the INTSCI3nTXI interrupt processing routine also clears the TEND flag to 0 automatically, disabling the branch to the INTSCI3nTEI interrupt processing routine.

Table 15.25 SCI3 Interrupt Sources

| Name | Interrupt Source | Interrupt Flag | DMAC Activation | DTS Activation |
|-------------|---------------------|----------------|-----------------|----------------|
| INTSCI3nERI | Receive error | ORER, FER, PER | Not possible | Not possible |
| INTSCI3nRXI | Receive data full | RDRF | Possible | Possible |
| INTSCI3nTXI | Transmit data empty | TDRE | Possible | Possible |
| INTSCI3nTEI | Transmit end | TEND | Not possible | Not possible |

15.9 Usage Notes

15.9.1 Break Detection and Processing

A break can be detected by reading the RXDMON bit in SCI3nSEMR when detecting a framing error. Since all inputs from the SCInRxD pin are 0 in the break state, the FER flag is set to 1 and the PER flag may also be set to 1. The SCI3 continues data reception even after it receives a break. For this reason, note that the FER flag is set to 1 again even after the FER flag is cleared to 0.

15.9.2 Mark State and Break Output

While the TE bit is 0 (transmission/reception disabled), the SCInTxD pin can output any level by switching the SCInTxD pin to a general output port. This allows the SCInTxD pin to enter the mark state or to output a break during data transmission. When the TE bit is cleared to 0, the transmitter unit is initialized regardless of the current transmission state.

15.9.3 Receive Error Flags and Transmit Operations in Clock Synchronous Mode

During the clock synchronous simultaneous data transmit/receive operation, transmission cannot be started when a receive error flag (ORER) is set to 1, even if the TDRE flag is cleared to 0. Be sure to clear the receive error flags to 0 before starting transmission. Note that the receive error flags cannot be cleared to 0 even by clearing the RE bit to 0.

15.9.4 Relationship between Writing to SCI3nTDR and the TDRE Flag

The TDRE flag in SCI3nSSR is a status flag indicating that transmit data in SCI3nTDR has been transferred to SCI3nTSR. The TDRE flag is set to 1 when the SCI3 transfers data from SCI3nTDR to SCI3nTSR.

Data can be written to SCI3nTDR regardless of the status of the TDRE flag. However, writing new data to SCI3nTDR while the TDRE flag is 0 will cause the data stored in SCI3nTDR to be lost because it has not been transferred to SCI3nTSR. Therefore, make sure to check that the TDRE flag is set to 1 before writing transmit data to SCI3nTDR.

15.9.5 Restrictions on Using an External Clock for Transmission in Clock Synchronous Mode

When using an external synchronization clock, clear the TDRE flag to 0 and then input a transmission clock (See **Figure 15.27**). Also in continuous transmission mode, clear the TDRE flag to 0 and then input a transmission clock for the next frame.

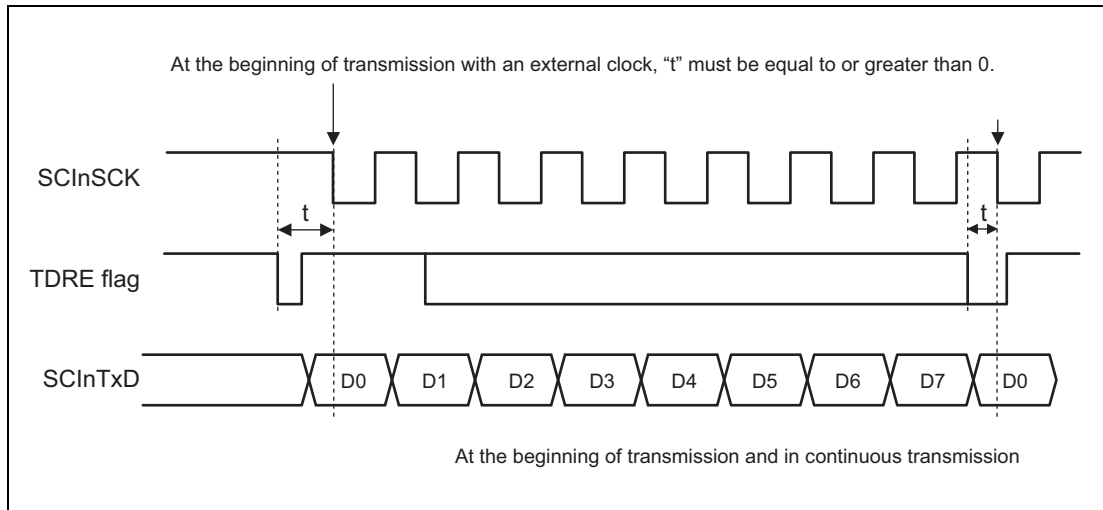

Figure 15.27 Restrictions on Using an External Clock for Transmission in Clock Synchronous Mode

15.9.6 External Clock Input in Clock Synchronous Mode

For the external clock SCInSCK input in clock synchronous mode, see **Section 37.9.7, SCI3 Timing**.

Section 16 LIN/UART Interface (RLIN3)

This section contains a generic description of the LIN/UART interface (RLIN3).

The first part of this section describes all RH850/P1M-E specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of RLIN3.

16.1 Features of RH850/P1M-E RLIN3

16.1.1 Number of Units and Channels

This microcontroller has the following number of RLIN3 units.

Each RLIN3 unit has a single channel interface. "Number of channels" therefore has the same meaning as "number of units" in this section.

Table 16.1 Number of Units

| Product Name | RH850/P1M-E 100 pins | RH850/P1M-E 144 pins |
|-----------------|-------------------------|-------------------------|
| Number of units | 2 | 2 |
| Name | RLIN3n (n = 0, 1) | RLIN3n (n = 0, 1) |

Table 16.2 Unit Configurations and Channels

| Unit Name (Channel Name) | Channels per Unit | RH850/P1M-E 100 pins (2 ch) | RH850/P1M-E 144 pins (2 ch) |
|-----------------------------|----------------------|-----------------------------------|-----------------------------------|
| RLIN30 | 1 | √ | √ |
| RLIN31 | 1 | √ | √ |

Note: The channel names are same as those of the corresponding units.

Table 16.3 Index

| Index | Description |
|-------|---|
| n | Throughout this section, the individual RLIN3 units are identified by the index "n" (n = 0): for example, RLIN3nLCUC is the LIN control register. |
| b | Throughout this section, the individual transmit/receive data buffers of RLIN3n are identified by the index "b" (b = 1 to 8): for example, RLIN3nLDBR1 is the first stage data buffer register. |

The following lists the index corresponding to each product.

Table 16.4 Index Correspondence of Each Product

| Index Corresponding to Product |
|--------------------------------|
| All products |
| b = 1 to 8 |

16.1.2 Register Base Address

RLIN3 base addresses are listed in the following table.

RLIN3 register addresses are given as offsets from the base addresses in general.

Table 16.5 Register Base Addresses

| Base Address Name | Base Address |
|-------------------|------------------------|
| <RLIN30_base> | FFDF 8000 _H |
| <RLIN31_base> | FFDF 9000 _H |

16.1.3 Clock Supply

The RLIN3 clock supply is shown in the following table.

Table 16.6 Clock Supply

| Unit Name | Unit Clock Name | Supply Clock Name |
|-----------|---------------------------------|-------------------------------------|
| RLIN3n | LIN communication clock sources | High-speed peripheral clock CLK_HSB |

16.1.4 Interrupt Request

RLIN3 interrupt requests are listed in the following table.

Table 16.7 Interrupt Requests

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number |
|-----------------------|-------------------------------------|------------------|--------------------|
| RLIN30 | | | |
| INTRLIN3nUR2 (n = 0) | RLIN30 status interrupt | 114 | — |
| INTRLIN3nUR1 (n = 0) | RLIN30 receive completion interrupt | 115 | 95 |
| INTRLIN3nUR0 (n = 0) | RLIN30 transmit interrupt | 116 | 96 |
| RLIN31 | | | |
| INTRLIN3nUR2 (n = 1) | RLIN31 status interrupt | 117 | — |
| INTRLIN3nUR1 (n = 1) | RLIN31 receive completion interrupt | 118 | 97 |
| INTRLIN3nUR0 (n = 1) | RLIN31 transmit interrupt | 119 | 98 |

16.1.5 Reset Sources

Please refer to **Section 8, Reset Controller**.

16.1.6 External Input/output Signals

External input/output signals of RLIN3 are listed below.

Table 16.8 External Input/Output Signals

| Unit Signal Name | I/O | Description | Alternative Port Pin Signal Name |
|------------------|-----|-----------------------------|----------------------------------|
| RLIN30 | | | |
| RLIN3nRX (n = 0) | I | RLIN30 receive data input | RLIN30RX |
| RLIN3nTX (n = 0) | O | RLIN30 transmit data output | RLIN30TX |
| RLIN31 | | | |
| RLIN3nRX (n = 1) | I | RLIN31 receive data input | RLIN31RX |
| RLIN3nTX (n = 1) | O | RLIN31 transmit data output | RLIN31TX |

16.1.7 Combination of Pin Name and Port Name

Combinations of RLIN3 pins and ports are listed in the following table.

Table 16.9 Combination of Pins and Ports

| Function | Pin Name | Port Name | | | | | |
|----------|----------|--------------------|---------|---------------------|---------------------|---------------------|---------|
| | | Group 1 | Group 2 | Group 3 | Group 4 | Group 5 | Group 6 |
| RLIN30 | RLIN30RX | P1_1 | P3_4 | P4_0 | P5_10 | P5_14 | P5_14 |
| | RLIN30TX | P1_0 ^{*1} | P3_5 | P4_1 | P5_11 ^{*1} | P5_15 ^{*1} | P0_0 |
| RLIN31 | RLIN31RX | P2_5 | P0_1 | P5_15 ^{*1} | P5_12 ^{*1} | — | — |
| | RLIN31TX | P2_4 | P3_11 | P3_11 | P5_13 ^{*1} | — | — |

Note 1. Usable in the 144-pin product

16.2 Overview

16.2.1 Functional Overview

The LIN/UART interface is a hardware LIN communication controller that supports LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, and SAE J2602, and automatically performs frame communication and error determination.

The LIN/UART interface is provided with UART mode and can also be used as a UART.

The appropriate mode should be used for the LIN/UART interface according to the application: LIN master, or UART.

LIN master

- LIN reset mode
- LIN mode (LIN master mode)
 - LIN wake-up mode
 - LIN operation mode
- LIN self-test mode

UART

- LIN reset mode
- UART mode

Table 16.10 gives the LIN/UART interface specifications.

Table 16.10 LIN/UART Interface Specifications (1/2)

| Item | Specifications | |
|----------------------------|------------------------------------|--|
| Number of Channel | 2 channels | |
| LIN communication function | Protocol | LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, and SAE J2602 |
| | Variable frame structure | Master <ul style="list-style-type: none"> • Break transmission width: 13 to 28 Tbits • Break delimiter transmission width: 1 to 4 Tbits • Transmission inter-byte space width (header): 0 to 7 Tbits (space between Sync field and ID field)*¹ • Transmission response space width: 0 to 7 Tbits*¹ • Transmission inter-byte space width: 0 to 3 Tbits (space between data bytes in response area) • Transmission wake-up width: 1 to 16 Tbits |
| | Checksum | <ul style="list-style-type: none"> • Automatic operation for both transmission and reception • Classic or enhanced selectable (for each frame) |
| | Response field data byte count | Variable from 0 to 8 bytes Multi-byte (9 or more bytes) response transmission and reception also possible |
| | Frame communication mode | Master <ul style="list-style-type: none"> • Mode in which header transmission and response transmission/reception are started with a single transmission start request • Mode in which header transmission and response transmission are started with separate transmission start requests (frame separate mode) |
| | Wake-up transmission and reception | LIN wake-up mode provided <ul style="list-style-type: none"> • Wake-up transmission (1 to 16 Tbits) • Wake-up reception Low-level width of input signals measured |
| | Status | Master <ul style="list-style-type: none"> • Frame/wake-up transmission complete • Header transmission complete • Frame/wake-up reception complete*² • Data 1 reception complete • Error detection • Operation mode (LIN reset mode, LIN wake-up mode, LIN operation mode, LIN self-test mode) |
| | Error status | Master <ul style="list-style-type: none"> • Bit error • Checksum error • Frame timeout error/response timeout error • Physical bus error • Framing error • Response preparation error |
| | Baud rate selection | Baud rate conforming to the LIN specifications generated using baud rate generator |
| | Test mode | Self-test mode for user evaluation |
| | Interrupt function | Master <ul style="list-style-type: none"> • Header/frame/wake-up transmission complete • Frame/wake-up reception complete*² • Error detection |

Table 16.10 LIN/UART Interface Specifications (2/2)

| Item | Specifications |
|--|---|
| UART communication function | Data buffer <ul style="list-style-type: none"> • Transmission data buffer/transmission data buffer for wait (exclusively for transmission; data length of 1. Character length of 7, 8, and 9 bits supported) • UART buffer (exclusively for transmission; variable data length from 1 to 9 bits. Character length of 7 and 8 bits supported) • Reception data buffer (exclusively for reception; data length of 1. Character length of 7, 8, and 9 bits supported) |
| | Data format <hr/> Character length: 7 or 8 bits Length of 9 bits supported by using the expansion bit. <hr/> Transmission stop bit: 1 or 2 bits <hr/> Parity function: odd, even, 0, or none <hr/> LSB- or MSB-first transfer selectable <hr/> Reverse input/output of transmission/reception data possible |
| | Status <ul style="list-style-type: none"> • Transmission status • Reception status • Successful UART buffer transmission • Error detection • Expansion bit detection • ID match • Reset mode status |
| | Error status <ul style="list-style-type: none"> • Bit error • Framing error • Parity error • Overrun error |
| | Baud rate selection <hr/> With the built-in baud rate generator, any baud rate can be set. <hr/> When a certain expansion bit is at the expected level, the data received can be compared to the 8-bit data preset in the register. <hr/> The stop bit received is guaranteed (start of transmission can be delayed when start of transmission is attempted during reception of the stop bit). |
| Interrupt function <ul style="list-style-type: none"> • Transmission start/complete • Reception complete • Status/error detection | |

Note 1. Since the same register is used for setting, the inter-byte space (header) = response space.

Note 2. For wake-up reception, the input signal low-level width count is indicated.

16.2.2 Block Diagram

Figure 16.1 shows a block diagram of the LIN/UART interface.

Figure 16.1 LIN/UART Interface Block Diagram

16.2.3 Description of Blocks

- RLIN3nTX, RLIN3nRX: LIN/UART interface I/O pins
- LINn baud rate generator: Generates the LIN/UART interface communication clock
- LINn registers: LIN/UART interface registers
- LINn interrupt control circuit: Controls interrupt requests generated by the LIN/UART interface

16.3 Registers

16.3.1 List of Registers

RLIN3 registers are listed in the following table.

For <RLIN3n_base>, see **Section 16.1.2, Register Base Address**.

Table 16.11 Registers

| Module | Register | Symbol | Address | LIN Master | UART |
|--------|---|--------------|---------------------------------|------------|------|
| RLIN3n | LIN wake-up baud rate selector register | RLN3nLWBR | <RLIN3n_base> + 01 _H | √ | √ |
| RLIN3n | LIN / UART baud rate prescaler 01 register | RLN3nLBRP01 | <RLIN3n_base> + 02 _H | — | √ |
| RLIN3n | LIN / UART baud rate prescaler 0 register | RLN3nLBRP0 | <RLIN3n_base> + 02 _H | √ | √ |
| RLIN3n | LIN / UART baud rate prescaler 1 register | RLN3nLBRP1 | <RLIN3n_base> + 03 _H | √ | √ |
| RLIN3n | LIN self-test control register | RLN3nLSTC | <RLIN3n_base> + 04 _H | √ | — |
| RLIN3n | LIN / UART mode register | RLN3nLMD | <RLIN3n_base> + 08 _H | √ | √ |
| RLIN3n | LIN break field configuration register/ UART configuration register | RLN3nLBFC | <RLIN3n_base> + 09 _H | √ | √ |
| RLIN3n | LIN / UART space configuration register | RLN3nLSC | <RLIN3n_base> + 0A _H | √ | √ |
| RLIN3n | LIN wake-up configuration register | RLN3nLWUP | <RLIN3n_base> + 0B _H | √ | — |
| RLIN3n | LIN interrupt enable register | RLN3nLIE | <RLIN3n_base> + 0C _H | √ | — |
| RLIN3n | LIN / UART error detection enable register | RLN3nLEDE | <RLIN3n_base> + 0D _H | √ | √ |
| RLIN3n | LIN / UART control register | RLN3nLCUC | <RLIN3n_base> + 0E _H | √ | √ |
| RLIN3n | LIN / UART transmission control register | RLN3nLTRC | <RLIN3n_base> + 10 _H | √ | √ |
| RLIN3n | LIN / UART mode status register | RLN3nLMST | <RLIN3n_base> + 11 _H | √ | √ |
| RLIN3n | LIN / UART status register | RLN3nLST | <RLIN3n_base> + 12 _H | √ | √ |
| RLIN3n | LIN / UART error status register | RLN3nLEST | <RLIN3n_base> + 13 _H | √ | √ |
| RLIN3n | LIN data field configuration register | RLN3nLDFC | <RLIN3n_base> + 14 _H | √ | √ |
| RLIN3n | LIN / UART ID buffer register | RLN3nLIDB | <RLIN3n_base> + 15 _H | √ | √ |
| RLIN3n | LIN checksum buffer register | RLN3nLCBR | <RLIN3n_base> + 16 _H | √ | — |
| RLIN3n | UART data buffer 0 register | RLN3nLUDB0 | <RLIN3n_base> + 17 _H | — | √ |
| RLIN3n | LIN / UART data buffer 1 register | RLN3nLDBR1 | <RLIN3n_base> + 18 _H | √ | √ |
| RLIN3n | LIN / UART data buffer 2 register | RLN3nLDBR2 | <RLIN3n_base> + 19 _H | √ | √ |
| RLIN3n | LIN / UART data buffer 3 register | RLN3nLDBR3 | <RLIN3n_base> + 1A _H | √ | √ |
| RLIN3n | LIN / UART data buffer 4 register | RLN3nLDBR4 | <RLIN3n_base> + 1B _H | √ | √ |
| RLIN3n | LIN / UART data buffer 5 register | RLN3nLDBR5 | <RLIN3n_base> + 1C _H | √ | √ |
| RLIN3n | LIN / UART data buffer 6 register | RLN3nLDBR6 | <RLIN3n_base> + 1D _H | √ | √ |
| RLIN3n | LIN / UART data buffer 7 register | RLN3nLDBR7 | <RLIN3n_base> + 1E _H | √ | √ |
| RLIN3n | LIN / UART data buffer 8 register | RLN3nLDBR8 | <RLIN3n_base> + 1F _H | √ | √ |
| RLIN3n | UART operation enable register | RLN3nLUOER | <RLIN3n_base> + 20 _H | — | √ |
| RLIN3n | UART option register 1 | RLN3nLUOR1 | <RLIN3n_base> + 21 _H | — | √ |
| RLIN3n | UART transmission data register | RLN3nLUTDR | <RLIN3n_base> + 24 _H | — | √ |
| RLIN3n | UART transmission data register L | RLN3nLUTDRL | <RLIN3n_base> + 24 _H | — | √ |
| RLIN3n | UART transmission data register H | RLN3nLUTDRH | <RLIN3n_base> + 25 _H | — | √ |
| RLIN3n | UART reception data register | RLN3nLURDR | <RLIN3n_base> + 26 _H | — | √ |
| RLIN3n | UART reception data register L | RLN3nLURDRL | <RLIN3n_base> + 26 _H | — | √ |
| RLIN3n | UART reception data register H | RLN3nLURDRH | <RLIN3n_base> + 27 _H | — | √ |
| RLIN3n | UART wait transmission data register | RLN3nLUWTDR | <RLIN3n_base> + 28 _H | — | √ |
| RLIN3n | UART wait transmission data register L | RLN3nLUWTDRL | <RLIN3n_base> + 28 _H | — | √ |
| RLIN3n | UART wait transmission data register H | RLN3nLUWTDRH | <RLIN3n_base> + 29 _H | — | √ |

Note: √: Used, —: Not used
When writing to an unused register, write the value after reset.

16.3.2 LIN Master Related Registers

16.3.2.1 RLN3nLWBR — LIN Wake-Up Baud Rate Select Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 01_H

Value after reset: 00_H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|-----------|-----|-----|-----|-----------|-----|-----|-------|
| | NSPB[3:0] | | | | LPRS[2:0] | | | LWBR0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 16.12 RLN3nLWBR Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|--|
| 7 to 4 | NSPB[3:0] | Bit Sampling Count Select b_7 b_4 0 0 0 0: 16 sampling 1 1 1 1: 16 sampling Settings other than the above are prohibited. |
| 3 to 1 | LPRS[2:0] | Prescaler Clock Select b_3 b_1 0 0 0: 1/1 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/8 1 0 0: 1/16 1 0 1: 1/32 1 1 0: 1/64 1 1 1: 1/128 |
| 0 | LWBR0 | Wake-up Baud Rate Select 0: In LIN wake-up mode, the clock specified in the LCKS bit of the RLN3nLMD register is used. (LIN1.3) 1: In LIN wake-up mode, the clock f_a is used regardless of the setting in the LCKS bit of the RLN3nLMD register. (LIN2.x) |

Set the RLN3nLWBR register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

NSPB[3:0] Bits (Bit Sampling Count Select)

These bits select the number of sampling in one Tbit (reciprocal of the baud rate).

In LIN master mode (LIN/UART mode select bits in LIN mode register = 00_B), set these bits to 0000_B or 1111_B (16 sampling).

LPRS[2:0] Bits (Prescaler Clock Select)

These bits select the frequency division ratio for the prescaler.

The LIN communication clock source is divided by this prescaler.

LWBR0 Bit (Wake-up Baud Rate Select)

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN3nLWBR register to 0. This allows an input signal with a low-level width of 2.5 Tbits or more to be measured.

When LIN Specification Package Revision 2.x is used, set the LWBR0 bit to 1. Setting the LWBR0 bit to 1 selects f_a as the LIN system clock (f_{LIN}) during LIN wake-up mode regardless of the setting of the RLN3nLMD.LCKS bit (the LCKS bit is not changed). This allows an input signal with a low-level width of 2.5 Tbits or more to be measured.

Setting the baud rate to 19200 bps while f_a is selected allows an input signal with a low-level width of 130 μ s or longer to be detected during LIN wake-up mode regardless of the setting of the RLN3nLMD.LCKS bit.

16.3.2.2 RLN3nLBRP0 — LIN Baud Rate Prescaler 0 Register

Access: This register can be read/written in 8-bit units

Address: <RLN3n_base> + 02_H

Value after reset: 00_H

| | | | | | | | | |
|-------------------|------------|-----|-----|-----|-----|-----|-----|-----|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | LBRP0[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 16.13 RLN3nLBRP0 Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------|---|
| 7 to 0 | LBRP0[7:0] | Assuming that the value set in this register is N (0 to 255), the baud rate prescaler divides the frequency of the prescaler clock by N + 1. Setting range: 00 _H to FF _H |

Set the RLN3nLBRP0 register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

The value set in this register is used to control the frequency of baud rate clock sources f_a , f_b , and f_c .

Assuming that the value set in this register is N, baud rate prescaler 0 divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) by N + 1.

The RLN3nLBRP0 and RLN3nLBRP1 registers are accessible in a 16-bit unit as RLN3nLBRP01.

16.3.2.3 RLN3nLBRP1 — LIN Baud Rate Prescaler 1 Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 03_H

Value after reset: 00_H

| | | | | | | | | |
|-------------------|------------|-----|-----|-----|-----|-----|-----|-----|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | LBRP1[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 16.14 RLN3nLBRP1 Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------|---|
| 7 to 0 | LBRP1[7:0] | Assuming that the value set in this register is M (0 to 255), the baud rate prescaler divides the frequency of the prescaler clock by M + 1. Setting range: 00 _H to FF _H |

Set the RLN3nLBRP1 register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

The value set in this register is used to control the frequency of baud rate clock source fd.

Assuming that the value set in this register is M, baud rate prescaler 1 divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) by M+1.

The RLN3nLBRP0 and RLN3nLBRP1 registers are accessible in 16-bit units as RLN3nLBRP01.

16.3.2.4 RLN3nLSTC — LIN Self-Test Control Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 04_H

Value after reset: 00_H

| | | | | | | | | |
|-------------------|-----|-----|-----|-----|-----|-----|-----|------|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | LSTM |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 16.15 RLN3nLSTC Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 7 to 0 | — | Writing A7 _H , 58 _H , and 01 _H successively to the RLN3nLSTC register places the module into LIN self-test mode. |
| 0 | LSTM | LIN Self-Test Mode 0: The module is not in LIN self-test mode. 1: The module is in LIN self-test mode. |

The RLN3nLSTC register cancels protection of LIN self-test mode.

Set the RLN3nLSTC register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

Writing A7_H, 58_H, and 01_H successively to the RLN3nLSTC register places the module into LIN self-test mode.

When successive writing is completed and the mode is changed to LIN self-test mode, the LSTM bit is set to 1.

Do not write any other value during successive writing.

For making transition to LIN self-test mode, see **Section 16.9, LIN Self-Test Mode**.

When read, bits 6 to 1 return “000000_B”, and bit 7 returns an undefined value.

LSTM Bit (LIN Self-Test Mode)

When transition to LIN self-test mode is completed, the LSTM bit is set to 1.

For leaving LIN self-test mode, see **Section 16.9, LIN Self-Test Mode**.

Writing 1 to this bit does not affect the value of the RLN3nLSTC register if it is not a part of successive writing of A7_H, 58_H, and 01_H.

16.3.2.5 RLN3nLMD — LIN Mode Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base>+ 08_H

Value after reset: 00_H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|---|---|--------|------|-----------|-----|----------|-----|
| | — | — | LRDNFS | LIOS | LCKS[1:0] | | LMD[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

Table 16.16 RLN3nLMD Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|--|
| 7, 6 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 5 | LRDNFS | LIN Reception Data Noise Filter Disable 0: The noise filter is enabled. 1: The noise filter is disabled. |
| 4 | LIOS | LIN Interrupt Output Select 0: No RLIN3n interrupt is used. 1: RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n status interrupt are used. |
| 3, 2 | LCKS[1:0] | LIN System Clock Select b3 b2 0 0: fa (Clock generated by baud rate prescaler 0) 0 1: fb (1/2 clock generated by baud rate prescaler 0) 1 0: fc (1/8 clock generated by baud rate prescaler 0) 1 1: fd (1/2 clock generated by baud rate prescaler 1) |
| 1, 0 | LMD[1:0] | LIN/UART Mode Select b1 b0 0 0: LIN master mode |

Set the RLN3nLMD register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode)

LRDNFS Bit (LIN Reception Data Noise Filter Disable)

The LRDNFS bit enables or disables the noise filter when receiving data.

With 0 set, the noise filter is enabled when receiving data.

With 1 set, the noise filter is disabled when receiving data.

LIOS Bit (LIN Interrupt Output Select)

The LIOS bit selects the number of interrupt outputs from the LIN/UART interface.

With 0 set, no RLIN3 interrupt is generated from the LIN/UART interface.

With 1 set, the RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n status interrupt are generated from the LIN/UART interface.

For each interrupt source, see **Section 16.4, Interrupt Sources**.

LCKS[1:0] Bits (LIN System Clock Select)

The LCKS bits select the clock to be input to the protocol controller.

With 00_B set, the protocol controller is provided with fa (clock generated by baud rate prescaler 0).

With 01_B set, the protocol controller is provided with fb (1/2 clock generated by baud rate prescaler 0).

With 10_B set, the protocol controller is provided with fc (1/8 clock generated by baud rate prescaler 0).

With 11_B set, the protocol controller is provided with fd (1/2 clock generated by baud rate prescaler 1).

When 1_B is set in the LWBR0 bit in the RLN3nLWBR register (LIN 2.x is used), and the RLN3nLMST register is 01_H (LIN wake-up mode), the protocol controller is supplied with fa regardless of the setting of this bit (the LCKS bit is not changed).

LMD[1:0] Bits (LIN/UART Mode Select)

The LMD bits select the LIN/UART interface mode.

To use the LIN/UART interface as an LIN master, set these bits to 00_B .

16.3.2.6 RLN3nLBFC — LIN Break Field Configuration Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 09_H

Value after reset: 00_H

| | | | | | | | | |
|-------------------|---|---|----------|-----|----------|-----|-----|-----|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | BDT[1:0] | | BLT[3:0] | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

Table 16.17 RLN3nLBFC Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 7, 6 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 5, 4 | BDT[1:0] | Transmission Break Delimiter (High Level) Width Select b_5 b_4 0 0: 1 Tbit 0 1: 2 Tbits 1 0: 3 Tbits 1 1: 4 Tbits |
| 3 to 0 | BLT[3:0] | Transmission Break (Low Level) Width Select b_3 b_0 0 0 0 0: 13 Tbits 0 0 0 1: 14 Tbits 0 0 1 0: 15 Tbits : 1 1 1 0: 27 Tbits 1 1 1 1: 28 Tbits |

Set the RLN3nLBFC register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

Some combinations of the set values result in the length of a frame exceeding the timeout time. Set the appropriate values in this register.

BDT[1:0] Bits (Transmission Break Delimiter (High Level) Width Select)

The BDT bits set the break delimiter (high level) width of transmission frame header. 1 Tbit to 4 Tbits can be set.

BLT[3:0] Bits (Transmission Break (Low Level) Width Select)

The BLT bits set the break (low level) width of transmission frame header. 13 Tbits to 28 Tbits can be set.

16.3.2.7 RLN3nLSC — LIN Space Configuration Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base>+ 0A_H

Value after reset: 00_H

| | | | | | | | | |
|-------------------|---|---|----------|-----|---|-----------|-----|-----|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | IBS[1:0] | | — | IBHS[2:0] | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R | R/W | R/W | R/W |

Table 16.18 RLN3nLSC Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|--|
| 7, 6 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 5, 4 | IBS[1:0] | Inter-Byte Space Select b_5 b_4 0 0: 0 Tbit 0 1: 1 Tbit 1 0: 2 Tbits 1 1: 3 Tbits |
| 3 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 2 to 0 | IBHS[2:0] | Inter-Byte Space (Header)/Response Space Select b_2 b_0 0 0 0: 0 Tbit 0 0 1: 1 Tbit 0 1 0: 2 Tbits 0 1 1: 3 Tbits 1 0 0: 4 Tbits 1 0 1: 5 Tbits 1 1 0: 6 Tbits 1 1 1: 7 Tbits |

Set the RLN3nLSC register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

Some combinations of the set values result in the length of a frame or a response exceeding the timeout time. Set the appropriate values in this register.

IBS[1:0] Bits (Inter-Byte Space Select)

The IBS bits set the width of the inter-byte space of the transmission frame response field.

0 Tbit to 3 Tbits can be set.

These bits are enabled only during response transmission; these are disabled during response reception. For transmission from the transmission data buffer (RLN3nLUTDR register) or the transmission data buffer for wait (RLN3nLUWTDR register), the setting of these bits is ineffective. In this case, set these bits to “00_B”.

IBHS[2:0] Bits (Inter-Byte Space (Header)/Response Space Select)

The IBHS bits set the width of the inter-byte space (header) of the transmission frame header field and the response space.

0 Tbit to 7 Tbits can be set.

The response space setting is enabled only during response transmission; setting is disabled during response reception.

The inter-byte space (header) is equal to the response space.

16.3.2.8 RLN3nLWUP — LIN Wake-Up Configuration Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base>+ 0B_H

Value after reset: 00_H

| | | | | | | | | |
|-------------------|-----------|-----|-----|-----|---|---|---|---|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | WUTL[3:0] | | | | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R | R | R | R |

Table 16.19 RLN3nLWUP Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|--|
| 7 to 4 | WUTL[3:0] | Wake-up Transmission Low Level Width Select b7 b4 0 0 0 0: 1 Tbit 0 0 0 1: 2 Tbits 0 0 1 0: 3 Tbits 0 0 1 1: 4 Tbits : 1 1 0 0: 13 Tbits 1 1 0 1: 14 Tbits 1 1 1 0: 15 Tbits 1 1 1 1: 16 Tbits |
| 3 to 0 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |

Set the RLN3nLWUP register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

WUTL[3:0] Bits (Wake-up Transmission Low Level Width Select)

The WUTL bits set the low level width of the wake-up signal transmission. 1 Tbit to 16 Tbits can be set.

With 1 is set in the LWBR0 bit in the RLN3nLWBR register (LIN 2.x is used), fa is selected as the LIN system clock (f_{LIN}) regardless of the setting of the RLN3nLMD.LCKS bit (the LCKS bit is not changed).

16.3.2.9 RLN3nLIE — LIN Interrupt Enable Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 0C_H

Value after reset: 00_H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|---|---|---|---|------|-------|-------|-------|
| | — | — | — | — | SHIE | ERRIE | FRCIE | FTCIE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W |

Table 16.20 RLN3nLIE Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 7 to 4 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 3 | SHIE | Successful Header Transmission Interrupt Enable 0: Disables successful header transmission interrupt. 1: Enables successful header transmission interrupt. |
| 2 | ERRIE | Error Detection Interrupt Enable 0: Disables error detection interrupt. 1: Enables error detection interrupt. |
| 1 | FRCIE | Successful Frame/Wake-up Reception Interrupt Enable 0: Disables successful frame/wake-up reception interrupt. 1: Enables successful frame/wake-up reception interrupt. |
| 0 | FTCIE | Successful Frame/Wake-up Transmission Interrupt Enable 0: Disables successful frame/wake-up transmission interrupt. 1: Enables successful frame/wake-up transmission interrupt. |

Set the RLN3nLIE register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

SHIE Bit (Successful Header Transmission Interrupt Enable)

The SHIE bit enables or disables interrupt request upon successful transmission of a header.

With 0 set, the interrupt request for RLIN3n transmission is not generated when the HTRC flag in the RLN3nLST register is set to 1.

With 1 set, the interrupt request for RLIN3n transmission is generated when the HTRC flag in the RLN3nLST register is set to 1.

ERRIE Bit (Error Detection Interrupt Enable)

The ERRIE bit enables or disables an interrupt request upon detection of an error.

With 0 set, the interrupt request for RLIN3n status is not generated when the ERR flag in the RLN3nLST register is set to 1.

With 1 set, the interrupt request for RLIN3n status is not generated when the ERR flag in the RLN3nLST register is set to 1.

Occurrence factors are bit errors, physical bus errors, frame/response timeout errors, framing errors, checksum errors, and response preparation errors.

Detection of the bit error, physical bus error, frame/response timeout error, and framing error can be enabled or disabled using the RLN3nLEDE register.

FRCIE Bit (Successful Frame/Wake-up Reception Interrupt Enable)

The FRCIE bit enables or disables an interrupt request upon successful reception of a frame or a wake-up signal (input signal low-level width count).

With 0 set, the interrupt request for RLIN3n reception complete is not generated when the FRC flag in the RLN3nLST register is set to 1.

With 1 set, the interrupt request for RLIN3n reception complete is generated when the FRC flag in the RLN3nLST register is set to 1.

FTCIE Bit (Successful Frame/Wake-up Transmission Interrupt Enable)

The FTCIE bit enables or disables an interrupt request upon successful transmission of a frame or a wake-up signal.

With 0 set, the interrupt request for RLIN3n transmission is not generated when the FTC flag in the RLN3nLST register is set to 1.

With 1 set, the interrupt request for RLIN3n transmission is generated when the FTC flag in the RLN3nLST register is set to 1.

16.3.2.10 RLN3nLEDE — LIN Error Detection Enable Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 0D_H

Value after reset: 00_H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|------|---|---|---|------|-------|-------|------|
| | LTES | — | — | — | FERE | FTERE | PBERE | BERE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R/W | R/W | R/W | R/W |

Table 16.21 RLN3nLEDE Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 7 | LTES | Timeout Error Select 0: Frame timeout error 1: Response timeout error |
| 6 to 4 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 3 | FERE | Framing Error Detection Enable 0: Disables framing error detection. 1: Enables framing error detection. |
| 2 | FTERE | Timeout Error Detection Enable 0: Disables frame/response timeout error detection. 1: Enables frame/response timeout error detection. |
| 1 | PBERE | Physical Bus Error Detection Enable 0: Disables physical bus error detection. 1: Enables physical bus error detection. |
| 0 | BERE | Bit Error Detection Enable 0: Disables bit error detection. 1: Enables bit error detection. |

Set the RLN3nLEDE register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

LTES Bit (Timeout Error Select)

The LTES bit selects the timeout function to be used.

With 0 set, the timeout function is used for frame timeout.

With 1 set, the timeout function is used for response timeout.

For details on the timeout error, see **Section 16.7.6, Error Status**.

FERE Bit (Framing Error Detection Enable)

The FERE bit enables or disables detection of the framing error.

With 0 set, the framing error is not detected.

With 1 set, the framing error is detected.

When this bit is set to 1, the detection result is indicated in the FER flag in the RLN3nLEST register.

For details on the framing error, see **Section 16.7.6, Error Status**.

FTERE Bit (Timeout Error Detection Enable)

The FTERE bit enables or disables detection of the frame timeout error or the response timeout error.

With 0 set, the frame timeout error or response timeout error is not detected.

With 1 set, the frame timeout error or response timeout error is detected.

When this bit is set to 1, the detection result is indicated in the FTER flag in the RLIN3nLEST register.

With the LTES bit, either the frame timeout error or response timeout error can be selected.

Do not use the timeout error if response data of 9 bytes or more is to be transmitted or received.

For details on the timeout error, see **Section 16.7.6, Error Status**.

PBERE Bit (Physical Bus Error Detection Enable)

The PBERE bit enables or disables detection of the physical bus error.

With 0 set, the physical bus error is not detected.

With 1 set, the physical bus error is detected.

When this bit is set to 1, the detection result is indicated in the PBER flag in the RLIN3nLEST register.

For details on the physical bus error, see **Section 16.7.6, Error Status**.

BERE Bit (Bit Error Detection Enable)

The BERE bit enables or disables detection of the bit error.

With 0 set, the bit error is not detected.

With 1 set, the bit error is detected.

When this bit is set to 1, the detection result is indicated in the BER flag in the RLIN3nLEST register.

For details on the bit error, see **Section 16.7.6, Error Status**.

16.3.2.11 RLN3nLCUC — LIN Control Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 0E_H

Value after reset: 00_H

| | | | | | | | | |
|-------------------|---|---|---|---|---|---|-----|-----|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | OM1 | OM0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 16.22 RLN3nLCUC Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 7 to 2 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 1 | OM1 | LIN Mode Select 0: LIN wake-up mode 1: LIN operation mode |
| 0 | OM0 | LIN Reset 0: LIN reset mode 1: Release from LIN reset mode |

Set the RLN3nLCUC register to 01_H to cause a transition to LIN wake-up mode after canceling LIN reset mode, and set the register to 03_H to cause a transition to LIN operation mode.

In LIN self-test mode, set the RLN3nLCUC register to 03_H after a transition to LIN self-test mode is completed.

After a value is written to this register, confirm that the value written is actually indicated in the RLN3nLMST register before writing another value.

OM1 Bit (LIN Mode Select)

The OM1 bit selects the specific operation mode (either LIN wake-up mode or LIN operation mode) after canceling LIN reset mode.

Setting this bit to 0 causes a transition to LIN wake-up mode.

Setting it to 1 leads to release from LIN operation mode.

This bit is valid only when the OMM0 bit in the RLN3nLMST register is 1.

Writing a value to this bit is disabled while the FTS bit in the RLN3nLTRC register is 1.

OM0 Bit (LIN Reset)

The OM0 bit selects either causing a transition to LIN reset mode or canceling LIN reset mode.

Setting this bit to 0 causes a transition to LIN reset mode.

Setting it to 1 leads to release from LIN reset mode.

16.3.2.12 RLN3nLTRC — LIN Transmission Control Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 10_H

Value after reset: 00_H

| | | | | | | | | |
|-------------------|---|---|---|---|---|---|-----|-----|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | RTS | FTS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 16.23 RLN3nLTRC Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 7 to 2 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 1 | RTS | Response Transmission/Reception Start 0: Response transmission/reception is stopped in frame separate mode. 1: Response transmission/reception is started in frame separate mode. |
| 0 | FTS | Frame Transmission/Wake-up Transmission /Reception Start 0: Frame Transmission/wake-up transmission/reception is stopped. 1: Frame Transmission/wake-up transmission reception is started. |

RTS Bit (Response Transmission/Reception Start)

Set the RTS bit to 1 in frame separate mode after header transmission is started (FTS bit is 1) and response transmission data is ready. Once set, this bit is automatically cleared to 0 upon completion of frame communication (including error detection) or transition to LIN reset mode.

Only 1 can be written to this bit; 0 cannot be written.

To write 1 to this bit, write 02_H to the RLN3nLTRC register using the store instruction.

Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).

Writing a value to this bit is disabled when the FTS bit is 0 (frame transmission or wake-up transmission/reception is halted).

When response data of 9 bytes or more is to be transmitted or received, set this bit to 1 each time a data group (variable from 0 to 8 bytes) is transmitted or received. Once set, this bit is automatically cleared to 0 at the end of data group communication or transition to LIN reset mode.

FTS Bit (Frame Transmission/Wake-up Transmission/Reception Start)

Set the FTS bit to 1 to start frame transmission.

Also set this bit to 1 to allow wake-up transmission and reception (input signal low-level width count).

Only 1 can be written to this bit; 0 cannot be written.

Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).

This bit is set to 0 upon completion of frame or wake-up communication (including error detection) and transition to LIN reset mode.

16.3.2.13 RLN3nLMST — LIN Mode Status Register

Access: This register can only be read in 8-bit units

Address: <RLIN3n_base> + 11_H

Value after reset: 00_H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|---|---|---|---|---|---|------|------|
| | — | — | — | — | — | — | OMM1 | OMM0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 16.24 RLN3nLMST Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 7 to 2 | Reserved | When read, the value after reset is read. |
| 1 | OMM1 | LIN Mode Status Monitor 0: LIN wake-up mode. 1: LIN operation mode. |
| 0 | OMM0 | LIN Reset Status Monitor 0: LIN reset mode. 1: LIN reset mode. |

OMM1 Bit (LIN Mode Status Monitor)

The OMM1 bit indicates the current operating mode.

OMM0 Bit (LIN Reset Status Monitor)

The OMM0 bit indicates the current operating mode.

16.3.2.14 RLN3nLST — LIN Status Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 12_H

Value after reset: 00_H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|------|------|---|---|-----|---|-----|-----|
| | HTRC | D1RC | — | — | ERR | — | FRC | FTC |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R | R | R | R | R/W | R/W |

Table 16.25 RLN3nLST Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 7 | HTRC | Successful Header Transmission Flag 0: Header transmission has not been completed. 1: Header transmission has been completed. |
| 6 | D1RC | Successful Data 1 Reception Flag 0: Data 1 reception has not been completed. 1: Data 1 reception has been completed. |
| 5, 4 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 3 | ERR | Error Detection Flag 0: No error has been detected. 1: Error has been detected. |
| 2 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 1 | FRC | Frame/Wake-up Reception Complete Flag 0: Frame or wake-up reception has not been completed. 1: Frame or wake-up reception has been completed. |
| 0 | FTC | Frame/Wake-up Transmission Complete Flag 0: Frame or wake-up transmission has not been completed. 1: Frame or wake-up transmission has been completed. |

The RLN3nLST register is automatically cleared to 00_H upon transition to LIN reset mode and start of the next communication (when the FTS bit of the RLN3nLTRC register is 1).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00_H.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

HTRC Flag (Successful Header Transmission Flag)

Only 0 can be written to the HTRC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The HTRC flag is set to 1 upon completion of header transmission. Here, an interrupt request for RLIN3n transmission is generated if the SHIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

D1RC Flag (Successful Data 1 Reception Flag)

Only 0 can be written to the D1RC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The D1RC flag is set to 1 upon completion of data 1 reception. Here, an interrupt request is not generated. To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC

register is 1), write 0 to the bit in LIN operation mode.

When response data of 9 bytes or more is to be received, this bit is set to 1 each time data 1 of a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

ERR Flag (Error Detection Flag)

The ERR flag is set to 1 upon detection of an error (when at least one of the flags of the RLN3nLEST register is set to 1). Here, an interrupt request for RLIN3n status is generated if the ERRIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the RPER, CSER, FER, FTER, PBER, and BER flags in the RLN3nLEST register in LIN operation mode or LIN wake-up mode. This clears the ERR flag to 0.

FRC Flag (Frame/Wake-up Reception Complete Flag)

Only 0 can be written to the FRC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The FRC flag is set to 1 upon completion of frame or wake-up reception. Here, an interrupt request for RLIN3n reception complete is generated if the FRCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode or LIN wake-up mode.

When response data of 9 bytes or more is to be received, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

FTC Flag (Frame/Wake-up Transmission Complete Flag)

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The FTC flag is set to 1 upon completion of frame or wake-up transmission. Here, an interrupt request for RLIN3n transmission is generated if the FTCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode or LIN wake-up mode.

When response data of 9 bytes or more is to be transmitted, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is transmitted. Write 0 before starting transmission of the next data group.

16.3.2.15 RLN3nLEST — LIN Error Status Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 13_H

Value after reset: 00_H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|------|---|------|---|-----|------|------|-----|
| | RPER | — | CSER | — | FER | FTER | PBER | BER |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R/W | R | R/W | R/W | R/W | R/W |

Table 16.26 RLN3nLEST Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 7 | RPER | Response Preparation Error Flag 0: Response preparation error has not been detected. 1: Response preparation error has been detected. |
| 6 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 5 | CSER | Checksum Error Flag 0: Checksum error has not been detected. 1: Checksum error has been detected. |
| 4 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 3 | FER | Framing Error Flag 0: Framing error has not been detected. 1: Framing error has been detected. |
| 2 | FTER | Timeout Error Flag 0: Frame/response timeout error has not been detected. 1: Frame/response timeout error has been detected. |
| 1 | PBER | Physical Bus Error Flag 0: Physical bus error has not been detected. 1: Physical bus error has been detected. |
| 0 | BER | Bit Error Flag 0: Bit error has not been detected. 1: Bit error has been detected. |

The RLN3nLEST register is automatically cleared to 00_H upon transition to LIN reset mode and start of the next communication (when the FTS bit of the RLN3nLTRC register is 1).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00_H.

When the FTS bit in the RLN3nLTRC register is 1 (frame transmission or wake-up transmission/reception is started), do not write a value to this register.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

RPER Flag (Response Preparation Error Flag)

Only 0 can be written to the RPER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The RPER flag is set to 1 upon response preparation error detection. To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

CSER Flag (Checksum Error Flag)

Only 0 can be written to the CSER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The CSER flag is set to 1 upon checksum error detection. To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

FER Flag (Framing Error Flag)

Only 0 can be written to the FER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

When the value of the FERE bit of the RLN3nLEDE register is 1 (framing error detection enabled), the FER flag is set to 1 upon framing error detection. To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

FTER Flag (Timeout Error Flag)

Only 0 can be written to the FTER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

When the FTERE bit of the RLN3nLEDE register is 1 (frame/response timeout error detection enabled), the FTER flag is set to 1 upon frame timeout error or response timeout error detection. To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

PBER Flag (Physical Bus Error Flag)

Only 0 can be written to the PBER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

When the PBERE bit of the RLN3nLEDE register is 1 (physical bus error detection enabled), the PBER flag is set to 1 upon physical bus error detection. To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode or LIN wake-up mode.

BER Flag (Bit Error Flag)

Only 0 can be written to the BER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

When the BERE bit of the RLN3nLEDE register is 1 (bit error detection enabled), the BER flag is set to 1 upon bit error detection. To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode or LIN wake-up mode.

16.3.2.16 RLN3nLDFC — LIN Data Field Configuration Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 14_H

Value after reset: 00_H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|-----|-----|-----|-----|-----------|-----|-----|-----|
| | LSS | FSM | CSM | RFT | RFDL[3:0] | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 16.27 RLN3nLDFC Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|--|
| 7 | LSS | Transmission/Reception Continuation Select 0: The data group to be transmitted/received next is the last one. 1: The data group to be transmitted/received next is not the last one. (Checksum is not included.) |
| 6 | FSM | Frame Separate Mode Select 0: Frame separate mode is not set. 1: Frame separate mode is set. |
| 5 | CSM | Checksum Select 0: Classic checksum mode 1: Enhanced checksum mode |
| 4 | RFT | Response Field Communication Direction Select 0: Reception 1: Transmission |
| 3 to 0 | RFDL[3:0] | Response Field Length Select b3 b0 0 0 0 0: 0 byte (+ checksum) 0 0 0 1: 1 byte (+ checksum) 0 0 1 0: 2 bytes (+ checksum) : 0 1 1 1: 7 bytes (+ checksum) 1 0 0 0: 8 bytes (+ checksum) Settings other than the above are prohibited. |

LSS Bit (Transmission/Reception Continuation Select)

The LSS bit indicates that the data group to be transmitted or received next is not the last data group when response data of 9 bytes or more is to be transmitted or received.

With 0 set, data and checksum are transmitted or received because the next data group to be transmitted or received is the last one.

With 1 set, only data is transmitted or received, and the checksum is not included because the next data group to be transmitted or received is not the last one.

Set the LSS bit only when the FSM bit is 1 (frame separate mode) and response data of 9 bytes or more is to be transmitted or received.

Set the LSS bit only when the RTS bit in the RLN3nLTRC is 0 (response transmit/receive is stopped).

FSM Bit (Frame Separate Mode Select)

The FSM bit sets the response communication mode.

With 0 set, frame separate mode is not selected. In this case, after header transmission is started (the FTS bit in the RLN3nLTRC register is 1), response is transmitted/received without setting the RTS bit in the RLN3nLTRC register.

With 1 set, frame separate mode is selected. If the RTS bit of the RLN3nLTRC register is set to 1 during header transmission, response transmission is executed after header transmission is completed.

For response reception which is 8 bytes or less (the RFT bit is 0), set the FSM bit to 0.

When causing a transition to LIN self-test mode, set this bit to 0 before transition.

For details on frame separate mode, see **Section 16.7.3.1, Transmission of LIN Frames**.

Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

When response data of 9 bytes or more is to be transmitted or received, set the FSM bit to 1.

CSM Bit (Checksum Select)

The CSM bit sets the checksum mode.

With 0 set, classic checksum mode is selected.

With 1 set, enhanced checksum mode is selected.

When the timeout error is used (the FTERE bit in the RLN3nLEDE register is 1), the specific timeout time depends on the setting of this bit. For details on the bit error, see **Section 16.7.6, Error Status**.

Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

When response data of 9 bytes or more is to be transmitted or received, do not change the CSM bit setting after the first data group through the last data group.

During communication of response data of 9 bytes or more, only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.

RFT Bit (Response Field Communication Direction Select)

The RFT bit sets the direction of the response field/wake-up signal communication.

With 0 set, reception is performed in the response field. In LIN wake-up mode, wake-up reception is performed (input signal low-level width count).

With 1 set, transmission is performed in the response field. In LIN wake-up mode, wake-up transmission is performed.

Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

When response data of 9 bytes or more is to be transmitted or received, do not change the RFT bit setting after the first data group through the last data group.

RFDL[3:0] Bits (Response Field Length Select)

The RFDL bits set the length of the response field data.

The data length can be 0 to 8 bytes excluding the checksum size.

To transmit response data with the FSM bit set to 0 (not frame separate mode), set the RFDL bits before header transmission (the FTS bit in the RLN3nLTRC register is 0).

To transmit response data with the FSM bit set to 1 (frame separate mode), set the RFDL bits before response transmission (the RTS bit in the RLN3nLTRC register is 0).

To receive response data, set the RFDL bits before header transmission (the FTS bit in the RLN3nLTRC register is 0).

When response data of 9 bytes or more is to be transmitted or received, set the RFDL bits before data group transmission/reception (RTS bit in the RLN3nLTRC register is 0).

Only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.

16.3.2.17 RLN3nLIDB — LIN ID Buffer Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 15_H

Value after reset: 00_H

| | | | | | | | | |
|-------------------|------|------|---------|-----|-----|-----|-----|-----|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | IDP1 | IDP0 | ID[5:0] | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 16.28 RLN3nLIDB Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 7 | IDP1 | Parity Setting (P1) Sets the parity bits (P1) to be transmitted in the ID field. |
| 6 | IDP0 | Parity Setting (P0) Sets the parity bits (P0) to be transmitted in the ID field. |
| 5 to 0 | ID[5:0] | ID Setting Sets the 6-bit ID value to be transmitted in the ID field. |

Set the RLN3nLIDB register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

In LIN self-test mode, this register operates as described below.

Write the value to be transmitted before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 16.9, LIN Self-Test Mode**.

IDP[1:0] Bits (Parity Setting)

The IDP bits set the parity bits (P0 and P1) to be transmitted in the ID field of the LIN frame. IDP0 is for P0 and IDP1 for P1.

Since parity is not automatically calculated, set the calculation result. Note that if the erroneous result is set, it is transmitted as is.

ID[5:0] Bits (ID Setting)

The ID bits set the 6-bit ID value to be transmitted in the ID field of the LIN frame.

16.3.2.18 RLN3nLCBR — LIN Checksum Buffer Register

Access: This register can only be read in 8-bit units. In LIN self-test mode, this register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 16_H

Value after reset: 00_H

| | | | | | | | | |
|-------------------|-----------|-----|-----|-----|-----|-----|-----|-----|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | CKSM[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 16.29 RLN3nLCBR Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|---|
| 7 to 0 | CKSM[7:0] | Holds the checksum value transmitted or received. |

In LIN mode, this register operates as follows:

- When the RFT bit in the RLN3nLDFC register is 1 (transmission):
The value transmitted can be read. Read the value after transmission is completed.
Writing to this register is invalid.
- When the RFT bit in the RLN3nLDFC register is 0 (reception):
The value received can be read. Read the value after reception is completed.
Writing to this register is invalid.

In LIN self-test mode, this register operates as follows:

- When the RFT bit in the RLN3nLDFC register is 1 (transmission):
After completion of the frame transmission (after loopback), the reversed value of the received value can be read.
- When the RFT bit in the RLN3nLDFC register is 0 (reception):
Write the value to be received before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 16.9, LIN Self-Test Mode**.

Set the RLN3nLCBR register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

When response data of 9 bytes or more is to be transmitted or received, the checksum is appended only to the last data group; this register is not updated for other data groups.

16.3.2.19 RLN3nLDBRb — LIN Data Buffer b Register (b = 1 to 8)

Access: This register can be read/written in 8-bit units.

Address: RLN3nLDBR1: <RLIN3n_base> + 18_H
 RLN3nLDBR2: <RLIN3n_base> + 19_H
 RLN3nLDBR3: <RLIN3n_base> + 1A_H
 RLN3nLDBR4: <RLIN3n_base> + 1B_H
 RLN3nLDBR5: <RLIN3n_base> + 1C_H
 RLN3nLDBR6: <RLIN3n_base> + 1D_H
 RLN3nLDBR7: <RLIN3n_base> + 1E_H
 RLN3nLDBR8: <RLIN3n_base> + 1F_H

Value after reset: 00_H

| | | | | | | | | |
|-------------------|----------|-----|-----|-----|-----|-----|-----|-----|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | LDB[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 16.30 RLN3nLDBRb Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 7 to 0 | LDB[7:0] | Sets the data to be transmitted or reads the received data. Setting range: 00 _H to FF _H |

- For response transmission:

The LDBRn registers set the data to be transmitted in the response field.
Use these registers with the following settings.

 - RFT in RLN3nLDFC register is 1 (transmission)
 - FSM in RLN3nLDFC register is 0 (not frame separate mode)
 - FTS in RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted)

or

 - RFT in RLN3nLDFC register is 1 (transmission)
 - FSM in RLN3nLDFC register is 1 (frame separate mode)
 - RTS in RLN3nLTRC register is 0 (response transmission/reception is halted)
- For response reception:

The LDBRn registers hold the data received in the response field.
The received data is overwritten. If an error is detected, the data up to the byte in which the error was detected are stored in the register.
Do not read these registers when the FTS bit is 1 (frame transmission or wake-up transmission/reception is started)
- For transmission of response data of 9 bytes or more:

Use the LDBRn registers with the following settings.

 - RFT in RLN3nLDFC register is 1 (transmission)
 - FSM in RLN3nLDFC register is 1 (frame separate mode)
 - RTS in RLN3nLTRC register is 0 (response transmission/reception is halted)
- For reception of response data of 9 bytes or more:

Do not read these registers when the RTS bit is 1 (response transmission/reception is started).

In LIN self-test mode, these registers operate as described below.

Write the value to be transmitted before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 16.9, LIN Self-Test Mode**.

16.3.3 UART Related Registers

16.3.3.1 RLN3nLWBR — LIN Wake-Up Baud Rate Select Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 01_H

Value after reset: 00_H

| | | | | | | | | |
|-------------------|-----------|-----|-----|-----|-----------|-----|-----|---|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | NSPB[3:0] | | | | LPRS[2:0] | | | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R |

Table 16.31 RLN3nLWBR Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|---|
| 7 to 4 | NSPB[3:0] | Bit Sampling Count Select b_7 b_4 0 0 0 0: 16 sampling 0 1 0 1: 6 sampling 0 1 1 0: 7 sampling 0 1 1 1: 8 sampling 1 0 0 0: 9 sampling 1 0 0 1: 10 sampling 1 0 1 0: 11 sampling 1 0 1 1: 12 sampling 1 1 0 0: 13 sampling 1 1 0 1: 14 sampling 1 1 1 0: 15 sampling 1 1 1 1: 16 sampling Settings other than the above are prohibited. |
| 3 to 1 | LPRS[2:0] | Prescaler Clock Select b_3 b_1 0 0 0: 1/1 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/8 1 0 0: 1/16 1 0 1: 1/32 1 1 0: 1/64 1 1 1: 1/128 |
| 0 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |

Set the LN3nLWBR register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

NSPB[3:0] Bits (Bit Sampling Count Select)

The NSPB bits select the number of sampling in one Tbit (reciprocal of the baud rate). In UART mode, it is possible to set the NSPB bits from 6 sampling to 16 sampling.

LPRS[2:0] Bits (Prescaler Clock Select)

The LPRS bits select the frequency division ratio for the prescaler.

The LIN communication clock source is divided by this prescaler.

16.3.3.2 RLN3nLBRP01 — UART Baud Rate Prescaler 01 Register

Access: RLN3nLBRP01 register can be read/written in 16-bit units.
 RLN3nLBRP0 register can be read/written in 8-bit units.
 RLN3nLBRP1 register can be read/written in 8-bit units.

Address: RLN3nLBRP01: <RLIN3n_base> + 02_H
 RLN3nLBRP0: <RLIN3n_base> + 02_H
 RLN3nLBRP1: <RLIN3n_base> + 03_H

Value after reset: 0000_H

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|-----------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| | BRP[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 16.32 RLN3nLBRP01 Register Contents

| Bit Position | Bit Name | Function |
|--------------|-------------|---|
| 15 to 0 | LBRP0[15:0] | Assuming that the value set in this register is L (0 to 65535), the baud rate prescaler divides the frequency of the prescaler clock by L + 1. Setting range: 0000 _H to FFFF _H |

Set the RLN3nLBRP01 register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

Assuming that the value set in this register is L, the baud rate prescaler divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) in the RLN3nLWBR register by L + 1.

The RLN3nLBRP01 register can be accessed in 8-bit units by the registers RLN3nLBRP0 and RLN3nLBRP1.

16.3.3.3 RLN3nLMD — UART Mode Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 08_H

Value after reset: 00_H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|---|---|--------|---|---|---|----------|-----|
| | — | — | LRDNFS | — | — | — | LMD[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R | R | R | R/W | R/W |

Table 16.33 RLN3nLMD Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 7, 6 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 5 | LRDNFS | UART Reception Data Noise Filter Disable 0: The noise filter is enabled. 1: The noise filter is disabled. |
| 4 to 2 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 1, 0 | LMD[1:0] | LIN/UART Mode Select b1 b0 0 1: UART mode |

Set the RLN3nLMD register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

LRDNFS Bit (UART Reception Data Noise Filter Disable)

The LRDNFS bit enables or disables the noise filter when receiving data.

With 0 set, the noise filter is enabled when receiving data.

With 1 set, the noise filter is disabled when receiving data.

LMD[1:0] Bits (LIN/UART Mode Select)

The LMD bits select the LIN/UART interface mode.

To use the LIN/UART interface as an UART, set these bits to 01_B.

16.3.3.4 RLN3nLBFC — UART Configuration Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 09_H

Value after reset: 00_H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|---|------|------|----------|-----|-------|------|------|
| | — | UTPS | URPS | UPS[1:0] | | USBLS | UBOS | UBLS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 16.34 RLN3nLBFC Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 7 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 6 | UTPS | UART Output Polarity Switch 0: Transmit data normal output 1: Transmit data inverted output |
| 5 | URPS | UART Input Polarity Switch 0: Reception data normal output 1: Reception data inverted output |
| 4, 3 | UPS[1:0] | UART Parity Select 00: Parity disabled 01: Even parity 10: 0 Parity 11: Odd parity |
| 2 | USBLS | UART Stop Bit length Select 0: Stop bit: 1 bit 1: Stop bit: 2 bits |
| 1 | UBOS | UART Transfer Format Order Select 0: LSB First 1: MSB First |
| 0 | UBLS | UART Character Length Select 0: UART 8 bits communication 1: UART 7 bits communication |

Set the RLN3nLBFC register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

UTPS Bit (UART Output Polarity Switch)

Sets the output polarity for UART communication.

With 0 set, transmit data is output without inversion.

With 1 set, inverted transmit data is output.

The setting of this bit is valid for all the bits of the UART frame.

In half-duplex communication, this setting should match the setting of URPS bit.

URPS Bit (UART Input Polarity Switch)

Sets the input polarity for UART communication.

With 0 set, receive data is input without inversion.

With 1 set, receive data is input with inversion.

The setting of this bit is valid for all the bits of the UART frame.

In half-duplex communication, this setting should match the setting of UTPS bit.

When setting this bit to “1” and expansion bit reception ((with expansion bit comparison) or (with data

comparison)) is performed, set the UEBDL bit in the RLN3nLUOR1 register and RLN3nLIDB register to the inverses of the expected values to enable comparison of the inverses of the received values.

UPS[1:0] Bits (UART Parity Select)

Sets the UART parity.

- When these bits are set to “00_B”, data is communicated without the parity.

[Transmission]

A parity bit is not added to transmit data.

[Reception]

Data is received without parity processing. Therefore, a parity error does not occur.

- When these bits are set to “01”, data is communicated with the even parity.

[Transmission]

If the number of 1s in transmit data is odd, “1” is added to the parity bit. If the number of 1s in transmit data is even, “0” is added to the parity bit.

[Reception]

If the number of 1s in receive data including the parity bit is odd, a parity error occurs.

- When these bits are set to “10”, data is communicated with 0 parity.

[Transmission]

Regardless of the number of 1s in transmit data, “0” is added to the parity bit.

[Reception]

The value of the parity bit is not judged. Therefore, no parity error occurs.

- When these bits are set to “11”, data is communicated with the odd parity.

[Transmission]

If the number of 1s in transmit data is odd, “0” is added to the parity bit. If the number of 1s in transmit data is even, “1” is added to the parity bit.

[Reception]

If the number of 1s in receive data including the parity bit is even, a parity error occurs.

USBLS Bit (UART Stop Bit Length Select)

Sets the stop bit length of data for UART communication.

With 0 set, stop bit length of 1 bit is selected.

With 1 set, stop bit length of 2 bits is selected.

UBOS Bit (UART Transfer Format Select)

Sets the bit order of data for UART communication.

With 0 set, LSB first is selected.

With 1 set, MSB first is selected.

UBLS Bit (UART Character Length Select)

Sets the character length of one frame for UART communication.

With 0 set, the character length is 8 bits.

With 1 set, the character length is 7 bits.

When the character length of one frame is 9 bits (the UEBE bit in the RLIN3nLUOR1 register is 1), the setting of this bit is ignored.

16.3.3.5 RLIN3nLSC — UART Space Configuration Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 0A_H

Value after reset: 00_H

| | | | | | | | | |
|-------------------|---|---|----------|-----|---|---|---|---|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | IBS[1:0] | | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R | R | R | R |

Table 16.35 RLIN3nLSC Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 7, 6 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 5, 4 | IBS[1:0] | Inter-Byte Space Select $\begin{matrix} b5 & b4 \\ 0 & 0: 0 \text{ Tbit} \\ 0 & 1: 1 \text{ Tbit} \\ 1 & 0: 2 \text{ Tbits} \\ 1 & 1: 3 \text{ Tbits} \end{matrix}$ |
| 3 to 0 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |

Set the RLIN3nLSC register when the OMM0 bit in the RLIN3nLMST register is 0_B (LIN reset mode).

IBS[1:0] Bits (Inter-Byte Space Select)

The IBS bits set the width of the space between the UART frames when transmitting data from the UART buffer. 0 to 3 Tbits can be set.

16.3.3.6 RLN3nLEDE —UART Error Detection Enable Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 0D_H

Value after reset: 00_H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|---|---|---|---|------|------|---|------|
| | — | — | — | — | FERE | OERE | — | BERE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R | R/W |

Table 16.36 RLN3nLEDE Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 7 to 4 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 3 | FERE | Framing Error Detection Enable 0: Disables framing error detection. 1: Enables framing error detection. |
| 2 | OERE | Overrun Error Detection Enable 0: Disables overrun error detection. 1: Enables overrun error detection. |
| 1 | Reserved | When read, the value after reset is read. When writing to this bit, write the value after reset. |
| 0 | BERE | Bit Error Detection Enable 0: Disables bit error detection. 1: Enables bit error detection. |

Set the RLN3nLEDE register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

FERE Bit (Framing Error Detection Enable)

The FERE bit enables or disables detection of the framing error.

With 0 set, the framing error is not detected.

With 1 set, the framing error is detected.

When this bit is set to 1, the detection result is indicated in the FER flag in the RLN3nLEST register.

For details on the framing error, see **Section 16.8.5, Error Status**.

OERE Bit (Overrun Error Detection Enable)

This bit enables or disables detection of the overrun error.

With 0 set, the overrun error is not detected.

With 1 set, the overrun error is detected.

When this bit is set to 1, the detection result is reflected in the OER flag in the RLN3nLEST register.

For details on the overrun error, see **Section 16.8.5, Error Status**.

BERE Bit (Bit Error Detection Enable)

The BERE bit enables or disables detection of the bit error.

With 0 set, the bit error is not detected.

With 1 set, the bit error is detected.

When this bit is set to 1, the detection result is indicated in the BER flag in the RLIN3nLEST register.

In full-duplex communication, do not set this bit to “1”.

Do not set this register when the NSPB bits in the RLIN3nLWBR register are 0101_B (6 sampling) and the LRDNFS bit in the RLIN3nLMD register is 0 (noise filter is enabled).

For details on the bit error, see **Section 16.8.5, Error Status**.

16.3.3.7 RLIN3nLCUC — UART Control Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 0E_H

Value after reset: 00_H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|---|---|---|---|---|---|---|-----|
| | — | — | — | — | — | — | — | OM0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

Table 16.37 RLIN3nLCUC Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 7 to 1 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 0 | OM0 | LIN Reset 0: LIN reset mode 1: Release from LIN reset mode |

After a value is written to this register, confirm that the value written is actually indicated in the RLIN3nLMST register before writing another value.

OM0 Bit (LIN Reset)

The OM0 bit selects either a transition to LIN reset mode or release from LIN reset mode.

Setting this bit to 0 causes a transition to LIN reset mode.

Setting it to 1 leads to release from LIN reset mode.

16.3.3.8 RLN3nLTRC — UART Transmission Control Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 10_H

Value after reset: 00_H

| | | | | | | | | |
|-------------------|---|---|---|---|---|---|-----|---|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | RTS | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R |

Table 16.38 RLN3nLTRC Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 7 to 2 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 1 | RTS | UART Buffer Transmission Start 0: UART Buffer transmission is stopped. 1: UART Buffer transmission is started. |
| 0 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |

RTS Bit (UART Buffer Transmission Start)

When transmitting data from the UART buffer, set this bit to “1”.

Only 1 can be written to this bit; 0 cannot be written.

Write to this bit when the UTOE bit in the RLN3nLUOER register is 1 (transmission enabled) and the UTS bit in the RLN3nLST register is 0 (transmission is not in progress).

Once set, regardless of errors, this bit is automatically cleared to 0 upon completion of the number of data transmission specified by the MDL bit in the RLN3nLDFC register. This bit is also automatically cleared to 0 upon transition to LIN reset mode.

Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).

When writing 1 to this bit while the UTSW bit in the RLN3nLRFC register is 1 (when UART buffer transmission is requested, the start of transmission is delayed until the stop bit of reception data is completed), write only during the reception of the stop bit.

16.3.3.9 RLIN3nLMST — UART Mode Status Register

Access: This register can only be read in 8-bit units

Address: <RLIN3n_base> + 11_H

Value after reset: 00_H

| | | | | | | | | |
|-------------------|---|---|---|---|---|---|---|------|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | OMM0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 16.39 RLIN3nLMST Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 7 to 1 | Reserved | When read, the value after reset is read. |
| 0 | OMM0 | LIN Reset Status Monitor 0: LIN reset mode 1: Not in LIN reset mode |

OMM0 Bit (LIN Reset Status Monitor)

The OMM0 bit indicates the current operating mode.

16.3.3.10 RLN3nLST — UART Status Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 12_H

Value after reset: 00_H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|---|---|-----|-----|-----|---|---|-----|
| | — | — | URS | UTS | ERR | — | — | FTC |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

Table 16.40 RLN3nLST Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 7, 6 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 5 | URS | Data Reception Status 0: Reception is not operated. 1: Reception is operated. |
| 4 | UTS | Transmission Status 0: Transmission is not operated. 1: Transmission is operated. |
| 3 | ERR | Error Detection Flag 0: No error has been detected. 1: Error has been detected. |
| 2, 1 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 0 | FTC | Successful UART Buffer Transmission Flag 0: UART buffer transmission has not been completed. 1: UART buffer transmission has been completed. |

The RLN3nLST register is automatically cleared to “00_H” upon transition to LIN reset mode. In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains “00_H”. To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits by using the store instruction.

URS Bit (Data Reception Status)

At the start of the reception, this flag is set to 1.

The reception is started under the following condition.

- When the start bit is detected

At the end of reception, this flag is cleared to 0. While reception is stopped, this flag retains 0.

The reception is ended under the following condition.

- Sampling point of the first bit of the stop bits

UTS Bit (Transmission Status Flag)

At the start of the transmission, this flag is set to 1. During the transmission, this flag retains 1.

The transmission is started under the following conditions.

- When transmission data is set to the RLN3nLUTDR or RLN3nLUWTDR register
- When the RTS bit in the RLN3nLTRC register is set to 1

This flag is cleared to 0 at the end of transmission.

The transmission is ended under the following conditions.

- When transmission of data set in the RLN3nLUTDR or RLN3nLUWTDR register is completed and next data is not set
- When transmission from UART buffer is completed (when the RTS bit in the RLN3nLTRC register is cleared to 0)

ERR Flag (Error Detection Flag)

This flag is set to 1 upon detection of an error, detection of an expansion bit, or upon ID matching (when at least one of the flags of the RLN3nLEST register is 1). At this time, an interrupt request for RLIN3n status is generated. However, when this bit is 1, an interrupt is not generated upon detection of an error, detection of an expansion bit, or upon ID matching. To clear the bit to 0, write 0 to the UPER, IDMT, EXBT, FER, OER, and BER flags in the RLN3nLEST register.

FTC Flag (Successful UART Buffer Transmission Flag)

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value that it was before 1 was written.

Regardless of errors, this bit is set to 1 upon completion of transmission of the number of data specified by the MDL bit in the RLN3nLDFC register from the UART buffer. At this time, an interrupt request for RLIN3n transmission is generated. Write 0 to clear this flag.

16.3.3.11 RLN3nLEST — UART Error Status Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 13_H

Value after reset: 00_H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|---|------|------|------|-----|-----|---|-----|
| | — | UPER | IDMT | EXBT | FER | OER | — | BER |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R/W | R/W | R | R/W |

Table 16.41 RLN3nLEST Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 7 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 6 | UPER | Parity Error Flag 0: Parity error has not been detected. 1: Parity error has been detected. |
| 5 | IDMT | ID Matching Flag 0: The receive data does not match with the ID value. 1: The receive data matches with the ID value. |
| 4 | EXBT | Expansion Bit Detection Flag 0: Expansion bit has not been detected. 1: Expansion bit has been detected. |
| 3 | FER | Framing Error Flag 0: Framing error has not been detected. 1: Framing error has been detected. |
| 2 | OER | Overrun Error Flag 0: Overrun error has not been detected. 1: Overrun error has been detected. |
| 1 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 0 | BER | Bit Error Flag 0: Bit error has not been detected. 1: Bit error has been detected. |

The RLN3nLEST register is automatically cleared to 00_H upon transition to LIN reset mode. In LIN reset mode, this register cannot be written to, and the value of 00_H is held. To clear certain bits in this register, write 0 to those bits, and write 1 to the bits not to be cleared by using the store instruction.

UPER Flag (Parity Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that it was before 1 was written.

This flag is set to 1 upon parity error detection. Write 0 to clear this flag.

IDMT Flag (ID Matching Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that it was before 1 was written.

The IDMT flag becomes 1 when all the following conditions are met:

- The UEBE bit in the RLN3nLUOR1 register is 1 (expansion bit enabled)
- The UECD bit in the RLN3nLUOR1 register is 0 (expansion bit comparison enabled)

- The UEBDCE bit in the RLN3nLUOR1 register is 1 (data comparison after expansion bit is detected)
 - The received expansion bit and the value of the UEBDL bit of the RLN3nLUOR1 register match.
 - The value of the 8-bit of the received data excluding the expansion bit and the value of the RLN3nLIDB register match.

Write 0 to clear this flag.

EXBT Flag (Expansion Bit Detection Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that it was before 1 was written.

When the UEBE bit in the RLN3nLUOR1 register is 1 (expansion bit enable), if the received expansion bit matches the UEBDL bit in the RLN3nLUOR1 register, this flag is set to 1.

Write 0 to clear this flag.

FER Flag (Framing Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that it was before 1 was written.

The FER flag is set to 1 upon framing error detection while the FERE bit of the RLN3nLEDE register is 1 (framing error detection enabled). Write 0 to clear this flag.

OER Flag (Overrun Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that it was before 1 was written.

The OER flag is set to 1 upon overrun error detection while the OERE bit of the RLN3nLEDE register is 1 (overrun error detection enabled). Write 0 to clear this flag.

BER Flag (Bit Error Flag)

Only 0 can be written to the this flag; when 1 is written, the bit retains the value that it was before 1 was written.

The BER flag is set to 1 when the transmitted data and the data monitored by the receive pin do not match while the BERE bit of the RLN3nLEDE register is 1 (bit error detection enabled).

Write 0 to clear this flag.

16.3.3.12 RLIN3nLDFC — UART Data Field Configuration Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 14_H

Value after reset: 00_H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|---|---|------|---|----------|-----|-----|-----|
| | — | — | UTSW | — | MDL[3:0] | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R | R/W | R/W | R/W | R/W |

Table 16.42 RLIN3nLDFC Register Contents

| Bit Position | Bit Name | Function | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------------|----------|--|----|----|--|---------|--|--------|---------|--|--------|---------|--|--------|---------|--|--------|---------|--|--------|---------|--|--------|---------|--|--------|---------|--|--------|---------|--|--------|---------|--|--------|
| 7, 6 | Reserved | When read, the value after reset is read. When writing, write the value after reset. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 5 | UTSW | Transmission Start Wait 0: When UART buffer transmission is requested, transmission is started immediately. 1: When UART buffer transmission is requested, transmission is not started until reception of the stop bit is completed. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 4 | Reserved | When read, the value after reset is read. When writing, write the value after reset. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

UTSW Bit (Transmission Start Wait)

This bit controls the transmission start timing of UART buffer.

With 0 set, transmission is started as soon as the start of UART buffer transmission is requested.

With 1 set, transmission is started after the completion of the stop bit reception.

Note that the wait time is only 1 bit even if the stop bit length is set to 2 bits with the USBLS bit in the RLIN3nLBFC register.

This bit is enabled when the RTS bit in the RLIN3nLTRC register is set to 1. In addition, writing a value to this bit is disabled when the RTS bit is 1 (UART buffer transmission started).

Set this bit to 1 only to switch from reception to transmission in half-duplex communication.

MDL[3:0] Bits (UART Buffer Data Length Select)

These bits specify the data length of the UART buffer.

Writing a value to these bits is disabled when the RTS bit in the RLIN3nLTRC register is 1 (UART buffer transmission started).

16.3.3.13 RLN3nLIDB — UART ID Buffer Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 15_H

Value after reset: 00_H

| | | | | | | | | |
|-------------------|---------|-----|-----|-----|-----|-----|-----|-----|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | ID[7:0] | | | | | | | |

16.3.3.16 RLN3nLUOER — UART Operation Enable Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 20_H

Value after reset: 00_H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|---|---|---|---|---|---|------|------|
| | — | — | — | — | — | — | UROE | UTOE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 16.48 RLN3nLUOER Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 7 to 2 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 1 | UROE | Reception Enable 0: Disables reception. 1: Enables reception. |
| 0 | UTOE | Transmission Enable 0: Disables transmission. 1: Enables transmission. |

The RLN3nLUOER register is automatically cleared to 00_H upon transition to LIN reset mode.

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00_H.

UROE Bit (Reception Enable)

The UROE bit enables or disables reception.

With 0 set, reception is disabled.

With 1 set, reception is enabled.

Do not clear this bit during reception. If the communication is suspended during reception, set the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode) to shift to the LIN reset mode. However, the transmit operation is also suspended at this time.

When the UART buffer transmits data, do not set this bit to 1.

UTOE Bit (Transmission Enable)

The UTOE bit enables or disables transmission.

With 0 set, transmission is disabled.

With 1 set, transmission is enabled.

Do not clear this bit during transmission. If the communication is suspended during transmission, set the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode) to shift to the LIN reset mode.

However, the receive operation is also suspended at this time.

16.3.3.17 RLN3nLUOR1 — UART Option Register 1

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 21_H

Value after reset: 00_H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|---|---|---|------|--------|--------|-------|------|
| | — | — | — | UECD | UTIGTS | UEBDCE | UEBDL | UEBE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R/W | R/W | R/W | R/W |

Table 16.49 RLN3nLUOR1 Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 7 to 5 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 4 | UECD | Expansion Bit Comparison Disable 0: Enables expansion bit comparison. 1: Disables expansion bit comparison. |
| 3 | UTIGTS | Transmission Interrupt Generation Timing Select 0: Transmission interrupt is generated at the start of transmission. 1: Transmission interrupt is generated at the completion of transmission. |
| 2 | UEBDCE | Expansion Bit Data Comparison Enable 0: Disables data comparison after an expansion bit is detected. 1: Enables data comparison after an expansion bit is detected. |
| 1 | UEBDL | Expansion Bit Detection Level Select 0: Selects expansion bit value 0 as the expansion bit detection level. 1: Selects expansion bit value 1 as the expansion bit detection level. |
| 0 | UEBE | Expansion Bit Enable 0: Disables expansion bit operation. 1: Enables expansion bit operation. |

UECD Bit (Expansion Bit Comparison Disable)

The UECD bit enables or disables comparison between the received expansion bit and the UEBDL bit value when the UEBE bit is 1 (expansion bit operation is enabled).

With 0 set, comparison between the received expansion bit and the UEBDL bit value is enabled when the expansion bit is received.

With 1 set, comparison between the received expansion bit and the UEBDL bit value is disabled when the expansion bit is received.

Set this bit when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).

Do not set this bit to 1 when the UART buffer is used.

Do not set this bit to 1 when the UEBDCE bit is 1 (data comparison after expansion bit is detected).

UTIGTS Bit (Transmission Interrupt Generation Timing Select)

The UTIGTS bit sets the generation timing of the transmission interrupt.

With 0 set, the transmission interrupt is generated at the start of transmission.

With 1 set, the transmission interrupt is generated at the completion of transmission.

When transmission from the UART buffer is performed with 0 set, the transmission interrupt is generated only at the start of the transmission of the last data of the data length set with the MDL bits in the RLN3nLDFC register.

When transmission from the UART buffer is performed with 1 set, the transmission interrupt is

generated only at the completion of the transmission of the last data of the data length set with the MDL bits in the RLN3nLDFC register.

UEBDCE Bit (Expansion Bit Data Comparison Enable)

After an expansion bit is detected, this bit enables or disables the comparison between the 8-bit receive data excluding the expansion bit and the value of the RLN3nLIDB register.

With 0 set, when the level selected by the UEBDL bit is detected as an expansion bit, the comparison between the received value in the RLN3nLURDR register and the value of the RLN3nLIDB register is disabled.

With 1 set, when the level selected by the UEBDL bit is detected as an expansion bit, the comparison between the received value in the RLN3nLURDR register and the value of the RLN3nLIDB register is enabled.

Set this bit when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).

Do not set this bit to 1 when the UEBE bit is 0 (expansion bit operation disabled).

Do not set this bit to 1 when the UECD bit is 1 (expansion bit comparison disabled).

Do not set this bit to 1 when the UART buffer is used.

UEBDL Bit (Expansion Bit Detection Level Select)

The UEBDL bit sets the level to be detected as the expansion bit when the UEBE bit is 1 (expansion bit operation is enabled) and the UECD bit is 0 (comparison of the expansion bit is enabled).

With 0 set, expansion bit value 0 is the level to be detected as the expansion bit.

With 1 set, expansion bit value 1 is the level to be detected as the expansion bit.

Set this bit when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).

Do not set this bit to 1 when the UART buffer is used.

UEBE Bit (Expansion Bit Enable Bit)

The UEBE bit enables or disables expansion bit operation.

With 0 set, expansion bit operation is disabled.

With 1 set, expansion bit operation is enabled.

Set this bit when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).

Do not set this bit to 1 when the UART buffer is used.

16.3.3.18 RLN3nLUTDR — UART Transmission Data Register

Access: RLN3nLUTDR register can be read/written in 16-bit units.
RLN3nLUTDRL register can be read/written in 8-bit units.
RLN3nLUTDRH register can be read/written in 8-bit units.

Address: RLN3nLUTDR: <RLIN3n_base> + 24_H
RLN3nLUTDRL: <RLIN3n_base> + 24_H
RLN3nLUTDRH: <RLIN3n_base> + 25_H

Value after reset: 0000_H

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|----|----|----|----|----|----|---|----------|-----|-----|-----|-----|-----|-----|-----|-----|
| | — | — | — | — | — | — | — | UTD[8:0] | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 16.50 RLN3nLUTDR Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 15 to 9 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 8 to 0 | UTD[8:0] | Sets the data to be transmitted. Setting range: 000 _H to 1FF _H |

The RLN3nLUTDR register sets the data to be transmitted from the transmit data register.

Writing data to this register with the UTOE bit in the RLN3nLUOER register set to 1 starts transmission.

This register can be accessed in 8 bits.

In 9-bit communication mode, do not attempt 8-bit access.

Do not write data to this register when data transmission from the UART buffer is in progress.

Also, do not write data to this register when a transmission request is being generated due to write access to the RLN3nLUWTDR register.

When transmitting data continuously, do not set another piece of transmission data in this register before the generation of transmission interrupt.

The table below shows the bit arrangement according to the set communication format.

Table 16.51 Bit Arrangement of the RLN3nLUTDR Register According to Each Communication Format

| | RLN3nLUTDR | | | | | | | | |
|------------------|------------|------|------|------|------|------|------|------|------|
| | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |

16.3.3.19 RLN3nLURDR — UART Reception Data Register

Access: RLN3nLURDR register can only be read in 16-bit units.
RLN3nLURDRL register can only be read in 8-bit units.
RLN3nLURDRH register can only be read in 8-bit units.

Address: RLN3nLURDR: <RLIN3n_base> + 26_H
RLN3nLURDRL: <RLIN3n_base> + 26_H
RLN3nLURDRH: <RLIN3n_base> + 27_H

Value after reset: 0000_H

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|----|----|----|----|----|----|---|-----------|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | URD [8:0] | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 16.52 RLN3nLURDR Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|---|
| 15 to 9 | Reserved | When read, the value after reset is read. |
| 8 to 0 | URD [8:0] | Stores the received data Storing range: 000 _H to 1FF _H |

The RLN3nLURDR allows the reception data to be read from the receive data register.

When the UROE bit in the RLN3nLUOER register is 1, the reception data is stored in this register and can be read out.

This register is updated when the stop bit of the receive data is received.

This register is also updated when an error is caused by the parity or stop bit.

However, the value of this register is not updated upon occurrence of an overrun error when the OERE bit of the RLN3nLEDE register is 1 (overrun error detection enabled). The value of this register is updated upon occurrence of an overrun error when the OERE bit is 0 (overrun error detection disabled).

Read this register upon occurrence of a receive error (overrun error, framing error, parity error) when the OERE bit of the RLN3nLEDE register is 1 (overrun error detection enabled). If the next data is received without reading this register, an overrun error occurs.

This register can be accessed in 8 bits.

However, during expansion bit use (UEBE bit of the RLN3nLUOR1 register is 1 (expansion bit operation enabled)), do not attempt 8-bit access.

The table below shows the bit arrangement according to the set communication format.

Table 16.53 Bit Arrangement of the RLN3nLURDR Register According to Each Communication Format

| | RLN3nLURDR | | | | | | | | |
|------------------|------------|------|------|------|------|------|------|------|------|

16.3.3.20 RLN3nLUWTDR — UART Wait Transmission Data Register

Access: RLN3nLUWTDR register can be read/written in 16-bit units.
RLN3nLUWTDRL register can be read/written in 8-bit units.
RLN3nLUWTDRLH register can be read/written in 8-bit units.

Address: RLN3nLUWTDR: <RLIN3n_base> + 28_H
RLN3nLUWTDRL: <RLIN3n_base> + 28_H
RLN3nLUWTDRLH: <RLIN3n_base> + 29_H

Value after reset: 0000_H

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|----|----|----|----|----|----|---|-----------|-----|-----|-----|-----|-----|-----|-----|-----|
| | — | — | — | — | — | — | — | UWTD[8:0] | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 16.54 RLN3nLUWTDR Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|---|
| 15 to 9 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 8 to 0 | UWTD[8:0] | Sets the data to be transmitted from the wait transmit data register after waiting for the stop bit reception to be completed. Setting range: 000 _H to 1FF _H |

The RLN3nLUWTDR register sets the data to be transmitted from the UART wait transmit data register.

Writing data to this register with the UTOE bit in the RLN3nLUOER register set to 1 starts transmission.

Use this register only to switch from reception to transmission in half-duplex communication.

The user should write to this register only while the stop bit is being received.

Note that the wait time is only 1 bit even if the stop bit length is set to 2 bits with the USBLS bit in the RLN3nLBFC register.

When this register is read, the RLN3nLUTDR register value is actually read.

In 9-bit communication mode, do not attempt 8-bit access.

Do not write data to this register when data transmission from the UART buffer is in progress.

The table below shows the bit arrangement according to the set communication format.

Table 16.55 Bit Arrangement of the RLN3nLUWTDR Register According to Each Communication Format

| | RLN3nLUWTDR | | | | | | | | |
|------------------|-------------|------|------|------|------|------|------|------|------|

| 9-bit; MSB first | Bit0 | Bit1 | Bit2 | Bit3 | Bit4 | Bit5 | Bit6 | Bit7 | Bit8 |

16.4 Interrupt Sources

The LIN/UART interface generates three types of interrupt requests.

- RLIN3n successful transmission interrupt
- RLIN3n successful reception interrupt
- RLIN3n status interrupt

When the LIOS bit in the RLN3nLMD register is set to 0, no interrupt occurs.

Setting the LIOS bit in the RLN3nLMD register to 1 allows to output the RLIN3n transmission interrupt, RLIN3n successful reception interrupt, or RLIN3n status interrupt depending on the interrupt source.

Table 16.56 lists the sources for each interrupt.

Table 16.56 Interrupt Sources

| | | LIOS bit in RLN3nLMD register is 1*1 | | |
|-----------|-----------------|--|--|--|
| | | RLIN3n Transmission Interrupt | RLIN3n Successful Reception Interrupt | RLIN3n Status Interrupt |
| LIN mode | LIN master mode | <ul style="list-style-type: none"> • Successful frame transmission • Successful wake-up transmission • Successful header transmission | <ul style="list-style-type: none"> • Successful wake-up reception • Successful wake-up reception | <ul style="list-style-type: none"> • Bit error • Physical bus error • Frame/response timeout error • Framing error • Checksum error • Response preparation error |
| UART mode | | <ul style="list-style-type: none"> • Transmission start/successful transmission | <ul style="list-style-type: none"> • Successful reception • Expansion bit mismatch | <ul style="list-style-type: none"> • Bit error • Overrun error • Framing error • Expansion bit match • ID match • Parity error |

Note 1. The LIOS bit setting is valid in LIN Mode. In UART mode, setting the LIOS bit is not required.

In LIN mode, each interrupt request is output when the corresponding bit in the RLN3nLIE register is 1 (interrupt is enabled) and the corresponding flag in the RLN3nLST register is 1.

16.5 Modes

The LIN/UART interface provides the following four modes, depending upon the specific function to be performed:

- LIN reset mode
- LIN mode
 - LIN master mode
- UART mode
- LIN self-test mode

In LIN reset mode, clock supply to the LIN/UART interface stops. This enables to reduce power consumption.

Figure 16.2 shows mode transitions. **Table 16.57** describes mode transition conditions. **Table 16.58** lists operations available in each mode.

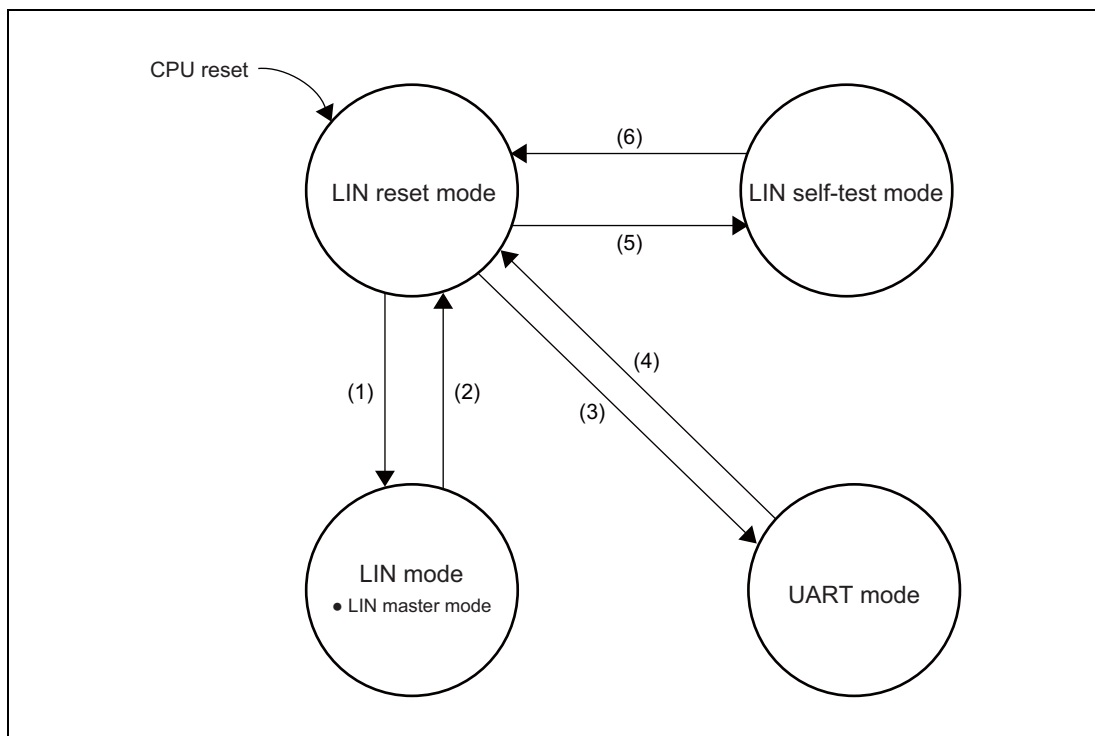

Figure 16.2 Mode Transitions

Table 16.57 Transition Condition of Each Mode

| Transition Mode | | Transition Condition |
|------------------------|----------------------|---|
| (1) LIN reset mode | → LIN mode | <ul style="list-style-type: none"> LIN master mode LMD bits in the RLN3nLMD register = 00_B and OM1 and OM0 bits in the RLN3nLCUC register = 01_B or 11_B |
| (2) LIN mode | → LIN reset mode | OM0 bit in RLN3nLCUC register = 0 _B |
| (3) LIN reset mode | → UART mode | LMD bits in RLN3nLMD register = 01 _B and OM0 bit in RLN3nLCUC register = 1 _B |
| (4) UART mode | → LIN reset mode | OM0 bit in RLN3nLCUC register = 0 _B |
| (5) LIN reset mode | → LIN self-test mode | See Section 16.9, LIN Self-Test Mode. |
| (6) LIN self-test mode | → LIN reset mode | See Section 16.9, LIN Self-Test Mode. |

Table 16.58 Operations Available in Each Mode

| LIN Mode | | |
|--|--|--------------------|
| LIN Master Mode | UART Mode | LIN Self-Test Mode |
| Header transmission Response transmission Response reception Wake-up transmission Wake-up reception Error detection | UART transmission UART reception Error detection | Self test |

Whether mode has transitioned to LIN reset mode, the LIN mode, or the UART mode can be verified by reading the LMD bits in the RLN3nLMD register and the OMM0 bit in the RLN3nLMST register.

For a description of the LIN self-test mode, see **Section 16.9, LIN Self-Test Mode.**

16.6 LIN Reset Mode

Setting the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode) causes a transition to LIN reset mode. The change to LIN reset mode can be verified by determining that the OMM0 bit in the RLN3nLMST register has been set to 0 (LIN reset mode). In this mode, the LIN communication and the UART communication functions are halted.

From LIN reset mode, transitions to LIN mode, UART mode, and LIN self-test mode can be made.

When the mode changes to LIN reset mode, the following registers are initialized to their reset values, and as long as LIN reset mode is in effect, they retain their initial values.

- RLN3nLTRC register
- RLN3nLST register
- RLN3nLEST register
- RLN3nLUOER register

The following registers retain their previous values even when a transition to LIN reset mode is made:

- RLN3nLWBR register
- RLN3nLBRP0 register
- RLN3nLBRP1 register
- RLN3nLMD register
- RLN3nLBFC register
- RLN3nLSC register
- RLN3nLWUP register
- RLN3nLIE register
- RLN3nLEDE register
- RLN3nLDFC register
- RLN3nLIDB register
- RLN3nLCBR register
- RLN3nLUDB0 register
- RLN3nLDBRb register (b = 1 to 8)
- RLN3nLUOR1 register
- RLN3nLUTDR register
- RLN3nLURDR register
- RLN3nLUWTDR register

16.7 LIN Mode

LIN mode can operate in LIN master mode.

In LIN master mode, the following operations can be performed: header transmission, response transmission, response reception, wake-up transmission, wake-up reception, and error detection. In LIN reset mode, setting the LMD bits in the RLN3nLMD register to 00_B (LIN master mode) and the OM1 and OM0 bits in the RLN3nLCUC register to either 01_B or 11_B sets LIN master mode, turning the OMM1 and OMM0 bits in the RLN3nLMST register to either 01_B to 11_B .

When changing a submode to another submode within LIN mode, a transition to LIN reset mode should first be made and change the LMD bits in the RLN3nLMD register.

The LIN mode provides the following two operation modes:

- LIN operation mode
- LIN wake-up mode

Figure 16.3 shows the transition of operation modes. **Table 16.59** describes the transition conditions of operation modes.

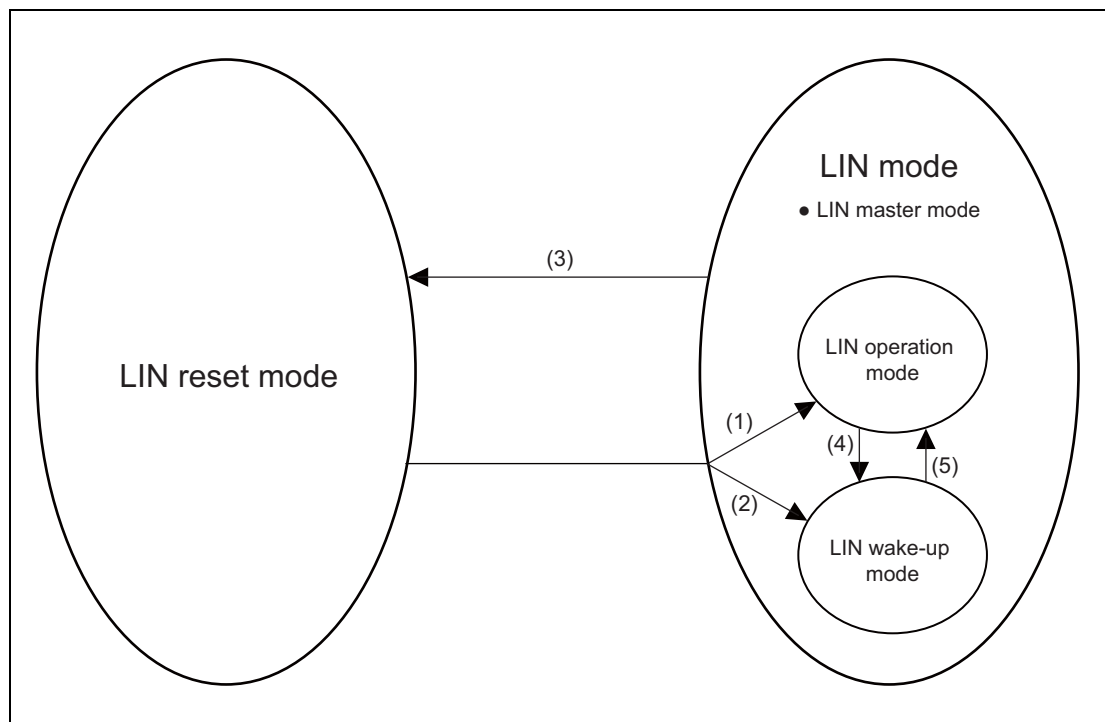

Figure 16.3 Transition of Operation Modes

Table 16.59 Transition Condition for Operation Mode

| Operation Mode Transition | | Transition Condition |
|---------------------------|---|--|
| (1) | LIN reset mode → LIN mode • LIN operation mode | LMD bits in RLN3nLMD register = 00 _B and OM1 and OM0 bits in RLN3nLCUC register = 11 _B |
| (2) | LIN reset mode → LIN mode • LIN wake-up mode | LMD bits in RLN3nLMD register = 00 _B and OM1 and OM0 bits in RLN3nLCUC register = 01 _B |
| (3) | LIN mode → LIN reset mode • LIN operation mode • LIN wake-up mode | OM0 bit in RLN3nLCUC register = 0 _B |
| (4) *1 | LIN mode → LIN mode • LIN operation mode • LIN wake-up mode | OM1 and OM0 bits in RLN3nLCUC register = 01 _B |
| (5) *1 | LIN mode → LIN mode • LIN wake-up mode • LIN operation mode | OM1 and OM0 bits in RLN3nLCUC register = 11 _B |

Note 1. Transition between LIN operation mode and LIN wake-up mode cannot be made when communication is in progress (when the FTS bit in the RLN3nLTRC register is 1).

(1) LIN Operation Mode

In LIN operation mode, frame processing (header transmission, header reception, response transmission, response reception, and error detection) can be performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN3nLCUC register to 11_B changes the mode to LIN operation mode, changing the OMM1 and OMM0 bits in the RLN3nLMST register to 11_B. Communication settings should be performed after the OMM1 and OMM0 bits have become 11_B.

(2) LIN Wake-up Mode

In LIN wake-up mode, wake-up signal processing (wake-up transmission, wake-up reception, and error detection) can be performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN3nLCUC register to 01_B changes the mode to LIN wake-up mode, changing the OMM1 and OMM0 bits in the RLN3nLMST register to 01_B. Communication settings should be performed after the OMM1 and OMM0 bits have become 01_B.

16.7.1 LIN Master Mode

16.7.1.1 Header Transmission

Figure 16.4 shows the operation of the LIN/UART interface (LIN master mode) in header transmission. **Table 16.60** describes the processing in header transmission.

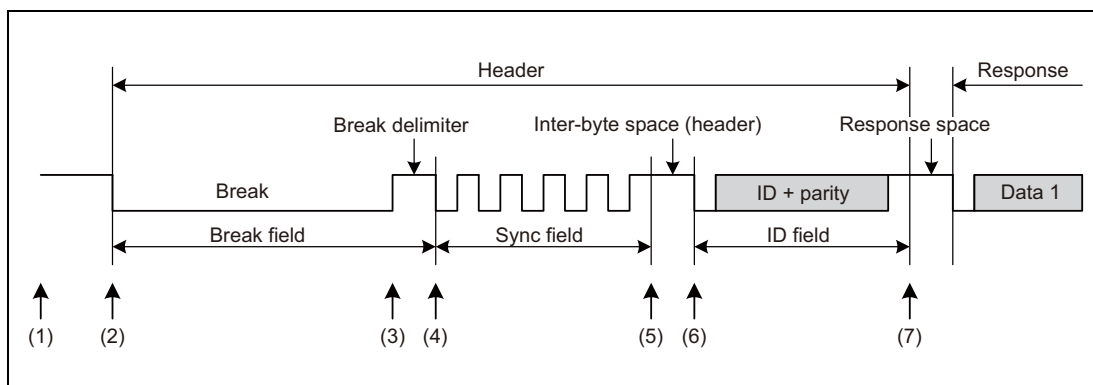

Figure 16.4 Operation in Header Transmission

Table 16.60 Processing in Header Transmission

| Software Processing | LIN/UART Interface Processing |
|---|--|
| (1) <ul style="list-style-type: none"> • Sets a baud rate • Sets noise filter ON/OFF • Enables interrupt • Enables error detection • Sets frame configuration parameters • Changes the LIN/UART interface to the LIN master mode: LIN operation mode • Sets information on the frame to be transmitted (ID, parity, data length, response direction, checksum method, and transmission data) | Waits for the setting of the FTS bit in the RLIN3nLTRC register by software (idle) |
| (2) Sets the FTS bit in the RLIN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started) | Transmits a break. |
| (3) Waits for an interrupt request | Transmits a break delimiter. |
| (4) | Transmits a sync field (55 _H). |
| (5) | Transmits an inter-byte space (header). |
| (6) | Transmits an ID field. |
| (7) | Sets a successful header transmission flag. |

NOTE

For information about error detection conditions, see **Section 16.7.6, Error Status**.

16.7.1.2 Response Transmission

Figure 16.5 shows the operation of the LIN/UART interface (LIN master mode) in response transmission. Table 16.61 describes the processing in response transmission.

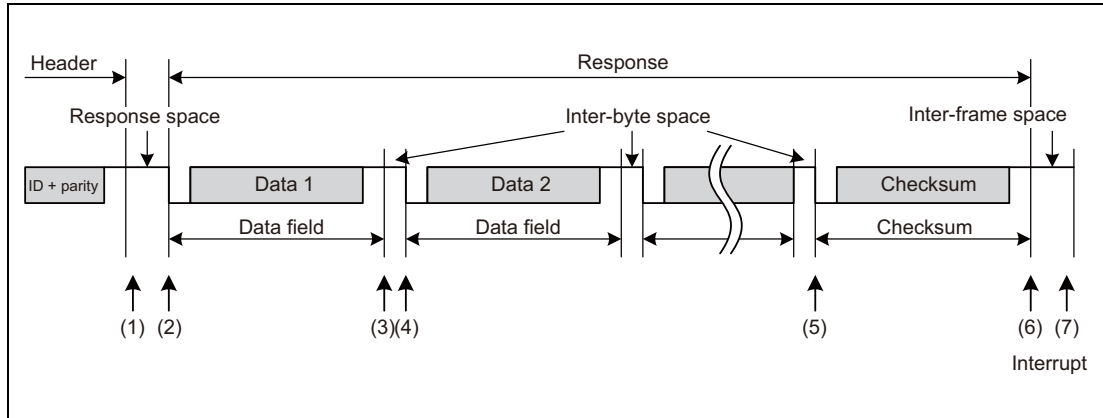

Figure 16.5 Operation in Response Transmission

Table 16.61 Processing in Response Transmission

Receives data 3 when the start bit is detected. <p>(The transmission of an inter-byte space is repeated as many times as the data length specified in bits RFDL[3:0] in the RLN3nLDFC register. This is halted if any bit in the RLN3nLEST register is 1 (detection of any error). Process (5), checksum transmission, does not proceed if an error occurs).</p> <p style="text-align: center;">⋮</p> |
| (5) | <ul style="list-style-type: none"> Receives the checksum when the start bit is detected. Determines the checksum. Sets the successful frame/wake-up reception flag. Sets the FTS bit in the RLN3nLTRC register to 0 (frame transmission or wake-up transmission/reception stopped). |
| (6) <ul style="list-style-type: none"> Processing after communication Reads the received data. Checks the RLN3nLST register, and clears flags. | Idle |

NOTE

For information about error detection, see Section 16.7.6, Error Status.

16.7.2 Data Transmission/Reception

16.7.2.1 Data Transmission

One bit of data is transmitted per 1 Tbit.

The data that is transmitted returns to the reception data input pin via the LIN transceiver. The received data and the transmitted data are compared bit by bit, and the results are stored in the BER flag in the RLIN3nLEST register (see **Section 16.7.6, Error Status**).

In LIN master mode, 1 Tbit is generated to be $16/f_{LIN}$, and thus the sampling point for received data is at the 13th clock cycle (81.25% position).

Figure 16.7 shows an example of data transmission timing.

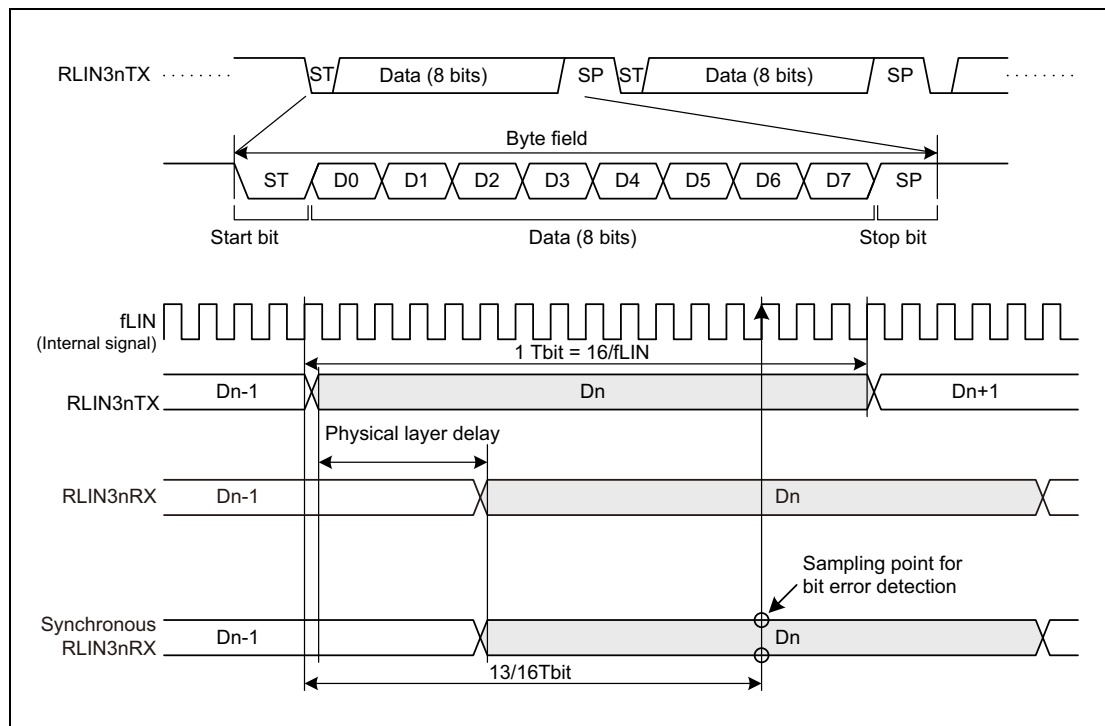

Figure 16.7 Example of Data Transmission Timing (LIN Master Mode)

16.7.2.2 Data Reception

Data reception is performed by using the synchronized RLIN3nRX signal (an internal signal) that is the input from the RLIN3nRX pin synchronized with prescaler clock.

The byte field is synchronized at the falling edge of the start bit for the synchronized RLIN3nRX signal. After the falling edge is detected, sampling is performed again 0.5 Tbit later, and the falling edge is recognized as a start bit if the synchronized RLIN3nRX signal is low level. The falling edge is not recognized as a start bit if the RLIN3nRX signal after the reset is de-asserted is fixed to low level or if a high level is detected on re-sampling.

After the start bit is detected, the system samples 1 bit per Tbit.

The LIN/UART interface has a noise filter function for reception data. If the LRDNFS bit in the RLN3nLMD register is 0, the LIN/UART interface uses a noise filter, and the value determined by a 3-sampling majority rule on prescaler clocks is used as the sampling value. If the LRDNFS bit in the RLN3nLMD register is 1, the LIN/UART interface does not use a noise filter, and the value of the synchronized RLIN3nRX value at the sampling position is used as the sampling value.

Figure 16.8 shows an example of data reception timing.

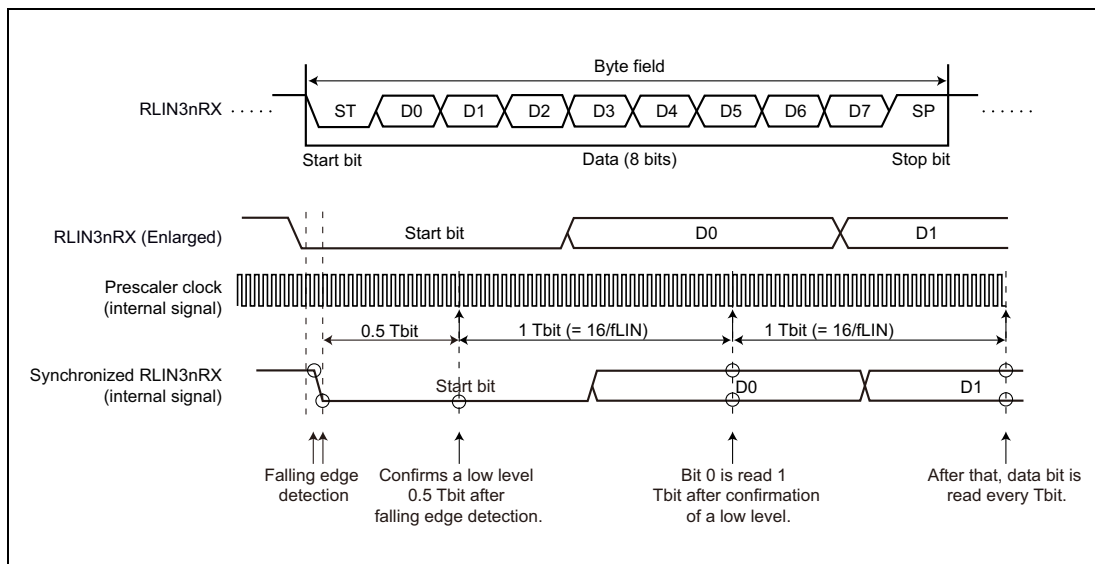

Figure 16.8 Example of Data Reception Timing (LIN Master Mode)

16.7.3 Transmission/Reception Data Buffering

This section explains the buffer processing that takes place when the LIN/UART interface sends or receives data continuously.

16.7.3.1 Transmission of LIN Frames

For an 8-byte transmission, the contents stored in registers RLN3nLDBR1 to RLN3nLDBR8 are sequentially transmitted to data areas 1 to 8 of the LIN frame. In the case of a 4-bytes transmission, the contents stored in registers RLN3nLDBR1 to RLN3nLDBR4 are transmitted to data areas 1 to 4 of the LIN frame, but the contents of registers RLN3nLDBR5 to RLN3nLDBR8 are not transmitted. The transmitted checksum data is stored in the RLN3nLCBR register.

Figure 16.9 shows the LIN transmission processing and the required buffers.

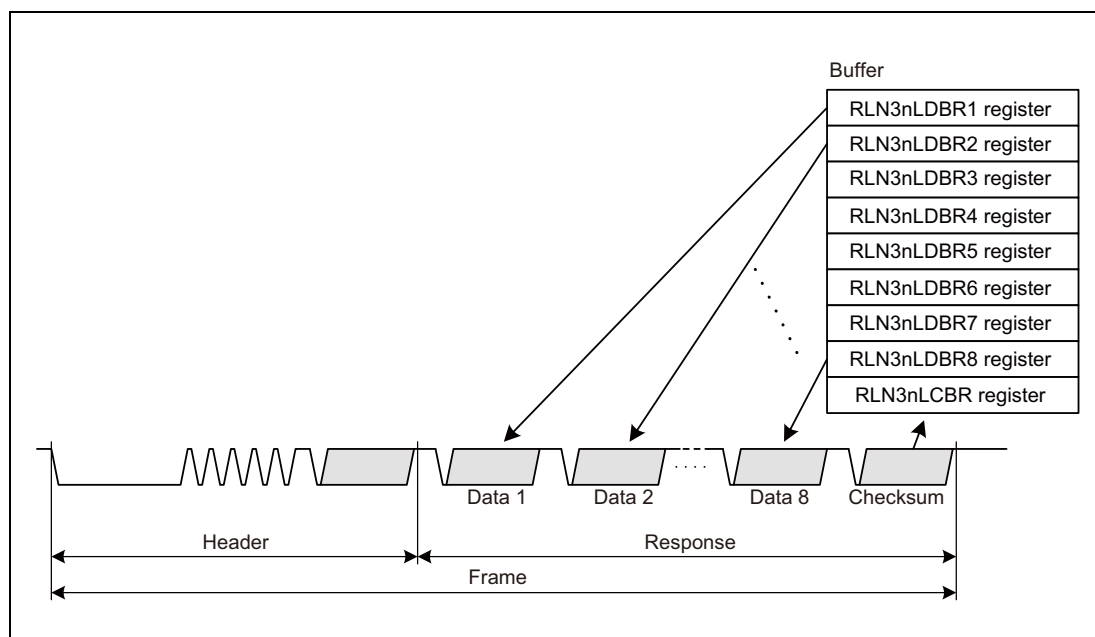

Figure 16.9 LIN Transmission Processing and Required Buffer

[Frame Separate Mode]

Setting the FSM bit in the RLN3nLDFC register to 1 turns on the frame separate mode.

In frame separate mode, a header and a response are transmitted when prompted by separate transmission start requests.

When the transmission of a header is finished, the HTRC flag in the RLN3nLST register is set to 1 (successful header transmission).

Use frame separate mode when transmitting or receiving response data of 9 bytes or more in LIN master mode.

16.7.3.2 Reception of LIN Frames

For an 8-byte reception, the contents of data areas 1 to 8 of the LIN frame are stored in registers RLN3nLDBR1 to RLN3nLDBR8, respectively, upon reception of a stop bit. In the case of a 4-byte reception, the contents of data areas 1 to 4 of the LIN frame are stored in registers RLN3nLDBR1 to RLN3nLDBR4, respectively; no data is stored in registers RLN3nLDBR5 to RLN3nLDBR8. Also, the received checksum data is stored in the RLN3nLCBR register.

Figure 16.10 shows the LIN reception processing and the required buffers.

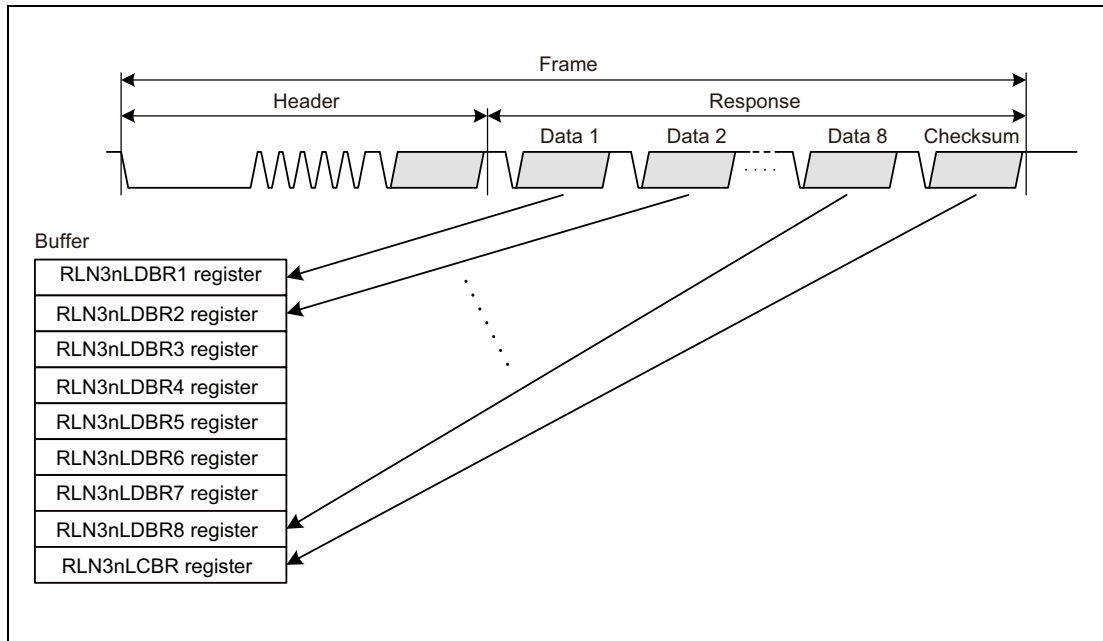

Figure 16.10 LIN Reception Processing and Required Buffer

[Reception of Data 1]

When the reception of the first byte of data is finished, the D1RC flag in the RLN3nLST register is set to 1 (successful data 1 reception).

16.7.3.3 Multi-Byte Response Transmission/Reception Function

Normally in LIN communications, a response is 9 bytes or less including a checksum field; however, responses of 10 bytes or more can also be transmitted and received.

In such a case, the bit error, framing error, response preparation error detection, and auto checksum functions are enabled.

If the data length is longer than 8 bytes, the LSS bit in RLN3nLDFC register should be set to 1 (indicating that the next data group to be transmitted or received is not the last data group) in the first data group (variable from 0 to 8 bytes) before transmitting or receiving the data group. After the transmission or reception, the user should determine whether the next data group is the last data group. If it is the last data group, the LSS bit in the RLN3nLDFC register should be set to 0 (indicating that the next data group to be transmitted or received is the last data group), and a checksum should be appended to the last data group.

By changing the RFDL bit in RLN3nLDFC register settings when the RTS bit in RLN3nLTRC register is 0, the user can change the data length for each data group.

When performing multi-byte response transmission/reception in LIN master mode, set the FSM bit in RLN3nLDFC register to 1 (frame separate mode).

16.7.4 Wake-up Transmission/Reception

The wake-up transmission/reception can be used in LIN wake-up mode.

16.7.4.1 Wake-up Transmission

In LIN wake-up mode, setting the RFT bit in the RLN3nLDFC register to 1 (LIN master mode: response transmission) and the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started) causes a wake-up signal to be output from the output pin. The low width of the wake-up signal should be set using the WUTL[3:0] bits in the RLN3nLWUP register.

However, if the LWBR0 bit of the RLN3nLWBR register in LIN master mode is 1 (LIN2.x), the LIN system clock (fLIN) becomes low level width at fa regardless of the setting of the LCKS bit of the RLN3nLMD register. By setting the WUTL[3:0] bits of the RLN3nLWUP register to 0100_B (5 Tbits), 260 μs low width can be output in LIN wake-up mode regardless of the setting of the LCKS bit of the RLN3nLMD register.

If a wake-up low-level is output without any bit error, the FTC flag in the RLN3nLST register is set to 1 (successful frame or wake-up transmission); when the FTCIE bit in the RLN3nLIE register is 1 (successful frame/wakeup transmission interrupt enabled), an interrupt request for RLIN3n transmission is generated.

If RLN3nLEDE.BERE is set and a bit error is detected, wake-up transmission is canceled and the BER flag in the RLN3nLEST register is set to 1 (bit error detection).

When RLN3nLEDE.PBERE is set in LIN master mode, set RLN3nLEST.PBER flag to 1 (physical bus error detection) at the same time of a bit error.

Figure 16.11 shows the wake-up transmission timing.

Figure 16.11 Wake-up Transmission Timing

16.7.4.2 Wake-up Reception

To detect a wake-up signal, use the input signal low-level width count function. The input signal low level width count function measures the low level width of the input signal to the RLIN3nRX pin, using the same sampling point as data reception. This allows the 2.5-Tbit or longer low-level width of the input signal of fLIN to be measured.

In LIN master mode, by setting the LWBR0 bit in the RLN3nLWBR register, operation can be executed without changing the baud rate generator setting when switching between LIN operation mode and LIN wake-up mode.

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN3nLWBR register to 0. When LIN Specification Package Revision 2.x is used, set the LWBR0 bit to 1. Setting the LWBR0 bit to 1 sets the LIN system clock (fLIN) to fa regardless of the setting of the LCKS bit in the RLN3nLMD register. (The LCKS bit is not changed). By setting the baud rate to 19200bps while fa is selected, an input signal with a low-level width of 130 μ s or longer to be measured regardless of the setting of the LCKS bit in the RLN3nLMD register.

When using the wake-up reception function, in LIN wake-up mode set the RFT bit in the RLN3nLDFC register to 0 (LIN master mode: response reception), or the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started).

When the low level width to be measured is reached, the FRC flag in the RLN3nLST register is set to 1 (successful frame/wake-up reception). If the FRCIE bit in the RLN3nLIE register is 1 (successful frame or wake-up reception interrupt enabled), an interrupt request for successful RLIN3n reception is generated.

Figure 16.12 Input Signal Low level Count Function

16.7.4.3 Wakeup Collision

If the master node and the slave node transmit wakeup signals simultaneously, a collision will occur on the LIN bus, though a collision of wakeup signals is not detected by the LIN/UART interface.

16.7.5 Status

In LIN mode operation, the LIN/UART interface can detect seven types of statuses.

The four statuses, successful frame/wake-up transmission, successful frame/wake-up reception, error detection, and successful header transmission/reception, can generate interrupt requests.

Table 16.63 shows the types of statuses available in LIN master mode.

Table 16.63 Types of Statuses in LIN Master Mode

| Status | Status Set Condition | Status Clear Condition | Operation Mode Capable of Status Detection | Corresponding Bit | Interrupt |
|--------------------------------|--|---|--|--------------------------------|-----------|
| Reset | After the OM0 bit in the RLN3nLCUC register is set to not-LIN-reset-mode, if actually the LIN/UART interface is cleared from LIN reset mode. | After the OM0 bit in the RLN3nLCUC register is set to LIN reset mode, if actually the LIN/UART interface enters LIN reset mode. | All modes | OMM0 bit in RLN3nLMST register | — |
| Operation mode | After the OM1 bit in the RLN3nLCUC register is set to LIN operation mode, if actually the LIN/UART interface enters LIN operation mode. | After the OM1 bit in the RLN3nLCUC register is set to LIN wake-up mode, if actually the LIN/UART interface enters LIN wake-up mode. | <ul style="list-style-type: none"> LIN operation mode LIN wake-up mode | OMM1 bit in RLN3nLMST register | — |
| Frame/wake-up transmission end | When a frame (header transmission + response transmission), a wake-up signal, or a data group is transmitted successfully. | <ul style="list-style-type: none"> When another communication is started (When the FTS bit in the RLN3nLTRC register is set) When cleared by software After transition to LIN reset mode | <ul style="list-style-type: none"> LIN operation mode LIN wake-up mode | FTC flag in RLN3nLST register | √ |
| Frame/wake-up reception end | When a frame (header transmission + response reception), a wake-up signal, or a data group is received successfully. | <ul style="list-style-type: none"> When another communication is started (When the FTS bit in the RLN3nLTRC register is set) When cleared by software After transition to LIN reset mode | <ul style="list-style-type: none"> LIN operation mode LIN wake-up mode | FRC flag in RLN3nLST register | √ |
| Error detection | If any of the RPER flag, CSER flag, FER flag, FTER flag, PBER flag, and BER flag in the RLN3nLEST register is set to 1 (error detected). | <ul style="list-style-type: none"> When another communication is started (When the FTS bit in the RLN3nLTRC register is set) When cleared by software*1 After transition to LIN reset mode | <ul style="list-style-type: none"> LIN operation mode LIN wake-up mode | ERR flag in RLN3nLST register | √ |
| Data 1 reception end | The RFT bit in the RLN3nLDFC register is 0 (reception) and the first byte of the response field or the first byte of each data group is received successfully.*2 | <ul style="list-style-type: none"> When another communication is started (When the FTS bit in the RLN3nLTRC register is set) When cleared by software After transition to LIN reset mode | LIN operation mode | D1RC flag in RLN3nLST register | — |
| Header transmission end | When a header field is transmitted successfully. | <ul style="list-style-type: none"> When another communication is started (When the FTS bit in the RLN3nLTRC register is set) When cleared by software After transition to LIN reset mode | LIN operation mode | HTRC flag in RLN3nLST register | √ |

Note 1. In LIN operation mode and LIN operation mode, the ERR flag in the RLN3nLST register is cleared to 0 by writing 0 to the RPER flag, CSER flag, FER flag, FTER flag, PBER flag, or BER flag in the RLN3nLEST register.

Note 2. Not detected when the RFDL [3:0] bits in the RLN3nLDFC register are 0000_B (0-byte + checksum).

16.7.6 Error Status

16.7.6.1 LIN Master Mode

(1) Types of Error Statuses

The LIN/UART interface can detect six types of error statuses in LIN master mode. The condition of these error statuses can be verified by checking of the corresponding bits in the RLIN3nLEST register.

All error statuses are interrupt factors.

Table 16.64 shows the types of error statuses.

Table 16.64 Types of Error Statuses in LIN Master Mode

| Status | Error Detection Condition | Operation Mode Capable of Error Detection | Communication | Enable/Disable Detection | Corresponding Bit |
|----------------------------|--|--|---------------|--------------------------|----------------------------------|
| Bit error | The transmitted data and the data on the LIN bus monitored by the receive pin do not match ^{*1*2} | <ul style="list-style-type: none"> LIN operation mode LIN wake-up mode | Cancel | Enabled | BER flag in RLIN3nLEST register |
| Physical bus error | <ul style="list-style-type: none"> LIN bus detected a high level when sending a break LIN bus detected a low level when sending a break delimiter LIN bus detected a high level when sending a wake-up | <ul style="list-style-type: none"> LIN operation mode LIN wake-up mode | Cancel | Enabled | PBER flag in RLIN3nLEST register |
| Timeout error | A frame or response transmission/reception is not completed within a given time ^{*3} | LIN operation mode | Cancel | Enabled | FTER flag in RLIN3nLEST register |
| Framing error | In response field reception, a stop bit of each data byte is low level | LIN operation mode | Cancel | Enabled | FER flag in RLIN3nLEST register |
| Checksum error | In response field reception, the result of checksum indicate an error | LIN operation mode | — | Disabled | CSER flag in RLIN3nLEST register |
| Response preparation error | <p>One of the following conditions occurs in frame separate mode during a multi-byte response reception:</p> <ul style="list-style-type: none"> After header transmission is complete, the first byte of receive data is received before a response transmission/reception request is set. After the previous data group reception is complete, the first byte of receive data is received before a transmission/reception request for the next data group is set. | LIN operation mode | Cancel | Disabled | RPER flag in RLIN3nLEST register |

Note 1. If a bit error is detected, the process is canceled after a stop bit is sent. If a bit error is detected in a non-data area, such as an inter-byte space, the transmission is canceled immediately after that area. If a bit error is detected during the transmission of a wake-up, the transmission of the wake-up is canceled after the bit which had the error is sent.

Note 2. In a multi-byte response transmission, bit errors are detected also between data groups.

Note 3. The timeout time depends on the response field data length (the RFDL [3:0] bits in the RLIN3nLDFC register) and the checksum selection (the CSM bit in the RLIN3nLDFC register), and this can be calculated according to the following formula:

When the FSM bit in the RLIN3nLDFC register is 1 (frame separate mode), the time-out interval until setting of the RTS bit in the RLIN3nLTRC register is the interval for receiving eight bytes of data. Once the RTS bit is set, the time-out time is reset to the time corresponding to the response field data length (determined by the RFDL[3:0] bits of the RLIN3nLDFC register).

[Frame timeout]

When classic is selected (when the CSM bit in RLIN3nLDFC is 0): Timeout time = 49 + (number of data bytes + 1) × 14 [Tbit]

When enhanced is selected (when the CSM bit in RLIN3nLDFC is 1): Timeout time = 48 + (number of data bytes + 1) × 14 [Tbit]

The aforementioned timeout time is a time longer than the TFRAME_MAX of LIN Specification Package Revision 1.3 when classic is selected, or the TFRAME_MAX of LIN Specification Package Revision 2.x when enhanced is selected.

[Response timeout]

$$\text{Timeout time} = (\text{number of data bytes} + 1) \times 14 \text{ [Tbit]}$$

When an error is detected, the timeout error detection function stops.

The error status is cleared when the next communication is started (when the FTS bit in the RLN3nLTRC register is set), by software, or at a transition to LIN reset mode.

(2) Target Time Area for LIN Error Detection

Figure 16.13 shows the time domain in which the LIN/UART interface in LIN master mode performs monitoring for error detection.

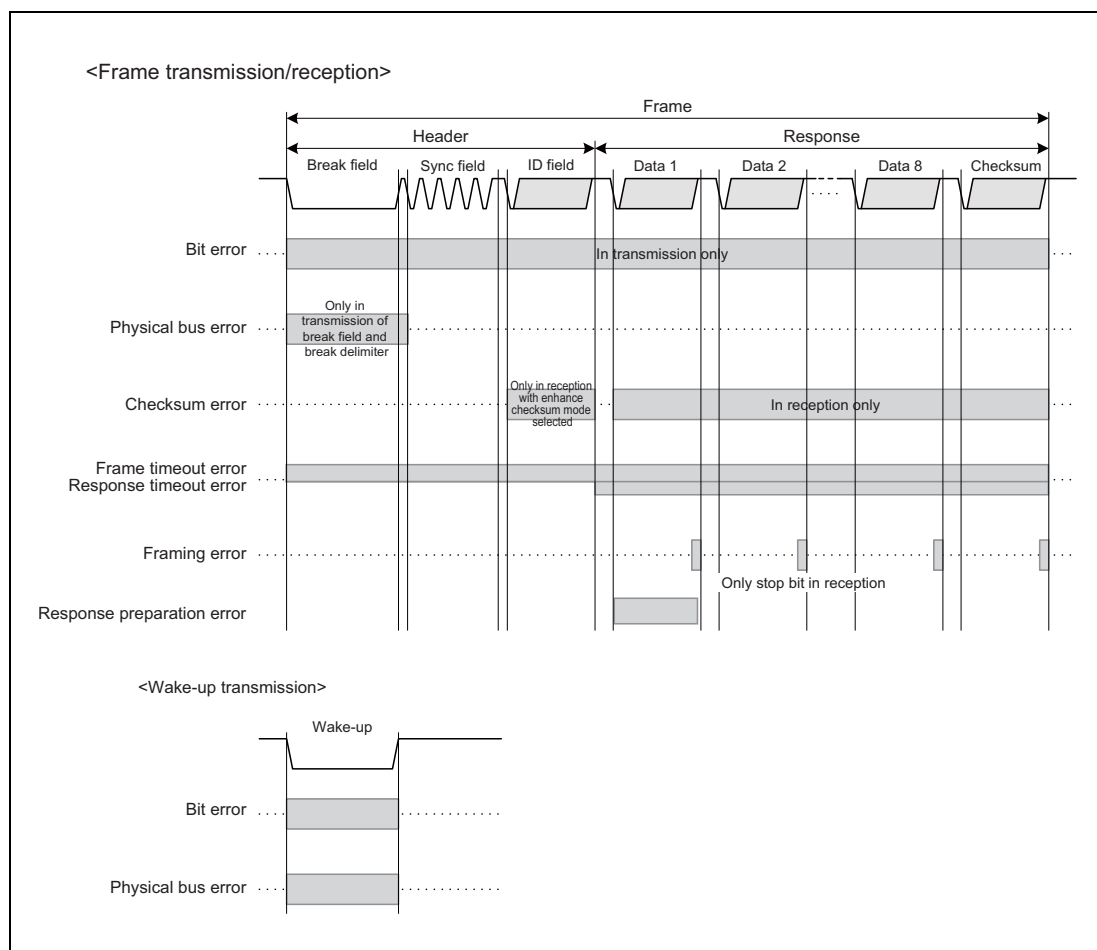

Figure 16.13 Target Time Area for LIN Error Detection (LIN Master Mode)

16.8 UART Mode

In LIN reset mode, setting the LMD bits in the RLIN3nLMD register to 01_B (UART mode) and the OM0 bit in the RLIN3nLCUC register to 1 changes the mode to UART mode, turning the OMM0 bit in the RLIN3nLMST register to 1.

16.8.1 Transmission

Figure 16.14 shows LIN/UART interface (in UART mode) transmission operations; **Table 16.65** shows LIN/UART interface (in UART mode) transmission processing.

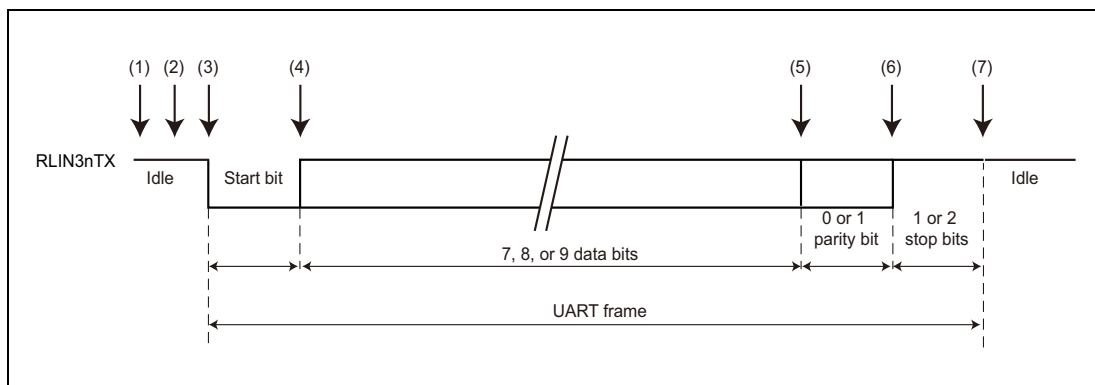

Figure 16.14 LIN/UART Interface (in UART Mode) Transmission Operation

16.8.1.1 Continuous Transmission

The LIN/UART interface (in UART mode) can transmit multiple sets of data continuously by using the RLN3nLUTDR register. **Figure 16.15** shows an operation example where the transmission interrupt generation timing is the start of transmission and an operation example where the transmission interrupt generation timing is the end of transmission.

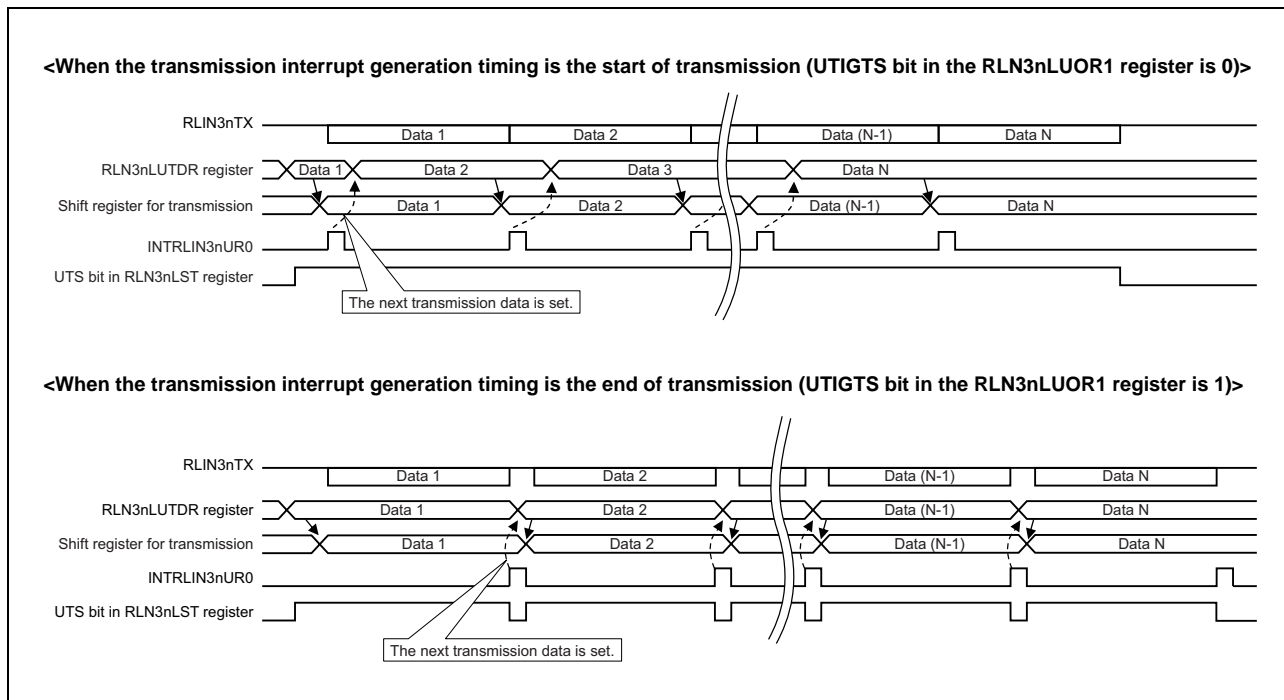

Figure 16.15 Operation Example of LIN/UART Interface (UART Mode) Continuous Transmission

An interrupt can be generated at the end of a transmission by changing the UTIGTS bit in the RLN3nLUOR1 register from 0 to 1 after the start of transmission of final data, provided that the transmission interrupt generation timing is the start of transmission and the end of transmission of final data needs to be known.

16.8.1.2 UART Buffer Transmission

The LIN/UART interface (in UART mode) has a maximum of nine bytes of UART buffers, and thus it is capable of performing continuous transmissions through the use of UART buffers.

Figure 16.16 shows the UART buffer transmission operation of the LIN/UART interface (in UART mode). **Table 16.66** shows the UART buffer transmission processing.

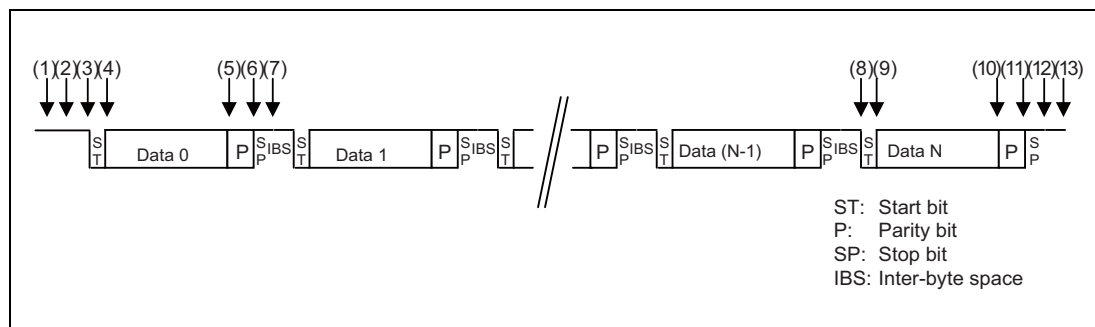

Figure 16.16 UART Buffer Transmission of LIN/UART Interface (in UART Mode)

| (10) | Transmits a parity bit when parity is used. |
| (11) | Transmits 1 or 2 stop bits. |
| (12) | <ul style="list-style-type: none"> • Sets the successful buffer transmission flag. • Clears the UART buffer transmit start bit (RTS). • A transmission interrupt request signal. • Clears the transmission status flag. |
| (13) | <ul style="list-style-type: none"> • Checks the RLN3nLST register, and clears flags • In the case of continuous data transmission, goes to step (2). |

(1) UART Buffer Transmission

For a 9-byte transmission, the contents stored in the RLN3nLUDB0 and RLN3nLDBR1 to RLN3nLDBR8 registers are transmitted to data areas 0 to 8. The RLN3nLUDB0 register is used only if 9-byte transmission is set. In other cases, the RLN3nLDBR1 to RLN3nLDBR8 registers are selected depending upon the length of data involved. For a 4-byte transmission, the contents stored in the RLN3nLDBR1 to RLN3nLDBR4 registers are transmitted to data areas 1 to 4, but the contents of the RLN3nLDBR5 to RLN3nLDBR8 registers are not transmitted. An RLIN3n transmission interrupt is generated after the number of data specified in the MDL [3:0] bits of the RLN3nLDFC register is transmitted. The spaces between transmission data items can be set in the IBS bit in the RLN3nLSC register.

Figure 16.17 shows a 9-byte UART buffer and the transmission processing.

Figure 16.17 UART Buffer and Transmission Processing (for 9-Byte Transmission)

16.8.1.3 Data Transmission

One bit of data is transmitted per Tbit.

In half-duplex communication, if the BERE bit in the RLN3nLEDE register is 1 (bit error detection enabled), the transmission data and the input pin level are compared bit by bit during data transmission, and the results are stored in the BER flag in the RLN3nLEST register (see **Section 16.8.5, Error Status**). The timing at which the input pin is sampled during data transmission can vary depending upon the settings of the LPRS[2:0] and NSPB[3:0] bits in the RLN3nLWBR register.

The bit error detection timing in UART mode is shown in **Table 16.67**.

Table 16.67 Error Detection Timing in UART Mode

| Sampling Count Per Bit | Bit Error Detection Timing |
|--|-------------------------------------|
| 6 samples | 3rd clock cycle + 1 prescaler clock |
| 7 samples | 4th clock cycle + 1 prescaler clock |
| 8 samples | 4th clock cycle + 1 prescaler clock |
| 9 samples | 5th clock cycle + 1 prescaler clock |
| 10 samples | 5th clock cycle + 1 prescaler clock |
| 11 samples | 6th clock cycle + 1 prescaler clock |
| 12 samples | 6th clock cycle + 1 prescaler clock |
| 13 samples | 7th clock cycle + 1 prescaler clock |
| 14 samples <td 7th clock cycle + 1 prescaler clock | |
| 15 samples | 8th clock cycle + 1 prescaler clock |
| 16 samples | 8th clock cycle + 1 prescaler clock |

Example of Data Transmission Timing (when 1 Tbit = 16 Sampling) is shown in **Figure 16.18**

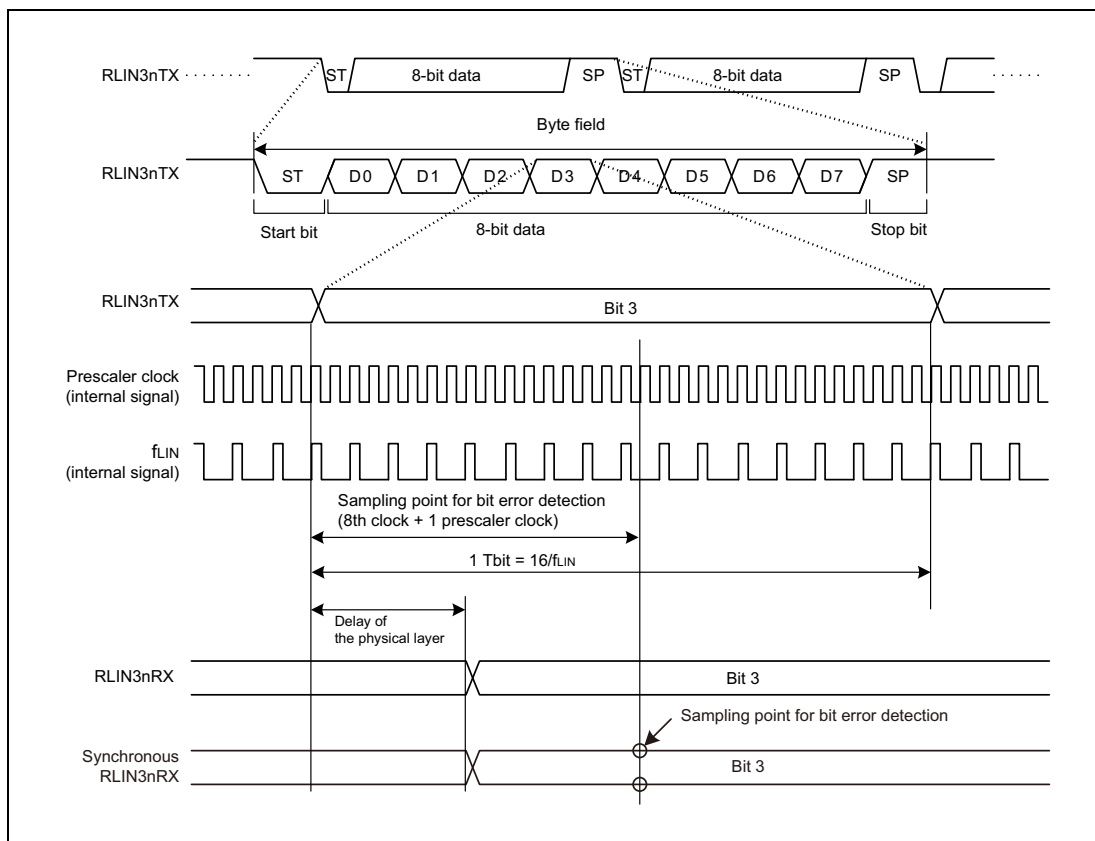

Figure 16.18 Example of Data Transmission Timing (When 1 Tbit = 16 Sampling)

16.8.1.4 Transmission Start Wait Function

For performing half-duplex communication, the LIN/UART interface (in UART mode) has the function of securing the reception stop bit length when switching from reception to transmission.

If it is desired to delay the start of transmission until the stop bits for the reception are completed, set data in the RLIN3nLUWTDR register, which is used only for the wait function, instead of setting transmission data in the RLIN3nLUTDR register as a start-of-transmission request. When transmitting from the UART buffer, set 1 (UART buffer transmission started) in the RTS bit in the RLIN3nLTRC register with 1 set in the UTSW bit in the RLIN3nLDFC register.

In such a case, the LIN/UART interface delays the start of transmission until the stop bits of reception data are completed.

Note that even if the UART stop bit length selection bit (USBLS) in RLIN3nBLFC register is 1 (stop bits = 2 bits), there is only a 1-bit delay.

Figure 16.19 shows the operation of transmission wait function.

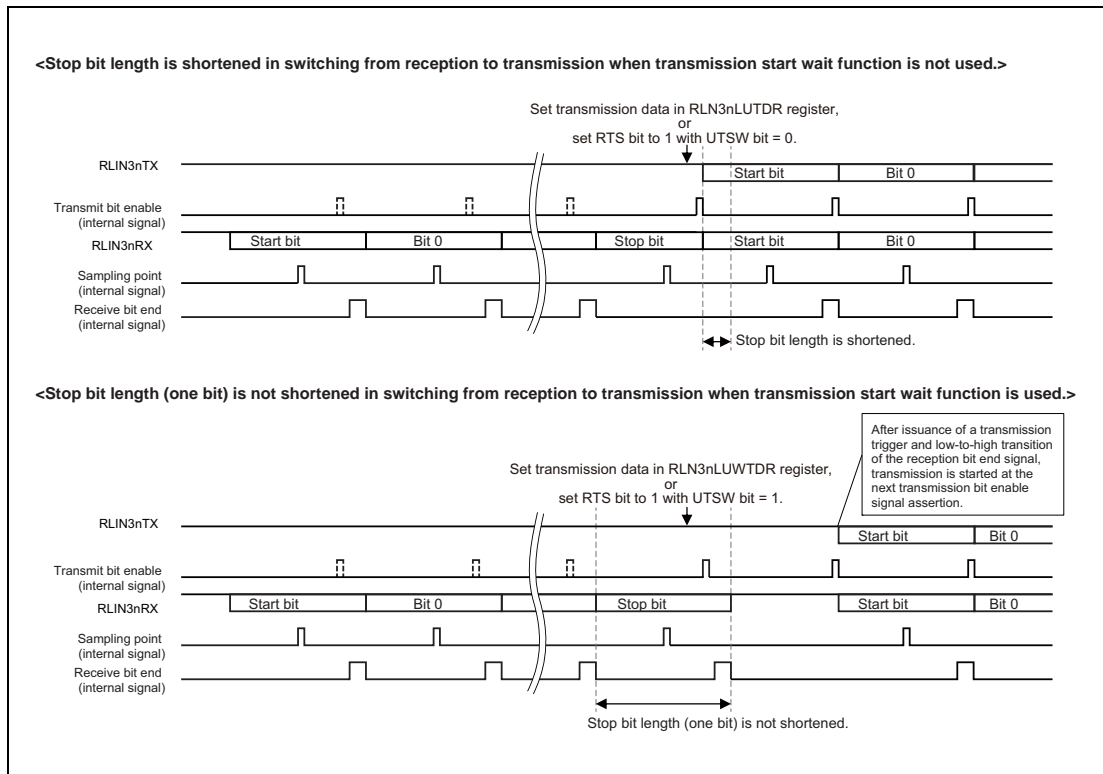

Figure 16.19 Example of Data Transmission Timing (When 1 Tbit = 16 samplings)

16.8.2 Reception

Figure 16.20 shows the LIN/UART interface (in UART mode) reception operation. Table 16.68 shows the LIN/UART interface (in UART mode) reception processing.

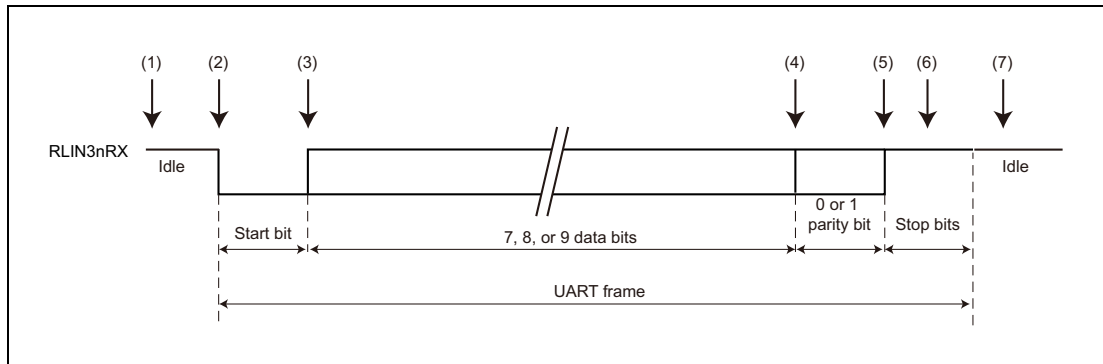

Figure 16.20 LIN/UART Interface (in UART Mode) Reception Operation

Table 16.68 LIN/UART Interface (in UART Mode) Reception Processing

| Software Processing | LIN/UART Interface Processing |
|---|--|
| (1) <ul style="list-style-type: none"> • Sets a baud rate. • Sets noise filter ON/OFF. • Enables error detection. • Sets data format. • Clears the LIN/UART interface from LIN reset mode. • Sets the receive enable bit (UROE bit) to 1. | <ul style="list-style-type: none"> • Waits for the reception to be enabled by software. • Waits for detection of a start bit. |
| (2) Waits for an interrupt request. | <ul style="list-style-type: none"> • Waits for a falling edge from the reception pin, and detects a start bit. • Sets the reception status flag. |
| (3) | Receives data. |
| (4) | Receives a parity bit when parity is used. |
| (5) | Receives only 1 stop bit. |
| (6) | <ul style="list-style-type: none"> • Generates a RLIN3n reception complete interrupt request. • Clears the reception status flag. |
| (7) Checks the RLN3nLST register, and clears flags | Waits for a falling edge from the reception pin. |

16.8.2.1 Data Reception

Data reception is performed by using the synchronized RLIN3nRX (an internal signal) that is the input from the RLIN3nRX pin synchronized with the prescaler clock.

The byte field is synchronized at the falling edge of the start bit for the synchronized RLIN3nRX signal. After the falling edge is detected, resampling is performed 0.5 Tbits later when the number of sampling per 1 Tbit is even and $\{(the\ number\ of\ sampling + 1) / 2\}$ / (the number of sampling) Tbits later when the number is odd. If the synchronized RLIN3nRX signal is low level, the bit is recognized as a start bit. The bit is not recognized as a start bit if the RLIN3nRX signal after the reset is de-asserted or if a high level is detected during the resampling.

After the start bit is detected, 1 bit is sampled per Tbit.

However, when the BERE bit in the RLN3nLEDE register is 1, the sampling point is the same as the bit error detection timing.

The LIN/UART interface has a noise filter function for received data. If the LRDNFS bit in the RLN3nLMD register is 0, the noise filter is used. For a sampling value, the value determined by a 3-sampling majority rule by the prescaler clock is used. If the LRDNFS bit in the RLN3nLMD register is 1, the noise filter is not used. In this case, for a sampling value, the synchronized RLIN3nRX value at the sampling position is used as is.

Figure 16.21 shows an example of data reception timing.

Figure 16.21 Example of Data Reception Timing (When Sampling Count is 16 in 1 Tbit)

16.8.3 Expansion Bits

The LIN/UART interface (in UART mode) can transmit and receive 9-bit long data by setting the UEBE bit in the RLIN3nLUOR1 register to 1.

16.8.3.1 Expansion Bit Transmission

The LIN/UART interface (in UART mode) can transmit 9-bit long data when the expansion bit enable bit (UEBE) in the UART option register 1 (RLIN3nLUOR1) is 1 and by writing the 9-bit data to either the UART transmission data register (RLIN3nLUTDR) or the UART wait transmission data register (RLIN3nLUWTD).

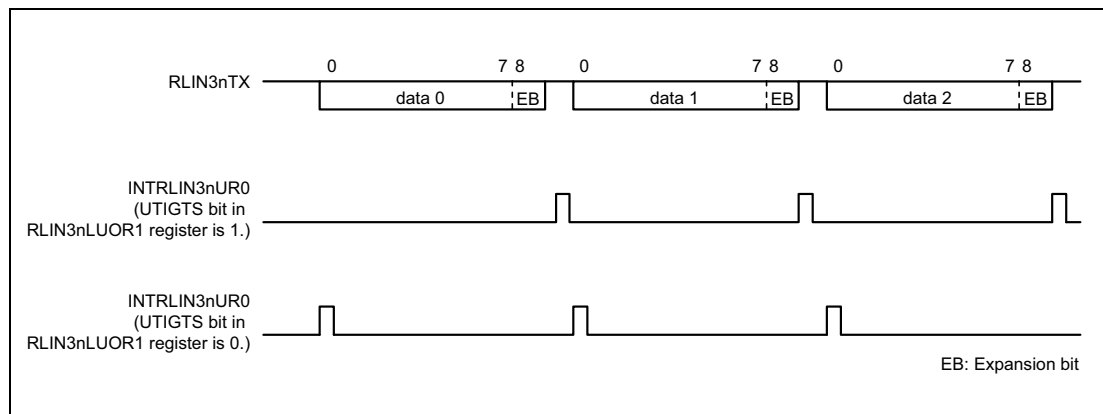

Figure 16.22 Transmission Example When Expansion Bit is Enabled (LSB First)

16.8.3.2 Expansion Bit Reception

With the LIN/UART interface (in UART mode), 9-bit data can always be received without requiring a comparison of expansion bits, provided that the expansion bit enable bit (UEBE) in the UART option register 1 (RLIN3nLUOR1) is 1, the expansion bit comparison disable bit (UECD) is 1, and the expansion bit data comparison enable bit (UEBDCE) is 0. Irrespective of the particular setting of the expansion bit detection level select bit (UEBDL) in the UART option register 1 (RLIN3nLUOR1), a successful RLIN3n reception interrupt is generated when 9-bit data is received.

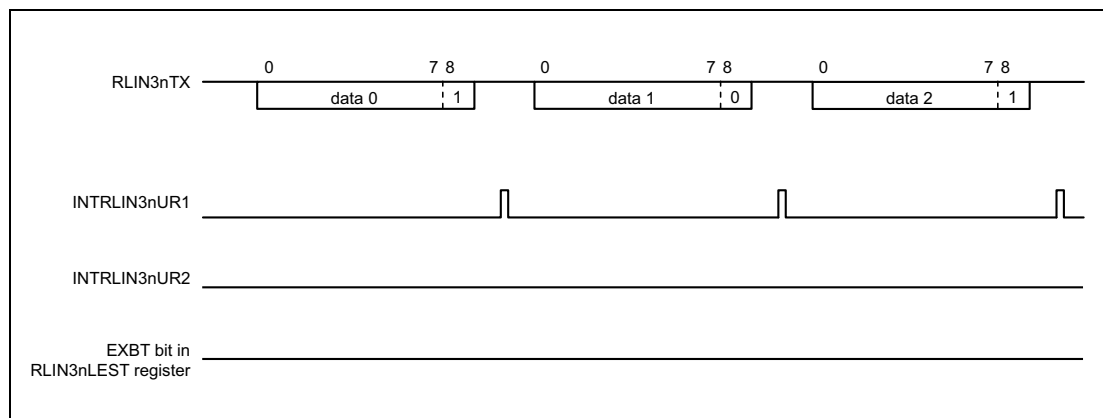

Figure 16.23 Expansion Bit Reception Example (LSB First)

16.8.3.3 Expansion Bit Reception (with Expansion Bit Comparison)

The LIN/UART interface (in UART mode) can compare received expansion bits and the UEBDL bits when the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1, the expansion bit comparison disable bit (UECD) is 0 and the expansion bit/data comparison enable bit (UEBDCE) is 0.

If the level that was set in the expansion bit detection level select bit (UEBDL) is detected, an RLIN3n status interrupt request is generated upon completion of data reception, and the expansion bit detection flag (EXBT) in the LIN error status register (RLN3nLEST) is set. If the reversed value of an expansion bit detection level is detected, RLIN3n reception complete interrupt request is generated. In either case, the received data is stored in the UART reception data register (RLN3nLURDR), unless there was an overrun error.

Figure 16.24 shows an example when the expansion bit detection level select bit (UEBDL) is set to 0.

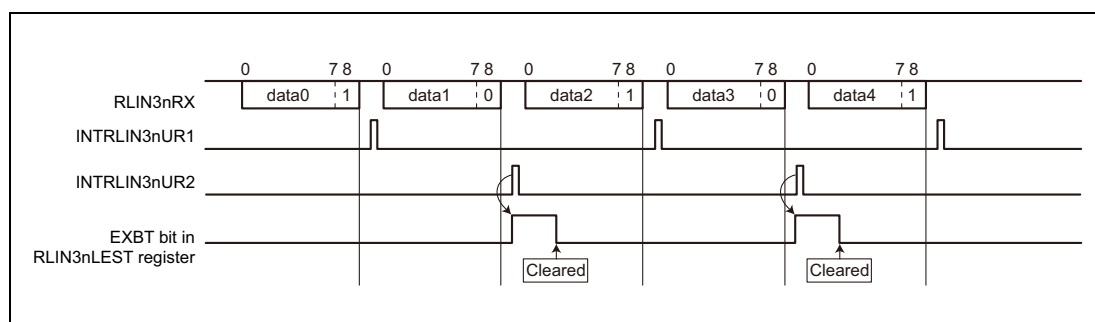

Figure 16.24 Expansion Bit Reception Example (with Expansion Bit Comparison) (LSB First, UEBDL = 0)

NOTE

- If a reception error (parity error, framing error, or overrun error) occurs in received data 0, 2, or 4 (if a reversed value of an expansion bit detection level is detected), an RLIN3n status interrupt is generated, and the error flag is updated. In this case, a successful RLIN3n reception interrupt is not generated.
- If a reception error (parity error, framing error, or overrun error) occurs in received data 1 or 3 (if an expansion bit detection level is detected), an RLIN3n status interrupt is generated, and the error flag is updated. If the overrun error occurs, the expansion bit detection flag (EXBT) is also set.

16.8.3.4 Expansion Bit Reception (with Data Comparison)

If the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1, the expansion bit comparison disable bit (UECD) is 0 and the expansion bit/data comparison enable bit (UEBDCE) is 1, and if the level that was set by the expansion bit detection level select bit (UEBDL) is detected, the LIN/UART interface (in UART mode) compares the 8 bits, exclusive of the expansion bit in the received data, with the a pre-set RLN3nLIDB register value.

If the result of the comparison is a match, the LIN/UART interface performs the following operations:

- Generates an RLIN3n status interrupt
- Sets an expansion bit detection flag (EXBT)
- Sets an ID match flag (IDMT)
- Stores the received data in the UART reception data register (RLN3nLURDR)

Even when the result of the comparison is a match, successful RLIN3n reception interrupt is not generated.

If the result of the comparison is not a match, no successful RLIN3n reception interrupt or RLIN3n status interrupt is generated, and the EXBT and IDMT flags are not set to 1. The received data is not stored in the UART reception data register (RLN3nLURDR).

When changing the UEBDCE bit to 0, make the change before the reception of another set of data is finished.

Figure 16.25 shows an example when the expansion bit detection level select bit (UEBDL) is set to 0.

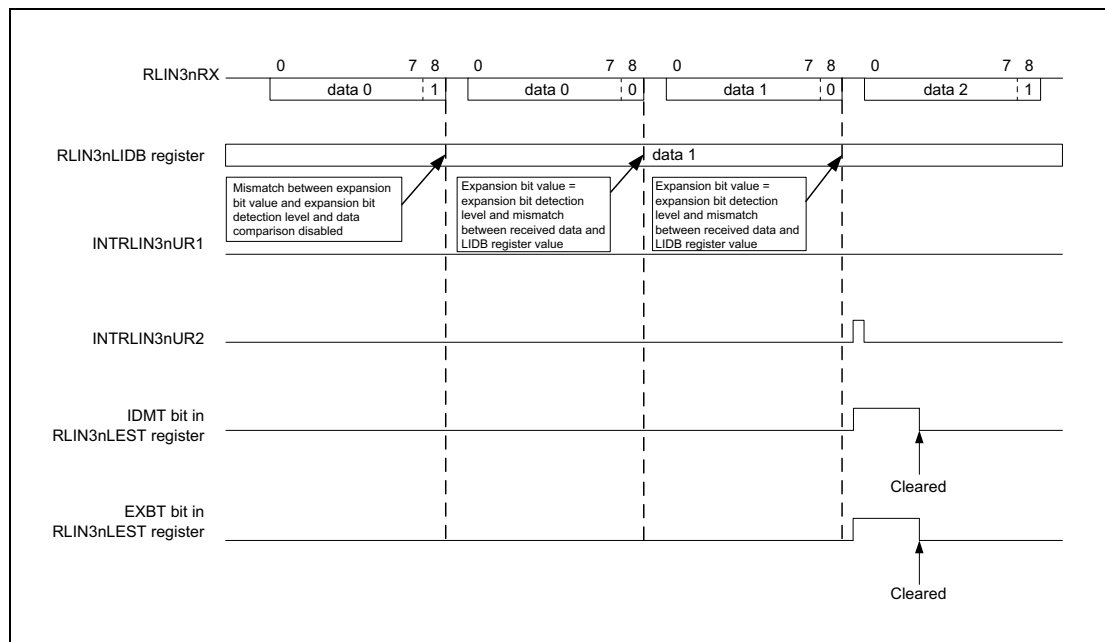

Figure 16.25 Expansion Bit Reception Example (with Data Comparison) (LSB First, UEBDL = 0)

NOTE

When a reception error (parity, framing, or overrun) occurs, a status interrupt of RLIN3n is generated and the error flag is updated. When the overrun error occurs and the comparison result matches, the EXBT and IDMT flags are also set.

16.8.4 Status

In UART mode, the LIN/UART interface can detect five types of statuses.

Two statuses, successful UART buffer transmission and error detection, can generate interrupt requests.

Table 16.69 shows the types of statuses available in UART mode.

Table 16.69 Types of Statuses in UART Mode

| Status | Status Set Condition | Status Clear Condition | Corresponding Bit | Interrupt |
|-------------------------------------|---|---|--------------------------------|-----------|
| Reset | After the OM0 bit in the RLN3nLCUC register is set to not-LIN-reset-mode, if actually the LIN/UART interface is cleared from LIN reset mode. | After the OM0 bit in the RLN3nLCUC register is set to LIN reset mode, if actually the LIN/UART interface enters LIN reset mode. | OMM0 bit in RLN3nLMST register | — |
| Successful UART buffer transmission | <ul style="list-style-type: none"> When the UTIGTS bit in the RLN3nLUOR1 register is 0 (transmission interrupt request is generated upon start of transmission), the transmission of the last data of the data length set by the MDL bit in the RLN3nLDFC register is started. When the UTIGTS bit in the RLN3nLUOR1 register is 1 (transmission interrupt request is generated upon end of transmission), the transmission of the data length set by the MDL bit in the RLN3nLDFC register is ended. | <ul style="list-style-type: none"> When cleared by software Transition to LIN reset mode | FTC flag in RLN3nLST register | √ |
| Error detection | If any of the UPER flag, IDMT flag, EXBT flag, FER flag, OER flag, and BER flag in the RLN3nLEST register is set to 1 (error detected). | <ul style="list-style-type: none"> When cleared by software*¹ Transition to LIN reset mode | ERR flag in RLN3nLST register | √ |
| Transmission status | <ul style="list-style-type: none"> When data is written to the RLN3nLUTDR or RLN3nLUWTDRC register. When 1 is written to the RTS bit in the RLN3nLTRC register. | <ul style="list-style-type: none"> The transmission of the data set in the RLN3nLUTDR or RLN3nLUWTDRC register is complete, but another transmission data item is not set The transmission of the data in the UART buffer is complete, and the RTS bit in the RLN3nLTRC register is cleared Transition to LIN reset mode | UTS flag in RLN3nLST register | — |
| Reception status | <ul style="list-style-type: none"> When a start bit is detected. | <ul style="list-style-type: none"> When a sampling point for stop bits is detected Transition to LIN reset mode | URS flag in RLN3nLST register | — |

Note 1. Writing a 0 to the UPER, IDMT, EXBT, FER, OER, and BER flags in the RLN3nLEST register when the LIN reset mode is being canceled sets the ERR flag in the RLN3nLST register to 0.

16.8.5 Error Status

Types of Error Statuses

In UART mode, the LIN/UART interface can detect four types of errors and two types of statuses. The condition of these statuses can be verified by using the corresponding bits in the RLIN3nLEST register.

Table 16.70 shows available status types.

Table 16.70 Types of Statuses in UART Mode

| Status | Error Detection Condition | Communication | Enable/Disable Detection | Corresponding Bit |
|-------------------------|---|--|--------------------------|----------------------------------|
| Bit error | The transmitted data and the data monitored on the receive pin do not match ¹ | Continues until the transmission of the set transmission data is finished. | Enabled | BER flag in RLIN3nLEST register |
| Overrun error | After received data is stored in the RLIN3nLURDR register, another data item is received before the data is read. (In this case, no data is stored in the RLIN3nLURDR register). | — (Reception is finished by the time this error is detected) | Enabled | OER flag in RLIN3nLEST register |
| Framing error | When the first stop bit is low level in the reception processing. | — (Reception is finished by the time this error is detected) | Enabled | FER flag in RLIN3nLEST register |
| Parity error | The received parity value fails to match the parity value calculated from the received data | Continues until the data reception is finished. | Disabled ² | UPER flag in RLIN3nLEST register |
| Expansion bit detection | The value of the received expansion bit matches the value of the UEEDL bit in the RLIN3nLUOR1 register. | — | Enabled | EXBT flag in RLIN3nLEST register |
| ID match detection | The value of the received expansion bit matches the value of the UEEDL bit in the RLIN3nLUOR1 register and the 8-bit receive data excluding the expansion bit matches the value of the RLIN3nLIDB register. | — | Enabled | IDMT flag in RLIN3nLEST register |

Note 1. In the case of transmission from the UART buffer, bit errors are detected even in the space between UART frames (inter-byte space).

Note 2. Setting the UPS[1:0] bits in the RLIN3nLBFC register to 10_B (0 parity) disables the checking of parity bit values. In this case, no parity error is generated.

The error status is cleared by software or at a transition to LIN reset mode.

16.9 LIN Self-Test Mode

The LIN/UART interface provides a LIN self-test mode.

When the LIN/UART interface enters the LIN self-test mode, RLIN3nTX and RLIN3nRX are disconnected from external pins and RLIN3nTX and RLIN3nRX are connected to the LIN/UART interface internally. Therefore, the frame transmitted from RLIN3nTX is looped back to RLIN3nRX. The LIN self-test mode can perform tests exclusively in LIN mode.

The self-test can be performed in the following two modes:

- LIN master self-test mode (transmission): Header transmission and response transmission
- LIN master self-test mode (reception): Header transmission and response reception

In LIN self-test mode, operation is performed at the fastest baud rate, regardless of the setting of the baud rate generator.

Regardless of the setting of the baud rate related registers, the baud rate setting is the LIN communication clock source/16 [bps]. (The NSPB bits in the RLIN3nLWBR register should be set to 0000_B or 1111_B.)

In addition, in LIN self-test mode, the following functions are not supported.

- LIN wake-up mode
- Frame separate mode
- Multi-byte response transmission/reception
- Frame/response timeout error

Do not use these functions.

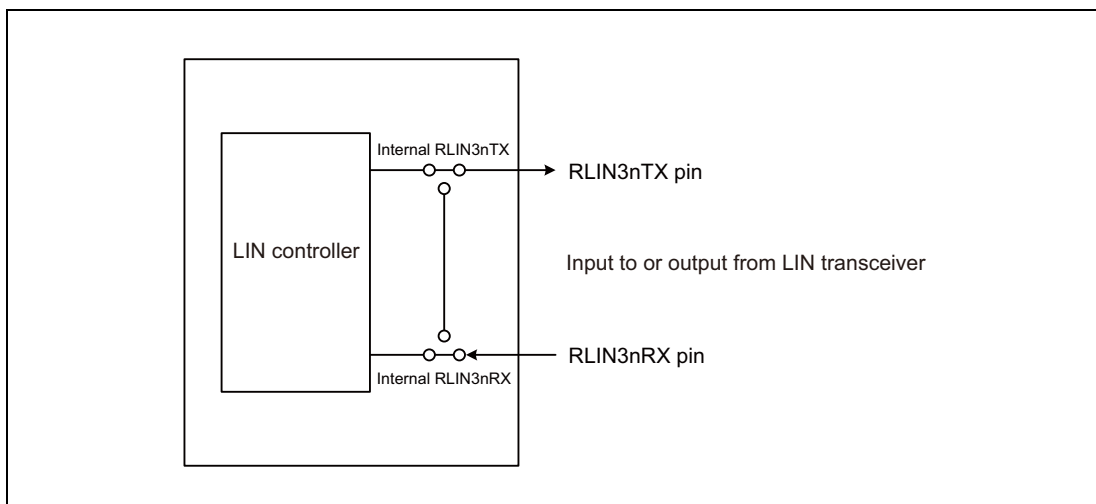

Figure 16.26 Connection in LIN Reset Mode, LIN Mode, and UART Mode

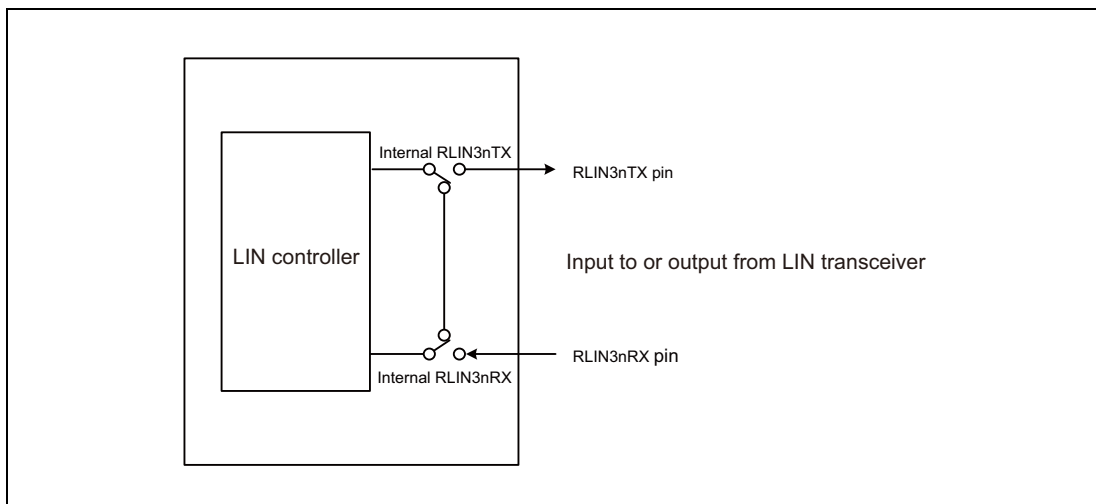

Figure 16.27 Connection in LIN Self-Test Mode

16.9.1 Transitioning to LIN Self-Test Mode

Writing to the RLN3nLSTC register makes a transition to the LIN self-test mode.

The LSTM bit in the RLN3nLSTC register set to 1 indicates that the mode has transitioned to the LIN self-test mode.

To transition to LIN self-test mode, be sure to execute a specific sequence. In that sequence, information must be written three times consecutively to the LIN self-test control register, as shown below:

- Transition to LIN reset mode
Set the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode).
Read the OMM0 bit in the RLN3nLMST register; verify that it is 0 (LIN reset mode).
- Select a LIN mode
LMD bits in RLN3nLMD = 00_B (LIN master mode)
1st write: RLN3nLSTC register = 1010 0111 (A7_H)
- 2nd write: RLN3nLSTC register = 0101 1000 (58_H)
- 3rd write: RLN3nLSTC register = 0000 0001_B (01_H)
- Verify the transition to LIN self-test mode
Read the LSTM bit in the RLN3nLSTC register; verify that it is 1 (LIN self-test mode).

If the key of the first write (A7_H) is written twice by mistake, the transition to LIN self-test mode is canceled. The above sequence should be retried from the step of first write. In addition, if a write to another LIN-related register is performed during transition to LIN self-test mode (three consecutive write operations to the RLN3nLSTC register), the transition is also canceled.

16.9.2 Transmission in LIN Master Self-Test Mode

To execute a self-test on LIN master transmission, perform the procedure below:

- Set the baud rate, noise filter, and interrupt output related registers.
 RLN3nLWBR register = 0000 xxxx_B^{*1}
 RLN3nLBRP0 register = xxxx xxxx_B^{*1}
 RLN3nLBRP1 register = xxxx xxxx_B^{*1}
 RLN3nLMD register = 00xx xx00_B^{*1}
- Set the interrupt enable and error enable related registers.
 RLN3nLIE register = 0000 xxxx_B^{*2}
 RLN3nLEDE register = x000 x0xx
- Set the break field and space related registers.
 RLN3nLBFC register = 00xx xxxx_B
 RLN3nLSC register = 00xx 0xxx_B
- Cancel the LIN reset mode.
 Write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are 11_B.
- Set the transmit frame related registers.
 RLN3nLDFC register = 00x1 xxxx_B
 RLN3nLIDB register = xxxx xxxx_B
 RLN3nLDRB1 to RLN3nLDRB8 registers = xxxx xxxx_B
- Header transmission → response transmission started
 Set the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started).
 The LIN master self-test mode (transmission) is executed. In this mode, interrupt are generated, and status and error status are also updated. The checksum is automatically calculated by the LIN/UART interface.
 To suspend the transmission during LIN master self-test mode (transmission), write 0 to the OM0 bit of the RLN3nLCUC register (LIN reset mode) and transition to LIN reset mode.
- When the transmission is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb (b = 1 to 8), and RLN3nLCBR registers (the data is stored as a reversed value because the transmitted value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the transmission fails to complete due to an error, the corresponding error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

Note: x: Don't care

Note 1. The following register settings are not reflected to the operation of the LIN self-test mode. The LPRS bit in the RLN3nLWBR register, the RLN3nLBRP0 register, the RLN3nLBRP1 register and the LCKS bit in the RLN3nLMD register. Therefore, those settings are not necessary.

Note 2. If necessary, set the related registers described in **Section 6, Interrupt**.

Note 3. When the successful header transmission interrupt and the successful frame transmission interrupt are used in the same interrupt processing, if the software processing of the successful header transmission interrupt is not completed before the generation of the successful frame transmission interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header transmission interrupt enabled).

The time required from the setting of the successful header transmission flag to the setting of the successful frame/wake-up transmission flag is calculated by the following formula.

$$10 \times (\text{number of data bytes} + 1) [\text{Tbit}]$$

$$1 \text{ Tbit} = 1/\text{frequency of LIN system clock source (fLIN)} \times 16$$

16.9.3 Reception in LIN Master Self-Test Mode

To execute a self-test on LIN master reception, perform the procedure below:

- Set the baud rate, noise filter, and interrupt output related registers.
 - RLN3nLWBR register = 0000 xxxx_B^{*1}
 - RLN3nLBRP0 register = xxxx xxxx_B^{*1}
 - RLN3nLBRP1 register = xxxx xxxx_B^{*1}
 - RLN3nLMD register = 00xx xx00_B^{*1}
- Set the interrupt enable and error enable related registers.
 - RLN3nLIE register = 0000 xxxx_B^{*2}
 - RLN3nLEDE register = x000 x0xx_B
- Set the break field and space related registers.
 - RLN3nLBFC register = 00xx xxxx_B
 - RLN3nLSC register = 00xx 0xxx_B^{*1}
- Cancel the LIN reset mode.
 - Write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are 11_B.
- Set the reception frame related registers.
 - RLN3nLDFC register = 00x0 xxxx_B
 - RLN3nLIDB register = xxxx xxxx_B
 - RLN3nLDRB1 to RLN3nLDRB8 registers = xxxx xxxx_B
 - RLN3nLCBR register = xxxx xxxx_B

Since the checksum value to be transmitted is not automatically calculated, users must calculate it and set it to the RLN3nLCBR register. A checksum test can be performed by setting an incorrect checksum value here.
- Header transmission → response reception started
 - Set the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started).
 - The LIN master self-test mode (reception) is executed. In this mode, interrupt are generated, and status and error status are also updated.
 - To suspend the transmission during LIN master self-test mode (reception), write 0 to the OM0 bit of the RLN3nLCUC register (LIN reset mode) and transition to LIN reset mode.
- When the reception is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb (b = 1 to 8), and RLN3nLCBR registers (the data is stored as a reversed value because the set value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the reception fails to complete due to an error, the corresponding error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

Note: x: Don't care

Note 1. The following register settings are not reflected to the operation of the LIN self-test mode. The LPRS bit in the RLN3nLWBR register, the RLN3nLBRP0 register, the RLN3nLBRP1

register, the LCKS bit in the RLN3nLMD register, and the IBS bit in the RLN3nLSC register. Therefore, those settings are not necessary.

Note 2. If necessary, set the related registers described in **Section 6, Interrupt**.

Note 3. When the successful header transmission interrupt and the successful frame reception interrupt are used in the same interrupt processing, if the software processing of the successful header transmission interrupt is not completed before the generation of the successful frame reception interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header transmission interrupt enabled).

The time required from the setting of the successful header transmission flag to the setting of the successful frame/wake-up reception flag is calculated by the following formula.

$$10 \times (\text{number of data bytes} + 1) \text{ [Tbit]}$$

$$1 \text{ Tbit} = 1/\text{LIN system clock source (fLIN)} \times 16$$

16.9.4 Terminating LIN Self-Test Mode

To terminate LIN self-test mode, perform the procedure below:

- Write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register.
If the OMM1 and OMM0 bits in the RLN3nLMST register are not 11_B, write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register. After confirming that the OMM1 and OMM0 bits in the RLN3nLMST register are set to 11_B, transition to LIN reset mode.
- Verify the cancelation of LIN self-test mode.
Read the LSTM bit in the RLN3nLSTC register; confirm that it is 0 (not in LIN self-test mode).
- Verify the transition to LIN reset mode.
Read the OMM0 bit in the RLN3nLMST register; verify that it is 0 (LIN reset mode).

16.10 Baud Rate Generator

The prescaler clock is obtained by frequency-dividing the LIN communication clock source by the prescaler, and the LIN system clock (f_{LIN}) is obtained by frequency-dividing the prescaler clock by the baud rate generator. The clock obtained by frequency-dividing the LIN system clock (f_{LIN}) by the number of samplings is the baud rate. The reciprocal of this baud rate is called the bit time (Tbit).

The LIN/UART interface has two types of baud rate generators. The baud rate generator to be used is switched according to the mode.

16.10.1 LIN Master Mode

Figure 16.28 shows a block diagram of baud rate generation in LIN master mode.

Figure 16.28 Block Diagram of Baud Rate Generation in LIN Master Mode

By setting the RLIN3nLBRP0 register so that f_a is 307200 Hz ($= 19200 \times 16$), the resulting f_{LIN} are $f_a = 19200 \times 16$, $f_b = 9600 \times 16$, and $f_c = 2400 \times 16$. These f_{LIN} by 16 in the bit timing generator, enabling bit rates of 19200 bps, 9600 bps and 2400 bps, to be generated. Also, by setting the RLIN3nLBRP1 register so that f_d is 166672 Hz ($= 10417 \times 16$), the resulting f_{LIN} is $f_d = 10417 \times 16$. This f_{LIN} by 16 in the bit timing generator, enabling 10417 bps to be generated.

Table 16.71 shows examples of baud rate generation for each frequency of the LIN communications clock source (19200, 10417, 9600, and 2400 bps) in LIN master mode and the sizes of errors in the rates.

**Table 16.71 Example of Baud Rate Generation in LIN master mode
(19200 bps, 10417 bps, 9600 bps, and 2400 bps)**

| LIN Communication Clock Source | Prescaler | Baud Rate Generator 0 (N + 1) Dividing | Baud Rate Generator 0 (N + 1) Dividing | System Clock | Baud Rate | Error |
|--------------------------------|-----------|--|--|--------------|-----------|---------|
| 80 MHz | 1/2 | 130 | — | fa | 19230.77 | +0.16% |
| | 1/1 | — | 240 | fd | 10416.67 | -0.003% |
| | 1/2 | 130 | — | fb | 9615.38 | +0.16% |
| | 1/2 | 130 | — | fc | 2403.85 | +0.16% |

NOTE

The number of samples per bit is 16 (when RLN3nLWBR.NSPB[3:0] = 0000_B or 1111_B).

Baud rate is calculated by the following formula:

Baud rate of LIN slave

$$= \{\text{Frequency of LIN communication clock source}\} \times (\text{RLN3nLWBR.LPRS}[2:0] \text{ selection clock}) \\ \div (\text{RLN3nLBRP0} + 1) \div 16 \text{ [bps]} \text{ (When fa is selected for fLIN)}$$

$$= \{\text{Frequency of LIN communication clock source}\} \times (\text{RLN3nLWBR.LPRS}[2:0] \text{ selection clock}) \\ \div (\text{RLN3nLBRP0} + 1) \div 2 \text{ or } 16 \text{ [bps]} \text{ (When fb is selected for fLIN)}$$

$$= \{\text{Frequency of LIN communication clock source}\} \times (\text{RLN3nLWBR.LPRS}[2:0] \text{ selection clock}) \\ \div (\text{RLN3nLBRP0} + 1) \div 8 \div 16 \text{ [bps]} \text{ (When fc is selected for fLLIN)}$$

$$= \{\text{Frequency of LIN communication clock source}\} \times (\text{RLN3nLWBR.LPRS}[2:0] \text{ selection clock}) \\ \div (\text{RLN3nLBRP1} + 1) \div 2 \div 16 \text{ [bps]} \text{ (When fd is selected for fLIN)}$$

16.10.2 UART Mode

Figure 16.29 shows a block diagram of baud rate generation in UART mode.

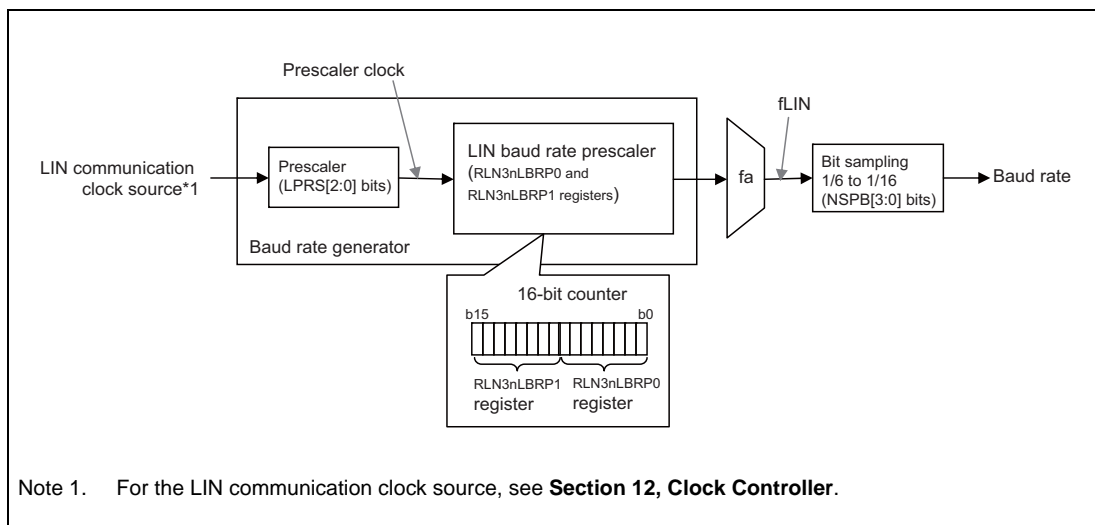

Figure 16.29 Block Diagram of Baud Rate Generation in UART Mode

UART baud rate is calculated with the following formula:

$$\begin{aligned} &\text{UART baud rate} \\ &= \{ \text{LIN communication clock source frequency} \} \times (\text{RLN3nLWBR.LPRS}[2:0] \text{ select clock}) \div \\ &(\text{RLN3nLBRP0} + 1) \div \{ \text{RLN3nLWBR.NSPB}[3:0] \text{ select count} \} [\text{bps}] \end{aligned}$$

Table 16.72 shows examples of baud rate generation for each frequency of the LIN communications clock source (19200, 9600, 2400, and 10417 bps) and the sizes of the errors in the rates.

Table 16.72 Examples of UART Baud Rate Setting (When LIN Communication Clock Source is 80 MHz)

| UART Baud Rate (Target) | Prescaler | Baud Rate Generator 01 (L + 1) Dividing | Baud Rate | Error |
|-------------------------|-----------|---|-----------|--------|
| 1200 bps | 1/2 | 2084 | 1199.616 | -0.03% |
| 2400 bps | 1/2 | 1042 | 2399.232 | -0.03% |
| 4800 bps | 1/2 | 520 | 4807.692 | +0.16% |
| 9600 bps | 1/2 | 260 | 9615.385 | +0.16% |
| 19200 bps | 1/2 | 130 | 19230.77 | +0.16% |
| 31250 bps | 1/2 | 80 | 31250.00 | 0.00% |
| 38400 bps | 1/2 | 66 | 37878.79 | -1.36% |

NOTE

The number of samples per bit in Table 16.72 is 16 (when RLN3nLWBR.NSPB[3:0] = 0000_B or 1111_B).

16.11 Noise Filter

The LIN/UART interface has a noise filter for reducing erroneous receiving of data due to noise. By setting the LRDNFS bit in the RLIN3nLMD register to 0 (use the noise filter), the noise filter is enabled. The noise filter samples the level of the synchronized RLIN3nRX with the prescaler clock, and outputs the sampling value determined by a 3-sampling majority rule. The value of each bit of the receive data is determined based on the noise filter output.

Figure 16.30 shows the configuration of the noise filter, **Figure 16.31** shows an example of a noise filter circuit, and **Figure 16.32** shows the determination of the received data when the noise filter is used.

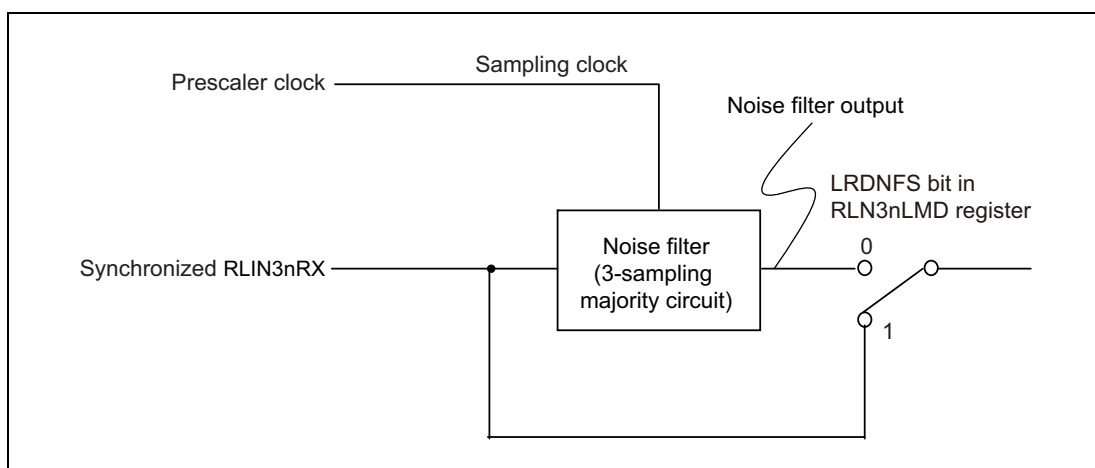

Figure 16.30 Configuration of Noise Filter

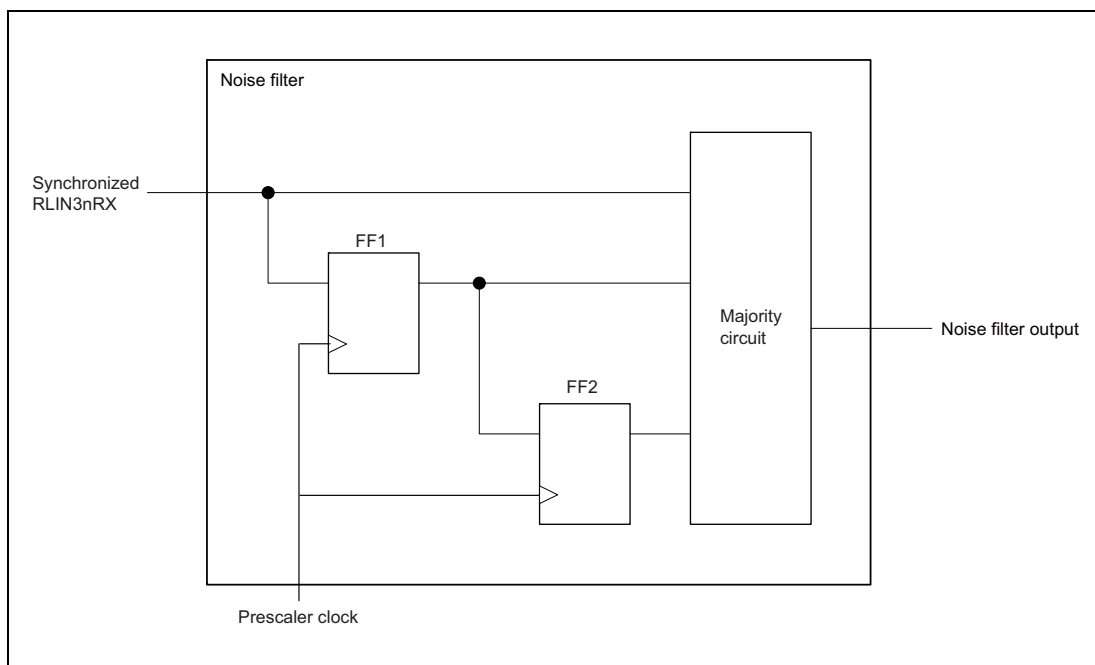

Figure 16.31 Example of Noise Filter Circuit

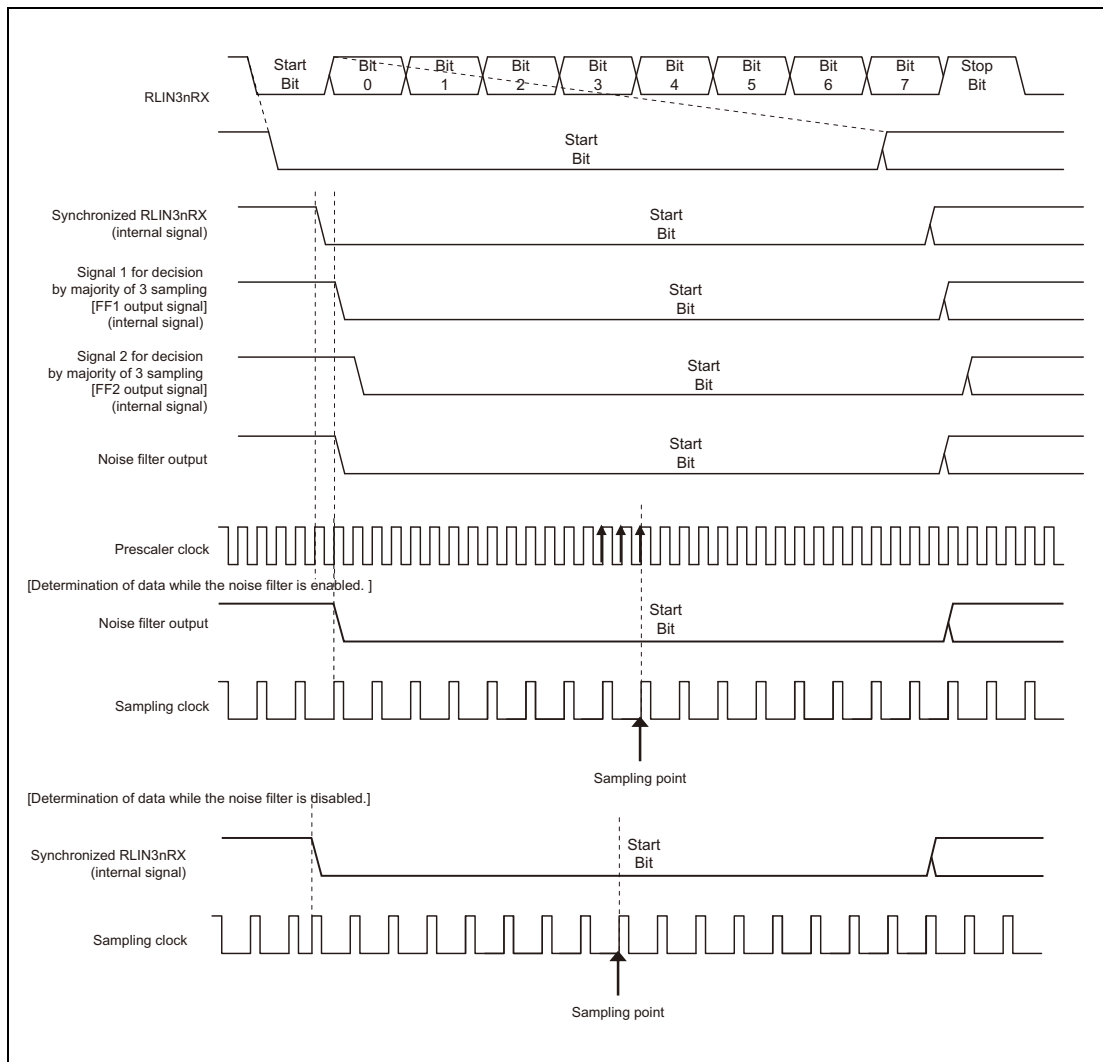

Figure 16.32 Determination of Received Data when Noise Filter is Used

Section 17 CANFD Interface (RS-CANFD)

This section contains a generic description of the CANFD Interface (RS-CANFD).

The first part of this section describes all RH850/P1M-E specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of RS-CANFD.

17.1 Features of RH850/P1M-E RS-CANFD

17.1.1 Number of Units and Channels

This microcontroller has the following number of RS-CANFD units.

Table 17.1 Number of Units

| Product Name | RH850/P1M-E 100 pins | RH850/P1M-E 144 pins |
|-----------------|-------------------------|-------------------------|
| Number of Units | 1 | |
| Name | RSCFDn (n = 0) | |

The individual products have the CANFD Interface Channels listed below.

Table 17.2 Unit Configurations and Channels

| Unit Name | Channel Name | RH850/P1M-E 100 pins | | RH850/P1M-E 144 pins | |
|-----------|--------------|-------------------------|----------------|-------------------------|----------------|
| | | 1 MB (3 ch) | 2 MB (3 ch) | 1 MB (3 ch) | 2 MB (3 ch) |
| RSCFD0 | CAN0 | √ | √ | √ | √ |
| | CAN1 | √ | √ | √ | √ |
| | CAN2 | √ | √ | √ | √ |

The RS-CANFD has two interface modes (classical CAN mode and CAN FD mode) and uses different registers for each mode. There are two types of register names RSCANnXXX and RSCFDnCFDXXX (XXX: arbitrary) depending on interface modes. When explaining specifications common to two registers, register names are described as RSCFDn(CFD)XXX.

Table 17.3 Indices

| Index | Meaning |
|-------|--|
| n | Throughout this section, the individual RS-CANFD units are generically indicated by the index "n" (n = 0); for example, RSCFDn(CFD)GCTR is the global control register of the RSCFDn unit. |
| m | Throughout this section, the individual channels of RS-CANFD units are generically indicated by the index "m" (m = 0 to 2); for example, RSCFDn(CFD)CmSTS is the channel m status register. |
| j | The individual registers associated with receive rule table are generically indicated by the index "j" (j = 0 to 15); for example, RSCFDn(CFD)GAFLIDj is the receive rule ID register. |
| k | The individual transmit/receive FIFO buffers are generically indicated by the index "k" (k = 0 to [channel m × 3 + 2]); for example, RSCFDn(CFD)CFCK is the transmit/receive FIFO buffer configuration/control register. |
| x | The individual receive FIFO buffers are generically identified by the index "x" (x = 0 to 7); for example, RSCFDn(CFD)RFSTx is the receive FIFO buffer status register. |
| d | Data field registers of transmit/receive FIFO buffers and receive FIFO buffers are identified by "d" (classical CAN mode: d = 0 to 1, CAN FD mode: d = 0 to 15). For example, the transmit/receive FIFO buffer data field register is described as RSCFDn(CFD)CFDFd_k. |
| q | The individual receive buffers are generically indicated by the index "q" (q = 0 to [channel m × 16 + 15]); for example, RSCFDn(CFD)RMIDq is the receive buffer ID register. |
| p | The individual transmit buffers are generically indicated by the index "p" (p = 0 to [channel m × 16 + 15]); for example, RSCFDn(CFD)TMCp is the transmit buffer control register. |
| b | Data field registers of receive buffers and transmit buffers are identified by "b" (classical CAN mode: b = 0 to 1, CAN FD mode: b = 0 to 4). For example, the receive buffer data field register is described as RSCFDn(CFD)RMDFb_q. |
| r | The individual RAM tests for CAN are generically indicated by the index "r" (r = 0 to 63); for example, RSCFDn(CFD)RPGACCr is the RAM test page access register. |
| y | The registers not covered above are indicated by the letter "y" (y = 0, 1); for example, RSCFDn(CFD)RMNDy is a receive buffer new data register. |

Note: The functions and descriptions of registers in this section are for the RS-CANFDs that has 3 channels (m = 0 to 2). When referring to information with indices, regard the index values as the ones corresponding to your target product.

The following table lists the values of indices for individual products.

Table 17.4 Indices for Individual Products (1/2)

| Index Correspondence of Each Product | | | | |
|--------------------------------------|---|---|---|---|
| | RH850/P1M-E 100 pins | | RH850/P1M-E 144 pins | |
| | 1 MB (3 ch) | 2 MB (3 ch) | 1 MB (3 ch) | 2 MB (3 ch) |
| j | 0 to 15 | 0 to 15 | 0 to 15 | 0 to 15 |
| k | 0 to 8 | 0 to 8 | 0 to 8 | 0 to 8 |
| x | 0 to 7 | 0 to 7 | 0 to 7 | 0 to 7 |
| d | 0, 1* ¹ 0 to 15* ² | 0, 1* ¹ 0 to 15* ² | 0, 1* ¹ 0 to 15* ² | 0, 1* ¹ 0 to 15* ² |
| q | 0 to 47 | 0 to 47 | 0 to 47 | 0 to 47 |
| p | 0 to 47 | 0 to 47 | 0 to 47 | 0 to 47 |

Table 17.4 Indices for Individual Products (2/2)

| Index Correspondence of Each Product | | | | |
|--------------------------------------|--|--|--|--|
| | RH850/P1M-E 100 pins | | RH850/P1M-E 144 pins | |
| | 1 MB (3 ch) | 2 MB (3 ch) | 1 MB (3 ch) | 2 MB (3 ch) |
| b | 0, 1 ^{*1} 0 to 4 ^{*2} | 0, 1 ^{*1} 0 to 4 ^{*2} | 0, 1 ^{*1} 0 to 4 ^{*2} | 0, 1 ^{*1} 0 to 4 ^{*2} |
| r | 0 to 63 | 0 to 63 | 0 to 63 | 0 to 63 |
| y | 0, 1 | 0, 1 | 0, 1 | 0, 1 |

Note 1. In classical CAN mode

Note 2. In CAN FD mode

17.1.2 Register Base Address

RSCFDn base addresses are listed in the following table.

RSCFDn register addresses are given as offsets from the base addresses in general.

Table 17.5 Register Base Address

| Base Address Name | Base Address |
|-------------------|------------------------|
| <RSCFD0_base> | FFD2 0000 _H |

17.1.3 Clock Supply

The RSCFDn clock supply is shown in the following table.

Table 17.6 Clock Supply

| Unit Name | Clock for the Unit | Supply Clock Name |
|-----------|--------------------|-------------------------------------|
| RSCFDn | clk_xincan | Main OSC clock CLK_MOSC |
| | clk | Low-speed peripheral clock CLK_LSB |
| | pclk | High-speed peripheral clock CLK_HSB |

The operating frequency of the RSCFDn depends on the transfer rate and the number of channels in use. **Table 17.7** shows the range of the frequency.

Table 17.7 Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/P1M-E

| Condition | | Range of Operating Frequency | | |
|---------------------------------|------------------------|------------------------------|--------------------------|-------------------|
| Transfer Rate | No. of Channels in Use | pclk | clk_xincan* ¹ | clk* ¹ |
| (Transfer Rate) ≤ 2Mbps | max. 3ch | 80 MHz (fixed) | 16 MHz (fixed) | 40 MHz (fixed) |
| 2Mbps < (Transfer Rate) ≤ 8Mbps | max. 3ch | 80 MHz (fixed) | (do not select) | 40 MHz (fixed) |

Note 1. Setting the DCS bit in the RSCFDn(CFD)GCFG register enables to select either clk_xincan or clk.

17.1.4 Interrupt Requests

The RSCFDn interrupt requests are listed in the following table.

Table 17.8 Interrupt Requests

| Unit Interrupt Signal | Outline | Interrupt Number | DMA Trigger Number |
|-----------------------|----------------------------|---|--|
| RSCFDn | | | |
| INTRCANGERR | CAN global error interrupt | ch189 | — |
| INTRCANGRECC | CAN receive FIFO interrupt | ch190 | — |
| CAN0 | INTRCAN0ERR | CAN0 error interrupt | ch183 |
| | INTRCAN0REC | CAN0 transmit/receive FIFO receive completion interrupt | ch184 |
| | INTRCAN0TRX | CAN0 transmit interrupt | ch185 |
| CAN1 | INTRCAN1ERR | CAN1 error interrupt | ch186 |
| | INTRCAN1REC | CAN1 transmit/receive FIFO receive completion interrupt | ch187 |
| | INTRCAN1TRX | CAN1 transmit interrupt | ch188 |
| CAN2 | INTRCAN2ERR | CAN2 error interrupt | ch191 |
| | INTRCAN2REC | CAN2 transmit/receive FIFO receive completion interrupt | ch192 |
| | INTRCAN2TRX | CAN2 transmit interrupt | ch193 |
| DMACANRF0 | RX FIFO DMA request 0 | — | ch13 ^{*1} or ch34 ^{*2} |
| DMACANRF1 | RX FIFO DMA request 1 | — | ch14 ^{*1} or ch35 ^{*2} |
| DMACANRF2 | RX FIFO DMA request 2 | — | ch15 ^{*1} or ch36 ^{*2} |
| DMACANRF3 | RX FIFO DMA request 3 | — | ch16 ^{*1} or ch37 ^{*2} |
| DMACANRF4 | RX FIFO DMA request 4 | — | ch17 ^{*1} or ch38 ^{*2} |
| DMACANRF5 | RX FIFO DMA request 5 | — | ch18 ^{*1} or ch39 ^{*2} |
| DMACANRF6 | RX FIFO DMA request 6 | — | ch19 ^{*1} or ch40 ^{*2} |
| DMACANRF7 | RX FIFO DMA request 7 | — | ch20 ^{*1} or ch41 ^{*2} |
| DMACANCF0 | COM FIFO DMA request 0 | — | ch21 ^{*1} or ch42 ^{*2} |
| DMACANCF1 | COM FIFO DMA request 1 | — | ch22 ^{*1} or ch43 ^{*2} |
| DMACANCF2 | COM FIFO DMA request 2 | — | ch23 ^{*1} or ch44 ^{*2} |

Note 1. Exclusively used with INTTAUD0li (i = 0 to 10)

Note 2. Exclusively used with INTTAUD1li (i = 0 to 10)

NOTE

For selecting the DMA requests, see **Section 7.11.1, DTS Trigger Select Register Descriptions.**

17.1.5 Reset Source

Please refer to **Section 8, Reset Controller**.

17.1.6 External Input/Output Signals

External input/output signals of RSCFDn are listed below.

Table 17.9 External Input/Output Signals

| Unit Signal Name | Outline | Alternative Port Pin Signal |
|---------------------|---------------------------|-----------------------------|
| RSCFD0 | | |
| CANmRX (m = 0 to 2) | CANm receive data input | CANmRX (m = 0 to 2) |
| CANmTX (m = 0 to 2) | CANm transmit data output | CANmTX (m = 0 to 2) |

17.1.7 Combinations of Pins and Ports

Combinations of RS-CANFD0 pins and ports are listed in the following table.

Table 17.10 Combinations of Pins and Ports

| Function | Channel Name | Pin Name | Port Name | | | |
|----------|--------------|-----------|-----------|---------|---------|---------|
| | | | Group 1 | Group 2 | Group 3 | Group 4 |
| RSCFD0 | CAN0 | RSCAN0RX0 | P2_0 | P3_7 | P4_5 | — |
| | | RSCAN0TX0 | P2_1 | P3_8 | P4_6 | — |
| | CAN1 | RSCAN0RX1 | P2_2 | P3_12 | P4_2 | P4_7*1 |
| | | RSCAN0TX1 | P2_3 | P3_13 | P4_3 | P4_3 |
| | CAN2 | RSCAN0RX2 | P5_6 | P5_6 | — | — |
| | | RSCAN0TX2 | P5_7*1 | P5_5 | — | — |

Note 1. Usable in the 144-pin product

17.2 Overview

17.2.1 Functional Overview

Table 17.11 shows the RS-CANFD module specifications. **Figure 17.1** shows the RS-CANFD module block diagram.

Table 17.11 RS-CANFD Module Specifications (1/3)

| Item | Specification |
|---------------------|--|
| Number of channels | 3 |
| Protocol | ISO11898-1 compliant Using CAN FD frames is selectable by switching interface modes. |
| Communication speed | <p>Classical CAN mode:</p> <ul style="list-style-type: none"> Maximum 1 Mbps $\text{Communication speed (CANm bit time clock)} = \frac{1}{\text{CANm bit time}}$ $\text{CANm bit time} = \text{CANmTq} \times \text{Tq count per bit}$ $\text{CANmTq} = \frac{(\text{BRP}[9:0] \text{ bits in the RSCANnCmCFG register} + 1)}{f_{\text{CAN}}}$ <p>f_{CAN}: Frequency of CAN clock (selected by the DCS bit in the RSCANnGCFG register)</p> <p>CAN FD mode:</p> <ul style="list-style-type: none"> Nominal bit rate: max.1 Mbps, data bit rate: max. 8 Mbps $\text{Transmission rate (CANm nominal bit time clock)} = \frac{1}{\text{CANm nominal bit time}}$ $\text{Transmission rate (CANm data bit time clock)} = \frac{1}{\text{CANm data bit time}}$ $\text{CANm nominal bit time} = \text{CANmTq(N)} \times \text{Tq count per nominal bit}$ $\text{CANm data bit time} = \text{CANmTq(D)} \times \text{Tq count per data bit}$ $\text{CANmTq(N)} = \frac{(\text{NBRP}[9:0] \text{ bits in the RSCFDnCFDCmNCFG register} + 1)}{f_{\text{CAN}}}$ $\text{CANmTq(D)} = \frac{(\text{DBRP}[7:0] \text{ bits in the RSCFDnCFDCmDCFG register} + 1)}{f_{\text{CAN}}}$ <p>f_{CAN}: Frequency of CAN clock (selected by the DCS bit in the RSCFDnCFDGCFG register)</p> <p>$m = 0$ to 2 Tq: Time quantum</p> |
| Buffer | <p>240 buffers in total</p> <ul style="list-style-type: none"> Individual buffers: 48 buffers (16 buffers × 3 channels) Transmit buffer: 16 buffers per channel Transmit queue: Single queue per channel (shared with the transmit buffer; up to 16 buffers allocatable) Shared buffers: 192 buffers for all channels Receive buffer: 0 to 48 buffers Receive FIFO buffer: 8 FIFO buffers (up to 128 buffers allocatable to each) Transmit/receive FIFO buffer: 3 FIFO buffers per channel (up to 128 buffers allocatable to each) ECC included |
| Reception function | <ul style="list-style-type: none"> Receives data frames and remote frames. Selects ID format (standard ID, extended ID, or both IDs) to be received. Sets interrupt enable/disable for each FIFO. Mirror function (reception of messages transmitted from the own CAN node) Timestamp function (to record message reception time as a 16-bit timer value) |

Table 17.11 RS-CANFD Module Specifications (2/3)

| Item | Specification |
|-----------------------------------|---|
| Reception filter function | <ul style="list-style-type: none"> • Selects receive messages according to 192 receive rules. • Sets the number of receive rules (0 to 128) for each channel. • Acceptance filter processing: Sets ID and mask for each receive rule. • DLC filter processing: Enables DLC filter check for each acceptance rule. |
| Receive message transfer function | <ul style="list-style-type: none"> • Routing function Transfers receive messages to arbitrary destinations (can be transferred to up to 8 buffers) Transfer destination: Receive buffer, receive FIFO buffer, and/or transmit/receive FIFO buffer • Label addition function Stores label information together with a message in a receive buffer and FIFO buffer. |
| Transmission function | <ul style="list-style-type: none"> • Transmits data frames and remote frames. • Selects ID format (standard ID, extended ID, or both IDs) to be transmitted. • Sets interrupt enable/disable for each transmit buffer and transmit/receive FIFO buffer. • Selects ID priority transmission or transmit buffer number priority transmission. • Transmit request can be aborted (possible to confirm with a flag) • One-shot transmission function |
| Interval transmission function | Transmits messages at configurable intervals (transmit mode or gateway mode of transmit/receive FIFO buffers) |
| Transmit queue function | Transmits all stored messages according to the ID priority. |
| Transmit history function | Stores the history information of transmission-completed messages Adds timestamp (recording message transmission time as a 16-bit timer value) to the history information. |
| Gateway function | Transmits a received message automatically. |
| Bus off recovery mode selection | Selects the method for returning from bus off state. <ul style="list-style-type: none"> • ISO11898-1 compliant • Automatic entry to channel halt mode at bus-off entry • Automatic entry to channel halt mode at bus-off end • Transition to channel halt mode by program request • Transition to the error-active state by program request (forcible return from the bus off state) |
| Error status monitoring | <ul style="list-style-type: none"> • Monitors CAN protocol errors (stuff error, form error, ACK error, CRC error, bit error, ACK delimiter error, and bus lock). • Detects error status transitions (error warning, error passive, bus off entry, and bus off recovery) • Reads the error counter. • Monitors DLC errors. |
| Interrupt source | 11 sources <ul style="list-style-type: none"> • Global interrupts (2 sources) Receive FIFO interrupt Global error interrupt • Channel interrupts (3 sources/channel) CANm transmit interrupt (m = 0 to 2) <ul style="list-style-type: none"> – CANm transmit complete interrupt – CANm transmit abort interrupt – CANm transmit/receive FIFO transmit complete interrupt (in transmit mode, gateway mode) – CANm transmit history interrupt – CANm transmit queue interrupt CANm transmit/receive FIFO receive complete interrupt (in receive mode, gateway mode) CANm error interrupt |
| CAN stop mode | Reduces power consumption by stopping clock supply to the RS-CANFD module. |
| CAN clock source | Selects the clk or the clk_xincan. As for the range of operating frequency, see Table 17.7 . |

Table 17.11 RS-CANFD Module Specifications (3/3)

| Item | Specification |
|---------------|--|
| Test function | Test function for user evaluation <ul style="list-style-type: none"> • Listen-only mode • Self-test mode 0 (external loopback) • Self-test mode 1 (internal loopback) • Restricted operation mode • RAM test (read/write test) • Inter-channel communication test [CRC error test enabled] |

17.2.2 Interface Modes

The RS-CANFD has two interface modes.

- Classical CAN mode: Handles only classical CAN frames.
- CAN FD mode: Handles classical CAN frames and CAN FD frames.

These two modes use different register maps with the same base address. Register maps change by switching interface modes.

Interface modes are switched by the RCMC bit in the RSCFDn(CFD)GRMCFG register.

17.2.3 Block Diagram

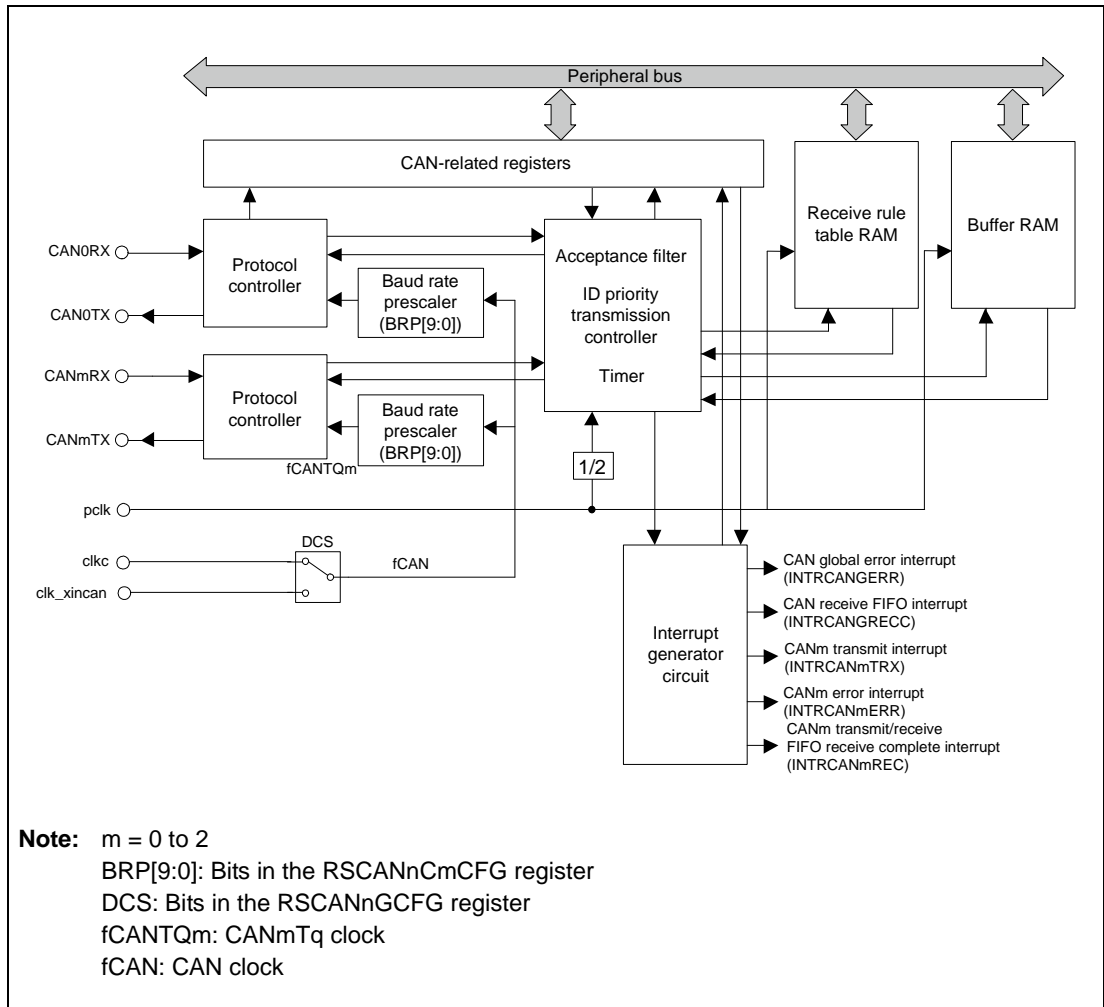

Figure 17.1 RS-CANFD Module Block Diagram (Classical CAN Mode)

In CAN FD mode, different clock signals are input to the baud rate prescaler and the protocol controller respectively. See **Section 17.11.1.3, Communication Speed Setting**.

17.3 Registers (Classical CAN Mode)

17.3.1 List of Registers

The following tables list RS-CANFD registers to be used in classical CAN mode.

For details about <RSCFDn_base>, see **Section 17.1.2, Register Base Address**.

For details about registers initialized in Global reset mode or Channel reset mode, see following.

- **Table 17.180, Registers Initialized in Global Reset Mode or Channel Reset Mode**
- **Table 17.181, Registers Initialized Only in Global Reset Mode**

Table 17.12 Registers (1/2)

| Module | Register | Symbol | Address |
|--|--|-----------------|---|
| Interface mode-related registers | | | |
| RSCANn | Global interface mode select register | RSCANnGRMCFG | <RSCFDn_base> + 04FC _H |
| Channel-related registers | | | |
| RSCANn | Channel m Configuration Register | RSCANnCmCFG | <RSCFDn_base> + 0000 _H + (10 _H × m) |
| RSCANn | Channel m control register | RSCANnCmCTR | <RSCFDn_base> + 0004 _H + (10 _H × m) |
| RSCANn | Channel m status register | RSCANnCmSTS | <RSCFDn_base> + 0008 _H + (10 _H × m) |
| RSCANn | Channel m error flag register | RSCANnCmERFL | <RSCFDn_base> + 000C _H + (10 _H × m) |
| Global-related registers | | | |
| RSCANn | Global configuration register | RSCANnGCFG | <RSCFDn_base> + 0084 _H |
| RSCANn | Global control register | RSCANnGCTR | <RSCFDn_base> + 0088 _H |
| RSCANn | Global status register | RSCANnGSTS | <RSCFDn_base> + 008C _H |
| RSCANn | Global error flag register | RSCANnGERFL | <RSCFDn_base> + 0090 _H |
| RSCANn | Global timestamp counter register | RSCANnGTSC | <RSCFDn_base> + 0094 _H |
| RSCANn | Global TX Interrupt Status Register 0 | RSCANnGTINTSTS0 | <RSCFDn_base> + 0460 _H |
| RSCANn | Global FD configuration register | RSCANnGFDCFG | <RSCFDn_base> + 0474 _H |
| Receive rule-related registers | | | |
| RSCANn | Receive Rule Entry Control Register | RSCANnGAFLECTR | <RSCFDn_base> + 0098 _H |
| RSCANn | Receive Rule Configuration Register 0 | RSCANnGAFLCFG0 | <RSCFDn_base> + 009C _H |
| RSCANn | Receive Rule ID Register j | RSCANnGAFLIDj | <RSCFDn_base> + 0500 _H + (10 _H × j) |
| RSCANn | Receive Rule Mask Register j | RSCANnGAFLMj | <RSCFDn_base> + 0504 _H + (10 _H × j) |
| RSCANn | Receive Rule Pointer 0 Register j | RSCANnGAFLP0_j | <RSCFDn_base> + 0508 _H + (10 _H × j) |
| RSCANn | Receive Rule Pointer 1 Register j | RSCANnGAFLP1_j | <RSCFDn_base> + 050C _H + (10 _H × j) |
| Receive buffer-related registers | | | |
| RSCANn | Receive Buffer Number Register | RSCANnRMNB | <RSCFDn_base> + 00A4 _H |
| RSCANn | Receive Buffer New Data Register y | RSCANnRMNDy | <RSCFDn_base> + 00A8 _H + (04 _H × y) |
| RSCANn | Receive Buffer ID Register q | RSCANnRMIDq | <RSCFDn_base> + 0600 _H + (10 _H × q) |
| RSCANn | Receive Buffer Pointer Register q | RSCANnRMPTRq | <RSCFDn_base> + 0604 _H + (10 _H × q) |
| RSCANn | Receive Buffer Data Field 0 Register q | RSCANnRMDf0_q | <RSCFDn_base> + 0608 _H + (10 _H × q) |
| RSCANn | Receive Buffer Data Field 1 Register q | RSCANnRMDf1_q | <RSCFDn_base> + 060C _H + (10 _H × q) |
| Receive FIFO buffer-related registers | | | |
| RSCANn | Receive FIFO Buffer Configuration and Control Register x | RSCANnRFCCx | <RSCFDn_base> + 00B8 _H + (04 _H × x) |
| RSCANn | Receive FIFO Buffer Status Register x | RSCANnRFSTSx | <RSCFDn_base> + 00D8 _H + (04 _H × x) |
| RSCANn | Receive FIFO Buffer Pointer Control Register x | RSCANnRFPCTRx | <RSCFDn_base> + 00F8 _H + (04 _H × x) |
| RSCANn | Receive FIFO Buffer Access ID Register x | RSCANnRFIDx | <RSCFDn_base> + 0E00 _H + (10 _H × x) |
| RSCANn | Receive FIFO Buffer Access Pointer Register x | RSCANnRFPTRx | <RSCFDn_base> + 0E04 _H + (10 _H × x) |
| RSCANn | Receive FIFO Buffer Access Data Field 0 Register x | RSCANnRFDf0_x | <RSCFDn_base> + 0E08 _H + (10 _H × x) |

Table 17.12 Registers (2/2)

| Module | Register | Symbol | Address |
|---|--|-----------------|---|
| RSCANn | Receive FIFO Buffer Access Data Field 1 Register x | RSCANnRFDF1_x | <RSCFDn_base> + 0E0C _H + (10 _H × x) |
| Transmit/Receive FIFO buffer related registers | | | |
| RSCANn | Transmit/receive FIFO Buffer Configuration and Control Register k | RSCANnCFCCk | <RSCFDn_base> + 0118 _H + (04 _H × k) |
| RSCANn | Transmit/receive FIFO Buffer Status Register k | RSCANnCFSTSk | <RSCFDn_base> + 0178 _H + (04 _H × k) |
| RSCANn | Transmit/receive FIFO Buffer Pointer Control Register k | RSCANnCFPCTRk | <RSCFDn_base> + 01D8 _H + (04 _H × k) |

| 1111 _B | Transmit buffer $16 \times m + 15$ to $16 \times m + 0$ |

17.3.2 Details of Interface Mode-Related Registers

17.3.2.1 RSCANnGRMCFG — Global Interface Mode Select Register

Access: RSCANnGRMCFG register can be read/written in 32-bit units
 RSCANnGRMCFG, RSCANnGRMCFGH registers can be read/written in 16-bit units
 RSCANnGRMCFG, RSCANnGRMCFGH, RSCANnGRMCFGH registers can be read/written in 8-bit units

Address: RSCANnGRMCFG: <RSCFDn_base> + 04FC_H
 RSCANnGRMCFG: <RSCFDn_base> + 04FC_H,
 RSCANnGRMCFGH: <RSCFDn_base> + 04FE_H
 RSCANnGRMCFG: <RSCFDn_base> + 04FC_H,
 RSCANnGRMCFGH: <RSCFDn_base> + 04FD_H,
 RSCANnGRMCFGH: <RSCFDn_base> + 04FE_H,
 RSCANnGRMCFGH: <RSCFDn_base> + 04FF_H

Value after reset: 0000 0000_H

| | | | | | | | | | | | | | | | | |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

Table 17.17 RSCANnGRMCFG Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 31 to 1 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |
| 0 | RCMC | Interface Mode Select 0: Classical CAN mode 1: CAN FD mode |

Note 1. The RSCANnGRMCFG register and the RSCFDnCFDGRMCFG register are the same register. Therefore, set either one of the registers.

Modify the RSCANnGRMCFG register only in global reset mode. Before setting other RS-CANFD registers, set this register.

RCMC Bit

Setting this bit to 0 makes classical CAN mode available. Setting this bit to 1 causes the RS-CANFD module to transition to CAN FD mode. To switch the RS-CANFD module from CAN FD mode to classical CAN mode, set the values after reset to all respective registers and bits allocated only to the register map in CAN FD mode, and then modify the value of RSCANnGRMCFG register.

17.3.3 Details of Channel-Related Registers

17.3.3.1 RSCANnCmCFG — Channel m Configuration Register (m = 0 to 2)

Access: RSCANnCmCFG register can be read/written in 32-bit units
 RSCANnCmCFGL, RSCANnCmCFGH registers can be read/written in 16-bit units
 RSCANnCmCFGLL, RSCANnCmCFGLH, RSCANnCmCFGHL, RSCANnCmCFGHH registers can be read/
 written in 8-bit units

Address: RSCANnCmCFG: $\langle \text{RSCFDn_base} \rangle + 0000_{\text{H}} + (10_{\text{H}} \times m)$
 RSCANnCmCFGL: $\langle \text{RSCFDn_base} \rangle + 0000_{\text{H}} + (10_{\text{H}} \times m)$,
 RSCANnCmCFGH: $\langle \text{RSCFDn_base} \rangle + 0002_{\text{H}} + (10_{\text{H}} \times m)$
 RSCANnCmCFGLL: $\langle \text{RSCFDn_base} \rangle + 0000_{\text{H}} + (10_{\text{H}} \times m)$,
 RSCANnCmCFGLH: $\langle \text{RSCFDn_base} \rangle + 0001_{\text{H}} + (10_{\text{H}} \times m)$,
 RSCANnCmCFGHL: $\langle \text{RSCFDn_base} \rangle + 0002_{\text{H}} + (10_{\text{H}} \times m)$,
 RSCANnCmCFGHH: $\langle \text{RSCFDn_base} \rangle + 0003_{\text{H}} + (10_{\text{H}} \times m)$

Value after reset: 0000 0000_H

| Bit Position | Bit Name | Function |
|--------------|------------|--|
| 19 to 16 | TSEG1[3:0] | Time Segment 1 Control b19 b18 b17 b16 0 0 0 0: Setting prohibited 0 0 0 1: Setting prohibited 0 0 1 0: Setting prohibited 0 0 1 1: 4 Tq 0 1 0 0: 5 Tq 0 1 0 1: 6 Tq 0 1 1 0: 7 Tq 0 1 1 1: 8 Tq 1 0 0 0: 9 Tq 1 0 0 1: 10 Tq 1 0 1 0: 11 Tq 1 0 1 1: 12 Tq 1 1 0 0: 13 Tq 1 1 0 1: 14 Tq 1 1 1 0: 15 Tq 1 1 1 1: 16 Tq |
| 15 to 10 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |
| 9 to 0 | BRP[9:0] | Prescaler Division Ratio setting When these bits are set to P (0 to 1023), the baud rate prescaler divides fCAN by P + 1. |

Modify the RSCANnCMCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode before transitioning to channel communication mode or channel halt mode. For a description of the bit timing parameters and settings, see **Section 17.11.1, Initial Settings**.

SJW[1:0] Bits

These bits are used to specify a Tq value for the resynchronization jump width. Allowed values are 1 Tq to 4 Tq, inclusive.

Set a value less than or equal to the value of the TSEG2 bits.

TSEG2[2:0] Bits

These bits are used to specify a Tq value for the length of phase segment 2 (PHASE_SEG2).

Allowed values are 2 Tq to 8 Tq, inclusive.

Set a value smaller than the value of the TSEG1 bits.

TSEG1[3:0] Bits

These bits are used to specify a Tq value for the total length of the propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1).

Allowed values are 4 Tq to 16 Tq, inclusive.

BRP[9:0] Bits

The CANmTq clock (fCANTQm) is calculated by dividing the CAN clock (fCAN) by the baud rate prescaler, ((BRP[9:0]) + 1). One clock cycle of the CANmTq clock is 1 Time Quantum (Tq).

17.3.3.2 RSCANnCMCTR — Channel m Control Register (m = 0 to 2)

Access: RSCANnCMCTR register can be read/written in 32-bit units
 RSCANnCMCTRL, RSCANnCMCTRH registers can be read/written in 16-bit units
 RSCANnCMCTRL, RSCANnCMCTRLH, RSCANnCMCTRHL, RSCANnCMCTRHH registers can be read/
 written in 8-bit units

Address: RSCANnCMCTR: <RSCFDn_base> + 0004_H + (10_H × m)
 RSCANnCMCTRL: <RSCFDn_base> + 0004_H + (10_H × m),
 RSCANnCMCTRH: <RSCFDn_base> + 0006_H + (10_H × m)
 RSCANnCMCTRL: <RSCFDn_base> + 0004_H + (10_H × m),
 RSCANnCMCTRLH: <RSCFDn_base> + 0005_H + (10_H × m),
 RSCANnCMCTRHL: <RSCFDn_base> + 0006_H + (10_H × m),
 RSCANnCMCTRHH: <RSCFDn_base> + 0007_H + (10_H × m)

Value after reset: 0000 0005_H

| 8 | BEIE | Bus Error Interrupt Enable 0: Bus error interrupt is disabled. 1: Bus error interrupt is enabled. |
| 7 to 4 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |
| 3 | RTBO | Forcible Return from Bus-off When this bit is set to 1, forcible return from the bus off state is made. This bit is always read as 0. |
| 2 | CSLPR | Channel Stop Mode 0: Other than channel stop mode 1: Channel stop mode |
| 1, 0 | CHMDC[1:0] | Mode Select b1 b0 0 0: Channel communication mode 0 1: Channel reset mode 1 0: Channel halt mode 1 1: Setting prohibited |

CRCT Bit

This bit is used to test the CRC generation circuit in the RS-CANFD module. Setting this bit to 1 inverts the first bit of the ID field when a message is received. With this inversion of bit, the CRC calculation result does not match the normal CRC value of the received frame, which can detect a CRC error (the CERR bit in the RSCANnCMERFL register is 1). When using this function, note the following.

- This function is available while the CTME bit in the RSCANnCMCTR register is 1 (communication test mode enabled).
- This function cannot communicate with other CAN nodes. Use this function for inter-channel communication test (the CmICBCE bit in the RSCANnGTSTCFG register is 1).

- Bit inversion in the ID field may cause bit stuffing rule violation. In that case, no CRC error is detected but a stuff error is detected.

Modify this bit only in channel halt mode. This bit is always 0 in channel reset mode.

CTMS[1:0] Bits

These bits are used to select a communication test mode. Modify these bits in channel halt mode only. These bits are set to 0 in channel reset mode.

CTME Bit

Setting this bit to 1 enables communication test mode. Modify this bit in channel halt mode. This bit is set to 0 in channel reset mode.

ERRD Bit

This bit is used to control the display mode of bits 14 to 8 in the RSCANnCMERFL register.

When this bit is cleared to 0, if any error is detected while the flags of bits 14-8 in the RSCANnCMERFL register are all 0, only the flags of the first error event are set to 1. If two or more errors occur in the first error event, all the flags of the detected errors are set to 1.

When this bit is set to 1, all the flags of errors that have occurred are set to 1 regardless of the error occurrence order.

Modify this bit only in channel reset mode or channel halt mode.

BOM[1:0] Bits

These bits are used to select the bus off recovery mode of the RS-CANFD module.

When the BOM[1:0] bits are set to 00_B, return from the bus off state to the error active state is compliant with the CAN specifications. That is, the RS-CANFD module reenters the CAN communication (error active state) after 11 consecutive recessive bits are detected 128 times. A bus off recovery interrupt request is generated at the time of return from the bus off state. Even if the CHMDC[1:0] bits are set to 10_B (channel halt mode) before recessive bits are detected 128 times, the RS-CANFD module does not transition to channel halt mode until recessive bits are detected 128 times.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 01_B, the CHMDC[1:0] bits in the RSCANnCMCTR register (m = 0 to 2) are set to 10_B and the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated and the TEC[7:0] and REC[7:0] bits in the RSCANnCMSTS register are cleared to 00_H.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 10_B, the CHMDC[1:0] bits are set to 10_B and the RS-CANFD module transitions to channel halt mode after return from the bus off state (11 consecutive recessive bits are detected 128 times). A bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00_H.

When the BOM[1:0] bits are set to 11_B and the CHMDC[1:0] bits are set to 10_B while the RS-CANFD module is in the bus off state, the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00_H. However, if 11 consecutive recessive bits are detected 128 times and the RS-CANFD module has recovered to the error active state from the bus off state before the CHMDC[1:0] bits are set to 10_B, a bus off recovery interrupt request is generated.

If a program writes to the CHMDC[1:0] bits at the same time as the RS-CANFD module transitions to channel halt mode (at bus off entry when the BOM[1:0] bits are 01_B or at bus off end when the BOM[1:0] bits are 10_B), the program's writing takes precedence. Modify the BOM[1:0] bits only in channel reset mode.

TAIE Bit

When transmit abort of the transmit buffer is completed with the TAIE bit set to 1, an interrupt request is generated. Modify this bit only in channel reset mode.

ALIE Bit

When the ALF flag in the RSCANnCMERFL register is set to 1 with the ALIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BLIE Bit

When the BLF flag in the RSCANnCMERFL register is set to 1 with the BLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

OLIE Bit

When the OVLV flag in the RSCANnCMERFL register is set to 1 with the OLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BORIE Bit

When the BORF flag in the RSCANnCMERFL register is set to 1 with the BORIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BOEIE Bit

When the BOEF flag in the RSCANnCMERFL register is set to 1 with the BOEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EPIE Bit

When the EPF flag in the RSCANnCMERFL register is set to 1 with the EPIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EWIE Bit

When the EWF flag in the RSCANnCMERFL register is set to 1 with the EWIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BEIE Bit

When the BEF flag in the RSCANnCMERFL register is set to 1 with the BEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

RTBO Bit

Setting this bit to 1 in the bus off state forcibly changes the state from the bus off state to the error active state. This bit is automatically cleared to 0. Setting this bit to 1 clears the TEC[7:0] and REC[7:0] bits in the RSCANn CmSTS register to 00_H and also clears the BOSTS flag in the RSCANn CmSTS register to 0 (not in bus off state). The other registers remain unchanged. No bus off recovery interrupt request is generated upon return from the bus off state in this case. Use this bit only when the BOM[1:0] bits in the RSCANn CmCTR register are 00_B (ISO11898-1 compliant).

A delay of up to 1 CAN bit time occurs after the RTBO bit is set to 1 until the RSCAN module transitions to the error active state. Set this bit to 1 in channel communication mode.

CSLPR Bit

Setting this bit to 1 places the channel into channel stop mode.

Clearing this bit to 0 makes the channel exit channel stop mode.

This bit should not be modified in channel communication mode or channel halt mode.

CHMDC[1:0] Bits

These bits are used to select a channel mode (channel communication mode, channel reset mode, or channel halt mode). For details, see **Section 17.6.2, Channel Modes**. Setting the CSLPR bit to 1 in channel reset mode allows transition to channel stop mode. Do not set the CHMDC[1:0] bits to 11_B.

When the RSCAN module has automatically transitioned to channel halt mode based on the setting of the BOM[1:0] bits, the CHMDC[1:0] bits are automatically set to 10_B.

17.3.3.3 RSCANn CmSTS — Channel m Status Register (m = 0 to 2)

Access: RSCANn CmSTS register can be read only in 32-bit units
 RSCANn CmSTSL, RSCANn CmSTSH registers can be read only in 16-bit units
 RSCANn CmSTSLL, RSCANn CmSTSLH, RSCANn CmSTSHL, RSCANn CmSTSHH registers can be read only in 8-bit units

Address: RSCANn CmSTS: <RSCFDn_base> + 0008_H + (10_H × m)
 RSCANn CmSTSL: <RSCFDn_base> + 0008_H + (10_H × m),
 RSCANn CmSTSH: <RSCFDn_base> + 000A_H + (10_H × m)
 RSCANn CmSTSLL: <RSCFDn_base> + 0008_H + (10_H × m),
 RSCANn CmSTSLH: <RSCFDn_base> + 0009_H + (10_H × m),
 RSCANn CmSTSHL: <RSCFDn_base> + 000A_H + (10_H × m),
 RSCANn CmSTSHH: <RSCFDn_base> + 000B_H + (10_H × m)

Table 17.20 RSCANn CmSTS Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 31 to 24 | TEC[7:0] | The transmit error counter (TEC) can be read. |
| 23 to 16 | REC[7:0] | The receive error counter (REC) can be read. |
| 15 to 8 | Reserved | These bits are read as the value after reset. |
| 7 | COMSTS | Communication Status Flag 0: Communication is not ready. 1: Communication is ready. |
| 6 | RECSTS | Receive Status Flag 0: Bus idle, in transmission or bus off state 1: In reception |
| 5 | TRMSTS | Transmit Status Flag 0: Bus idle or in reception 1: In transmission or bus off state |
| 4 | BOSTS | Bus Off Status Flag 0: Not in bus off state 1: In bus off state |
| 3 | EPSTS | Error Passive Status Flag 0: Not in error passive state 1: In error passive state |
| 2 | CSLPSTS | Channel Stop Status Flag 0: Not in channel stop mode 1: In channel stop mode |
| 1 | CHLTSTS | Channel Halt Status Flag 0: Not in channel halt mode 1: In channel halt mode |
| 0 | CRSTSTS | Channel Reset Status Flag 0: Not in channel reset mode 1: In channel reset mode |

TEC[7:0] Bits

These bits contain the transmit error counter value. For transmit error counter increment/decrement conditions, see the CAN specification (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

REC[7:0] Bits

These bits contain the receive error counter value. For receive error counter increment/decrement conditions, see the CAN specifications (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

COMSTS Flag

This bit indicates that communication is ready.

This flag is set to 1 when the CAN module has detected 11 consecutive recessive bits after it has transitioned from channel reset mode or channel halt mode to channel communication mode. This flag is cleared to 0 in channel reset mode or channel halt mode.

RECSTS Flag

This flag is set to 1 when reception has started, and is cleared to 0 when the bus has become idle or transmission has started.

TRMSTS Flag

This flag is set to 1 when transmission has started, and is cleared to 0 when the bus has become idle or reception has started. This flag remains 1 in the bus off state.

BOSTS Flag

This flag is set to 1 when the bus off state ($TEC[7:0] > 255$) is entered. It is cleared to 0 when the CAN module has exited the bus off state.

EPSTS Flag

This flag is set to 1 when the RS-CANFD module has entered the error passive state ($(128 \leq TEC[7:0] \leq 255)$ or $(128 \leq REC[7:0])$), It is cleared to 0 when the RS-CANFD module has exited the error passive state or has entered channel reset mode.

CSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel stop mode, and is cleared to 0 when the CAN module has returned from channel stop mode.

CHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel halt mode, and is cleared to 0 when the CAN module has returned from channel halt mode.

CRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel reset mode, and is cleared to 0 when the CAN module has transitioned to channel communication mode or channel halt mode. This flag remains 1 when the CAN module transitions from channel reset mode to channel stop mode.

17.3.3.4 RSCANnCmERFL — Channel m Error Flag Register (m = 0 to 2)

Access: RSCANnCmERFL register can be read/written in 32-bit units
 RSCANnCmERFLL, RSCANnCmERFLH registers can be read/written in 16-bit units
 RSCANnCmERFLLL, RSCANnCmERFLLH, RSCANnCmERFLHL, RSCANnCmERFLHH registers can be read/written in 8-bit units

Address: RSCANnCmERFL: <RSCFDn_base> + 000C_H + (10_H × m)
 RSCANnCmERFLL: <RSCFDn_base> + 000C_H + (10_H × m),
 RSCANnCmERFLH: <RSCFDn_base> + 000E_H + (10_H × m)
 RSCANnCmERFLLL: <RSCFDn_base> + 000C_H + (10_H × m),
 RSCANnCmERFLLH: <RSCFDn_base> + 000D_H + (10_H × m),
 RSCANnCmERFLHL: <RSCFDn_base> + 000E_H + (10_H × m),
 RSCANnCmERFLHH: <RSCFDn_base> + 000F_H + (10_H × m)

Value after reset: 0000 0000_H

| | | | | | | | | | | | | | | | | |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 17.21 RSCANnCmERFL Register Contents (1/2)

| Bit Position | Bit Name | Function |
|--------------|--------------|---|
| 31 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 30 to 16 | CRCREG[14:0] | CRC Calculation Data A CRC value calculated based on the transmit message or receive message is indicated. |
| 15 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 14 | ADERR | ACK Delimiter Error Flag 0: No ACK delimiter error is detected. 1: ACK delimiter error is detected. |
| 13 | BOERR | Dominant Bit Error Flag 0: No dominant bit error is detected. 1: Dominant bit error is detected. |
| 12 | B1ERR | Recessive Bit Error Flag 0: No recessive bit error is detected. 1: Recessive bit error is detected. |
| 11 | CERR | CRC Error Flag 0: No CRC error is detected. 1: CRC error is detected. |
| 10 | AERR | ACK Error Flag 0: No ACK error is detected. 1: ACK error is detected. |
| 9 | FERR | Form Error Flag 0: No form error is detected. 1: Form error is detected. |

Table 17.21 RSCANnCMERFL Register Contents (2/2)

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 8 | SERR | Stuff Error Flag 0: No stuff error is detected. 1: Stuff error is detected. |
| 7 | ALF | Arbitration-lost Flag 0: No arbitration-lost is detected. 1: Arbitration-lost is detected. |
| 6 | BLF | Bus Lock Flag 0: No channel bus lock is detected. 1: Channel bus lock is detected. |
| 5 | OVLf | Overload Flag 0: No overload is detected. 1: Overload is detected. |
| 4 | BORF | Bus Off Recovery Flag 0: No bus off recovery is detected. 1: Bus off recovery is detected. |
| 3 | BOEF | Bus Off Entry Flag 0: No bus off entry is detected. 1: Bus off entry is detected. |
| 2 | EPF | Error Passive Flag 0: No error passive is detected. 1: Error passive is detected. |
| 1 | EWf | Error Warning Flag 0: No error warning is detected. 1: Error warning is detected. |
| 0 | BEF | Bus Error Flag 0: No channel bus error is detected. 1: Channel bus error is detected. |

See the CAN specification (ISO11898-1) for a description of error occurrence conditions. To clear each flag of this register, the program must write a 0 to the corresponding bit. These flags cannot be set to 1 by the program. If any of these flags is set to 1 at the same time that the program writes 0 to the flag, the flag is still set to 1. The channel reset mode transition clears all of these flags to 0.

If the ERRD bit in the RSCANnCMCTR register is set to 0 (ie, only the flags for the first error event are displayed) and an error related to bits 14 to 8 of RSCANnCMERFL is detected, the flag bits are only set to 1 by the error event if bits 14 to 8 were all 0 at the time when the error occurred.

CRCREG[14:0] Flag

When the CTME bit in the RSCANnCMCTR register is set to 1 (communication test mode is enabled), the CRC value calculated based on the transmit or receive message can be read. When the CTME bit is set to 0 (communication test mode is disabled), these bits are always read as 0. This bit is always 0 in channel reset mode.

ADERR Flag

This flag is set to 1 when a form error has been detected in the ACK delimiter during transmission.

B0ERR Flag

This flag is set to 1 when a recessive bit has been detected even though a dominant bit was transmitted.

B1ERR Flag

This flag is set to 1 when a dominant bit has been detected even though a recessive bit was transmitted.

CERR Flag

This flag is set to 1 when a CRC error has been detected.

AERR Flag

This flag is set to 1 when an ACK error has been detected.

FERR Flag

This flag is set to 1 when a form error has been detected.

SERR Flag

This flag is set to 1 when a stuff error has been detected.

ALF Flag

This flag is set to 1 when an arbitration-lost has been detected.

BLF Flag

This flag is set to 1 when 32 consecutive dominant bits have been detected on the CAN bus in channel communication mode. After that, a bus lock can be detected again when either of the following conditions is met.

- A recessive bit is detected after the BLF bit has been cleared from 1 to 0.
- The CAN module transitions to channel reset mode and returns to channel communication mode after the BLF bit has been cleared from 1 to 0.

OVLf Flag

This flag is set to 1 when the overload frame transmit condition has been detected when performing reception or transmission.

BORF Flag

This flag is set to 1 when 11 consecutive recessive bits have been detected 128 times and the CAN module returns from the bus off state. However, this flag is not set to 1 if the CAN module returns from the bus off state in any of the following ways before 11 consecutive recessive bits are detected 128 times.

- The CHMDC[1:0] bits in the RSCANnCMCTR register are set to 01_B (channel reset mode).
- The RTBO bit in the RSCANnCMCTR register is set to 1 (forcible return from the bus off state is made).
- The BOM[1:0] bits in the RSCANnCMCTR register are set to 01_B (transition to channel halt mode at bus off entry).
- The CHMDC[1:0] bits in the RSCANnCMCTR register are set to 10_B (channel halt mode) before 11 consecutive recessive bits are detected 128 times with the BOM[1:0] bits set to 11_B (transition to channel halt mode upon a request from the program during bus off).

BOEF Flag

This flag is set to 1 when the bus off state is entered (TEC[7:0] value > 255). This flag is also set to 1 if the bus off state is entered when the BOM[1:0] bits in the RSCANn CmCTR register (m = 0 to 2) are set to 01_B (transition to channel halt mode at bus off entry).

EPF Flag

This flag is set to 1 when the error passive state is entered ($(128 \leq \text{TEC}[7:0] \leq 255)$ or $(128 \leq \text{REC}[7:0])$).

This flag is set to 1 only when the REC[7:0] or TEC[7:0] value first exceeds 127. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 127, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 127 or less and then the REC[7:0] or TEC[7:0] value exceeds 127 again.

EWf Flag

This flag is set to 1 only when the REC[7:0] or TEC[7:0] value first exceeds 95. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 95, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 95 or less and then the REC[7:0] or TEC[7:0] value exceeds 95 again.

BEF Flag

This flag is set to 1 when any one of the ADERR, BOERR, B1ERR, CERR, AERR, FERR, and SERR flags in the RSCANn CmERFL register is set to 1.

NOTE

To clear the flag of this register to 0, use a store instruction to write "0" to the given flag and "1" to the other flags.

17.3.4 Details of Global-Related Registers

17.3.4.1 RSCANnGCFG — Global Configuration Register

Access: RSCANnGCFG register can be read/written in 32-bit units
 RSCANnGCFGL, RSCANnGCFGH registers can be read/written in 16-bit units
 RSCANnGCFGLL, RSCANnGCFGLH, RSCANnGCFGHL, RSCANnGCFGHH registers can be read/written in 8-bit units

Address: RSCANnGCFG: <RSCFDn_base> + 0084_H
 RSCANnGCFGL: <RSCFDn_base> + 0084_H, RSCANnGCFGH: <RSCFDn_base> + 0086_H
 RSCANnGCFGLL: <RSCFDn_base> + 0084_H, RSCANnGCFGLH: <RSCFDn_base> + 0085_H,
 RSCANnGCFGHL: <RSCFDn_base> + 0086_H, RSCANnGCFGHH: <RSCFDn_base> + 0087_H

Value after reset: 0000 0000_H

| 12 | TSSS | Timestamp Source Select 0: pclk/2 ^{*1} 1: Bit time clock |

Table 17.22 RSCANnGCFG Register Contents (2/2)

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 11 to 8 | TSP[3:0] | Timestamp Clock Source Division b11 b10 b9 b8 0 0 0 0: Not divided 0 0 0 1: Divided by 2 0 0 1 0: Divided by 4 0 0 1 1: Divided by 8 0 1 0 0: Divided by 16 0 1 0 1: Divided by 32 0 1 1 0: Divided by 64 0 1 1 1: Divided by 128 1 0 0 0: Divided by 256 1 0 0 1: Divided by 512 1 0 1 0: Divided by 1024 1 0 1 1: Divided by 2048 1 1 0 0: Divided by 4096 1 1 0 1: Divided by 8192 1 1 1 0: Divided by 16384 1 1 1 1: Divided by 32768 |
| 7 | TMTSCE | Transmission Timestamp Enable 0: Transmission timestamp is disabled. 1: Transmission timestamp is enabled. |
| 6 | EEFE | ECC Error Flag Enable 0: The ECC error flag is disabled. 1: The ECC error flag is enabled. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | DCS | CAN Clock Source Select*2 0: clkc 1: clk_xincan |
| 3 | MME | Mirror Function Enable 0: Mirror function is disabled. 1: Mirror function is enabled. |
| 2 | DRE | DLC Replacement Enable 0: DLC replacement is disabled. 1: DLC replacement is enabled. |
| 1 | DCE | DLC Check Enable 0: DLC check is disabled. 1: DLC check is enabled. |
| 0 | TPRI | Transmit Priority Select 0: ID priority 1: Transmit buffer number priority |

Note 1. When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to 000_B.

Note 2. For the CAN clock frequency settings, see **Table 17.7, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/P1M-E**.

Modify the RSCANnGCFG register only in global reset mode.

ITRCP[15:0] Bits

These bits are used to set a clock source division value of the interval timer for FIFO buffers. See **Section 17.8.3.1, Interval Transmission Function**.

TSBTCS[2:0] Bits

When the TSSS bit is 1, these bits are used to select the channel of the bit time clock that will be the clock source of the timestamp counter.

TSSS Bit

This bit is used to select a clock source of the timestamp counter.

TSP[3:0] Bits

A clock obtained by dividing the clock source selected with the TSBTCS[2:0] bits and TSSS bit according to the TSP[3:0] bits is used as the timestamp counter count source.

TMTSCE Bit

Setting this bit to 1 makes it possible to store the timestamp of a transmitted message in the transmit history buffer. The timestamp is stored in TMTS[15:0] bits in the RSCANnTHLACCm register.

EEFE Bit

Setting this bit to 1 sets the EEFE bit in the RSCANnGERFL register to 1 when a 2-bit ECC error is detected during the transmission priority determination. At this time, the message in which a 2-bit ECC error was detected is not transmitted.

DCS Bit

When this bit is set to 0, clk is used as the clock source of the CAN clock (fCAN).

When this bit is set to 1, clk_xincan is used as the clock source of the CAN clock (fCAN).

For the CAN clock frequency settings, see **Table 17.7, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/P1M-E**.

MME Bit

Setting this bit to 1 makes the mirror function available.

DRE Bit

When the DRE bit is set to 1, the DLC value of the receive rule is stored in the buffer instead of the DLC value of the received message after the DLC value has passed through the DLC filter. In this case, a value of 00_H is stored in each data byte that exceeds the DLC value of the receive rule.

The DLC replacement function is only available when the DCE bit is set to 1 (DLC check is enabled).

DCE Bit

Setting this bit to 1 makes the DLC check function available. When disabling the DLC check function, set the GAFLDLC[3:0] bits in the RSCANnGAFLP0_j register to 0000_B before clearing the DCE bit in the RSCANnGCFG register to 0.

TPRI Bit

This bit is used to set the transmit priority.

When this bit is set to 0, ID priority is selected and the transmit priority complies with the CAN bus arbitration rule (ISO11898-1 specifications). When this bit is set to 1, transmit buffer number priority is selected and the transmit buffer with the smallest number has the highest priority.

When using the transmit queue, this bit should be set to 0.

17.3.4.2 RSCANnGCTR — Global Control Register

Access: RSCANnGCTR register can be read/written in 32-bit units
 RSCANnGCTRL, RSCANnGCTRH registers can be read/written in 16-bit units
 RSCANnGCTRL, RSCANnGCTRLH, RSCANnGCTRHL, RSCANnGCTRHH registers can be read/written in 8-bit units

Address: RSCANnGCTR: <RSCFDn_base> + 0088_H
 RSCANnGCTRL: <RSCFDn_base> + 0088_H, RSCANnGCTRH: <RSCFDn_base> + 008A_H
 RSCANnGCTRL: <RSCFDn_base> + 0088_H, RSCANnGCTRLH: <RSCFDn_base> + 0089_H,
 RSCANnGCTRHL: <RSCFDn_base> + 008A_H, RSCANnGCTRHH: <RSCFDn_base> + 008B_H

Value after reset: 0000 0005_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 17.23 RSCANnGCTR Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|--|
| 31 to 17 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | TSRST | Timestamp Counter Reset Setting the TSRST bit to 1 resets the timestamp counter. This bit is always read as 0. |
| 15 to 11 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 10 | THLEIE | Transmit History Buffer Overflow Interrupt Enable 0: Transmit history buffer overflow interrupt is disabled. 1: Transmit history buffer overflow interrupt is enabled. |
| 9 | MEIE | FIFO Message Lost Interrupt Enable 0: FIFO message lost interrupt is disabled. 1: FIFO message lost interrupt is enabled. |
| 8 | DEIE | DLC Error Interrupt Enable 0: DLC error interrupt is disabled. 1: DLC error interrupt is enabled. |
| 7 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | GSLPR | Global Stop Mode 0: Other than global stop mode 1: Global stop mode |
| 1, 0 | GMDC[1:0] | Global Mode Select b1 b0 0 0: Global operating mode 0 1: Global reset mode 1 0: Global test mode 1 1: Setting prohibited |

TSRST Bit

This bit is used to reset the timestamp counter. When this bit is set to 1, the RSCANnGTSC register is cleared to 0000_H.

THLEIE Bit

When the THLEIE bit is set to 1 and the THLES flag in the RSCANnGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

MEIE Bit

When the MEIE bit is set to 1 and the MES flag in the RSCANnGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

DEIE Bit

When the DEIE bit is set to 1 and the DEF flag in the RSCANnGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

GSLPR Bit

Setting this bit to 1 places the RSCAN module into global stop mode.

Clearing this bit to 0 release the RSCAN module from global stop mode.

This bit should not be modified in global operating mode or global test mode.

GMDC[1:0] Bits

These bits are used to select the mode of entire RS-CANFD module (global operating mode, global reset mode, or global test mode). For details, see **Section 17.6.1, Global Modes**. Setting the GSLPR bit to 1 when in global reset mode places the RS-CANFD module in global stop mode.

17.3.4.3 RSCANnGSTS — Global Status Register

Access: RSCANnGSTS register can be read only in 32-bit units
 RSCANnGSTSL, RSCANnGSTSH registers can be read only in 16-bit units
 RSCANnGSTSLL, RSCANnGSTSLH, RSCANnGSTSHL, RSCANnGSTSHH registers can be read only in 8-bit units

Address: RSCANnGSTS: <RSCFDn_base> + 008C_H
 RSCANnGSTSL: <RSCFDn_base> + 008C_H, RSCANnGSTSH: <RSCFDn_base> + 008E_H
 RSCANnGSTSLL: <RSCFDn_base> + 008C_H, RSCANnGSTSLH: <RSCFDn_base> + 008D_H,
 RSCANnGSTSHL: <RSCFDn_base> + 008E_H, RSCANnGSTSHH: <RSCFDn_base> + 008F_H

Value after reset: 0000 000D_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 17.24 RSCANnGSTS Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 31 to 4 | Reserved | When read, the value after reset is returned. |
| 3 | GRAMINIT | CAN RAM Initialization Status Flag 0: CAN RAM initialization is completed. 1: CAN RAM initialization is ongoing. |
| 2 | GSLPSTS | Global Stop Status Flag 0: Not in global stop mode 1: In global stop mode |
| 1 | GHLTSTS | Global Test Status Flag 0: Not in global test mode 1: In global test mode |
| 0 | GRSTSTS | Global Reset Status Flag 0: Not in global reset mode 1: In global reset mode |

GRAMINIT Flag

This flag indicates the initialization status of the CAN RAM.

This flag is set to 1 after the MCU has been reset, and is cleared to 0 when CAN RAM initialization is completed.

GSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to global stop mode, and is cleared to 0 when the CAN module has returned from global stop mode.

GHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global test mode, and is cleared to 0 when the CAN module has exited global test mode.

GRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global reset mode, and is cleared to 0 when the CAN module has exited global reset mode. This flag remains 1 even when the CAN module has transitioned from global reset mode to global stop mode.

17.3.4.4 RSCANnGERFL — Global Error Flag Register

Access: RSCANnGERFL register can be read/written in 32-bit units
 RSCANnGERFLL, RSCANnGERFLH registers can be read/written in 16-bit units
 RSCANnGERFLLL, RSCANnGERFLLH, RSCANnGERFLHL, RSCANnGERFLHH registers can be read/
 written in 8-bit units

Address: RSCANnGERFL: <RSCFDn_base> + 0090_H
 RSCANnGERFLL: <RSCFDn_base> + 0090_H, RSCANnGERFLH: <RSCFDn_base> + 0092_H
 RSCANnGERFLLL: <RSCFDn_base> + 0090_H, RSCANnGERFLLH: <RSCFDn_base> + 0091_H,
 RSCANnGERFLHL: <RSCFDn_base> + 0092_H, RSCANnGERFLHH: <RSCFDn_base> + 0093_H

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|-------|-------|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | EEF2 | EEF1 | EEF0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 | R/W*1 | R/W*1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|----|----|----|----|----|----|---|---|---|---|---|---|---|-------|-----|-------|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | THLES | MES | DEF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 17.25 RSCANnGERFL Register Contents (1/2)

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 19 | Reserved | When read, the value after reset is returned. When writing these bits, write the value after reset. |
| 18 | EEF2 | ECC Error Flag for Channel 2 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority |
| 17 | EEF1 | ECC Error Flag for Channel 1 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority |
| 16 | EEF0 | ECC Error Flag for Channel 0 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority |
| 15, 14 | Reserved | When read, the value after reset is returned. When writing these bits, write the value after reset. |
| 13 to 8 | Reserved | When read, the undefined value is returned. When writing these bits, write the value after reset. |
| 7, 6 | Reserved | When read, the value after reset is returned. When writing these bits, write the value after reset. |
| 5 | Reserved | When read, the undefined value is returned. When writing this bit, write the value after reset. |
| 4, 3 | Reserved | When read, the value after reset is returned. When writing these bits, write the value after reset. |
| 2 | THLES | Transmit History Buffer Overflow Status Flag 0: No transmit history buffer overflow has occurred. 1: A transmit history buffer overflow has occurred. |
| 1 | MES | FIFO Message Lost Status Flag 0: No FIFO message lost error has occurred. 1: A FIFO message lost error has occurred. |

Table 17.25 RSCANnGERFL Register Contents (2/2)

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 0 | DEF | DLC Error Flag 0: No DLC error has occurred. 1: A DLC error has occurred. |

All flags in the RSCANnGERFL register are cleared to 0 in global reset mode.

EEFm Flag

While the EEFE bit in the RSCANnGCFG register is 1, when a 2-bit ECC error is detected during the transmission priority determination of channel m (m = 0 to 2), the EEFm flag is set to 1, disabling message transmission. This flag can be cleared to 0 by writing 0 by the program.

THLES Flag

The THLES flag is set to 1 when any one of the THLELT flags in the RSCANnTHLSTSm register (m = 0 to 5) is set to 1.

This flag is cleared to 0 when the THLELT flags of all channels are set to 0.

MES Flag

The MES flag is set to 1 when any one of the RFMLT flags in the RSCANnRFSTSc register (x = 0 to 7) or the CFMLT flags in the RSCANnCFSTSk register (k = 0 to 8) is set to 1.

This flag is cleared to 0 when all RFMLT flags and CFMLT flags are set to 0.

DEF Flag

The DEF flag is set to 1 when an error has been detected during the DLC check. The program can clear this flag by writing 0 to this bit.

NOTE

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to "0" to "0", and the bits not to be set to "0" to "1".

17.3.4.5 RSCANnGTSC — Global Timestamp Counter Register

Access: RSCANnGTSC register can be read only in 32-bit units.
RSCANnGTSL, RSCANnGTSCH registers can be read only in 16-bit units.

Address: RSCANnGTSC: <RSCFDn_base> + 0094_H
RSCANnGTSL: <RSCFDn_base> + 0094_H, RSCANnGTSCH: <RSCFDn_base> + 0096_H

Value after reset: 0000 0000_H

| | | | | | | | | | | | | | | | | |
|-------------------|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 17.26 RSCANnGTSC Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 31 to 16 | Reserved | These bits are read as the value after reset. |
| 15 to 0 | TS[15:0] | Timestamp Value The timestamp counter value can be read. Counter Value: 0000 _H to FFFF _H |

TS[15:0] Bits

When the TS[15:0] bits are read, the read value shows the timestamp counter (16-bit free-running counter) value at that time. When the SOF is detected, the TS[15:0] value is captured and later stored in the receive buffer or the FIFO buffer.

Furthermore, while the TMTSCE bit in the RSCANnGCFG register is 1, the TS[15:0] value is stored in the transmit history buffer. The timestamp counter is initialized in global reset mode.

The timestamp counter start timing and stop timing depend on the count source.

- When the TSSS bit in the RSCANnGCFG register is 0 (pclk):
The timestamp counter starts counting when the RSCAN module has transitioned to global operating mode.
This counter stops counting when the RSCAN module has transitioned to global stop mode or global test mode.
- When the TSSS bit is 1 (CANm bit time clock):
The timestamp counter starts counting when the corresponding channel has transitioned to channel communication mode.
This counter stops counting when the corresponding channel has transitioned to channel reset mode or channel halt mode.

17.3.4.6 RSCANnGTINTSTS0 — Global TX Interrupt Status Register 0

Access: RSCANnGTINTSTS0 register can be read only in 32-bit units
 RSCANnGTINTSTS0L, RSCANnGTINTSTS0H registers can be read only in 16-bit units
 RSCANnGTINTSTS0LL, RSCANnGTINTSTS0LH, RSCANnGTINTSTS0HL, RSCANnGTINTSTS0HH registers can be read only in 8-bit units

Address: RSCANnGTINTSTS0: <RSCFDn_base> + 0460_H
 RSCANnGTINTSTS0L: <RSCFDn_base> + 0460_H, RSCANnGTINTSTS0H: <RSCFDn_base> + 0462_H
 RSCANnGTINTSTS0LL: <RSCFDn_base> + 0460_H, RSCANnGTINTSTS0LH: <RSCFDn_base> + 0461_H,
 RSCANnGTINTSTS0HL: <RSCFDn_base> + 0462_H, RSCANnGTINTSTS0HH: <RSCFDn_base> + 0463_H

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Note 1. This bit is automatically cleared in the global reset or channel reset mode.

Table 17.27 RSCANnGTINTSTS0 Register Contents (1/2)

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 31 to 21 | Reserved | These bits are read as the value after reset. When writing, write the value after reset. |
| 20 | THIF2 | Channel 2 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested. |
| 19 | CFTIF2 | Channel 2 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested. |
| 18 | TQIF2 | Channel 2 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested. |
| 17 | TAIF2 | Channel 2 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested. |
| 16 | TSIF2 | Channel 2 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested. |
| 15 to 13 | Reserved | These bits are read as the value after reset. |
| 12 | THIF1 | Channel 1 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested. |
| 11 | CFTIF1 | Channel 1 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested. |
| 10 | TQIF1 | Channel 1 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested. |
| 9 | TAIF1 | Channel 1 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested. |

Table 17.27 RSCANnGTINTSTS0 Register Contents (2/2)

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 8 | TSIF1 | Channel 1 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested. |
| 7 to 5 | Reserved | These bits are read as the value after reset. |
| 4 | THIF0 | Channel 0 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested. |
| 3 | CFTIF0 | Channel 0 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested. |
| 2 | TQIF0 | Channel 0 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested. |
| 1 | TAIF0 | Channel 0 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested. |
| 0 | TSIF0 | Channel 0 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested. |

TSIFm Bits

The TSIFm bit is set to 1 when the TMIEp bit in the RSCANnTMIECy register is set to 1 (transmit buffer interrupt enabled) and the TMTRF[1:0] flags in the RSCANnTMSTSp register are set to 10_B (transmit completed without abort request) or 11_B (transmit completed with abort request).

When the TMTRF[1:0] flags are cleared to 00_B under the condition that the TSIFm bit can be set to 1, this flag is cleared to 0. In addition, clearing the TMIEp bit to 0 also clears this flag to 0.

TAIFm Bits

The TAIFm bit is set to 1 when the TAIE bit in the RSCANnCmCTR register is 1 (transmit abort interrupt enabled) and the TMTRF[1:0] flags in the RSCANnTMSTSp register are set to 01_B (transmit abort completed).

This flag is cleared to 0 when the TMTRF[1:0] flags are cleared to 00_B after the transmit abort is completed.

TQIFm Bits

When the TXQIE bit in the RSCANnTXQCCm register is set to 1 (transmit queue interrupt enabled) and the TXQIF bit in the RSCANnTXQSTSm register is set to 1 (transmit queue interrupt request), the TQIFm bit is set to 1.

When the TXQIF bit (transmit queue interrupt request) in the RSCANnTXQSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the TXQIE bit is cleared to 0.

CFTIFm Bits

When the CFTXIE bit in the RSCANnCFCCk register is set to 1 (transmit/receive FIFO transmit interrupt enabled) and the CFTXIF bit in the RSCANnCFSTSk register is set to 1 (transmit/receive FIFO transmit interrupt request), the CFTIFm bit is set to 1.

When the CFTXIF bit is cleared to 0 under the conditions that the CFTIFm bit can be set to 1, this bit is cleared to 0. This flag is also cleared to 0 when the CFTXIE bit is cleared to 0.

THIFm Bits

When the THLIE bit in the RSCANnTHLCCm register is set to 1 (transmit history interrupt enabled) and the THLIF bit in the RSCANnTHLSTSm register is set to 1 (transmit history interrupt request), the THIFm bit is set to 1.

When the THLIF bit in the RSCANnTHLSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the THLIE bit is cleared to 0.

17.3.4.7 RSCANnGFDCFG — Global FD Configuration Register

Access: RSCANnGFDCFG register can be read/written in 32-bit unit
 RSCANnGFDCFGL and RSCANnGFDCFGH registers can be read/written in 16-bit unit
 RSCANnGFDCFGLL, RSCANnGFDCFGLH, RSCANnGFDCFGHL, RSCANnGFDCFGHH registers can be read/written in 8-bit unit

Address: RSCANnGFDCFG: <RSCFDn_base> + 0474_H
 RSCANnGFDCFGL: <RSCFDn_base> + 0474_H, RSCANnGFDCFGH: <RSCFDn_base> + 0476_H
 RSCANnGFDCFGLL: <RSCFDn_base> + 0474_H, RSCANnGFDCFGLH: <RSCFDn_base> + 0475_H,
 RSCANnGFDCFGHL: <RSCFDn_base> + 0476_H, RSCANnGFDCFGHH: <RSCFDn_base> + 0477_H

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 17.28 RSCANnGFDCFG Register contents

| Bit Position | Bit Name | Function |
|--------------|-------------|---|
| 31 to 10 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |
| 9, 8 | TSCCFG[1:0] | Time-stamp capture setting bit b9 b8 0 0: Captured at a sample point in the SOF bit. 0 1: Captured when a valid frame has been transmitted/received. 1 0: Setting prohibited 1 1: Setting prohibited |
| 7 to 1 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |
| 0 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |

TSCCFG bit

Select a point where a time-stamp value is captured. Modify this bit only in global reset mode.

17.3.5 Details of Receive Rule-related Registers

17.3.5.1 RSCANnGAFLECTR — Receive Rule Entry Control Register

Access: RSCANnGAFLECTR register can be read/written in 32-bit units
RSCANnGAFLECTRL, RSCANnGAFLECTRH registers can be read/written in 16-bit units
RSCANnGAFLECTRLL, RSCANnGAFLECTRLH, RSCANnGAFLECTRHL, RSCANnGAFLECTRHH registers can be read/written in 8-bit units

Address: RSCANnGAFLECTR: <RSCFDn_base> + 0098_H
RSCANnGAFLECTRL: <RSCFDn_base> + 0098_H, RSCANnGAFLECTRH: <RSCFDn_base> + 009A_H
RSCANnGAFLECTRLL: <RSCFDn_base> + 0098_H, RSCANnGAFLECTRLH: <RSCFDn_base> + 0099_H,
RSCANnGAFLECTRHL: <RSCFDn_base> + 009A_H, RSCANnGAFLECTRHH: <RSCFDn_base> + 009B_H

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 17.29 RSCANnGAFLECTR Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------|---|
| 31 to 9 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |
| 8 | AFLDAE | Receive Rule Table Write Enable 0: Receive rule table write is disabled. 1: Receive rule table write is enabled. |
| 7 to 5 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |
| 4 to 0 | AFLPN[4:0] | Receive Rule Table Page Number Configuration A page number can be selected in the range of page 0 (0000 _B) to page 11 (01011 _B). |

AFLDAE Bit

Setting this bit to 0 disables the write to the receive rule table. After writes to the receive rule table are completed, set this bit to 0 to disable the write to the table. The receive rule table can be read regardless of the value of this bit.

Set the AFLDAE bit to 1 only in global reset mode.

AFLPN[4:0] Bits

These bits are used to set the page number of the receive rule table. Sixteen receive rules can be set per page.

Set these bits to a value within the range of 00000_B to 01011_B.

17.3.5.2 RSCANnGAFLCFG0 — Receive Rule Configuration Register 0

Access: RSCANnGAFLCFG0 register can be read/written in 32-bit units
 RSCANnGAFLCFG0L, RSCANnGAFLCFG0H registers can be read/written in 16-bit units
 RSCANnGAFLCFG0LL, RSCANnGAFLCFG0LH, RSCANnGAFLCFG0HL, RSCANnGAFLCFG0HH registers can be read/written in 8-bit units

Address: RSCANnGAFLCFG0: <RSCFDn_base> + 009C_H
 RSCANnGAFLCFG0L: <RSCFDn_base> + 009C_H, RSCANnGAFLCFG0H: <RSCFDn_base> + 009E_H
 RSCANnGAFLCFG0LL: <RSCFDn_base> + 009C_H, RSCANnGAFLCFG0LH: <RSCFDn_base> + 009D_H,
 RSCANnGAFLCFG0HL: <RSCFDn_base> + 009E_H, RSCANnGAFLCFG0HH: <RSCFDn_base> + 009F_H

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|-----------|-----|-----|-----|-----|-----|-----|-----|-----------|-----|-----|-----|-----|-----|-----|-----|

| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R |

Table 17.30 RSCANnGAFLCFG0 Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|--|
| 31 to 24 | RNC0[7:0] | Number of Rules for Channel 0 Set the number of receive rules used for channel 0. |
| 23 to 16 | RNC1[7:0] | Number of Rules for Channel 1 Set the number of receive rules used for channel 1. |
| 15 to 8 | RNC2[7:0] | Number of Rules for Channel 2 Set the number of receive rules used for channel 2. |
| 7 to 0 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |

Modify the RSCANnGAFLCFG0 register only in global reset mode.

Up to 64 × (number of channels) rules can be registered in the receive rule table for the entire unit. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 128.
- The total number of rules allocated to each channel is not larger than the number of rules that can be registered for the entire unit.

RNC0[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 0 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

RNC1[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 1 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

RNC2[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 2 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

17.3.5.3 RSCANnGAFLIDj — Receive Rule ID Register j (j = 0 to 15)

Access: RSCANnGAFLIDj register can be read/written in 32-bit units
RSCANnGAFLIDjL, RSCANnGAFLIDjH registers can be read/written in 16-bit units
RSCANnGAFLIDjLL, RSCANnGAFLIDjLH, RSCANnGAFLIDjHL, RSCANnGAFLIDjHH registers can be read/written in 8-bit units

Address: RSCANnGAFLIDj: <RSCFDn_base> + 0500_H + (10_H × j)
RSCANnGAFLIDjL: <RSCFDn_base> + 0500_H + (10_H × j),
RSCANnGAFLIDjH: <RSCFDn_base> + 0502_H + (10_H × j)
RSCANnGAFLIDjLL: <RSCFDn_base> + 0500_H + (10_H × j),
RSCANnGAFLIDjLH: <RSCFDn_base> + 0501_H + (10_H × j),
RSCANnGAFLIDjHL: <RSCFDn_base> + 0502_H + (10_H × j),
RSCANnGAFLIDjHH: <RSCFDn_base> + 0503_H + (10_H × j)

Value after reset: 0000 0000_H

| | | | | | | | | | | | | | | | | |
|-------------------|--------------|-------------|-------|---------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | GAFLID E | GAFLR TR | GAFLB | GAFLID[28:16] | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | GAFLID[15:0] | | | | | | | | | | | | | | | |

Table 17.31 RSCANnGAFLIDj Register Contents

| Bit Position | Bit Name | Function |
|--------------|--------------|--|
| 31 | GAFLIDE | IDE Select 0: Standard ID 1: Extended ID |
| 30 | GAFLRTR | RTR Select 0: Data frame 1: Remote frame |
| 29 | GAFLLB | Receive Rule Target Message Select 0: When a message transmitted from another CAN node is received 1: When the own transmitted message is received |
| 28 to 0 | GAFLID[28:0] | ID setting Set the ID of the receive rule. For the standard ID, set the ID in bits b10 to b0 and set bits b28 to b11 to 0. |

Modify the RSCANnGAFLIDj register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDE Bit

This bit is used to select the ID format (standard ID or extended ID) of the receive rule. This bit is compared with the IDE bit in the received message during the acceptance filter processing.

GAFLRTR Bit

This bit is used to select the frame format (data frame or remote frame) of the receive rule. This bit is compared with the RTR bit in the received message during the acceptance filter processing.

GAFLLB Bit

When this bit is set to 0, data processing using the receive rule is performed when receiving messages transmitted from another CAN node.

When this bit is set to 1 when the mirror function is used, data processing using the receive rule is performed when the CAN node is receiving its own transmitted messages.

GAFLID[28:0] Bits

These bits are used to set the ID field of the receive rule. The ID value set by these bits is compared with the ID of the received message during the acceptance filter processing.

17.3.5.4 RSCANnGAFLMj — Receive Rule Mask Register j (j = 0 to 15)

Access: RSCANnGAFLMj register can be read/written in 32-bit units
 RSCANnGAFLMjL, RSCANnGAFLMjH registers can be read/written in 16-bit units
 RSCANnGAFLMjLL, RSCANnGAFLMjLH, RSCANnGAFLMjHL, RSCANnGAFLMjHH registers can be read/
 written in 8-bit units

Address: RSCANnGAFLMj: <RSCFDn_base> + 0504_H + (10_H × j)
 RSCANnGAFLMjL: <RSCFDn_base> + 0504_H + (10_H × j),
 RSCANnGAFLMjH: <RSCFDn_base> + 0506_H + (10_H × j)
 RSCANnGAFLMjLL: <RSCFDn_base> + 0504_H + (10_H × j),
 RSCANnGAFLMjLH: <RSCFDn_base> + 0505_H + (10_H × j),
 RSCANnGAFLMjHL: <RSCFDn_base> + 0506_H + (10_H × j),
 RSCANnGAFLMjHH: <RSCFDn_base> + 0507_H + (10_H × j)

Value after reset: 0000 0000_H

Table 17.32 RSCANnGAFLMj Register Contents

| Bit Position | Bit Name | Function |
|--------------|---------------|---|
| 31 | GAFLIDEM | IDE Mask 0: The IDE bit is not compared. 1: The IDE bit is compared. |
| 30 | GAFLRTRM | RTR Mask 0: The RTR bit is not compared. 1: The RTR bit is compared. |
| 29 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |
| 28 to 0 | GAFLIDM[28:0] | ID Mask 0: The corresponding ID bit is not compared. 1: The corresponding ID bit is compared. |

Modify the RSCANnGAFLMj register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDEM Bit

When this bit is set to 1, filter processing is performed only for messages of the ID format specified by the GAFLIDE bit in the RSCANnGAFLIDj register.

When this bit is cleared to 0, the IDs of all the receive messages and the specified IDs are regarded as matched. To set the GAFLIDEM bit to 0, set all the GAFLIDM[28:0] bits to 0s at the same time.

GAFLRTRM Bit

This bit is used to mask the RTR bit of the receive rule.

GAFLIDM[28:0] Bits

These bits are used to mask the corresponding ID bit of the receive rule.

17.3.5.5 RSCANnGAFLP0_j — Receive Rule Pointer 0 Register j (j = 0 to 15)

Access: RSCANnGAFLP0_j register can be read/written in 32-bit units
 RSCANnGAFLP0_jL, RSCANnGAFLP0_jH registers can be read/written in 16-bit units
 RSCANnGAFLP0_jLL, RSCANnGAFLP0_jLH, RSCANnGAFLP0_jHL, RSCANnGAFLP0_jHH registers can be read/written in 8-bit units

Address: RSCANnGAFLP0_j: <RSCFDn_base> + 0508_H + (10_H × j)
 RSCANnGAFLP0_jL: <RSCFDn_base> + 0508_H + (10_H × j),
 RSCANnGAFLP0_jH: <RSCFDn_base> + 050A_H + (10_H × j)
 RSCANnGAFLP0_jLL: <RSCFDn_base> + 0508_H + (10_H × j),
 RSCANnGAFLP0_jLH: <RSCFDn_base> + 0509_H + (10_H × j),
 RSCANnGAFLP0_jHL: <RSCFDn_base> + 050A_H + (10_H × j),
 RSCANnGAFLP0_jHH: <RSCFDn_base> + 050B_H + (10_H × j)

Value after reset: 0000 0000_H

Table 17.33 RSCANnGAFLP0_j Register Contents

| Bit Position | Bit Name | Function |
|--------------|---------------|---|
| 31 to 28 | GAFLDLC[3:0] | Receive Rule DLC b31 b30 b29 b28 0 0 0 0: DLC check is disabled. 0 0 0 1: 1 data byte 0 0 1 0: 2 data bytes 0 0 1 1: 3 data bytes 0 1 0 0: 4 data bytes 0 1 0 1: 5 data bytes 0 1 1 0: 6 data bytes 0 1 1 1: 7 data bytes 1 X X X: 8 data bytes |
| 27 to 16 | GAFLPTR[11:0] | Receive Rule Label Set the 12-bit label information. |
| 15 | GAFLRMV | Receive Buffer Enable 0: No receive buffer is used. 1: A receive buffer is used. |
| 14 to 8 | GAFLRMDP[6:0] | Receive Buffer Number Select Set the receive buffer number to store receive messages. |
| 7 to 0 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |

Modify the RSCANnGAFLP0_j register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLDLC[3:0] Bits

These bits are used to set the minimum data length necessary for receiving messages. If the data length of a message that is being filtered is equal to or larger than the value set by the GAFLDLC[3:0] bits, the message passes the DLC check. Setting these bits to 0000_B disables the DLC check function allowing messages with any data length to pass the DLC check.

GAFLPTR[11:0] Bits

These bits are used to set a 12-bit label to be attached to messages that have passed through the filter. A label is attached when a message is stored in the receive buffer or the FIFO buffer.

GAFLRMV Bit

When this bit is set to 1, receive messages that have passed through the filter are stored in the receive buffer selected by the GAFLRMDP[6:0] bits.

GAFLRMDP[6:0] Bits

These bits are used to select the number of the receive buffer that stores receive messages that have passed through the filter when the GAFLRMV bit is set to 1. Set these bits to a value smaller than the value set by the NRXMB[7:0] bits in the RSCANnRMNB register.

17.3.5.6 RSCANnGAFLP1_j — Receive Rule Pointer 1 Register j (j = 0 to 15)

Access: RSCANnGAFLP1_j register can be read/written in 32-bit units
 RSCANnGAFLP1_jL, RSCANnGAFLP1_jH registers can be read/written in 16-bit units
 RSCANnGAFLP1_jLL, RSCANnGAFLP1_jLH, RSCANnGAFLP1_jHL, RSCANnGAFLP1_jHH registers can be read/written in 8-bit units

Address: RSCANnGAFLP1_j: <RSCFDn_base> + 050C_H + (10_H × j)
 RSCANnGAFLP1_jL: <RSCFDn_base> + 050C_H + (10_H × j),
 RSCANnGAFLP1_jH: <RSCFDn_base> + 050E_H + (10_H × j)
 RSCANnGAFLP1_jLL: <RSCFDn_base> + 050C_H + (10_H × j),
 RSCANnGAFLP1_jLH: <RSCFDn_base> + 050D_H + (10_H × j),
 RSCANnGAFLP1_jHL: <RSCFDn_base> + 050E_H + (10_H × j),
 RSCANnGAFLP1_jHH: <RSCFDn_base> + 050F_H + (10_H × j)

Value after reset: 0000 0000_H

Table 17.34 RSCANnGAFLP1_j Register Contents

| Bit Position | Bit Name | Function |
|--------------|---------------|--|
| 31 to 17 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |
| 16 to 8 | GAFLFDP[16:8] | Transmit/Receive FIFO Buffer k Select (Bit position – 8 = target transmit/receive FIFO buffer number k) 0: Transmit/receive FIFO buffer is not selected. 1: Transmit/receive FIFO buffer is selected. |
| 7 to 0 | GAFLFDP[7:0] | Receive FIFO Buffer x Select (Bit position = target receive FIFO buffer number x) 0: Receive FIFO buffer is not selected. 1: Receive FIFO buffer is selected. |

Modify the RSCANnGAFLP1_j register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLFDP[16:0] Bits

These bits are used to specify FIFO buffers that store receive messages that have passed through the filter. Up to eight FIFO buffers can be selected. However, when the GAFLRMV bit in the RSCANnGAFLP0_j register is set to 1 (messages are stored in the receive buffer), up to seven FIFO buffers can be selected. Only receive FIFO buffers and the transmit/receive FIFO buffer for which the CFM[1:0] bits in the RSCANnCFCK register are set to 00_B (receive mode) or 10_B (gateway mode) are selectable.

17.3.6 Details of Receive Buffer-Related Registers

17.3.6.1 RSCANnRMNB — Receive Buffer Number Register

Access: RSCANnRMNB register can be read/written in 32-bit units
 RSCANnRMNBL, RSCANnRMNBH registers can be read/written in 16-bit units
 RSCANnRMNBLL, RSCANnRMNBHL, RSCANnRMNBHL, RSCANnRMNBHL registers can be read/written in 8-bit units

Address: RSCANnRMNB: <RSCFDn_base> + 00A4_H
 RSCANnRMNBL: <RSCFDn_base> + 00A4_H, RSCANnRMNBH: <RSCFDn_base> + 00A6_H
 RSCANnRMNBLL: <RSCFDn_base> + 00A4_H, RSCANnRMNBHL: <RSCFDn_base> + 00A5_H,
 RSCANnRMNBHL: <RSCFDn_base> + 00A6_H, RSCANnRMNBHL: <RSCFDn_base> + 00A7_H

Value after reset: 0000 0000_H

Table 17.35 RSCANnRMNB Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------|--|
| 31 to 8 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |
| 7 to 0 | NRXMB[7:0] | Receive Buffer Number Configuration Set the number of receive buffers. Set a value of 0 to 48. |

Modify the RSCANnRMNB register only in global reset mode.

NRXMB[7:0] Bits

These bits are used to set the total number of receive buffers of the RS-CANFD module. The maximum value is $16 \times$ (number of channels).

Setting all of these bits to 0 makes receive buffers unavailable.

17.3.6.2 RSCANnRMNDy — Receive Buffer New Data Register y (y = 0, 1)

Access: RSCANnRMNDy register can be read/written in 32-bit units
 RSCANnRMNDyL, RSCANnRMNDyH registers can be read/written in 16-bit units
 RSCANnRMNDyLL, RSCANnRMNDyLH, RSCANnRMNDyHL, RSCANnRMNDyHH registers can be read/written in 8-bit units

Address: RSCANnRMNDy: <RSCFDn_base> + 00A8_H + (04_H × y)
 RSCANnRMNDyL: <RSCFDn_base> + 00A8_H + (04_H × y),
 RSCANnRMNDyH: <RSCFDn_base> + 00AA_H + (04_H × y)
 RSCANnRMNDyLL: <RSCFDn_base> + 00A8_H + (04_H × y),
 RSCANnRMNDyLH: <RSCFDn_base> + 00A9_H + (04_H × y),
 RSCANnRMNDyHL: <RSCFDn_base> + 00AA_H + (04_H × y),
 RSCANnRMNDyHH: <RSCFDn_base> + 00AB_H + (04_H × y)

Value after reset: 0000 0000_H

Table 17.36 RSCANnRMNDy Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 31 to 16 | RMNSq | Receive Buffer Receive Complete Flag q (q = y × 32 + 31 to y × 32 + 16) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q. When y = 1, these bits are reserved. When read, the value after reset is read. When writing, write the value after reset. |
| 15 to 0 | RMNSq | Receive Buffer Receive Complete Flag q (q = y × 32 + 15 to y × 32 + 0) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q. |

Write 0 to the RSCANnRMNDy register in global operating mode or global test mode.

RMNSq Flags (q = 0 to 47)

Each RMNSq flag is set to 1 when the processing for storing a message in the corresponding receive buffer starts.

To clear a flag to 0, the program must write 0 to the flag. Use a store instruction to write “0” to the flag and “1” to other flags. These bits cannot be set to 0 while a message is being stored. It takes ten pclk clock cycles to store a message.

These flags are cleared to 0 in global reset mode.

17.3.6.3 RSCANnRMIDq — Receive Buffer ID Register q (q = 0 to 47)

Access: RSCANnRMIDq register can be read only in 32-bit units
 RSCANnRMIDqL, RSCANnRMIDqH registers can be read only in 16-bit units
 RSCANnRMIDqLL, RSCANnRMIDqLH, RSCANnRMIDqHL, RSCANnRMIDqHH registers can be read only in 8-bit units

Address: RSCANnRMIDq: $\langle \text{RSCFDn_base} \rangle + 0600_{\text{H}} + (10_{\text{H}} \times q)$
 RSCANnRMIDqL: $\langle \text{RSCFDn_base} \rangle + 0600_{\text{H}} + (10_{\text{H}} \times q)$,
 RSCANnRMIDqH: $\langle \text{RSCFDn_base} \rangle + 0602_{\text{H}} + (10_{\text{H}} \times q)$
 RSCANnRMIDqLL: $\langle \text{RSCFDn_base} \rangle + 0600_{\text{H}} + (10_{\text{H}} \times q)$,
 RSCANnRMIDqLH: $\langle \text{RSCFDn_base} \rangle + 0601_{\text{H}} + (10_{\text{H}} \times q)$,
 RSCANnRMIDqHL: $\langle \text{RSCFDn_base} \rangle + 0602_{\text{H}} + (10_{\text{H}} \times q)$,
 RSCANnRMIDqHH: $\langle \text{RSCFDn_base} \rangle + 0603_{\text{H}} + (10_{\text{H}} \times q)$

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 17.37 RSCANnRMIDq Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------|---|
| 31 | RMIDE | Receive Buffer IDE 0: Standard ID 1: Extended ID |
| 30 | RMRTR | Receive Buffer RTR 0: Data frame 1: Remote frame |
| 29 | Reserved | These bits are read as the value after reset. |
| 28 to 0 | RMID[28:0] | Receive Buffer ID Data These bits contain the standard ID or extended ID of the received message. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0. |

RMIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive buffer.

RMRTR Bit

This bit indicates the frame format (data frame or remote frame) of the message stored in the receive buffer.

RMID[28:0] Bits

These bits contain the ID of the message stored in the receive buffer.

17.3.6.4 RSCANnRMPTRq — Receive Buffer Pointer Register q (q = 0 to 47)

Access: RSCANnRMPTRq register can be read only in 32-bit units
 RSCANnRMPTRqL, RSCANnRMPTRqH registers can be read only in 16-bit units
 RSCANnRMPTRqLL, RSCANnRMPTRqLH, RSCANnRMPTRqHL, RSCANnRMPTRqHH registers can be read only in 8-bit units

Address: RSCANnRMPTRq: <RSCFDn_base> + 0604_H + (10_H × q)
 RSCANnRMPTRqL: <RSCFDn_base> + 0604_H + (10_H × q),
 RSCANnRMPTRqH: <RSCFDn_base> + 0606_H + (10_H × q)
 RSCANnRMPTRqLL: <RSCFDn_base> + 0604_H + (10_H × q),
 RSCANnRMPTRqLH: <RSCFDn_base> + 0605_H + (10_H × q),
 RSCANnRMPTRqHL: <RSCFDn_base> + 0606_H + (10_H × q),
 RSCANnRMPTRqHH: <RSCFDn_base> + 0607_H + (10_H × q)

| 15 to 0 | RMTS[15:0] | Receive Buffer Timestamp Data Timestamp value of the received message. |

RMDLC[3:0] Bits

These bits indicate the data length of the message stored in the receive buffer.

RMPTR[11:0] Bits

These bits indicate the label information of the message stored in the receive buffer.

RMTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the receive buffer.

17.3.6.5 RSCANnRMDF0_q — Receive Buffer Data Field 0 Register q (q = 0 to 47)

Access: RSCANnRMDF0_q register can be read only in 32-bit units
 RSCANnRMDF0_qL, RSCANnRMDF0_qH registers can be read only in 16-bit units
 RSCANnRMDF0_qLL, RSCANnRMDF0_qLH, RSCANnRMDF0_qHL, RSCANnRMDF0_qHH registers can be read only in 8-bit units

Address: RSCANnRMDF0_q: <RSCFDn_base> + 0608_H + (10_H × q)
 RSCANnRMDF0_qL: <RSCFDn_base> + 0608_H + (10_H × q),
 RSCANnRMDF0_qH: <RSCFDn_base> + 060A_H + (10_H × q)
 RSCANnRMDF0_qLL: <RSCFDn_base> + 0608_H + (10_H × q),
 RSCANnRMDF0_qLH: <RSCFDn_base> + 0609_H + (10_H × q),
 RSCANnRMDF0_qHL: <RSCFDn_base> + 060A_H + (10_H × q),
 RSCANnRMDF0_qHH: <RSCFDn_base> + 060B_H + (10_H × q)

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 17.39 RSCANnRMDF0_q Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------|--|
| 31 to 24 | RMDB3[7:0] | Receive Buffer Data Byte 3 |
| 23 to 16 | RMDB2[7:0] | Receive Buffer Data Byte 2 |
| 15 to 8 | RMDB1[7:0] | Receive Buffer Data Byte 1 |
| 7 to 0 | RMDB0[7:0] | Receive Buffer Data Byte 0 |
| | | Data for a message stored in the receive buffer can be read. |

When the RMDLC[3:0] value in the RSCANnRMPTRq register is smaller than 1000_B, data bytes for which no data is set are read as 00_H.

17.3.6.6 RSCANnRMDF1_q — Receive Buffer Data Field 1 Register q (q = 0 to 47)

Access: RSCANnRMDF1_q register can be read only in 32-bit units
 RSCANnRMDF1_qL, RSCANnRMDF1_qH register can be read only in 16-bit units
 RSCANnRMDF1_qLL, RSCANnRMDF1_qLH, RSCANnRMDF1_qHL, RSCANnRMDF1_qHH registers can be read only in 8-bit units

Address: RSCANnRMDF1_q: <RSCFDn_base> + 060C_H + (10_H × q)
 RSCANnRMDF1_qL: <RSCFDn_base> + 060C_H + (10_H × q),
 RSCANnRMDF1_qH: <RSCFDn_base> + 060E_H + (10_H × q)
 RSCANnRMDF1_qLL: <RSCFDn_base> + 060C_H + (10_H × q),
 RSCANnRMDF1_qLH: <RSCFDn_base> + 060D_H + (10_H × q),
 RSCANnRMDF1_qHL: <RSCFDn_base> + 060E_H + (10_H × q),
 RSCANnRMDF1_qHH: <RSCFDn_base> + 060F_H + (10_H × q)

Value after reset: 0000 0000_H

Table 17.40 RSCANnRMDF1_q Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------|--|
| 31 to 24 | RMDB7[7:0] | Receive Buffer Data Byte 7 |
| 23 to 16 | RMDB6[7:0] | Receive Buffer Data Byte 6 |
| 15 to 8 | RMDB5[7:0] | Receive Buffer Data Byte 5 |
| 7 to 0 | RMDB4[7:0] | Data for a message stored in the receive buffer can be read. |

When the RMDLC[3:0] value in the RSCANnRMPTRq register is smaller than 1000_B, data bytes for which no data is set are read as 00_H.

17.3.7 Details of Receive FIFO Buffer-Related Registers

17.3.7.1 RSCANnRFCCx — Receive FIFO Buffer Configuration and Control Register x (x = 0 to 7)

Access: RSCANnRFCCx register can be read/written in 32-bit units
 RSCANnRFCCxL, RSCANnRFCCxH registers can be read/written in 16-bit units
 RSCANnRFCCxLL, RSCANnRFCCxLH, RSCANnRFCCxHL, RSCANnRFCCxHH registers can be read/written in 8-bit units

Address: RSCANnRFCCx: <RSCFDn_base> + 00B8_H + (04_H × x)
 RSCANnRFCCxL: <RSCFDn_base> + 00B8_H + (04_H × x),
 RSCANnRFCCxH: <RSCFDn_base> + 00BA_H + (04_H × x)
 RSCANnRFCCxLL: <RSCFDn_base> + 00B8_H + (04_H × x),
 RSCANnRFCCxLH: <RSCFDn_base> + 00B9_H + (04_H × x),
 RSCANnRFCCxHL: <RSCFDn_base> + 00BA_H + (04_H × x),
 RSCANnRFCCxHH: <RSCFDn_base> + 00BB_H + (04_H × x)

Value after reset: 0000 0000_H

Table 17.41 RSCANnRFCCx Register Contents (1/2)

| Bit Position | Bit Name | Function |
|--------------|-------------|--|
| 31 to 16 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |
| 15 to 13 | RFIGCV[2:0] | Receive FIFO Interrupt Request Timing Select $b_{15} \ b_{14} \ b_{13}$ 0 0 0: When FIFO is 1/8 full. 0 0 1: When FIFO is 2/8 full. 0 1 0: When FIFO is 3/8 full. 0 1 1: When FIFO is 4/8 full. 1 0 0: When FIFO is 5/8 full. 1 0 1: When FIFO is 6/8 full. 1 1 0: When FIFO is 7/8 full. 1 1 1: When FIFO is full. |
| 12 | RFIM | Receive FIFO Interrupt Source Select 0: An interrupt occurs when the condition set by the RFIGCV[2:0] bits is met. 1: An interrupt occurs each time a message has been received. |
| 11 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |
| 10 to 8 | RFDC[2:0] | Receive FIFO Buffer Depth Configuration $b_{10} \ b_9 \ b_8$ 0 0 0: 0 messages 0 0 1: 4 messages 0 1 0: 8 messages 0 1 1: 16 messages 1 0 0: 32 messages 1 0 1: 48 messages 1 1 0: 64 messages 1 1 1: 128 messages |

Table 17.41 RSCANnRFCCx Register Contents (2/2)

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 7 to 2 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |
| 1 | RFIE | Receive FIFO Interrupt Enable 0: Receive FIFO interrupt is disabled. 1: Receive FIFO interrupt is enabled. |
| 0 | RFE | Receive FIFO Buffer Enable 0: No receive FIFO buffer is used. 1: Receive FIFO buffers are used. |

RFIGCV[2:0] Bits

These bits are used to specify the number of received messages required to generate a receive FIFO interrupt request when the RFIM bit is set to 0 with a fraction for the total number of buffers (the setting of RFDC[2:0]).

When the RFDC[2:0] bits are set to 001_B (4 messages), set the RFIGCV[2:0] bits to 001_B, 011_B, 101_B, or 111_B. Modify these bits only in global reset mode.

RFIM Bit

This bit is used to select a FIFO interrupt source. Modify this bit only in global reset mode.

RFDC[2:0] Bits

These bits are used to select the number of messages that can be stored in a single receive FIFO buffer. When these bits are set to 000_B, no receive FIFO buffer should be used. Modify these bits only in global reset mode.

RFIE Bit

Setting the RFIE bit to 1 enables receive FIFO interrupts. Modify this bit when the RFE bit is set to 0 (no receive FIFO buffer is used).

RFE Bit

Setting the RFE bit to 1 enables the use of receive FIFO buffers. Clearing this bit to 0 sets the RFEMP flag in the RSCANnRFSTs_x register to 1 (buffer empty). Modify this bit in global operating mode or global test mode.

Set this bit to 1 with another instruction after the settings to all bits in the RSCANnRFCC_x register have been done.

This bit is cleared to 0 in global reset mode.

17.3.7.2 RSCANnRFSTStx — Receive FIFO Buffer Status Register x (x = 0 to 7)

Access: RSCANnRFSTStx register can be read/written in 32-bit units
 RSCANnRFSTStxL, RSCANnRFSTStxH registers can be read/written in 16-bit units
 RSCANnRFSTStxLL, RSCANnRFSTStxLH, RSCANnRFSTStxHL, RSCANnRFSTStxHH registers can be read/written in 8-bit units

Address: RSCANnRFSTStx: <RSCFDn_base> + 00D8_H + (04_H × x)
 RSCANnRFSTStxL: <RSCFDn_base> + 00D8_H + (04_H × x),
 RSCANnRFSTStxH: <RSCFDn_base> + 00DA_H + (04_H × x)
 RSCANnRFSTStxLL: <RSCFDn_base> + 00D8_H + (04_H × x),
 RSCANnRFSTStxLH: <RSCFDn_base> + 00D9_H + (04_H × x),
 RSCANnRFSTStxHL: <RSCFDn_base> + 00DA_H + (04_H × x),
 RSCANnRFSTStxHH: <RSCFDn_base> + 00DB_H + (04_H × x)

Value after reset: 0000 0001_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|-----------|----|----|----|----|----|----|----|----|----|----|------|-------|-------|-------|----|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | RFMC[7:0] | | | | | | | — | — | — | — | RFIF | RFMLT | RFFLL | RFEMP | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 | R/W*1 | R | R |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 17.42 RSCANnRFSTStx Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|---|
| 31 to 16 | Reserved | These bits are read as the value after reset. When writing, write the value after reset. |
| 15 to 8 | RFMC[7:0] | Receive FIFO Unread Message Counter The number of unread messages stored in the receive FIFO buffer is displayed. |
| 7 to 4 | Reserved | These bits are read as the value after reset. When writing, write the value after reset. |
| 3 | RFIF | Receive FIFO Interrupt Request Flag 0: No receive FIFO interrupt request is present. 1: A receive FIFO interrupt request is present. |
| 2 | RFMLT | Receive FIFO Message Lost Flag 0: No receive FIFO message is lost. 1: A receive FIFO message is lost. |
| 1 | RFFLL | Receive FIFO Buffer Full Status Flag 0: The receive FIFO buffer is not full. 1: The receive FIFO buffer is full. |
| 0 | RFEMP | Receive FIFO Buffer Empty Status Flag 0: The receive FIFO buffer contains unread message. 1: The receive FIFO buffer contains no unread message (buffer empty). |

RFMC[7:0] Flag

This flag indicates the number of unread messages in the receive FIFO buffer. This flag becomes 00_H when the RFE bit in the RSCANnRFCCx register is set to 0.

This flag is 00_H in global reset mode.

RFIF Flag

This flag is set to 1 when the receive FIFO interrupt request generation conditions set by the RFIGCV[2:0] bits and the RFIM bit in the RSCANnRFCCx register are met. This flag is cleared to 0 in global reset mode or by writing 0 to this flag. Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flags to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

RFMLT Flag

This flag is set to 1 when an attempt is made to store a new message while the receive FIFO buffer is full. In this case, the new message is discarded.

This flag is cleared to 0 in global reset mode or by writing 0 to this flag.

Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flags to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

RFFLL Flag

This flag is set to 1 when the number of messages stored in the receive FIFO buffer matches the FIFO buffer depth set by the RFDC[2:0] bits in the RSCANnRFCCx register.

If the number of messages stored in the receive FIFO buffer becomes smaller than the FIFO buffer depth set by the RFDC[2:0] bits, this flag is cleared to 0. This flag is also cleared to 0 when the RFE bit in the RSCANnRFCCx register is set to 0 (no receive FIFO buffer is used) or in global reset mode.

RFEMP Flag

This flag is set to 1 when all messages in the receive FIFO buffer have been read. This flag is also set to 1 when the RFE bit in the RSCANnRFCCx register is 0 or in global reset mode.

This flag is cleared to 0 when even a single received message is stored in the receive FIFO buffer.

NOTE

To clear the RFMLT or RFIF flag to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

17.3.7.3 RSCANnRFPCTR_x — Receive FIFO Buffer Pointer Control Register x (x = 0 to 7)

Access: RSCANnRFPCTR_x register can only be written in 32-bit units
 RSCANnRFPCTR_{xL}, RSCANnRFPCTR_{xH} registers can only be written in 16-bit units
 RSCANnRFPCTR_{xLL}, RSCANnRFPCTR_{xLH}, RSCANnRFPCTR_{xHL}, RSCANnRFPCTR_{xHH} registers can only be written in 8-bit units

Address: RSCANnRFPCTR_x: <RSCFDn_base> + 00F8_H + (04_H × x)
 RSCANnRFPCTR_{xL}: <RSCFDn_base> + 00F8_H + (04_H × x),
 RSCANnRFPCTR_{xH}: <RSCFDn_base> + 00FA_H + (04_H × x)
 RSCANnRFPCTR_{xLL}: <RSCFDn_base> + 00F8_H + (04_H × x),
 RSCANnRFPCTR_{xLH}: <RSCFDn_base> + 00F9_H + (04_H × x),
 RSCANnRFPCTR_{xHL}: <RSCFDn_base> + 00FA_H + (04_H × x),
 RSCANnRFPCTR_{xHH}: <RSCFDn_base> + 00FB_H + (04_H × x)

Value after reset: 0000 0000_H

Table 17.43 RSCANnRFPCTR_x Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|--|
| 31 to 8 | Reserved | The write value should be the value after reset. |
| 7 to 0 | RFPC[7:0] | Receive FIFO Pointer Control When these bits are set to FF _H , the read pointer moves to the next unread message in the receive FIFO buffer. |

RFPC[7:0] Bits

When the RFPC[7:0] bits are set to FF_H, the read pointer moves to the next unread message in the receive FIFO buffer. At this time, the RFMC[7:0] (receive FIFO unread message counter) value in the RSCANnRFST_{Sx} register is decremented by 1. Read the RSCANnRFID_x, RSCANnRFPTR_x, RSCANnRFDF0_x, and RSCANnRFDF1_x registers to read messages in the receive FIFO buffer, and then write FF_H to the RFPC[7:0] bits.

When writing FF_H to these bits, make sure that the RFE bit in the RSCANnRFCC_x register is set to 1 (receive FIFO buffers are used) and the RFEMP flag in the RSCANnRFST_{Sx} register is 0 (the receive FIFO buffer contains unread messages).

17.3.7.4 RSCANnRFIDx — Receive FIFO Buffer Access ID Register x (x = 0 to 7)

Access: RSCANnRFIDx register can be read only in 32-bit units
 RSCANnRFIDxL, RSCANnRFIDxH registers can be read only in 16-bit units
 RSCANnRFIDxLL, RSCANnRFIDxLH, RSCANnRFIDxHL, RSCANnRFIDxHH registers can be read only in 8-bit units

Address: RSCANnRFIDx: <RSCFDn_base> + 0E00_H + (10_H × x)
 RSCANnRFIDxL: <RSCFDn_base> + 0E00_H + (10_H × x),
 RSCANnRFIDxH: <RSCFDn_base> + 0E02_H + (10_H × x)
 RSCANnRFIDxLL: <RSCFDn_base> + 0E00_H + (10_H × x),

Table 17.44 RSCANnRFIDx Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------|---|
| 31 | RFIDE | Receive FIFO Buffer IDE 0: Standard ID 1: Extended ID |
| 30 | RFRTR | Receive FIFO Buffer RTR 0: Data frame 1: Remote frame |
| 29 | Reserved | These bits are read as the value after reset. |
| 28 to 0 | RFID[28:0] | Receive FIFO Buffer ID Data The standard ID or extended ID of received message can be read. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0. |

RFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive FIFO buffer.

RFRTR Bit

This bit indicates the frame format (data frame or remote frame) of the message stored in the receive FIFO buffer.

RFID[28:0] Bits

These bits indicate the ID of the message stored in the receive FIFO buffer.

17.3.7.5 RSCANnRFPTRx — Receive FIFO Buffer Access Pointer Register x (x = 0 to 7)

Access: RSCANnRFPTRx register can be read only in 32-bit units
 RSCANnRFPTRxL, RSCANnRFPTRxH registers can be read only in 16-bit units
 RSCANnRFPTRxLL, RSCANnRFPTRxLH, RSCANnRFPTRxHL, RSCANnRFPTRxHH registers can be read only in 8-bit units

Address: RSCANnRFPTRx: <RSCFDn_base> + 0E04_H + (10_H × x)
 RSCANnRFPTRxL: <RSCFDn_base> + 0E04_H + (10_H × x),
 RSCANnRFPTRxH: <RSCFDn_base> + 0E06_H + (10_H × x)
 RSCANnRFPTRxLL: <RSCFDn_base> + 0E04_H + (10_H × x),
 RSCANnRFPTRxLH: <RSCFDn_base> + 0E05_H + (10_H × x),
 RSCANnRFPTRxHL: <RSCFDn_base> + 0E06_H + (10_H × x),
 RSCANnRFPTRxHH: <RSCFDn_base> + 0E07_H + (10_H × x)

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 27 to 16 | RFPTR[11:0] | Receive FIFO Buffer Label Data Label information of the received message can be read. |
| 15 to 0 | RFTS[15:0] | Receive FIFO Buffer Timestamp Data Timestamp value of the received message can be read. |

RFDLC[3:0] Bits

These bits contain the data length of the message stored in the receive FIFO buffer.

RFPTR[11:0] Bits

These bits contain the label information of the message stored in the receive FIFO buffer.

RFTS[15:0] Bits

These bits contain the timestamp value of the message stored in the receive FIFO buffer.

17.3.7.6 RSCANnRFDF0_x — Receive FIFO Buffer Access Data Field 0 Register x (x = 0 to 7)

Access: RSCANnRFDF0_x register can be read-only in 32-bit units
RSCANnRFDF0_xL, RSCANnRFDF0_xH registers can be read only in 16-bit units
RSCANnRFDF0_xLL, RSCANnRFDF0_xLH, RSCANnRFDF0_xHL, RSCANnRFDF0_xHH registers can be read only in 8-bit units

Address: RSCANnRFDF0_x: <RSCFDn_base> + 0E08_H + (10_H × x)
RSCANnRFDF0_xL: <RSCFDn_base> + 0E08_H + (10_H × x),

Table 17.47 RSCANnRFDF1_x Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------|---|
| 31 to 24 | RFDB7[7:0] | Receive FIFO Buffer Data Byte 7 |
| 23 to 16 | RFDB6[7:0] | Receive FIFO Buffer Data Byte 6 |
| 15 to 8 | RFDB5[7:0] | Receive FIFO Buffer Data Byte 5 |
| 7 to 0 | RFDB4[7:0] | Data for a message stored in the receive FIFO buffer can be read. |

When the RFDLC[3:0] value in the RSCANnRFPTRx register is smaller than 1000_B, data bytes for which no data is set are read as 00_H.

17.3.8 Details of Transmit/Receive FIFO Buffer-Related Registers

17.3.8.1 RSCANnCFCCk — Transmit/receive FIFO Buffer Configuration and Control Register k (k = 0 to 8)

Access: RSCANnCFCCk register can be read/written in 32-bit units
 RSCANnCFCCkL, RSCANnCFCCkH registers can be read/written in 16-bit units
 RSCANnCFCCkLL, RSCANnCFCCkLH, RSCANnCFCCkHL, RSCANnCFCCkHH registers can be read/written in 8-bit units

Address: RSCANnCFCCk: <RSCFDn_base> + 0118_H + (04_H × k)
 RSCANnCFCCkL: <RSCFDn_base> + 0118_H + (04_H × k),
 RSCANnCFCCkH: <RSCFDn_base> + 011A_H + (04_H × k)
 RSCANnCFCCkLL: <RSCFDn_base> + 0118_H + (04_H × k),
 RSCANnCFCCkLH: <RSCFDn_base> + 0119_H + (04_H × k),
 RSCANnCFCCkHL: <RSCFDn_base> + 011A_H + (04_H × k),
 RSCANnCFCCkHH: <RSCFDn_base> + 011B_H + (04_H × k)

Value after reset: 0000 0000_H

| 7 to 3 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |
| 2 | CFTXIE | Transmit/Receive FIFO Transmit Interrupt Enable 0: Transmit/receive FIFO transmit interrupt is disabled. 1: Transmit/receive FIFO transmit interrupt is enabled. |
| 1 | CFRXIE | Transmit/Receive FIFO Receive Interrupt Enable 0: Transmit/receive FIFO receive interrupt is disabled. 1: Transmit/receive FIFO receive interrupt is enabled. |
| 0 | CFE | Transmit/Receive FIFO Buffer Enable 0: No transmit/receive FIFO buffer is used. 1: Transmit/receive FIFO buffers are used. |

CFITT[7:0] Bits

These bits are used to set a message transmission interval when transmitting messages continuously from a transmit/receive FIFO buffer whose CFM[1:0] bits are set to 01_B (transmit mode) or 10_B (gateway mode).

Clear the CFE bit to 0 (no transmit/receive FIFO buffer is used) before modifying the CFITT[7:0] bits.

CFTML[3:0] Bits

These bits are used to set the number of transmit buffer on the channel which will be linked to transmit/receive FIFO buffer k when the CFM[1:0] bits are set to 01_B (transmit mode) or 10_B (gateway mode). There are three transmit/receive FIFO buffers per channel, so channel number m of FIFO buffer k is calculated as $m = k/3$ (integer division). The actual assigned transmit buffer number p linked to FIFO buffer k will be $((16 \times m) + CFTML[3:0])$ (see **Table 17.15**).

See **Table 17.13** and **Table 17.14**, as for the relationship between transmit/receive FIFO buffer k and transmit buffer p.

Setting the CFDC[2:0] bits to 001_B or more enables the setting of the CFTML[3:0] bits.

Do not link to any transmit buffer which is already allocated to a transmit queue on the same channel or to another transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFITR Bit

This bit is enabled when the CFITSS bit is 0.

When this bit is 0, the interval timer clock source is the pclk/2 clock divided by the value of the ITRCP[15:0] bits in the RSCANnGCFG register.

When this bit is 1, the interval timer clock source is the pclk/2 clock divided by (the value of the ITRCP[15:0] bits in the RSCANnGCFG register × 10).

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFITSS Bit

When this bit is 0, the clock selected by the CFITR bit is the count source of the interval timer.

When this bit is 1, the bit time clock of the channel to which the FIFO is linked is the count source of the interval timer.

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFM[1:0] Bits

These bits are used to select transmit/receive FIFO mode. Modify these bits only in global reset mode.

CFIGCV[2:0] Bits

These bits are used to specify the number of received messages required to generate a transmit/receive FIFO receive interrupt request when the CFM[1:0] bits are set to 00_B (receive mode) or 10_B (gateway mode) and the CFIM bit is set to 0 with a fraction for the total number of buffers (the setting of CFDC[2:0]).

When the CFDC[2:0] bits are set to 001_B (4 messages), set the CFIGCV[2:0] bits to 001_B, 011_B, 101_B, or 111_B.

Modify these bits only in global reset mode.

CFIM Bit

This bit is used to select a transmit/receive FIFO interrupt source. Modify this bit only in global reset mode.

CFDC[2:0] Bits

These bits are used to set the number of messages that can be stored in a single transmit/receive FIFO buffer. When these bits are set to 000_B, do not use a transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CCTXIE Bit

When this bit is set to 1 and the CCTXIF flag in the RSCANnCFSTSk register is set to 1, a transmit/receive FIFO transmit interrupt request is generated.

Modify this bit when the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFRXIE Bit

When this bit is set to 1 and the CFRXIF flag in the RSCANnCFSTSk register is set to 1, a transmit/receive FIFO receive interrupt request is generated.

Modify this bit when the CFE bit is set to 0.

CFE Bit

Setting this bit to 1 enables the transmit/receive FIFO buffers.

When this bit is set to 0 in transmit mode or gateway mode, if a message in the transmit/receive FIFO buffer is being transmitted or will be transmitted next, the transmit/receive FIFO buffer becomes empty after completion of transmission of that message, or upon detection of a CAN bus error, or arbitration-lost. In other cases or in receive mode, the transmit/receive FIFO buffer becomes empty immediately.

This bit is cleared to 0 when the following conditions are met.

- Receive mode: Global reset mode
- Transmit mode or gateway mode: Channel reset mode

Modify this bit in the following mode.

- Receive mode: Global operating mode or global test mode
- Transmit mode or gateway mode: Channel communication mode or channel halt mode

After all other bits in the RSCANnCFCCk register have been set, set this bit to 1 by using another instruction.

17.3.8.2 RSCANnCFSTSk — Transmit/receive FIFO Buffer Status Register k (k = 0 to 8)

Access: RSCANnCFSTSk register can be read/written in 32-bit units
 RSCANnCFSTSkL, RSCANnCFSTSkH registers can be read/written in 16-bit units
 RSCANnCFSTSkLL, RSCANnCFSTSkLH, RSCANnCFSTSkHL, RSCANnCFSTSkHH registers can be read/written in 8-bit units

Address: RSCANnCFSTSk: <RSCFDn_base> + 0178_H + (04_H × k)
 RSCANnCFSTSkL: <RSCFDn_base> + 0178_H + (04_H × k),
 RSCANnCFSTSkH: <RSCFDn_base> + 017A_H + (04_H × k)
 RSCANnCFSTSkLL: <RSCFDn_base> + 0178_H + (04_H × k),
 RSCANnCFSTSkLH: <RSCFDn_base> + 0179_H + (04_H × k),
 RSCANnCFSTSkHL: <RSCFDn_base> + 017A_H + (04_H × k),
 RSCANnCFSTSkHH: <RSCFDn_base> + 017B_H + (04_H × k)

Value after reset: 0000 0001_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R/W*1 | R/W*1 | R/W*1 | R | R |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 17.49 RSCANnCFSTSk Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|--|
| 31 to 16 | Reserved | These bits are read as the value after reset. When writing, write the value after reset. |
| 15 to 8 | CFMC[7:0] | Transmit/Receive FIFO Message Counter The number of messages stored in the transmit/receive FIFO buffer. |
| 7 to 5 | Reserved | These bits are read as the value after reset. When writing, write the value after reset. |
| 4 | CFTXIF | Transmit/Receive FIFO Transmit Interrupt Request Flag 0: No transmit/receive FIFO transmit interrupt request is present. 1: A transmit/receive FIFO transmit interrupt request is present. |
| 3 | CFRXIF | Transmit/Receive FIFO Receive Interrupt Request Flag 0: No transmit/receive FIFO receive interrupt request is present. 1: A transmit/receive FIFO receive interrupt request is present. |
| 2 | CFMLT | Transmit/Receive FIFO Message Lost Flag 0: No transmit/receive FIFO message is lost. 1: A transmit/receive FIFO message is lost. |
| 1 | CFLL | Transmit/Receive FIFO Buffer Full Status Flag 0: The transmit/receive FIFO buffer is not full. 1: The transmit/receive FIFO buffer is full. |
| 0 | CFEMP | Transmit/Receive FIFO Buffer Empty Status Flag 0: The transmit/receive FIFO buffer contains messages. 1: The transmit/receive FIFO buffer contains no message (buffer empty). |

CFMC[7:0] Bits

The CFMC[7:0] bits indicate the following values according to the setting of the CFM[1:0] bits in the RSCANnCFCCk register.

- When CFM[1:0] value is 01_B (transmit mode): Number of untransmitted messages in the buffer
- When CFM[1:0] value is 00_B (receive mode): Number of unread received messages in the buffer
- When CFM[1:0] value is 10_B (gateway mode): Number of untransmitted received messages in the buffer

These bits are cleared to 0 when any of the following conditions is met.

- When CFM[1:0] value is 00_B: In global reset mode
- When CFM[1:0] value is 01_B or 10_B: In channel reset mode
- When the CFE bit in the RSCANnCFCCk register is cleared to 0.

CFTXIF Flag

The CFTXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 01_B or 10_B, and the interrupt source selected by the CFIM bit in the RSCANnCFCCk register occurs

The CFTXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFTXIF flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFRXIF Flag

The CFRXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B or 10_B, and the interrupt source selected by the CFIM bit in the RSCANnCFCCk register occurs

The CFRXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFRXIF flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFMLT Flag

The CFMLT flag is set to 1 when any of the following conditions is met.

- When an attempt is made to store a new message while the transmit/receive FIFO buffer is full. In this case, the new message is discarded.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFMLT flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFLL Flag

The CFLL flag is set to 1 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer matches the FIFO buffer depth set by the CFDC[2:0] bits in the RSCANnCFCCk register.

The CFLL flag is cleared to 0 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer becomes smaller than the FIFO buffer depth set by the CFDC[2:0] bits.
- When the CFE bit in the RSCANnCFCCk register is 0 (no transmit/receive FIFO buffer is used): When not in the transmit abort
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

CFEMP Flag

The CFEMP flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B: All messages have been read, or in global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: All messages have been transmitted, or in channel reset mode
- When the CFE bit is 0 (no transmit/receive FIFO buffer is used): Not in the transmit abort

The CFEMP flag is cleared to 0 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B or 10_B: At least one received message has been stored in the transmit/receive FIFO buffer.
- When the CFM[1:0] bits are set to 01_B: A value of FF_H has been written to the RSCANnCFPCTRk register after data was written to the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0_k, and RSCANnCFDF1_k registers.

NOTE

To clear CFTXIF, CFRXIF, or CFMLT flag to 0, the program must write 0. When writing, use a store instruction to write "0" to the given flag and "1" to other flags.

17.3.8.3 RSCANnCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register k (k = 0 to 8)

Access: RSCANnCFPCTRk register can only be written in 32-bit units
 RSCANnCFPCTRkL, RSCANnCFPCTRkH registers can only be written in 16-bit units
 RSCANnCFPCTRkLL, RSCANnCFPCTRkLH, RSCANnCFPCTRkHL, RSCANnCFPCTRkHH registers can only be written in 8-bit units

Address: RSCANnCFPCTRk: <RSCFDn_base> + 01D8_H + (04_H × k)
 RSCANnCFPCTRkL: <RSCFDn_base> + 01D8_H + (04_H × k),
 RSCANnCFPCTRkH: <RSCFDn_base> + 01DA_H + (04_H × k)
 RSCANnCFPCTRkLL: <RSCFDn_base> + 01D8_H + (04_H × k),
 RSCANnCFPCTRkLH: <RSCFDn_base> + 01D9_H + (04_H × k),
 RSCANnCFPCTRkHL: <RSCFDn_base> + 01DA_H + (04_H × k),
 RSCANnCFPCTRkHH: <RSCFDn_base> + 01DB_H + (04_H × k)

Table 17.50 RSCANnCFPCTRk Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|---|
| 31 to 8 | Reserved | The write value should be the value after reset. |
| 7 to 0 | CFPC[7:0] | Transmit/Receive FIFO Pointer Control <ul style="list-style-type: none"> Receive mode: Writing FF_H to these bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. Transmit mode: Writing FF_H to these bits moves the write pointer to the next stage of the transmit/receive FIFO buffer. Gateway mode: Setting prohibited |

CFPC[7:0] Bits

- Receive mode (CFM[1:0] value in the RSCANnCFCCk register is 00_B):
 Writing FF_H to the CFPC[7:0] bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value (transmit/receive FIFO message counter) in the RSCANnCFSTSk register is decremented by 1. Read the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0_k, and RSCANnCFDF1_k registers to read messages from the transmit/receive FIFO buffer, and then write FF_H to the CFPC[7:0] bits.
 When writing FF_H to these bits, make sure that the CFE bit in the RSCANnCFCCk register is set to 1 (transmit/receive FIFO buffers are used) and the CFEMP flag in the RSCANnCFSTSk register is 0 (the transmit/receive FIFO buffer contains messages).

- Transmit mode (CFM[1:0] value in the RSCANnCFCCk register is 01_B):
Writing FF_H to the CFPC[7:0] bits stores the data written to the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0_k, and RSCANnCFDF1_k registers in the transmit/receive FIFO buffer and moves the write pointer to the next stage of the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value is incremented by 1. Write transmit messages to the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0_k, and RSCANnCFDF1_k registers before writing FF_H to the CFPC[7:0] bits.
When writing FF_H to these bits, make sure that the CFE bit in the RSCANnCFCCk register is set to 1 and the CFFLL flag in the RSCANnCFSTSk register is 0 (the transmit/receive FIFO buffer is not full).
- Gateway mode (CFM[1:0] value in the RSCANnCFCCk register is 10_B):
Setting prohibited

17.3.8.4 RSCANnCFIDk — Transmit/receive FIFO Buffer Access ID Register k (k = 0 to 8)

Access: RSCANnCFIDk register can be read/written in 32-bit units
 RSCANnCFIDkL, RSCANnCFIDkH registers can be read/written in 16-bit units

Table 17.51 RSCANnCFIDk Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------|--|
| 31 | CFIDE | Transmit/Receive FIFO Buffer IDE 0: Standard ID 1: Extended ID |
| 30 | CFRTR | Transmit/Receive FIFO Buffer RTR 0: Data frame 1: Remote frame |
| 29 | THLEN | Transmit History Data Store Enable This bit is valid only when the CFM[1:0] value is 01 _B (transmit mode). 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer. |
| 28 to 0 | CFID[28:0] | Transmit/Receive FIFO Buffer ID Data <ul style="list-style-type: none"> When CFM[1:0] value is 01_B (transmit mode): Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11. When CFM[1:0] value is 00_B (receive mode): Standard ID or extended ID in the received message can be read. For standard ID, read bits 10 to 0. Bits 28 to 11 are read as 0. |

This register can be written only when the CFM[1:0] value in the RSCANnCFCCk register is 01_B (transmit mode). This register can be read only when the CFM[1:0] value is 00_B (receive mode). This register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

CFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, this bit is used to set the ID format of the message to be transmitted from the transmit/receive FIFO buffer.

CFRTR Bit

This bit indicates the data format (data frame or remote frame) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, this bit is used to set the data format of the message to be transmitted from the transmit/receive FIFO buffer.

THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, and buffer type) of transmit messages is stored in the transmit history buffer after transmission is completed.

This bit is enabled when the CFM[1:0] value is 01_B (transmit mode).

CFID[28:0] Bits

These bits contain the ID of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B.

These bits set the ID of the message to be transmitted from the transmit/receive FIFO buffer when the CFM[1:0] value is 01_B.

17.3.8.5 RSCANnCFPTRk — Transmit/receive FIFO Buffer Access Pointer Register k (k = 0 to 8)

Access: RSCANnCFPTRk register can be read/written in 32-bit units
 RSCANnCFPTRkL, RSCANnCFPTRkH registers can be read/written in 16-bit units
 RSCANnCFPTRkLL, RSCANnCFPTRkLH, RSCANnCFPTRkHL, RSCANnCFPTRkHH registers can be read/written in 8-bit units

Address: RSCANnCFPTRk: <RSCFDn_base> + 0E84_H + (10_H × k)
 RSCANnCFPTRkL: <RSCFDn_base> + 0E84_H + (10_H × k),
 RSCANnCFPTRkH: <RSCFDn_base> + 0E86_H + (10_H × k)
 RSCANnCFPTRkLL: <RSCFDn_base> + 0E84_H + (10_H × k),

Table 17.52 RSCANnCFPTRk Register Contents

| Bit Position | Bit Name | Function |
|--------------|-------------|---|
| 31 to 28 | CFDLC[3:0] | Transmit/Receive FIFO Buffer DLC Data b31 b30 b29 b28 0 0 0 0: 0 data bytes 0 0 0 1: 1 data byte 0 0 1 0: 2 data bytes 0 0 1 1: 3 data bytes 0 1 0 0: 4 data bytes 0 1 0 1: 5 data bytes 0 1 1 0: 6 data bytes 0 1 1 1: 7 data bytes 1 X X X: 8 data bytes |
| 27 to 16 | CFPTR[11:0] | Transmit/Receive FIFO Buffer Label Data <ul style="list-style-type: none"> When CFM[1:0] value is 01_B (transmit mode): Set the label information to be stored in the transmit history buffer. Only bits CFPTR[7:0] are valid. When CFM[1:0] value is 00_B (receive mode): The label information of the received message can be read. |
| 15 to 0 | CFTS[15:0] | Transmit/Receive FIFO Buffer Timestamp Data These bits are valid only when the CFM[1:0] value is 00 _B (receive mode). The timestamp value of the received message can be read. |

This register is writable only when the CFM[1:0] value in the RSCANnCFCCk register is 01_B (transmit mode). This register is readable only when the CFM[1:0] value is 00_B (receive mode). This register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

CFDLC[3:0] Bits

These bits indicate the data length of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, these bits are used to set the data length of the message to be transmitted from the transmit/receive FIFO buffer. If the data length is set to 1001_B or more, the actual transmit data defaults to 8 bytes.

CFPTR[11:0] Bits

These bits indicate the label information attached to the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, the CFPTR[7:0] value is stored in the transmit history buffer when message transmission has been completed.

CFTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the transmit/receive FIFO buffer.

These bits are valid when the CFM[1:0] value is 00_B.

17.3.8.6 RSCANnCFDF0_k — Transmit/receive FIFO Buffer Access Data Field 0 Register k (k = 0 to 8)

When CFM[1:0] value is 00_B (receive mode): The message data stored in the transmit/receive FIFO buffer can be read. |

This register is writable only when the CFM[1:0] value in the RSCANnCFCCk register is 01_B (transmit mode).

This register is readable only when the CFM[1:0] value is 00_B (receive mode). When the CFDLC[3:0] value in the RSCANnCFPTRk register is smaller than 1000_B, data bytes for which no data is set are read as 00_H.

This register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

17.3.9 Details of FIFO Status-Related Registers

17.3.9.1 RSCANnFESTS — FIFO Empty Status Register

Access: RSCANnFESTS registers can be read only in 32-bit units
 RSCANnFESTSL, RSCANnFESTSH registers can be read only in 16-bit units
 RSCANnFESTSLL, RSCANnFESTSLH, RSCANnFESTSHL, RSCANnFESTSHH registers can be read only in 8-bit units

Address: RSCANnFESTS: <RSCFDn_base> + 0238_H
 RSCANnFESTSL: <RSCFDn_base> + 0238_H, RSCANnFESTSH: <RSCFDn_base> + 023A_H
 RSCANnFESTSLL: <RSCFDn_base> + 0238_H, RSCANnFESTSLH: <RSCFDn_base> + 0239_H,
 RSCANnFESTSHL: <RSCFDn_base> + 023A_H, RSCANnFESTSHH: <RSCFDn_base> + 023B_H

Value after reset: 03FF FFFF_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 17.55 RSCANnFESTS Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 17 | Reserved | These bits are read as the value after reset. |
| 16 | CF8EMP | Transmit/Receive FIFO Buffer Empty Status Flag |
| 15 | CF7EMP | 0: Transmit/receive FIFO buffer k contains a message. 1: Transmit/receive FIFO buffer k contains no message. |
| 14 | CF6EMP | (k = 0 to 8) |
| 13 | CF5EMP | |
| 12 | CF4EMP | |
| 11 | CF3EMP | |
| 10 | CF2EMP | |
| 9 | CF1EMP | |
| 8 | CF0EMP | |
| 7 | RF7EMP | Receive FIFO Buffer Empty Status Flag |
| 6 | RF6EMP | 0: Receive FIFO buffer x contains an unread message. 1: Receive FIFO buffer x contains no unread message (buffer empty). |
| 5 | RF5EMP | (x = 0 to 7) |
| 4 | RF4EMP | |
| 3 | RF3EMP | |
| 2 | RF2EMP | |
| 1 | RF1EMP | |
| 0 | RF0EMP | |

The RSCANnFESTS register is set to 03FF FFFF_H in global reset mode.

CFkEMP Flag (k = 0 to 8)

The CFkEMP flag is set to 1 when the CFEMP flag in the RSCANnCFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)). When the CFEMP flag is cleared to 0 (the transmit/receive FIFO buffer contains messages), the CFkEMP flag is cleared to 0.

RFxEMP Flag (x = 0 to 7)

The RFxEMP flag is set to 1 when the RFEMP flag in the RSCANnRFSTStx register is set to 1 (the receive FIFO buffer contains no unread message). When the RFEMP flag is cleared to 0 (the receive FIFO buffer contains unread messages), the RFxEMP flag is cleared to 0.

17.3.9.2 RSCANnFFSTS — FIFO Full Status Register

Access: RSCANnFFSTS register can be read only in 32-bit units
 RSCANnFFSTSL, RSCANnFFSTSH registers can be read only in 16-bit units
 RSCANnFFSTSLL, RSCANnFFSTSLH, RSCANnFFSTSHL, RSCANnFFSTSHH registers can be read only in 8-bit units

Address: RSCANnFFSTS: <RSCFDn_base> + 023C_H
 RSCANnFFSTSL: <RSCFDn_base> + 023C_H, RSCANnFFSTSH: <RSCFDn_base> + 023E_H
 RSCANnFFSTSLL: <RSCFDn_base> + 023C_H, RSCANnFFSTSLH: <RSCFDn_base> + 023D_H,
 RSCANnFFSTSHL: <RSCFDn_base> + 023E_H, RSCANnFFSTSHH: <RSCFDn_base> + 023F_H

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CF8FLL |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| | CF7FLL | CF6FLL | CF5FLL | CF4FLL | CF3FLL | CF2FLL | CF1FLL | CF0FLL | RF7FLL | RF6FLL | RF5FLL | RF4FLL | RF3FLL | RF2FLL | RF1FLL | RF0FLL |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 17.56 RSCANnFFSTS Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 17 | Reserved | These bits are read as the value after reset. |
| 16 | CF8FLL | Transmit/Receive FIFO Buffer Full Status Flag 0: Transmit/receive buffer k is not full. 1: Transmit/receive buffer k is full. |
| 15 | CF7FLL | |
| 14 | CF6FLL | (k = 0 to 8) |
| 13 | CF5FLL | |
| 12 | CF4FLL | |
| 11 | CF3FLL | |
| 10 | CF2FLL | |
| 9 | CF1FLL | |
| 8 | CF0FLL | |
| 7 | RF7FLL | Receive FIFO Buffer Full Status Flag 0: Receive FIFO buffer x is not full. 1: Receive FIFO buffer x is full. |
| 6 | RF6FLL | (x = 0 to 7) |
| 5 | RF5FLL | |
| 4 | RF4FLL | |
| 3 | RF3FLL | |
| 2 | RF2FLL | |
| 1 | RF1FLL | |
| 0 | RF0FLL | |

The RSCANnFFSTS register is cleared to 0000 0000_H in global reset mode.

CFkFLL Flag (k = 0 to 8)

The CFkFLL flag is set to 1 when the CFFLL flag in the RSCANnCFSTSk register is set to 1 (the transmit/receive FIFO buffer is full).

When the CFFLL flag is cleared to 0 (the transmit/receive FIFO buffer is not full), the CFkFLL flag is cleared to 0.

RFxFLl Flag (x = 0 to 7)

The RFxFLl flag is set to 1 when the RFFLL flag in the RSCANnRFSTsx register is set to 1 (the receive FIFO buffer is full). When the RFFLL flag is cleared to 0 (the receive FIFO buffer is not full), the RFxFLl flag is cleared to 0.

17.3.9.3 RSCANnFMSTS — FIFO Message Lost Status Register

Access: RSCANnFMSTS register can be read only in 32-bit units
 RSCANnFMSTSL, RSCANnFMSTSH registers can be read only in 16-bit units
 RSCANnFMSTSL, RSCANnFMSTSLH, RSCANnFMSTSHL, RSCANnFMSTSHH registers can be read only in 8-bit units

Address: RSCANnFMSTS: <RSCFDn_base> + 0240_H
 RSCANnFMSTSL: <RSCFDn_base> + 0240_H, RSCANnFMSTSH: <RSCFDn_base> + 0242_H
 RSCANnFMSTSL: <RSCFDn_base> + 0240_H, RSCANnFMSTSLH: <RSCFDn_base> + 0241_H,
 RSCANnFMSTSHL: <RSCFDn_base> + 0242_H, RSCANnFMSTSHH: <RSCFDn_base> + 0243_H

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CF8MLT |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| | CF7MLT | CF6MLT | CF5MLT | CF4MLT | CF3MLT | CF2MLT | CF1MLT | CF0MLT | RF7MLT | RF6MLT | RF5MLT | RF4MLT | RF3MLT | RF2MLT | RF1MLT | RF0MLT |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 17.57 RSCANnFMSTS Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 31 to 17 | Reserved | These bits are read as the value after reset. |
| 16 | CF8MLT | Transmit/Receive FIFO Buffer Message Lost Status Flag 0: No transmit/receive FIFO buffer k message is lost. 1: A transmit/receive FIFO buffer k message is lost. |
| 15 | CF7MLT | |
| 14 | CF6MLT | (k = 0 to 8) |
| 13 | CF5MLT | |
| 12 | CF4MLT | |
| 11 | CF3MLT | |
| 10 | CF2MLT | |
| 9 | CF1MLT | |
| 8 | CF0MLT | |
| 7 | RF7MLT | Receive FIFO Buffer Message Lost Status Flag 0: No receive FIFO buffer x message is lost. 1: A receive FIFO buffer x message is lost. |
| 6 | RF6MLT | |
| 5 | RF5MLT | (x = 0 to 7) |
| 4 | RF4MLT | |
| 3 | RF3MLT | |
| 2 | RF2MLT | |
| 1 | RF1MLT | |
| 0 | RF0MLT | |

The RSCANnFMSTS register is cleared to 0000 0000_H in global reset mode.

CFkMLT Flag (k = 0 to 8)

The CFkMLT flag is set to 1 when the CFMLT flag in the RSCANnCFSTSk register is set to 1 (a transmit/receive FIFO message is lost). When the CFMLT flag is cleared to 0, the CFkMLT flag is cleared to 0.

RFxMLT Flag (x = 0 to 7)

The RFxMLT flag is set to 1 when the RFMLT flag in the RSCANnRFSTSx register is set to 1 (a receive FIFO message is lost). When the RFMLT flag is cleared to 0, the RFxMLT flag is cleared to 0.

17.3.9.4 RSCANnRFISTS — Receive FIFO Buffer Interrupt Flag Status Register

Access: RSCANnRFISTS register can be read only in 32-bit units
 RSCANnRFISTS_{SL}, RSCANnRFISTS_{SH} registers can be read only in 16-bit units
 RSCANnRFISTS_{SL}_L, RSCANnRFISTS_{SL}_H, RSCANnRFISTS_{SH}_L, RSCANnRFISTS_{SH}_H registers can be read only in 8-bit units

Address: RSCANnRFISTS: <RSCFDn_base> + 0244_H
 RSCANnRFISTS_{SL}: <RSCFDn_base> + 0244_H, RSCANnRFISTS_{SH}: <RSCFDn_base> + 0246_H
 RSCANnRFISTS_{SL}_L: <RSCFDn_base> + 0244_H, RSCANnRFISTS_{SL}_H: <RSCFDn_base> + 0245_H,
 RSCANnRFISTS_{SH}_L: <RSCFDn_base> + 0246_H, RSCANnRFISTS_{SH}_H: <RSCFDn_base> + 0247_H

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|----|----|----|----|----|----|----|----|-------|-------|-------|-------|-------|-------|-------|-------|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | RF7IF | RF6IF | RF5IF | RF4IF | RF3IF | RF2IF | RF1IF | RF0IF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 17.58 RSCANnRFISTS Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 8 | Reserved | These bits are read as the value after reset. |
| 7 | RF7IF | Receive FIFO Buffer Interrupt Request Status Flag |
| 6 | RF6IF | 0: No receive FIFO buffer x interrupt request is present. 1: A receive FIFO buffer x interrupt request is present. |
| 5 | RF5IF | (x = 0 to 7) |
| 4 | RF4IF | |
| 3 | RF3IF | |
| 2 | RF2IF | |
| 1 | RF1IF | |
| 0 | RF0IF | |

The RSCANnRFISTS register is cleared to 0000 0000_H in global reset mode.

RFxIF Flag (x = 0 to 7)

The RFxIF flag is set to 1 when the RFIF flag in the RSCANnRFISTS_x register is set to 1 (a receive FIFO interrupt request is present). When the RFIF flag is cleared to 0, the RFxIF flag is cleared to 0.

17.3.9.5 RSCANnCFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register

Access: RSCANnCFRISTS register can be read only in 32-bit units
 RSCANnCFRISTSL, RSCANnCFRISTSH registers can be read only in 16-bit units
 RSCANnCFRISTSLL, RSCANnCFRISTSLH, RSCANnCFRISTSHL, RSCANnCFRISTSHH registers can be read only in 8-bit units

Address: RSCANnCFRISTS: <RSCFDn_base> + 0248_H
 RSCANnCFRISTSL: <RSCFDn_base> + 0248_H, RSCANnCFRISTSH: <RSCFDn_base> + 024A_H
 RSCANnCFRISTSLL: <RSCFDn_base> + 0248_H, RSCANnCFRISTSLH: <RSCFDn_base> + 0249_H,
 RSCANnCFRISTSHL: <RSCFDn_base> + 024A_H, RSCANnCFRISTSHH: <RSCFDn_base> + 024B_H

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|----|----|----|----|----|----|----|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | CF8RXI | CF7RXI | CF6RXI | CF5RXI | CF4RXI | CF3RXI | CF2RXI | CF1RXI | CF0RXI |
| | | | | | | | | F | F | F | F | F | F | F | F | F |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 17.59 RSCANnCFRISTS Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 9 | Reserved | These bits are read as the value after reset. |
| 8 | CF8RXIF | Transmit/Receive FIFO Buffer Receive Interrupt Request Status Flag 0: No transmit/receive FIFO buffer k receive interrupt request is present. 1: A transmit/receive FIFO buffer k receive interrupt request is present. (k = 0 to 8) |
| 7 | CF7RXIF | |
| 6 | CF6RXIF | |
| 5 | CF5RXIF | |
| 4 | CF4RXIF | |
| 3 | CF3RXIF | |
| 2 | CF2RXIF | |
| 1 | CF1RXIF | |
| 0 | CF0RXIF | |

The RSCANnCFRISTS register is cleared to 0000 0000_H in global reset mode.

CFkRXIF Flag (k = 0 to 8)

The CFkRXIF flag is set to 1 when the CFRXIF flag in the RSCANnCFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). When the CFRXIF flag is cleared to 0, the CFkRXIF flag is cleared to 0.

17.3.9.6 RSCANnCFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register

Access: RSCANnCFTISTS register can be read only in 32-bit units
 RSCANnCFTISTSL, RSCANnCFTISTSH registers can be read only in 16-bit units
 RSCANnCFTISTSLL, RSCANnCFTISTSLH, RSCANnCFTISTSHL, RSCANnCFTISTSHH registers can be read only in 8-bit units

Address: RSCANnCFTISTS: <RSCFDn_base> + 024C_H
 RSCANnCFTISTSL: <RSCFDn_base> + 024C_H, RSCANnCFTISTSH: <RSCFDn_base> + 024E_H
 RSCANnCFTISTSLL: <RSCFDn_base> + 024C_H, RSCANnCFTISTSLH: <RSCFDn_base> + 024D_H,
 RSCANnCFTISTSHL: <RSCFDn_base> + 024E_H, RSCANnCFTISTSHH: <RSCFDn_base> + 024F_H

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|----|----|----|----|----|----|---|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| | — | — | — | — | — | — | — | CF8TXI | CF7TXI | CF6TXI | CF5TXI | CF4TXI | CF3TXI | CF2TXI | CF1TXI | CF0TXI |
| | | | | | | | | F | F | F | F | F | F | F | F | F |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 17.60 RSCANnCFTISTS Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 31 to 9 | Reserved | These bits are read as the value after reset. |
| 8 | CF8TXIF | Transmit/Receive FIFO Buffer Transmit Interrupt Request Status Flag 0: No transmit/receive FIFO buffer k transmit interrupt request is present. 1: A transmit/receive FIFO buffer k transmit interrupt request is present. (k = 0 to 8) |
| 7 | CF7TXIF | |
| 6 | CF6TXIF | |
| 5 | CF5TXIF | |
| 4 | CF4TXIF | |
| 3 | CF3TXIF | |
| 2 | CF2TXIF | |
| 1 | CF1TXIF | |
| 0 | CF0TXIF | |

The RSCANnCFTISTS register is cleared to 0000 0000_H in global reset mode.

CFkTXIF Flag (k = 0 to 8)

The CFkTXIF flag is set to 1 when the CFTXIF flag in the RSCANnCFSTSk register is set to 1 (a transmit/receive FIFO transmit interrupt request is present). When the CFTXIF flag is cleared to 0, the CFkTXIF flag is cleared to 0.

17.3.10 Details of Transmit Buffer-Related Registers

17.3.10.1 RSCANnTMCp — Transmit Buffer Control Register p (p = 0 to 47)

Access: RSCANnTMCp register can be read/written in 8-bit units

Address: RSCANnTMCp: <RSCFDn_base> + 0250_H + (01_H × p)

Value after reset: 00_H

| | | | | | | | | |
|-------------------|---|---|---|---|---|------|-------|-------|
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | TMOM | TMTAR | TMTR |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W*1 | R/W*1 |

Note 1. The only effective value for writing to this bit is 1, which sets the bit. Otherwise writing to the bit results in retention of its state.

Table 17.61 RSCANnTMCp Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 7 to 3 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |
| 2 | TMOM | One-Shot Transmission Enable 0: One-shot transmission is disabled. 1: One-shot transmission is enabled. |
| 1 | TMTAR | Transmit Abort Request 0: Transmit abort is not requested. 1: Transmit abort is requested. |
| 0 | TMTR | Transmit Request 0: Transmission is not requested. 1: Transmission is requested. |

When the RSCANnTMCp register meets any of the following conditions, set it to 00_H.

- The RSCANnTMCp register corresponds to the transmit buffer number selected by the CFTML[3:0] bits in the RSCANnCFCCk register (p = m × 16 + the value of CFTML[3:0] bits).
- The RSCANnTMCp register corresponds to the transmit buffer allocated to the transmit queue by the TXQDC[3:0] bits in the RSCANnTXQCCm (m = 0 to 2) register (p = (m × 16 + 15) to (m × 16 + 15 – the value of TXQDC[3:0] bits)).

All of the bits in the RSCANnTMCp register are cleared to 0 in channel reset mode. Modify the RSCANnTMCp register in channel communication mode or channel halt mode.

TMOM Bit

Setting this bit to 1 enables one-shot transmission. If transmission fails, retransmission defined in the CAN protocol is not performed.

Modify the TMOM bit when the TMTRM flag in the RSCANnTMSTSp register is set to 0. Set the TMOM bit to 1 together with the TMTR bit.

TMTAR Bit

Setting this bit to 1 generates a transmit abort request for the message stored in the transmit buffer. However, a message that is being transmitted or one that will be transmitted next cannot be aborted.

The TMTAR bit can be set to 1 when TMTR bit is 1.

The TMTAR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed.
- An error or arbitration-lost has been detected.

If this bit becomes 0 at the same time as the program writes 1 to this bit, this bit becomes 0.

TMTR Bit

Setting this bit to 1 transmits the message stored in the transmit buffer.

The TMTR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed after the TMTAR bit was set to 1.
- An error or arbitration-lost has been detected with the TMOM bit set to 1.

Set the TMTR bit to 1 when the value of TMTRF[1:0] in the RSCANnTMSTSp register is 00_B.

17.3.10.2 RSCANnTMSTSp — Transmit Buffer Status Register p (p = 0 to 47)

Access: RSCANnTMSTSp register can be read/written in 8-bit units

Address: RSCANnTMSTSp: <RSCFDn_base> + 02D0_H + (01_H × p)

Value after reset: 00_H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|---|---|---|--------|-------|------------|-----|--------|
| | — | — | — | TMTARM | TMTRM | TMTRF[1:0] | | TMTSTS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R |

Table 17.62 RSCANnTMSTSp Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------|---|
| 7 to 5 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |
| 4 | TMTARM | Transmit Buffer Transmit Abort Request Status Flag 0: No transmit abort request is present. 1: A transmit abort request is present. |
| 3 | TMTRM | Transmit Buffer Transmit Request Status Flag 0: No transmit request is present. 1: A transmit request is present. |
| 2, 1 | TMTRF[1:0] | Transmit Buffer Transmit Result Status Flag b2 b1 0 0: Transmission is in progress or no transmit request is present. 0 1: Transmit abort has been completed. 1 0: Transmission has been completed (without transmit abort request). 1 1: Transmission has been completed (with transmit abort request). |
| 0 | TMTSTS | Transmit Buffer Transmit Status Flag 0: Transmission is not in progress. 1: Transmission is in progress. |

All of the bits in the RSCANnTMSTSp register are cleared to 0 in channel reset mode.

TMTARM Flag

The TMTARM flag is set to 1 when the TMTAR bit in the RSCANnTMCp register is set to 1.

The TMTARM flag is set to 0 when the TMTAR bit in the RSCANnTMCp register is set to 0.

TMTRM Flag

The TMTRM flag is set to 1 when the TMTR bit in the RSCANnTMCp register is set to 1.

The TMTRM flag is set to 0 when the TMTR bit in the RSCANnTMCp register is set to 0.

TMTRF[1:0] Flag

This flag indicates the result of transmission from the transmit buffer.

00_B: Transmission is in progress or no transmit request is present.

01_B: Transmission from the transmit buffer was aborted.

10_B: Transmission has been completed with the TMTAR bit in the RSCANnTMCp register set to 0 (transmit abort is not requested).

11_B: Transmission has been completed with the TMTAR bit in the RSCANnTMCp register set to 1 (transmit abort is requested).

Write 00_B to the TMTRF[1:0] flag in channel communication mode or channel halt mode. Do not write any value other than 00_B to this flag.

TMTSTS Flag

This flag is set to 1 when transmission from the transmit buffer starts, and is cleared to 0 when transmission from the transmit buffer has been completed or terminated due to a bus error or arbitration lost.

17.3.10.3 RSCANnTMIDp — Transmit Buffer ID Register p (p = 0 to 47)

Access: RSCANnTMIDp register can be read/written in 32-bit units
 RSCANnTMIDpL, RSCANnTMIDpH registers can be read/written in 16-bit units
 RSCANnTMIDpLL, RSCANnTMIDpLH, RSCANnTMIDpHL, RSCANnTMIDpHH registers can be read/written in 8-bit units

Address: RSCANnTMIDp: $\langle \text{RSCFDn_base} \rangle + 1000_{\text{H}} + (10_{\text{H}} \times p)$
 RSCANnTMIDpL: $\langle \text{RSCFDn_base} \rangle + 1000_{\text{H}} + (10_{\text{H}} \times p)$,
 RSCANnTMIDpH: $\langle \text{RSCFDn_base} \rangle + 1002_{\text{H}} + (10_{\text{H}} \times p)$
 RSCANnTMIDpLL: $\langle \text{RSCFDn_base} \rangle + 1000_{\text{H}} + (10_{\text{H}} \times p)$,
 RSCANnTMIDpLH: $\langle \text{RSCFDn_base} \rangle + 1001_{\text{H}} + (10_{\text{H}} \times p)$,
 RSCANnTMIDpHL: $\langle \text{RSCFDn_base} \rangle + 1002_{\text{H}} + (10_{\text{H}} \times p)$,
 RSCANnTMIDpHH: $\langle \text{RSCFDn_base} \rangle + 1003_{\text{H}} + (10_{\text{H}} \times p)$

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 17.63 RSCANnTMIDp Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------|--|
| 31 | TMIDE | Transmit Buffer IDE 0: Standard ID 1: Extended ID |
| 30 | TMRTR | Transmit Buffer RTR 0: Data frame 1: Remote frame |
| 29 | THLEN | Transmit History Data Store Enable 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer. |
| 28 to 0 | TMID[28:0] | Transmit Buffer ID Data Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11. |

Modify this register when the TMTRM bit in the corresponding RSCANnTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write data to this register. If this register is allocated to the transmit queue, only write data to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

TMIDE Bit

This bit is used to set the ID format of the message to be transmitted from the transmit buffer.

TMRTR Bit

This bit is used to set the data format of the message to be transmitted from the transmit buffer.

THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, buffer type, and timestamp (timestamp is included if the TMTSCE bit in the RSCANnGCFG register is 1)) of transmit messages is stored in the transmit history buffer after transmission is completed.

TMID[28:0] Bits

These bits are used to set the ID of the message to be transmitted from the transmit buffer.

17.3.10.4 RSCANnTMPTRp — Transmit Buffer Pointer Register p (p = 0 to 47)

Access: RSCANnTMPTRp register can be read/written in 32-bit units
 RSCANnTMPTRpL, RSCANnTMPTRpH registers can be read/written in 16-bit units
 RSCANnTMPTRpLL, RSCANnTMPTRpLH, RSCANnTMPTRpHL, RSCANnTMPTRpHH registers can be read/written in 8-bit units

Address: RSCANnTMPTRp: <RSCFDn_base> + 1004_H + (10_H × p)
 RSCANnTMPTRpL: <RSCFDn_base> + 1004_H + (10_H × p),
 RSCANnTMPTRpH: <RSCFDn_base> + 1006_H + (10_H × p)
 RSCANnTMPTRpLL: <RSCFDn_base> + 1004_H + (10_H × p),
 RSCANnTMPTRpLH: <RSCFDn_base> + 1005_H + (10_H × p),
 RSCANnTMPTRpHL: <RSCFDn_base> + 1006_H + (10_H × p),
 RSCANnTMPTRpHH: <RSCFDn_base> + 1007_H + (10_H × p)

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 17.64 RSCANnTMPTRp Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------|---|
| 31 to 28 | TMDLC[3:0] | Transmit Buffer DLC Data b31 b30 b29 b28 0 0 0 0: 0 data bytes 0 0 0 1: 1 data byte 0 0 1 0: 2 data bytes 0 0 1 1: 3 data bytes 0 1 0 0: 4 data bytes 0 1 0 1: 5 data bytes 0 1 1 0: 6 data bytes 0 1 1 1: 7 data bytes 1 X X X: 8 data bytes |
| 27 to 24 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 23 to 16 | TMPTR[7:0] | Transmit Buffer Label Data Set the label information to be stored in the transmit history buffer. |
| 15 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

Modify this register when the TMTRM bit in the corresponding RSCANnTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

TMDLC[3:0] Bits

These bits are used to set the data length of the message to be transmitted from the transmit buffer when the TMRTR bit in the RSCANnTMIDp register is set to 0 (data frame). If the data length is set to 1001_{B} or more, the transmit data is 8 bytes long.

When the TMRTR bit is set to 1 (remote frame), these bits set the data length of the message to be requested.

TMPTR[7:0] Bits

When message transmission has been completed, the TMPTR[7:0] value is stored in the transmit history buffer.

17.3.10.5 RSCANnTMDF0_p — Transmit Buffer Data Field 0 Register p (p = 0 to 47)

Access: RSCANnTMDF0_p register can be read/written in 32-bit units
 RSCANnTMDF0_pL, RSCANnTMDF0_pH registers can be read/written in 16-bit units
 RSCANnTMDF0_pLL, RSCANnTMDF0_pLH, RSCANnTMDF0_pHL, RSCANnTMDF0_pHH registers can be read/written in 8-bit units

Address: RSCANnTMDF0_p: <RSCFDn_base> + 1008_H + (10_H × p)
 RSCANnTMDF0_pL: <RSCFDn_base> + 1008_H + (10_H × p),
 RSCANnTMDF0_pH: <RSCFDn_base> + 100A_H + (10_H × p)
 RSCANnTMDF0_pLL: <RSCFDn_base> + 1008_H + (10_H × p),
 RSCANnTMDF0_pLH: <RSCFDn_base> + 1009_H + (10_H × p),
 RSCANnTMDF0_pHL: <RSCFDn_base> + 100A_H + (10_H × p),
 RSCANnTMDF0_pHH: <RSCFDn_base> + 100B_H + (10_H × p)

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 17.67 RSCANnTMIECy Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 31 to 16 | TMIEp | Transmit Buffer Interrupt Enable p (p = y × 32 + 31 to y × 32 + 16) 0: Transmit buffer interrupt is disabled 1: Transmit buffer interrupt is enabled When y = 1, these bits are reserved. When read, the value after reset is read. When writing, write the value after reset. |
| 15 to 0 | TMIEp | Transmit Buffer Interrupt Enable p (p = y × 32 + 15 to y × 32 + 0) 0: Transmit buffer interrupt is disabled. 1: Transmit buffer interrupt is enabled. |

TMIEp Bits (p = 0 to 47)

When any of these bits is set to 1 and the corresponding transmission has been completed, a transmit buffer interrupt request is generated.

Modify these bits when the TMTRM flag in the corresponding RSCANnTMSTSp register is 0 (no transmit request is present).

Write 0 to bits corresponding to transmit buffers linked to transmit/receive FIFO buffers or transmit buffers allocated to the transmit queue.

Table 17.68 shows the bit assignment.

Table 17.68 TMIEp Bit Assignment

| Bit Position | Channel | Transmit Buffer Number |
|--------------|---------|------------------------|
| 0 | 0 | 0 |
| 1 | 0 | 1 |

17.3.11 Details of Transmit Buffer Status-Related Registers

17.3.11.1 RSCANnTMTRSTSy — Transmit Buffer Transmit Request Status Register y (y = 0, 1)

Access: RSCANnTMTRSTSy register can be read only in 32-bit units
RSCANnTMTRSTSyL, RSCANnTMTRSTSyH registers can be read only in 16-bit units
RSCANnTMTRSTSyLL, RSCANnTMTRSTSyLH, RSCANnTMTRSTSyHL, RSCANnTMTRSTSyHH registers can be read only in 8-bit units

Address: RSCANnTMTRSTSy: $\langle \text{RSCFDn_base} \rangle + 0350_{\text{H}} + (04_{\text{H}} \times y)$
RSCANnTMTRSTSyL: $\langle \text{RSCFDn_base} \rangle + 0350_{\text{H}} + (04_{\text{H}} \times y)$,
RSCANnTMTRSTSyH: $\langle \text{RSCFDn_base} \rangle + 0352_{\text{H}} + (04_{\text{H}} \times y)$
RSCANnTMTRSTSyLL: $\langle \text{RSCFDn_base} \rangle + 0350_{\text{H}} + (04_{\text{H}} \times y)$,

Table 17.69 RSCANnTMTRSTSy Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 31 to 16 | TMTRSTSp | Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 31 to y × 32 + 16) 0: No transmit request is present. 1: A transmit request is present. When y = 1, these bits are reserved. When read, the value after reset is read. When writing, write the value after reset. |
| 15 to 0 | TMTRSTSp | Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 15 to y × 32 + 0) 0: No transmit request is present. 1: A transmit request is present. |

TMTRSTSp Flags (p = 0 to 47)

These flags indicate the status of the TMTR bit in the RSCANnTMCp register.

When the TMTR bit is set to 1 (transmission is requested), the corresponding TMTRSTSp flag is set to 1.

The corresponding TMTRSTSp flag is cleared to 0 when the TMTR bit is set to 0 (transmission is not requested) or in channel reset mode.

Table 17.70 shows the bit assignment.

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 31 to 16 | TMCSTSp | Transmit Buffer Transmit Complete Status Flag p (p = y × 32 + 31 to y × 32 + 16) 0: Transmission has not been completed. 1: Transmission has been completed. When y = 1, these bits are reserved. When read, the value after reset is read. When writing, write the value after reset. |
| 15 to 0 | TMCSTSp | Transmit Buffer Transmit Complete Status Flag p (p = y × 32 + 15 to y × 32 + 0) 0: Transmission has not been completed. 1: Transmission has been completed. |

TMCSTSp Flags (p = 0 to 47)

When the TMTRF[1:0] flag in the RSCANnTMSTSp register is set to 10_B (transmission has been completed (without transmit abort request)) or 11_B (transmission has been completed (with transmit abort request)), the corresponding TMCSTSp flag is set to 1.

To clear the TMCSTSp flag to 0, set the corresponding TMTRF[1:0] flag to 00_B. This flag is cleared to 0 in channel reset mode.

Table 17.74 shows the bit assignment.

Table 17.77 RSCANnTXQCCm Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------|--|
| 31 to 14 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 13 | TXQIM | Transmit Queue Interrupt Source Select 0: When the transmit queue becomes empty upon completion of message transmission, a transmit queue interrupt request is generated. 1: A transmit queue interrupt request is generated each time a message has been transmitted. |
| 12 | TXQIE | Transmit Queue Interrupt Enable 0: Transmit queue interrupt is disabled. 1: Transmit queue interrupt is enabled. |
| 11 to 8 | TXQDC[3:0] | Transmit Queue Depth Configuration Setting these bits to g (g = 2 to 15) makes the (g + 1) transmit queue available. Setting these bits to 0 disables the transmit queue. Setting these bits to 1 is prohibited. |
| 7 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | TXQE | Transmit Queue Enable 0: The transmit queue is not used. 1: The transmit queue is used. |

TXQIM Bit

This bit is used to select a transmit queue interrupt source. Modify this bit in channel reset mode.

TXQIE Bit

When the TXQIE bit is set to 1 and the source selected by the TXQIM bit occurs, an interrupt request is generated.

Set the TXQE bit to 0 before modifying the TXQIE bit.

TXQDC[3:0] Bits

These bits are used to specify the number of transmit buffers to be allocated to the transmit queues. Transmit buffers are allocated to transmit queues in descending order of buffer number, that is, from $(m \times 16 + 15)$ to $(m \times 16 + 0)$ (see **Table 17.16**). For examples of how buffer allocation is done, see **Figure 17.9**. Modify these bits only in channel reset mode.

TXQE Bit

Setting this bit to 1 enables the transmit queue. Modify this bit in channel communication mode or channel halt mode. This bit is cleared to 0 in channel reset mode.

Before setting the TXQE bit to 1, set the TXQDC[3:0] bits to 0010_B or more.

17.3.12.2 RSCANnTXQSTSm — Transmit Queue Status Register m (m = 0 to 2)

Access: RSCANnTXQSTSm register can be read/written in 32-bit units
 RSCANnTXQSTSmL, RSCANnTXQSTSmH registers can be read/written in 16-bit units
 RSCANnTXQSTSmLL, RSCANnTXQSTSmLH, RSCANnTXQSTSmHL, RSCANnTXQSTSmHH registers can be read/written in 8-bit units

Address: RSCANnTXQSTSm: <RSCFDn_base> + 03C0_H + (04_H × m)
 RSCANnTXQSTSmL: <RSCFDn_base> + 03C0_H + (04_H × m),
 RSCANnTXQSTSmH: <RSCFDn_base> + 03C2_H + (04_H × m)
 RSCANnTXQSTSmLL: <RSCFDn_base> + 03C0_H + (04_H × m),
 RSCANnTXQSTSmLH: <RSCFDn_base> + 03C1_H + (04_H × m),
 RSCANnTXQSTSmHL: <RSCFDn_base> + 03C2_H + (04_H × m),
 RSCANnTXQSTSmHH: <RSCFDn_base> + 03C3_H + (04_H × m)

Value after reset: 0000 0001_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|----|----|----|----|----|----|---|---|---|---|---|---|---|-------|------------|------------|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | TXQIF | TXQFL L | TXQEM P |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 | R | R |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 17.78 RSCANnTXQSTSm Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 12 to 8 | Reserved | When read, the undefined value is returned. When writing, write the value after reset. |
| 7 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | TXQIF | Transmit Queue Interrupt Request Flag 0: No transmit queue interrupt request is present. 1: A transmit queue interrupt request is present. |
| 1 | TXQFL | Transmit Queue Full Status Flag 0: The transmit queue is not full. 1: The transmit queue is full. |
| 0 | TXQEMP | Transmit Queue Empty Status Flag 0: The transmit queue contains messages. 1: The transmit queue contains no message (transmit queue empty). |

TXQIF Flag

The TXQIF flag is set to 1 when the interrupt source specified by the TXQIM bit in the RSCANnTXQCCm register has occurred.

The TXQIF flag is cleared to 0 in channel reset mode or by writing 0 to this flag. This flag is not cleared to 0 by setting the TXQE bit in the RSCANnTXQCCm register to 0 (the transmit queue is not used).

TXQFLL Flag

The TXQFLL flag is set to 1 when the number of messages stored in the transmit queue matches the transmit queue depth set by the TXQDC[3:0] bits in the RSCANnTXQCCm register.

This flag is cleared to 0 in any of the following cases.

- The number of messages set for the transmit queue is smaller than the transmit queue depth set by the TXQDC[3:0] bits.
- In channel reset mode

TXQEMP Flag

The TXQEMP flag is cleared to 0 when even a single message is stored in the transmit queue.

This flag is set to 1 in any of the following cases.

- The TXQE bit is set to 0 (the transmit queue is not used).
- The transmit queue becomes empty.
- In channel reset mode

17.3.12.3 RSCANnTXQPCTRm — Transmit Queue Pointer Control Register m (m = 0 to 2)

Access: RSCANnTXQPCTRm register can only be written in 32-bit units
 RSCANnTXQPCTRmL, RSCANnTXQPCTRmH registers can only be written in 16-bit units
 RSCANnTXQPCTRmLL, RSCANnTXQPCTRmLH, RSCANnTXQPCTRmHL, RSCANnTXQPCTRmHH registers can only be written in 8-bit units

Address: RSCANnTXQPCTRm: <RSCFDn_base> + 03E0_H + (04_H × m)
 RSCANnTXQPCTRmL: <RSCFDn_base> + 03E0_H + (04_H × m),
 RSCANnTXQPCTRmH: <RSCFDn_base> + 03E2_H + (04_H × m)
 RSCANnTXQPCTRmLL: <RSCFDn_base> + 03E0_H + (04_H × m),
 RSCANnTXQPCTRmLH: <RSCFDn_base> + 03E1_H + (04_H × m),
 RSCANnTXQPCTRmHL: <RSCFDn_base> + 03E2_H + (04_H × m),
 RSCANnTXQPCTRmHH: <RSCFDn_base> + 03E3_H + (04_H × m)

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 17.79 RSCANnTXQPCTRm Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------|---|
| 31 to 8 | Reserved | The write value should be the value after reset. |
| 7 to 0 | TXQPC[7:0] | Transmit Queue Pointer Control Writing FF _H to these bits moves the write pointer of the transmit queue to the next queue buffer. |

TXQPC[7:0] Bits

Writing FF_H to the TXQPC[7:0] bits moves the write pointer to the next transmit queue buffer and generates a transmit request for the message. Write transmit messages to the RSCANnTMIDp, RSCANnTMPTRp, RSCANnTMDFO_p, and RSCANnTMDF1_p registers (p = 15, 31, 47) before writing FF_H to the TXQPC[7:0] bits.

When writing FF_H to these bits, make sure that the TXQE bit in the RSCANnTXQCCm register is set to 1 (the transmit queue is used) and the TXQFLL flag in the RSCANnTXQSTSm register is 0 (The transmit queue is not full).

17.3.13 Details of Transmit history-related Registers

17.3.13.1 RSCANnTHLCCm — Transmit History Configuration and Control Register m (m = 0 to 2)

Access: RSCANnTHLCCm register can be read/written in 32-bit units
 RSCANnTHLCCmL, RSCANnTHLCCmH registers can be read/written in 16-bit units
 RSCANnTHLCCmLL, RSCANnTHLCCmLH, RSCANnTHLCCmHL, RSCANnTHLCCmHH registers can be read/written in 8-bit units

Address: RSCANnTHLCCm: <RSCFDn_base> + 0400_H + (04_H × m)
 RSCANnTHLCCmL: <RSCFDn_base> + 0400_H + (04_H × m),
 RSCANnTHLCCmH: <RSCFDn_base> + 0402_H + (04_H × m)
 RSCANnTHLCCmLL: <RSCFDn_base> + 0400_H + (04_H × m),
 RSCANnTHLCCmLH: <RSCFDn_base> + 0401_H + (04_H × m),
 RSCANnTHLCCmHL: <RSCFDn_base> + 0402_H + (04_H × m),
 RSCANnTHLCCmHH: <RSCFDn_base> + 0403_H + (04_H × m)

Value after reset: 0000 0000_H

| | | | | | | | | | | | | | | | | |

Table 17.80 RSCANnTHLCCm Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 11 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 10 | THLDTE | Transmit History Target Buffer Select 0: Entries from transmit/receive FIFO buffers and transmit queue 1: Entries from transmit buffers, transmit/receive FIFO buffers, and transmit queue |
| 9 | THLIM | Transmit History Interrupt Source Select 0: When 12 items of data have been stored in the transmit history buffer 1: Each time transmit history data is stored in the transmit history buffer |
| 8 | THLIE | Transmit History Interrupt Enable 0: Transmit history interrupt is disabled. 1: Transmit history interrupt is enabled. |
| 7 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | THLE | Transmit History Buffer Enable 0: Transmit history buffer is not used. 1: Transmit history buffer is used. |

THLDTE Bit

When this bit is set to 0, the transmit history data of messages transmitted from transmit/receive FIFO buffers and the transmit queue is stored in the transmit history buffer. When this bit is set to 1, the transmit history data of messages transmitted from transmit buffers, transmit/receive FIFO buffers, and the transmit queue is stored in the transmit history buffer.

Modify this bit only in channel reset mode.

THLIM Bit

This bit is used to select a transmit history interrupt source.

Modify this bit only in channel reset mode.

THLIE Bit

When the THLIE bit is set to 1 and the source selected by the THLIM bit has occurred, a transmit history interrupt request is generated. Modify the THLIE bit only when the THLE bit is set to 0.

THLE Bit

Setting this bit to 1 enables the transmit history buffer. When data transmission from the buffer selected by the THLDTE bit has been completed, the transmit history data of transmit messages is stored in the transmit history buffer.

Modify this bit in channel communication mode or channel halt mode.

This bit is cleared to 0 in channel reset mode.

17.3.13.2 RSCANnTHLSTSm — Transmit History Status Register m (m = 0 to 2)

Access: RSCANnTHLSTSm register can be read/written in 32-bit units
 RSCANnTHLSTSmL, RSCANnTHLSTSmH register can be read/written in 16-bit units
 RSCANnTHLSTSmLL, RSCANnTHLSTSmLH, RSCANnTHLSTSmHL, RSCANnTHLSTSmHH registers can be read/written in 8-bit units

Address: RSCANnTHLSTSm: <RSCFDn_base> + 0420_H + (04_H × m)
 RSCANnTHLSTSmL: <RSCFDn_base> + 0420_H + (04_H × m),
 RSCANnTHLSTSmH: <RSCFDn_base> + 0422_H + (04_H × m)
 RSCANnTHLSTSmLL: <RSCFDn_base> + 0420_H + (04_H × m),
 RSCANnTHLSTSmLH: <RSCFDn_base> + 0421_H + (04_H × m),
 RSCANnTHLSTSmHL: <RSCFDn_base> + 0422_H + (04_H × m),
 RSCANnTHLSTSmHH: <RSCFDn_base> + 0423_H + (04_H × m)

Value after reset: 0000 0001_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|----|----|----|------------|----|----|---|---|---|---|---|---|-------|--------|--------|--------|
| | — | — | — | THLMC[4:0] | | | | — | — | — | — | — | THLIF | THLELT | THLFLL | THLEMP |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 | R/W*1 | R | R |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 17.81 RSCANnTHLSTSm Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------|---|
| 31 to 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 12 to 8 | THLMC[4:0] | Transmit History Buffer Unread Data Counter These bits indicate the number of unread data stored in the transmit history buffer. |
| 7 to 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | THLIF | Transmit History Interrupt Request Flag 0: No transmit history interrupt request is present. 1: A transmit history interrupt request is present. |
| 2 | THLELT | Transmit History Buffer Overflow Flag 0: Transmit history buffer overflow has not occurred. 1: Transmit history buffer overflow has occurred. |
| 1 | THLFLL | Transmit history Buffer Full Status Flag 0: Transmit history buffer is not full. 1: Transmit history buffer is full. |
| 0 | THLEMP | Transmit History Buffer Empty Status Flag 0: Transmit history buffer contains unread data. 1: Transmit history buffer contains no unread data (buffer empty). |

THLMC[4:0] Bits

These bits indicate the number of unread data stored in the transmit history buffer.

These bits are cleared to 0 in channel reset mode.

THLIF Flag

The THLIF flag is set to 1 when the interrupt source specified with the THLIM bit in the RSCANnTHLCCm register occurs.

This flag is cleared to 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLELT Flag

The THLELT flag is set to 1 when an attempt is made to store new transmit history data while the transmit history buffer is full. In this case, the new data is discarded. This flag becomes 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLFLL Flag

The THLFLL flag is set to 1 when 16 items of data have been stored in the transmit history buffer, and is cleared to 0 when the number of data stored in the transmit history buffer has decreased to less than 16. This bit is also cleared to 0 in channel reset mode or when the THLE bit in the RSCANnTHLCCm register is set to 0 (transmit history buffer is not used).

THLEMP Flag

The THLEMP flag is cleared to 0 when even a single item of transmit history data has been stored in the transmit history buffer.

This flag is set to 1 when all the data in the transmit history buffer has been read. This flag is also set to 1 in channel reset mode or when the THLE bit in the RSCANnTHLCCm register is set to 0 (transmit history buffer is not used).

NOTE

To clear THLIF or THLELT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

17.3.13.3 RSCANnTHLPCTRm — Transmit History Pointer Control Register m (m = 0 to 2)

Access: RSCANnTHLPCTRm register can only be written in 32-bit units
 RSCANnTHLPCTRmL, RSCANnTHLPCTRmH registers can only be written in 16-bit units
 RSCANnTHLPCTRmLL, RSCANnTHLPCTRmLH, RSCANnTHLPCTRmHL, RSCANnTHLPCTRmHH registers can only be written in 8-bit units

Address: RSCANnTHLPCTRm: <RSCFDn_base> + 0440_H + (04_H × m)
 RSCANnTHLPCTRmL: <RSCFDn_base> + 0440_H + (04_H × m),
 RSCANnTHLPCTRmH: <RSCFDn_base> + 0442_H + (04_H × m)
 RSCANnTHLPCTRmLL: <RSCFDn_base> + 0440_H + (04_H × m),
 RSCANnTHLPCTRmLH: <RSCFDn_base> + 0441_H + (04_H × m),
 RSCANnTHLPCTRmHL: <RSCFDn_base> + 0442_H + (04_H × m),
 RSCANnTHLPCTRmHH: <RSCFDn_base> + 0443_H + (04_H × m)

Value after reset: 0000 0000_H

| | | | | | | | | | | | | | | | | |
|-------------------|----|----|----|----|----|----|----|----|------------|----|----|----|----|----|----|----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | THLPC[7:0] | | | | | | | |

| R/W | R | R | R | R | R | R | R | R | W | W | W | W | W | W | W | W |

Table 17.82 RSCANnTHLPCTRm Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------|---|
| 31 to 8 | Reserved | When writing, write the value after reset. |
| 7 to 0 | THLPC[7:0] | Transmit History List Pointer Control Writing FF _H to these bits moves the read pointer to the next unread data in the transmit history buffer. |

THLPC[7:0] Bits

When the THLPC[7:0] bits are set to FF_H, the read pointer moves to the next data in the transmit history buffer. At this time, the THLMC[4:0] (transmit history buffer unread data counter) value in the RSCANnTHLSTSm register is decremented by 1. Write FF_H to the THLPC[7:0] bits after reading from the RSCANnTHLACCm register.

When writing FF_H to these bits, make sure that the THLE bit in the RSCANnTHLCCm register is set to 1 (transmit history buffer is used) and the THLEMP flag in the RSCANnTHLSTSm register is 0.

17.3.13.4 RSCANnTHLACCm — Transmit History Access Register m (m = 0 to 2)

Access: RSCANnTHLACCm register can be read only in 32-bit units
 RSCANnTHLACCmL, RSCANnTHLACCmH registers can be read only in 16-bit units
 RSCANnTHLACCmLL, RSCANnTHLACCmLH, RSCANnTHLACCmHL, RSCANnTHLACCmHH registers can be read only in 8-bit units

Address: RSCANnTHLACCm: $\langle \text{RSCFDn_base} \rangle + 1800_{\text{H}} + (04_{\text{H}} \times m)$
 RSCANnTHLACCmL: $\langle \text{RSCFDn_base} \rangle + 1800_{\text{H}} + (04_{\text{H}} \times m)$,
 RSCANnTHLACCmH: $\langle \text{RSCFDn_base} \rangle + 1802_{\text{H}} + (04_{\text{H}} \times m)$
 RSCANnTHLACCmLL: $\langle \text{RSCFDn_base} \rangle + 1800_{\text{H}} + (04_{\text{H}} \times m)$,
 RSCANnTHLACCmLH: $\langle \text{RSCFDn_base} \rangle + 1801_{\text{H}} + (04_{\text{H}} \times m)$,
 RSCANnTHLACCmHL: $\langle \text{RSCFDn_base} \rangle + 1802_{\text{H}} + (04_{\text{H}} \times m)$,
 RSCANnTHLACCmHH: $\langle \text{RSCFDn_base} \rangle + 1803_{\text{H}} + (04_{\text{H}} \times m)$

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 0 | 1 | 0 | Transmit/receive FIFO buffer | | | | | | | | | | | | | | | |
| 1 | 0 | 0 | Transmit queue | | | | | | | | | | | | | | | |

TMTS[15:0] Bits

When the TMTSCE bit in the RSCANnGCFG register is 1, timestamp values in transmit history data stored in the transmit history buffer are displayed. When the TMTSCE bit is 0, these bits are always read as 0.

TID[7:0] Bits

These bits indicate the label information of transmit history data stored in the transmit history buffer.

BN[3:0] Bits

These bits indicate the transmit source buffer number in the transmit history data stored in the transmit history buffer.

BT[2:0] Bits

These bits indicate the type of the transmit source buffer in the transmit history data stored in the transmit history buffer.

17.3.14 Details of Test-Related Registers

17.3.14.1 RSCANnGTSTCFG — Global Test Configuration Register

Access: RSCANnGTSTCFG register can be read/written in 32-bit units
 RSCANnGTSTCFGL, RSCANnGTSTCFGH registers can be read/written in 16-bit units
 RSCANnGTSTCFGLL, RSCANnGTSTCFGLH, RSCANnGTSTCFGHL, RSCANnGTSTCFGHH registers can be read/written in 8-bit units

Address: RSCANnGTSTCFG: <RSCFDn_base> + 0468_H
 RSCANnGTSTCFGL: <RSCFDn_base> + 0468_H, RSCANnGTSTCFGH: <RSCFDn_base> + 046A_H
 RSCANnGTSTCFGLL: <RSCFDn_base> + 0468_H, RSCANnGTSTCFGLH: <RSCFDn_base> + 0469_H,
 RSCANnGTSTCFGHL: <RSCFDn_base> + 046A_H, RSCANnGTSTCFGHH: <RSCFDn_base> + 046B_H

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 17.84 RSCANnGTSTCFG Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------|---|
| 31 to 23 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 22 to 16 | RTMPS[6:0] | RAM Test Page Configuration Set a value within a range of page 0 (00 _H) to page 29 (1D _H). |
| 15 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | C2ICBCE | CAN2 Inter-channel Communication Test Enable 0: CAN2 inter-channel communication test is disabled 1: CAN2 inter-channel communication test is enabled. |
| 1 | C1ICBCE | CAN1 Inter-Channel Communication Test Enable 0: CAN1 inter-channel communication test is disabled. 1: CAN1 inter-channel communication test is enabled. |
| 0 | C0ICBCE | CAN0 Inter-Channel Communication Test Enable 0: CAN0 inter-channel communication test is disabled. 1: CAN0 inter-channel communication test is enabled. |

Modify the RSCANnGTSTCFG register only in global test mode.

RTMPS[6:0] Bits

These bits are used to set the RAM test target page number for RAM test. Set a value in the range of 00_H to 1D_H, inclusive.

C2ICBCE Bit

Setting this bit to 1 enables the channel 2 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

C1ICBCE Bit

Setting this bit to 1 enables the channel 1 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

C0ICBCE Bit

Setting this bit to 1 enables the channel 0 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

17.3.14.2 RSCANnGTSTCTR — Global Test Control Register

Access: RSCANnGTSTCTR register can be read/written in 32-bit units
 RSCANnGTSTCTRL, RSCANnGTSTCTRH registers can be read/written in 16-bit units
 RSCANnGTSTCTRLL, RSCANnGTSTCTRLH, RSCANnGTSTCTRHL, RSCANnGTSTCTRHH registers can be read/written in 8-bit units

Address: RSCANnGTSTCTR: <RSCFDn_base> + 046C_H
 RSCANnGTSTCTRL: <RSCFDn_base> + 046C_H, RSCANnGTSTCTRH: <RSCFDn_base> + 046E_H
 RSCANnGTSTCTRLL: <RSCFDn_base> + 046C_H, RSCANnGTSTCTRLH: <RSCFDn_base> + 046D_H,
 RSCANnGTSTCTRHL: <RSCFDn_base> + 046E_H, RSCANnGTSTCTRHH: <RSCFDn_base> + 046F_H

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|---------|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| | — | — | — | — | — | — | — | — | — | — | — | — | — | RTME | — | ICBCTME |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R/W |

Table 17.85 RSCANnGTSTCTR Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 31 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | RTME | RAM Test Enable 0: RAM test is disabled. 1: RAM test is enabled. |
| 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ICBCTME | Inter-Channel Communication Test Enable 0: Inter-channel communication test is disabled 1: Inter-channel communication test is enabled |

RTME Bit

Setting this bit to 1 enables the RAM test. Modify this bit only in global test mode.

This bit is cleared to 0 in global reset mode (see **Figure 17.37**).

1. Set the GMDC[1:0] bits in the RSCANnGCTR register to 10_B (Global test mode).
2. Set the RTME bit to 1.
3. Check that the RTME bit is set to 1.

ICBCTME Bit

When this bit is set to 1, a communication test is enabled between the channels for which the CmICBCE bit (m = 0 to 2) in the RSCANnGTSTCFG register has been set to 1. Modify the ICBCTME bit only in global test mode.

This bit is cleared to 0 in global reset mode.

17.3.14.3 RSCANnGLOCKK — Global Lock Key Register

Access: RSCANnGLOCKK register can be write only in 32-bit units.
RSCANnGLOCKKL, RSCANnGLOCKKH registers can be write only in 16-bit units.

Address: RSCANnGLOCKK: <RSCFDn_base> + 047C_H
RSCANnGLOCKKL: <RSCFDn_base> + 047C_H, RSCANnGLOCKKH: <RSCFDn_base> + 047E_H

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | LOCK[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 |

Note 1. Writing to these bits is effective only when the RS-CANFD module is in global test mode.

Table 17.86 RSCANnGLOCKK Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------|---|
| 31 to 16 | Reserved | When writing these bits, write the value after reset. |
| 15 to 0 | LOCK[15:0] | Lock Key These bits are key bits to release protection of test mode. |

The RSCANnGLOCKK register releases protection of special test bits and is write only.

For the protection release data, see **Section 17.11.4.2, Procedure for Releasing the Protection.**

LOCK[15:0] Bits

Writing the protection release data to the LOCK[15:0] bits in succession enables writing 1 to the RTME bit in the RSCANnGTSTCTR register.

After the protection has been released, writing to the I/O register area (<RSCFDn_base> + 0000_H to <RSCFDn_base> + 04FF_H) of the CAN (except the RAM) enables the protection again.

Reading from the I/O register area of the CAN or reading from/writing to other areas does not enable the protection.

17.3.14.4 RSCANnRPGACC_r— RAM Test Page Access Register *r* (*r* = 0 to 63)

Access: RSCANnRPGACC_r register can be read/written in 32-bit units
 RSCANnRPGACC_{rL}, RSCANnRPGACC_{rH} registers can be read/written in 16-bit units
 RSCANnRPGACC_{rLL}, RSCANnRPGACC_{rLH}, RSCANnRPGACC_{rHL}, RSCANnRPGACC_{rHH} registers can be read/written in 8-bit units

Address: RSCANnRPGACC_r: <RSCFDn_base> + 1900_H + (04_H × *r*)
 RSCANnRPGACC_{rL}: <RSCFDn_base> + 1900_H + (04_H × *r*),
 RSCANnRPGACC_{rH}: <RSCFDn_base> + 1902_H + (04_H × *r*)
 RSCANnRPGACC_{rLL}: <RSCFDn_base> + 1900_H + (04_H × *r*),
 RSCANnRPGACC_{rLH}: <RSCFDn_base> + 1901_H + (04_H × *r*),
 RSCANnRPGACC_{rHL}: <RSCFDn_base> + 1902_H + (04_H × *r*),
 RSCANnRPGACC_{rHH}: <RSCFDn_base> + 1903_H + (04_H × *r*)

Value after reset: 0000 0000_H

| | | | | | | | | | | | | | | | | |

Table 17.87 RSCANnRPGACC_r Register Contents

| Bit Position | Bit Name | Function |
|--------------|-------------|--|
| 31 to 0 | RDTA [31:0] | RAM Data Test Access Data can be read and written in RSCAN RAM. |

Modify the RSCANnRPGACC_r register in global test mode with the RTME bit in the RSCANnGTSTCTR register set to 1 (RAM test is enabled).

The RSCANnRPGACC_r register can be read and written when the RTME bit is set to 1.

17.3.15 Details of Mode Read Register

17.3.15.1 RSCANnCANFDMDR — CAN FD Mode Read Register

Access: This register can be read in 32-bit units

Address: <RSCFDn_base> + 8000_H

Value after reset: 0000 0000_H

| | | | | | | | | | | | | | | | | |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 17.88 RSCANnCANFDMDR Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 1 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |
| 0 | FDMDR | CAN FD mode read 0: classical CAN mode is selected. 1: CAN FD mode is selected. |

17.4 Registers (CAN FD Mode)

This section describes all registers to be used when the RS-CANFD is used in CAN FD mode.

17.4.1 List of Registers

The following tables list RS-CANFD registers to be used in CAN FD mode.

For details about <RSCFDn_base>, see **Section 17.1.2, Register Base Address**.

For details about registers initialized in Global reset mode or Channel reset mode, see following.

- **Table 17.180, Registers Initialized in Global Reset Mode or Channel Reset Mode**
- **Table 17.181, Registers Initialized Only in Global Reset Mode**

Table 17.89 Registers (1/3)

| Module Name | Register Name | Symbol | Address |
|---|---|--------------------|---|
| Interface mode-related registers | | | |
| RSCFDn | Global interface mode select register | RSCFDnCFDGRMCFG | <RSCFDn_base> + 04FC _H |
| Channel-related registers | | | |
| RSCFDn | Channel m nominal bit rate configuration register | RSCFDnCFDCmNCFG | <RSCFDn_base> + 0000 _H + (10 _H × m) |
| RSCFDn | Channel m control register | RSCFDnCFDCmCTR | <RSCFDn_base> + 0004 _H + (10 _H × m) |
| RSCFDn | Channel m status register | RSCFDnCFDCmSTS | <RSCFDn_base> + 0008 _H + (10 _H × m) |
| RSCFDn | Channel m error flag register | RSCFDnCFDCmERFL | <RSCFDn_base> + 000C _H + (10 _H × m) |
| RSCFDn | Channel m data bit rate configuration register | RSCFDnCFDCmDCFG | <RSCFDn_base> + 0500 _H + (20 _H × m) |
| RSCFDn | Channel m CAN FD configuration register | RSCFDnCFDCmFDCFG | <RSCFDn_base> + 0504 _H + (20 _H × m) |
| RSCFDn | Channel m CAN FD control register | RSCFDnCFDCmFDCTR | <RSCFDn_base> + 0508 _H + (20 _H × m) |
| RSCFDn | Channel m CAN FD status register | RSCFDnCFDCmFDSTS | <RSCFDn_base> + 050C _H + (20 _H × m) |
| RSCFDn | Channel m CAN FD CRC register | RSCFDnCFDCmFDCRC | <RSCFDn_base> + 0510 _H + (20 _H × m) |
| Global-related registers | | | |
| RSCFDn | Global configuration register | RSCFDnCFDGCFCG | <RSCFDn_base> + 0084 _H |
| RSCFDn | Global control register | RSCFDnCFDGCCTR | <RSCFDn_base> + 0088 _H |
| RSCFDn | Global status register | RSCFDnCFDGCSTS | <RSCFDn_base> + 008C _H |
| RSCFDn | Global error flag register | RSCFDnCFDGERFL | <RSCFDn_base> + 0090 _H |
| RSCFDn | Global timestamp counter register | RSCFDnCFDGTSC | <RSCFDn_base> + 0094 _H |
| RSCFDn | Global TX Interrupt Status Register 0 | RSCFDnCFDGTINTSTS0 | <RSCFDn_base> + 0460 _H |
| RSCFDn | Global FD configuration register | RSCFDnCFDGFDCFCG | <RSCFDn_base> + 0474 _H |
| Receive rule-related registers | | | |
| RSCFDn | Receive Rule Entry Control Register | RSCFDnCFDGAFLLECTR | <RSCFDn_base> + 0098 _H |
| RSCFDn | Receive Rule Configuration Register 0 | RSCFDnCFDGAFLCFG0 | <RSCFDn_base> + 009C _H |
| RSCFDn | Receive Rule ID Register j | RSCFDnCFDGAFLIDj | <RSCFDn_base> + 1000 _H + (10 _H × j) |
| RSCFDn | Receive Rule Mask Register j | RSCFDnCFDGAFLMj | <RSCFDn_base> + 1004 _H + (10 _H × j) |
| RSCFDn | Receive Rule Pointer 0 Register j | RSCFDnCFDGAFLP0_j | <RSCFDn_base> + 1008 _H + (10 _H × j) |
| RSCFDn | Receive Rule Pointer 1 Register j | RSCFDnCFDGAFLP1_j | <RSCFDn_base> + 100C _H + (10 _H × j) |
| Receive buffer-related registers | | | |
| RSCFDn | Receive Buffer Number Register | RSCFDnCFDRMNB | <RSCFDn_base> + 00A4 _H |
| RSCFDn | Receive Buffer New Data Register y | RSCFDnCFDRMNDy | <RSCFDn_base> + 00A8 _H + (04 _H × y) |
| RSCFDn | Receive Buffer ID Register q | RSCFDnCFDRMIDq | <RSCFDn_base> + 2000 _H + (20 _H × q) |
| RSCFDn | Receive Buffer Pointer Register q | RSCFDnCFDRMPTRq | <RSCFDn_base> + 2004 _H + (20 _H × q) |
| RSCFDn | Receive buffer CAN FD status register q | RSCFDnCFDRMFDSTSq | <RSCFDn_base> + 2008 _H + (20 _H × q) |
| RSCFDn | Receive Buffer Data Field b Register q | RSCFDnCFDRMDFb_q | <RSCFDn_base> + 200C _H + (04 _H × b) + (20 _H × q) |

Table 17.89 Registers (2/3)

| Module Name | Register Name | Symbol | Address |
|---|--|--------------------|---|
| Receive FIFO buffer-related registers | | | |
| RSCFDn | Receive FIFO Buffer Configuration and Control Register x | RSCFDnCFDRFCCx | <RSCFDn_base> + 00B8 _H + (04 _H × x) |
| RSCFDn | Receive FIFO Buffer Status Register x | RSCFDnCFDRFSTSx | <RSCFDn_base> + 00D8 _H + (04 _H × x) |
| RSCFDn | Receive FIFO Buffer Pointer Control Register x | RSCFDnCFDRFPCTRx | <RSCFDn_base> + 00F8 _H + (04 _H × x) |
| RSCFDn | Receive FIFO Buffer Access ID Register x | RSCFDnCFDRFIDx | <RSCFDn_base> + 3000 _H + (80 _H × x) |
| RSCFDn | Receive FIFO Buffer Access Pointer Register x | RSCFDnCFDRFPTRx | <RSCFDn_base> + 3004 _H + (80 _H × x) |
| RSCFDn | Receive FIFO CAN FD status register x | RSCFDnCFDRFFDSTSx | <RSCFDn_base> + 3008 _H + (80 _H × x) |
| RSCFDn | Receive FIFO Buffer Access Data Field d Register x | RSCFDnCFDRFDf_d_x | <RSCFDn_base> + 300C _H + (04 _H × d) + (80 _H × x) |
| Transmit/Receive FIFO buffer related registers | | | |
| RSCFDn | Transmit/receive FIFO Buffer Configuration and Control Register k | RSCFDnCFDCFCCK | <RSCFDn_base> + 0118 _H + (04 _H × k) |
| RSCFDn | Transmit/receive FIFO Buffer Status Register k | RSCFDnCFDCFSTSk | <RSCFDn_base> + 0178 _H + (04 _H × k) |
| RSCFDn | Transmit/receive FIFO Buffer Pointer Control Register k | RSCFDnCFDCFPCTRk | <RSCFDn_base> + 01D8 _H + (04 _H × k) |
| RSCFDn | Transmit/receive FIFO Buffer Access ID Register k | RSCFDnCFDCFIDk | <RSCFDn_base> + 3400 _H + (80 _H × k) |
| RSCFDn | Transmit/receive FIFO Buffer Access Pointer Register k | RSCFDnCFDCFPTRk | <RSCFDn_base> + 3404 _H + (80 _H × k) |
| RSCFDn | Transmit/receive FIFO CAN FD configuration/status register k | RSCFDnCFDCFFDCSTSk | <RSCFDn_base> + 3408 _H + (80 _H × k) |
| RSCFDn | Transmit/receive FIFO Buffer Access Data Field d Register k | RSCFDnCFDCFDf_d_k | <RSCFDn_base> + 340C _H + (04 _H × d) + (80 _H × k) |
| FIFO status-related registers | | | |
| RSCFDn | FIFO Empty Status Register | RSCFDnCFDFESTS | <RSCFDn_base> + 0238 _H |
| RSCFDn | FIFO Full Status Register | RSCFDnCFDFFSTS | <RSCFDn_base> + 023C _H |
| RSCFDn | FIFO Message Lost Status Register | RSCFDnCFDFMSTS | <RSCFDn_base> + 0240 _H |
| RSCFDn | Receive FIFO Buffer Interrupt Flag Status Register | RSCFDnCFDRFISTS | <RSCFDn_base> + 0244 _H |
| RSCFDn | Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register | RSCFDnCFDCFRISTS | <RSCFDn_base> + 0248 _H |
| RSCFDn | Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register | RSCFDnCFDCFTISTS | <RSCFDn_base> + 024C _H |
| FIFO DMA-related registers | | | |
| RSCFDn | DMA enable register | RSCFDnCFDCDTCT | <RSCFDn_base> + 0490 _H |
| RSCFDn | DMA status register | RSCFDnCFDCDTSTS | <RSCFDn_base> + 0494 _H |
| Transmit buffer-related registers | | | |
| RSCFDn | Transmit Buffer Control Register p | RSCFDnCFDTMCp | <RSCFDn_base> + 0250 _H + (01 _H × p) |
| RSCFDn | Transmit Buffer Status Register p | RSCFDnCFDTMSTSp | <RSCFDn_base> + 02D0 _H + (01 _H × p) |
| RSCFDn | Transmit Buffer ID Register p | RSCFDnCFDTMIDp | <RSCFDn_base> + 4000 _H + (20 _H × p) |
| RSCFDn | Transmit Buffer Pointer Register p | RSCFDnCFDTMPTRp | <RSCFDn_base> + 4004 _H + (20 _H × p) |
| RSCFDn | Transmit buffer CAN FD configuration register p | RSCFDnCFDTMFDCRTP | <RSCFDn_base> + 4008 _H + (20 _H × p) |
| RSCFDn | Transmit Buffer Data Field b Register p | RSCFDnCFDTMDFb_p | <RSCFDn_base> + 400C _H + (04 _H × b) + (20 _H × p) |
| RSCFDn | Transmit Buffer Interrupt Enable Configuration Register y | RSCFDnCFDTMIECy | <RSCFDn_base> + 0390 _H + (04 _H × y) |
| Transmit buffer status-related registers | | | |
| RSCFDn | Transmit Buffer Transmit Request Status Register y | RSCFDnCFDTMTRSTSy | <RSCFDn_base> + 0350 _H + (04 _H × y) |
| RSCFDn | Transmit Buffer Transmit Abort Request Status Register y | RSCFDnCFDTMTARSTSy | <RSCFDn_base> + 0360 _H + (04 _H × y) |
| RSCFDn | Transmit Buffer Transmit Complete Status Register y | RSCFDnCFDTMTCSTSy | <RSCFDn_base> + 0370 _H + (04 _H × y) |
| RSCFDn | Transmit Buffer Transmit Abort Status Register y | RSCFDnCFDTMTASTSy | <RSCFDn_base> + 0380 _H + (04 _H × y) |
| Transmit queue-related registers | | | |
| RSCFDn | Transmit Queue Configuration and Control Register m | RSCFDnCFDTXQCCm | <RSCFDn_base> + 03A0 _H + (04 _H × m) |
| RSCFDn | Transmit Queue Status Register m | RSCFDnCFDTXQSTSm | <RSCFDn_base> + 03C0 _H + (04 _H × m) |
| RSCFDn | Transmit Queue Pointer Control Register m | RSCFDnCFDTXQPCTRM | <RSCFDn_base> + 03E0 _H + (04 _H × m) |

Table 17.89 Registers (3/3)

| Module Name | Register Name | Symbol | Address |
|---|---|-------------------|---|
| Transmit history-related registers | | | |
| RSCFDn | Transmit History Configuration and Control Register m | RSCFDnCFDTHLCCm | <RSCFDn_base> + 0400 _H + (04 _H × m) |
| RSCFDn | Transmit History Status Register m | RSCFDnCFDTHLSTSm | <RSCFDn_base> + 0420 _H + (04 _H × m) |
| RSCFDn | Transmit History Pointer Control Register m | RSCFDnCFDTHLPCTRm | <RSCFDn_base> + 0440 _H + (04 _H × m) |
| RSCFDn | Transmit History Access Register m | RSCFDnCFDTHLACCm | <RSCFDn_base> + 6000 _H + (04 _H × m) |
| Test-related registers | | | |
| RSCFDn | Global Test Configuration Register | RSCFDnCFDGTSTCFG | <RSCFDn_base> + 0468 _H |
| RSCFDn | Global Test Control Register | RSCFDnCFDGTSTCTR | <RSCFDn_base> + 046C _H |
| RSCFDn | Global Lock Key Register | RSCFDnCFDGLCKK | <RSCFDn_base> + 047C _H |
| RSCFDn | RAM Test Page Access Register r | RSCFDnCFDRPGACCr | <RSCFDn_base> + 6400 _H + (04 _H × r) |
| Mode read registers | | | |
| RSCFDn | CAN FD Mode Read Register | RSCFDnCANFMDR | <RSCFDn_base> + 8000 _H |

Table 17.90 Transmit Buffer p Allocated to Each Channel

| CANm | |
|-----------------------------|-----------------------------|
| Transmit buffer p | Transmit buffer 16 × m + 0 |
| | Transmit buffer 16 × m + 1 |
| | Transmit buffer 16 × m + 2 |
| | Transmit buffer 16 × m + 3 |
| | Transmit buffer 16 × m + 4 |
| | Transmit buffer 16 × m + 5 |
| | Transmit buffer 16 × m + 6 |
| | Transmit buffer 16 × m + 7 |
| | Transmit buffer 16 × m + 8 |
| | Transmit buffer 16 × m + 9 |
| | Transmit buffer 16 × m + 10 |

17.4.2 Details of Interface Mode-Related Registers

17.4.2.1 RSCFDnCFDGRMCFG — Global Interface Mode Select Register

Access: RSCFDnCFDGRMCFG register can be read/written in 32-bit units
 RSCFDnCFDGRMCFGL, RSCFDnCFDGRMCFGH registers can be read/written in 16-bit units
 RSCFDnCFDGRMCFGLL, RSCFDnCFDGRMCFGLH, RSCFDnCFDGRMCFGHL,
 RSCFDnCFDGRMCFGHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGRMCFG: <RSCFDn_base> + 04FC_H
 RSCFDnCFDGRMCFGL: <RSCFDn_base> + 04FC_H,
 RSCFDnCFDGRMCFGH: <RSCFDn_base> + 04FE_H
 RSCFDnCFDGRMCFGLL: <RSCFDn_base> + 04FC_H,
 RSCFDnCFDGRMCFGLH: <RSCFDn_base> + 04FD_H,
 RSCFDnCFDGRMCFGHL: <RSCFDn_base> + 04FE_H,
 RSCFDnCFDGRMCFGHH: <RSCFDn_base> + 04FF_H

Value after reset: 0000 0000_H

Table 17.94 RSCFDnCFDGRMCFG Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 31 to 1 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |
| 0 | RCMC | Interface Mode Select 0: Classical CAN mode 1: CAN FD mode |

Note 1. The RSCANnGRMCFG register and the RSCFDnCFDGRMCFG register are the same register. Therefore, set either one of the registers.

Modify the RSCFDnCFDGRMCFG register only in global reset mode. Before setting other RS-CANFD registers, set this register.

RCMC Bit

Setting this bit to 0 makes classical CAN mode available. Setting this bit to 1 causes the RS-CANFD module to transition to CAN FD mode. To switch the RS-CAN FD module from classical CAN mode to CAN FD mode, set the values after reset to all respective registers and bits allocated only to the register map in classical CAN mode and then modify the value of RSCFDnCFDGRMCFG register.

17.4.3 Details of Channel-Related Registers

17.4.3.1 RSCFDnCFDCmNCFG — Channel m Nominal Bit Rate Configuration Register (m = 0 to 2)

Access: RSCFDnCFDCmNCFG register can be read/written in 32-bit units
 RSCFDnCFDCmNCFG, RSCFDnCFDCmNCFGH registers can be read/written in 16-bit units
 RSCFDnCFDCmNCFGLL, RSCFDnCFDCmNCFGHL, RSCFDnCFDCmNCFGHLL, RSCFDnCFDCmNCFGHLH registers can be read/written in 8-bit units

Address: RSCFDnCFDCmNCFG: <RSCFDn_base> + 0000_H + (10_H × m)
 RSCFDnCFDCmNCFG: <RSCFDn_base> + 0000_H + (10_H × m),
 RSCFDnCFDCmNCFGH: <RSCFDn_base> + 0002_H + (10_H × m)
 RSCFDnCFDCmNCFGLL: <RSCFDn_base> + 0000_H + (10_H × m),
 RSCFDnCFDCmNCFGHL: <RSCFDn_base> + 0001_H + (10_H × m),
 RSCFDnCFDCmNCFGHLL: <RSCFDn_base> + 0002_H + (10_H × m),

| Bit Position | Bit Name | Function |
|--------------|-----------|---|
| 15 to 11 | NSJW[4:0] | Nominal Bit Rate Resynchronization Jump Width Control b15 b14 b13 b12 b11 0 0 0 0 0: 1 Tq 0 0 0 0 1: 2 Tq 0 0 0 1 0: 3 Tq : : 1 1 1 1 0: 31 Tq 1 1 1 1 1: 32 Tq |
| 10 | Reserved | This bit is read as the value after reset. The write value should be the value after reset. |
| 9 to 0 | NBRP[9:0] | Nominal Bit Rate Prescaler Division Ratio Setting When the set value = P (0 to 1023), the nominal bit rate prescaler divides fCAN by (P + 1). |

Modify the RSCFDnCFDCmNCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode, and then transition to channel communication mode or channel halt mode. For the description and settings for bit timing parameters, see **Section 17.11.1, Initial Settings**.

NTSEG2[4:0] Bits

These bits specify a Tq value for the length of phase segment 2 (PHASE_SEG2) of nominal bit rate.

Possible values are 2 to 32 Tq.

Set a value smaller than the value of the NTSEG1[6:0] bits.

NTSEG1[6:0] Bits

These bits specify the total length of propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1) of nominal bit rate as a Tq value.

Possible values are 4 to 128 Tq.

NSJW[4:0] Bits

These bits specify the resynchronization jump width of nominal bit rate as a Tq value. Possible values are 1 to 32 Tq. Specify a value equal to or smaller than the NTSEG2[4:0] value.

NBRP[9:0] Bits

The clock obtained by dividing the CAN clock (fCAN) by the nominal bit rate prescaler ((NBRP[9:0]) + 1) becomes CANmTq(N) clock (fCANTQ(N)m). One clock of the CANmTq(N) clock becomes one Time Quantum (Tq).

Be sure to specify the same value for both NBRP[9:0] and DBRP[7:0].

To specify a different value for the nominal bit rate and the data bit rate, change the values of the RSCFDnCFDCmNCFG.NTSEG1 and NTSEG2 bits and RSCFDnCFDCmDCFG.DTSEG1 and DTSEG2 bits, respectively.

17.4.3.2 RSCFDnCFDCmCTR — Channel m Control Register (m = 0 to 2)

Access: RSCFDnCFDCmCTR register can be read/written in 32-bit units
 RSCFDnCFDCmCTRL, RSCFDnCFDCmCTRHL registers can be read/written in 16-bit units
 RSCFDnCFDCmCTRLL, RSCFDnCFDCmCTRHL, RSCFDnCFDCmCTRHL, RSCFDnCFDCmCTRHL registers can be read/written in 8-bit units

Address: RSCFDnCFDCmCTR: <RSCFDn_base> + 0004_H + (10_H × m)
 RSCFDnCFDCmCTRL: <RSCFDn_base> + 0004_H + (10_H × m),
 RSCFDnCFDCmCTRHL: <RSCFDn_base> + 0006_H + (10_H × m)
 RSCFDnCFDCmCTRLL: <RSCFDn_base> + 0004_H + (10_H × m),
 RSCFDnCFDCmCTRLLH: <RSCFDn_base> + 0005_H + (10_H × m),

| 1, 0 | CHMDC[1:0] | Mode Select b1 b0 0 0: Channel communication mode 0 1: Channel reset mode 1 0: Channel halt mode 1 1: Setting prohibited |

ROM Bit

When the ROM bit and the CTME bit in the RSCFDnCFDCmCTR register are set to 1, restricted operation mode is enabled. Use the restricted operation mode only when the CTMS[1:0] value in the RSCFDnCFDCmCTR register is 00_B (standard test mode). Modify this bit only in channel halt mode. This bit is always 0 in channel reset mode.

CRCT Bit

This bit is used to test the CRC generation circuit in the RS-CANFD module. Setting this bit to 1 inverts the first bit of the ID field when a message is received. With this inversion of bit, the CRC calculation result does not match the normal CRC value of the received frame, which can detect a CRC error (the CERR bit in the RSCFDnCFDCmERFL register is 1). When using this function, note the following.

- This function is available while the CTME bit in the RSCFDnCFDCmCTR register is 1 (communication test mode enabled).
- This function cannot communicate with other CAN nodes. Use this function for inter-channel communication test (the CmICBCE bit in the RSCFDnCFDGTSTCFG register is 1).
- Bit inversion in the ID field may cause bit stuffing rule violation. In that case, no CRC error is detected but a stuff error is detected.

Modify this bit only in channel halt mode. This bit is set to 0 in channel reset mode.

CTMS[1:0] Bits

These bits are used to select a communication test mode. Modify these bits in channel halt mode only. These bits are set to 0 in channel reset mode.

CTME Bit

Setting this bit to 1 enables communication test mode. Modify these bits in channel halt mode. This bit is set to 0 in channel reset mode.

ERRD Bit

This bit is used to control the display mode of bits 14 to 8 in the RSCFDnCFDCmERFL register. When this bit is clear to 0, if any error is detected while the flags of bits 14 to 8 in the RSCFDnCFDCmERFL register are all 0, only the flags of the first error event are set to 1. If two or more errors occur in the first error event, all the flags of the detected errors are set to 1.

When this bit is set to 1, all the flags of errors that have occurred are set to 1 regardless of the error occurrence order.

Modify this bit only in channel reset mode or channel halt mode.

BOM[1:0] Bits

These bits are used to select the bus off recovery mode of the RS-CANFD module.

When the BOM[1:0] bits are set to 00_B, return from the bus off state to the error active state is compliant with the CAN specifications. That is, the RS-CANFD module reenters the CAN communication (error active state) after 11 consecutive recessive bits are detected 128 times. A bus off recovery interrupt request is generated at the time of return from the bus off state. Even if the CHMDC[1:0] bits are set to 10_B (channel halt mode) before recessive bits are detected 128 times, the RS-CANFD module does not transition to channel halt mode until recessive bits are detected 128 times.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 01_B, the CHMDC[1:0] bits in the RSCFDnCFDCmCTR register (m = 0 to 2) are set to 10_B and the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated and the TEC[7:0] and REC[7:0] bits in the RSCFDnCFDCmSTS register are cleared to 00_H.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 10_B, the CHMDC[1:0] bits are set to 10_B and the RS-CANFD module transitions to channel halt mode after return from the bus off state (11 consecutive recessive bits are detected 128 times). A bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00_H.

When the BOM[1:0] bits are set to 11_B and the CHMDC[1:0] bits are set to 10_B while the RS-CANFD module is in the bus off state, the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00_H. However, if 11 consecutive recessive bits are detected 128 times and the RS-CANFD module has recovered to the error active state from the bus off state before the CHMDC[1:0] bits are set to 10_B, a bus off recovery interrupt request is generated.

If a program writes to the CHMDC[1:0] bit at the same time as the RS-CANFD module transition to channel halt mode (at bus off entry when the BOM[1:0] bits are 01_B or at bus off end when the BOM[1:0] bits are 10_B), the program's writing takes precedence. Modify the BOM[1:0] bits only in channel reset mode.

TDCVFIE Bit

When the TDCVF flag in the RSCFDnCFDCmFDSTS register is set to 1 after the TDCVFIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

SOCOIE Bit

When the SOCO flag in the RSCFDnCFDCmFDSTS register is set to 1 after the SOCOIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

EOCOIE Bit

When the EOCO flag in the RSCFDnCFDCmFDSTS register is set to 1 after the EOCOIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

TAIE Bit

When transmit abort of the transmit buffer is completed with the TAIE bit set to 1, an interrupt request is generated. Modify this bit only in channel reset mode.

ALIE Bit

When the ALF flag in the RSCFDnCFDCmERFL register is set to 1 with the ALIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BLIE Bit

When the BLF flag in the RSCFDnCFDCmERFL register is set to 1 with the BLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

OLIE Bit

When the OVLV flag in the RSCFDnCFDCmERFL register is set to 1 with the OLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BORIE Bit

When the BORF flag in the RSCFDnCFDCmERFL register is set to 1 with the BORIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BOEIE Bit

When the BOEF flag in the RSCFDnCFDCmERFL register is set to 1 with the BOEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EPIE Bit

When the EPF flag in the RSCFDnCFDCmERFL register is set to 1 with the EPIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EWIE Bit

When the EWF flag in the RSCFDnCFDCmERFL register is set to 1 with the EWIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BEIE Bit

When the BEF flag in the RSCFDnCFDCmERFL register is set to 1 with the BEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

RTBO Bit

Setting this bit to 1 in the bus off state forcibly returns from the bus off state to the error active state. This bit is automatically cleared to 0. Setting this bit to 1 clears the TEC[7:0] and REC[7:0] bits in the RSCFDnCFDCmSTS register to 00_H and also clears the BOSTS flag in the RSCFDnCFDCmSTS register to 0 (not in bus off state). The other registers remain unchanged. No bus off recovery interrupt request is generated upon return from the bus off state in this case. Use this bit only when the BOM[1:0] bits in the RSCFDnCFDCmCTR register are 00_B (ISO11898-1 compliant).

A delay of up to 1 CAN bit time occurs after the RTBO bit is set to 1 until the RSCAN module transitions to the error active state. Set this bit to 1 in channel communication mode.

CSLPR Bit

Setting this bit to 1 places the channel into channel stop mode.

Clearing this bit to 0 makes the channel exit channel stop mode.

This bit should not be modified in channel communication mode or channel halt mode.

CHMDC[1:0] Bits

These bits are used to select a channel mode (channel communication mode, channel reset mode, or channel halt mode). For details, see **Section 17.6.2, Channel Modes**. Setting the CSLPR bit to 1 in channel reset mode allows transition to channel stop mode. Do not set the CHMDC[1:0] bits to 11_B. When the CAN module has automatically transitioned to channel halt mode based on the setting of the BOM[1:0] bits, the CHMDC[1:0] bits are automatically set to 10_B.

17.4.3.3 RSCFDnCFDCmSTS — Channel m Status Register (m = 0 to 2)

Access: RSCFDnCFDCmSTS register can be read/written in 32-bit units
 RSCFDnCFDCmSTSL, RSCFDnCFDCmSTSH registers can be read/written in 16-bit units
 RSCFDnCFDCmSTSLL, RSCFDnCFDCmSTSLH, RSCFDnCFDCmSTSHL, RSCFDnCFDCmSTSHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCmSTS: <RSCFDn_base> + 0008_H + (10_H × m)
 RSCFDnCFDCmSTSL: <RSCFDn_base> + 0008_H + (10_H × m),
 RSCFDnCFDCmSTSH: <RSCFDn_base> + 000A_H + (10_H × m)
 RSCFDnCFDCmSTSLL: <RSCFDn_base> + 0008_H + (10_H × m),
 RSCFDnCFDCmSTSLH: <RSCFDn_base> + 0009_H + (10_H × m),
 RSCFDnCFDCmSTSHL: <RSCFDn_base> + 000A_H + (10_H × m),
 RSCFDnCFDCmSTSHH: <RSCFDn_base> + 000B_H + (10_H × m)

Value after reset: 0000 0005_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R/W*1 | R | R | R | R | R | R | R | R |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 17.97 RSCFDnCFDCmSTS Register Contents (1/2)

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 24 | TEC[7:0] | The transmit error counter (TEC) can be read. |
| 23 to 16 | REC[7:0] | The receive error counter (REC) can be read. |
| 15 to 9 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |
| 8 | ESIF | Error State Indication Flag 0: No CAN FD message whose ESI bit is recessive has been received. 1: At least one CAN FD message whose ESI bit is recessive has been received. |
| 7 | COMSTS | Communication Status Flag 0: Communication is not ready. 1: Communication is ready. |
| 6 | RECSTS | Receive Status Flag 0: Bus idle, in transmission or bus off state 1: In reception |
| 5 | TRMSTS | Transmit Status Flag 0: Bus idle or in reception 1: In transmission or bus off state |
| 4 | BOSTS | Bus Off Status Flag 0: Not in bus off state 1: In bus off state |
| 3 | EPSTS | Error Passive Status Flag 0: Not in error passive state 1: In error passive state |
| 2 | CSLPSTS | Channel Stop Status Flag 0: Not in channel stop mode 1: In channel stop mode |

Table 17.97 RSCFDnCFDCmSTS Register Contents (2/2)

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 1 | CHLTSTS | Channel Halt Status Flag 0: Not in channel halt mode 1: In channel halt mode |
| 0 | CRSTSTS | Channel Reset Status Flag 0: Not in channel reset mode 1: In channel reset mode |

TEC[7:0] Bits

These bits contain the transmit error counter value. For transmit error counter increment/decrement conditions, see the CAN specifications (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

REC[7:0] Bits

These bits contain the receive error counter value. For receive error counter increment/decrement conditions, see the CAN specifications (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

ESIF Flag

When the recessive ESI bit is detected in a successfully received message, this flag is set to 1. In loopback mode or mirror mode, the own transmission message is regarded as a received message. To clear this flag to 0, write 0 to this bit by the program. This bit cannot be set to 1 by the program. If the flag setting (to 1) timing matches the writing 0 (by the program) timing, this flag is set to 1.

This flag is set to 0 in channel reset mode.

COMSTS Flag

This bit indicates that communication is ready.

This flag is set to 1 when the CAN module has detected 11 consecutive recessive bits after it has transitioned from channel reset mode or channel halt mode to channel communication mode. This flag is cleared to 0 in channel reset mode or channel halt mode.

RECSTS Flag

This flag is set to 1 when reception has started, and is cleared to 0 when the bus has become idle or transmission has started.

TRMSTS Flag

This flag is set to 1 when transmission has started, and is cleared to 0 when the bus has become idle or reception has started. This flag remains 1 in the bus off state.

BOSTS Flag

This flag is set to 1 when the bus off state ($TEC[7:0] > 255$) is entered. It is cleared to 0 when the CAN module has exited the bus off state.

EPSTS Flag

This flag is set to 1 when the RS-CANFD module has entered the error passive state ($(128 \leq \text{TEC}[7:0] \leq 255)$ or $(128 \leq \text{REC}[7:0])$), It is cleared to 0 when the RS-CANFD module has exited the error passive state or has entered channel reset mode.

CSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel stop mode, and is cleared to 0 when the CAN module has returned from channel stop mode.

CHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel halt mode, and is cleared to 0 when the CAN module has returned from channel halt mode.

CRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel reset mode, and is cleared to 0 when the CAN module has transitioned to channel communication mode or channel halt mode. This flag remains 1 when the CAN module transitions from channel reset mode to channel stop mode.

17.4.3.4 RSCFDnCFDCmERFL — Channel m Error Flag Register (m = 0 to 2)

Access: RSCFDnCFDCmERFL register can be read/written in 32-bit units
 RSCFDnCFDCmERFLL, RSCFDnCFDCmERFLH registers can be read/written in 16-bit units
 RSCFDnCFDCmERFLLL, RSCFDnCFDCmERFLLH, RSCFDnCFDCmERFLHL, RSCFDnCFDCmERFLHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCmERFL: <RSCFDn_base> + 000C_H + (10_H × m)
 RSCFDnCFDCmERFLL: <RSCFDn_base> + 000C_H + (10_H × m),
 RSCFDnCFDCmERFLH: <RSCFDn_base> + 000E_H + (10_H × m)
 RSCFDnCFDCmERFLLL: <RSCFDn_base> + 000C_H + (10_H × m),
 RSCFDnCFDCmERFLLH: <RSCFDn_base> + 000D_H + (10_H × m),
 RSCFDnCFDCmERFLHL: <RSCFDn_base> + 000E_H + (10_H × m),
 RSCFDnCFDCmERFLHH: <RSCFDn_base> + 000F_H + (10_H × m)

Value after reset: 0000 0000_H

| | | | | | | | | | | | | | | | | |
|-------------------|--------------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 17.98 RSCFDnCFDCmERFL Register Contents (1/2)

| Bit Position | Bit Name | Function |
|--------------|--------------|--|
| 31 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 30 to 16 | CRCREG[14:0] | CRC Calculation Data (CRC length:15 bits) A CRC value calculated based on the transmit message or receive message is indicated. |
| 15 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 14 | ADERR | ACK Delimiter Error Flag 0: No ACK delimiter error is detected. 1: ACK delimiter error is detected. |
| 13 | BOERR | Dominant Bit Error Flag 0: No dominant bit error is detected. 1: Dominant bit error is detected. |
| 12 | B1ERR | Recessive Bit Error Flag 0: No recessive bit error is detected. 1: Recessive bit error is detected. |
| 11 | CERR | CRC Error Flag 0: No CRC error is detected. 1: CRC error is detected. |
| 10 | AERR | ACK Error Flag 0: No ACK error is detected. 1: ACK error is detected. |
| 9 | FERR | Form Error Flag 0: No form error is detected. 1: Form error is detected. |

Table 17.98 RSCFDnCFDCmERFL Register Contents (2/2)

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 8 | SERR | Stuff Error Flag 0: No stuff error is detected. 1: Stuff error is detected. |
| 7 | ALF | Arbitration-lost Flag 0: No arbitration-lost is detected. 1: Arbitration-lost is detected. |
| 6 | BLF | Bus Lock Flag 0: No channel bus lock is detected. 1: Channel bus lock is detected. |
| 5 | OVLf | Overload Flag 0: No overload is detected. 1: Overload is detected. |
| 4 | BORF | Bus Off Recovery Flag 0: No bus off recovery is detected. 1: Bus off recovery is detected. |
| 3 | BOEF | Bus Off Entry Flag 0: No bus off entry is detected. 1: Bus off entry is detected. |
| 2 | EPF | Error Passive Flag 0: No error passive is detected. 1: Error passive is detected. |
| 1 | EWf | Error Warning Flag 0: No error warning is detected. 1: Error warning is detected. |
| 0 | BEF | Bus Error Flag 0: No channel bus error is detected. 1: Channel bus error is detected. |

See the CAN specification (ISO11898-1) for a description of error occurrence conditions. To clear each flag of this register, the program must write a 0 to the corresponding bit. These flags cannot be set to 1 by the program. If any of these flags is set to 1 at the same time that the program writes 0 to the flag, the flag is set to 1. Transition to channel reset mode resets these flags to 0.

If the ERRD bit in the RSCFDnCFDCmCTR register is set to 0 (ie, only the flags for the first error event are displayed) and an error related to bits 14 to 8 of RSCFDnCFDCmERFL is detected, the flag bits are only set to 1 by the error event if bits 14 to 8 were all 0 at the time when the error occurred.

CRCREG[14:0] Flag

When the CTME bit in the RSCFDnCFDCmCTR register is set to 1 (communication test mode is enabled), if transmit or receive message is a classical CAN frame (CRC length = 15 bits), this flag is updated and the CRC value calculated based on the message can be read. When a CAN FD frame is sent or received, the value of CRCREG[20:0] bits in the RSCFDnCFDCmFDCRC register is updated. When the CTME bit is set to 0 (communication test mode is disabled), these bits are always read as 0. This bit is always 0 in channel reset mode.

ADERR Flag

This flag is set to 1 when a form error has been detected in the ACK delimiter during transmission.

B0ERR Flag

This flag is set to 1 when a recessive bit has been detected even though a dominant bit was transmitted.

B1ERR Flag

This flag is set to 1 when a dominant bit has been detected even though a recessive bit was transmitted.

CERR Flag

This flag is set to 1 when a CRC error has been detected.

AERR Flag

This flag is set to 1 when an ACK error has been detected.

FERR Flag

This flag is set to 1 when a form error has been detected.

SERR Flag

This flag is set to 1 when a stuff error has been detected.

ALF Flag

This flag is set to 1 when an arbitration-lost has been detected.

BLF Flag

This flag is set to 1 when 32 consecutive dominant bits have been detected on the CAN bus in channel communication mode. After that, detection of a bus lock is restarted when either of the following conditions is met.

- A recessive bit is detected after the BLF bit has been cleared from 1 to 0.
- The CAN module transitions to channel reset mode and returns to channel communication mode after the BLF bit has been cleared from 1 to 0.

OVL F Flag

This flag is set to 1 when the overload frame transmit condition has been detected when performing reception or transmission.

BORF Flag

This flag is set to 1 when 11 consecutive recessive bits have been detected 128 times and the CAN module returns from the bus off state. However, this flag is not set to 1 if the CAN module returns from the bus off state in any of the following ways before 11 consecutive recessive bits are detected 128 times.

- The CHMDC[1:0] bits in the RSCFDnCFDCmCTR register are set to 01_B (channel reset mode).
- The RTBO bit in the RSCFDnCFDCmCTR register is set to 1 (forcible return from the bus off state).
- The BOM[1:0] bits in the RSCFDnCFDCmCTR register are set to 01_B (transition to channel halt mode at bus off entry).
- The CHMDC[1:0] bits in the RSCFDnCFDCmCTR register are set to 10_B (channel halt mode) before 11 consecutive recessive bits are detected 128 times with the BOM[1:0] bits set to 11_B (transition to channel halt mode upon a request from the program during bus off).

BOEF Flag

This flag is set to 1 when the bus off state is entered (TEC[7:0] value > 255). This flag is also set to 1 if the bus off state is entered when the BOM[1:0] bits in the RSCFDnCFDCmCTR register (m = 0 to 2) are set to 01_B (transition to channel halt mode at bus off entry).

EPF Flag

This flag is set to 1 when the error passive state is entered ($(128 \leq \text{TEC}[7:0] \leq 255)$ or $(128 \leq \text{REC}[7:0])$).

This flag is set to 1 only when the REC[7:0] or TEC[7:0] value first exceeds 127. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 127, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 127 or less and then the REC[7:0] or TEC[7:0] value exceeds 127 again.

EWf Flag

This flag is set to 1 only when the REC[7:0] or TEC[7:0] value first exceeds 95. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 95, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 95 or less and then the REC[7:0] or TEC[7:0] value exceeds 95 again.

BEF Flag

This flag is set to 1 when any one of the ADERR, BOERR, B1ERR, CERR, AERR, FERR, and SERR flags in the RSCFDnCFDCmERFL register is set to 1.

NOTE

To clear the flag of this register to 0, use a store instruction to write "0" to the given flag and "1" to the other flags.

17.4.3.5 RSCFDnCFDCmDCFG — Channel m Data Bit Rate Configuration Register (m = 0 to 2)

Access: RSCFDnCFDCmDCFG register can be read/written in 32-bit units
 RSCFDnCFDCmDCFGL, RSCFDnCFDCmDCFGLH registers can be read/written in 16-bit units
 RSCFDnCFDCmDCFGLL, RSCFDnCFDCmDCFGLH, RSCFDnCFDCmDCFGLH, RSCFDnCFDCmDCFGLH,
 RSCFDnCFDCmDCFGLH registers can be read/written in 8-bit units

Address: RSCFDnCFDCmDCFG: <RSCFDn_base> + 0500_H + (20_H × m)
 RSCFDnCFDCmDCFGL: <RSCFDn_base> + 0500_H + (20_H × m),

| 22 to 20 | DTSEG2[2:0] | Data Bit Rate Time Segment 2 Control b22 b21 b20 0 0 0: Setting prohibited 0 0 1: 2 Tq 0 1 0: 3 Tq 0 1 1: 4 Tq 1 0 0: 5 Tq 1 0 1: 6 Tq 1 1 0: 7 Tq 1 1 1: 8 Tq |

Table 17.99 RSCFDnCFDCmDCFG Register Contents (2/2)

| Bit Position | Bit Name | Function |
|--------------|-------------|--|
| 19 to 16 | DTSEG1[3:0] | Data Bit Rate Time Segment 1 Control b19 b18 b17 b16 0 0 0 0: Setting prohibited 0 0 0 1: 2 Tq 0 0 1 0: 3 Tq 0 0 1 1: 4 Tq 0 1 0 0: 5 Tq 0 1 0 1: 6 Tq 0 1 1 0: 7 Tq 0 1 1 1: 8 Tq 1 0 0 0: 9 Tq 1 0 0 1: 10 Tq 1 0 1 0: 11 Tq 1 0 1 1: 12 Tq 1 1 0 0: 13 Tq 1 1 0 1: 14 Tq 1 1 1 0: 15 Tq 1 1 1 1: 16 Tq |
| 15 to 8 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |
| 7 to 0 | DBRP[7:0] | Data Bit Rate Prescaler Division Ratio Setting When the set value = P (0 to 255), the data bit rate prescaler divides fCAN by (P + 1). |

Modify the RSCFDnCFDCmDCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode, and then transition to channel communication mode or channel halt mode. When only classical CAN frames are used in CAN FD mode, set the RSCFDnCFDCmDCFG register to the value equal to the set RSCFDnCFDCmNCFG register value. For the description and settings of bit timing parameters, see **Section 17.11.1, Initial Settings**.

DSJW[2:0] Bits

These bits specify the resynchronization jump width of data bit rate as a Tq value. Possible values are 1 to 8 Tq. Specify a value equal to or smaller than the DTSEG2[2:0] bits value.

DTSEG2[2:0] Bits

These bits are used to specify a Tq value for the length of phase segment 2 (PHASE_SEG2) of data bit rate.

Possible values are 2 to 8 Tq.

Specify a value equal to or smaller than the DTSEG1[3:0] bits value.

DTSEG1[3:0] Bits

These bits specify the total length of propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1) of data bit rate as a Tq value.

Possible values are 2 to 16 Tq.

DBRP[7:0] Bits

The clock obtained by dividing the CAN clock (f_{CAN}) by the data bit rate prescaler ($(DBRP[7:0] + 1)$) becomes $CANmTq(D)$ clock ($f_{CANTQ(D)m}$). One clock of the $CANmTq(D)$ clock becomes one Time Quantum (Tq).

Be sure to specify the same value for both $NBRP[9:0]$ and $DBRP[7:0]$.

To specify different values for the nominal bit rate and the data bit rate, change the values of the $RCFGDnCFGmNCFG.NTSEG1$ and $NTSEG2$ bits and $RSCFDnCFDCmDCFG.DTSEG1$ and $DTSEG2$ bits, respectively.

When the $TDCE$ bit is set to 1 (Transmitter delay compensation is enabled) in the $RSCFDnCFDCmFDCFG$ register, set the equal value of 1 or less to the bits $NBRP[9:0]$ and $DBRP[7:0]$.

17.4.3.6 RSCFDnCFDCmFDCFG — Channel m CAN FD Configuration Register (m = 0 to 2)

Access: RSCFDnCFDCmFDCFG register can be read/written in 32-bit units
 RSCFDnCFDCmFDCFGL, RSCFDnCFDCmFDCFGH registers can be read/written in 16-bit units
 RSCFDnCFDCmFDCFGLL, RSCFDnCFDCmFDCFGLH, RSCFDnCFDCmFDCFGHL,
 RSCFDnCFDCmFDCFGHH registers can be read/written in 8-bit units

Table 17.100 RSCFDnCFDCmFDCFG Register Contents (1/2)

| Bit Position | Bit Name | Function |
|--------------|-----------|--|
| 31, 30 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |
| 29 | REFE | Reception data edge filter enable bit 0: Reception data edge filter is disabled. 1: Reception data edge filter is enabled. |
| 28 | FDOE | FD-only mode enable bit 0: FD-only mode is disabled. 1: FD-only mode is enabled. |
| 27 | TMME | Transmit Buffer Merge Mode Enable 0: Transmit buffer merge mode is disabled. 1: Transmit buffer merge mode is enabled. |
| 26 | GWBR S | Gateway BRS 0: A frame is transmitted with the BRS bit in the received frame set to 0. 1: A frame is transmitted with the BRS bit in the received frame set to 1. |
| 25 | GWDFD | Gateway FDF 0: A frame is transmitted regarding the received frame as a classical CAN frame. 1: A frame is transmitted regarding the received frame as a CAN FD frame. |
| 24 | GWEN | CAN-CAN FD Gateway Enable 0: The CAN-CAN FD gateway is disabled. 1: The CAN-CAN FD gateway is enabled. |
| 23 | Reserved | This bit is read as the value after reset. The write value should be the value after reset. |
| 22 to 16 | TDCO[6:0] | Transmitter Delay Compensation Offset These bits are set to the transmitter delay compensation offset value. |
| 15 to 11 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |

Table 17.100 RSCFDnCFDCmFDCFG Register Contents (2/2)

| Bit Position | Bit Name | Function |
|--------------|-------------|--|
| 10 | ESIC | Error State Display Mode Select 0: Always displays the node error state. 1: When the node is not in the error passive state: Displays the message buffer error state. When the node is in the error passive state: Displays the node error state. |
| 9 | TDCE | Transmitter Delay Compensation Enable 0: Transmitter delay compensation is disabled. 1: Transmitter delay compensation is enabled. |
| 8 | TDCOC | Transmitter Delay Compensation Measurement Select 0: Measurement and offset 1: Only offset |
| 7 to 3 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |
| 2 to 0 | EOCCFG[2:0] | Error Occurrence Counting Method Select b2 b1 b0 0 0 0: All transmit messages and receive messages 0 0 1: All transmit messages 0 1 0: All receive messages 0 1 1: Setting prohibited 1 0 0: Only data phase of transmitted or received CAN FD message 1 0 1: Only data phase of transmitted CAN FD message 1 1 0: Only data phase of received CAN FD message 1 1 1: Setting prohibited |

REFE bit

Setting this bit to 1 enables reception data edge filtering when the idle condition is detected, and a dominant level with less than 2 time quanta is ignored. A dominant level with more than or equal to 2 time quanta is detected as an edge. Modify this bit only in channel reset mode.

FDOE bit

Setting this bit to 1 enables FD-only mode. When data is transmitted, a CAN FD frame will be sent regardless of the settings to the CFFDF bit in the RSCFDnCFDCFFDCSTSk register or the TMFDF bit in the RSCFDnCFDTMFDCSTRp register. When a Classical CAN frame is received, a form error is detected. Modify this bit only in channel reset mode.

TMME Bit

Setting this bit to 1 enables transmit buffer merge mode. Modify this bit only in channel reset mode or channel halt mode.

GWBRs Bit

When the GWEN bit is 1, the BRS bit in a CAN FD frame to be transmitted by the gateway function is set. When the GWFDF bit is set to 0, write 0 to this bit. Modify this bit only in channel reset mode.

GWFDF Bit

When the GWEN bit is 1, the FDF bit in a CAN FD frame to be transmitted by the gateway function is set. Modify this bit only in channel reset mode.

GWEN Bit

This bit is used to control the operation of the transmit/receive FIFO buffer with the CFM[1:0] bits in the RSCFDnCFDCFCCK register set to 10_B (gateway mode).

Setting this bit to 1 enables the CAN-CAN FD gateway, enabling transmission in a format different from that of frames received by the gateway function. Received frames are replaced in accordance with the settings of the GWDFD bit and the GWBRS bit. When the DLC value in the received classical CAN frame is 1001_B or more and the GWDFD bit is set to 1 (CAN FD frame), the DLC value is replaced with 1000_B.

While this bit is set to 1, do not perform routing the following frames by using the gateway function.

- CAN FD frames with a payload length of more than 8 bytes
- Remote frames

While this bit is set to 1, the following frame should be transmitted from the channel according to the setting of GWDFD.

- When GWDFD bit is set to 0, only classical CAN frame should be transmitted.
- When GWDFD bit is set to 1, only CAN FD frame should be transmitted.

Modify this bit only in channel reset mode.

Table 17.101 shows the settings and formats of transmit frame and receive frame while the CAN-CAN FD gateway is enabled.

Table 17.101 Operation when the CAN-CAN FD Gateway is Enabled

| Receive Frame | | | GWDFD Bit | Transmit Frame | | |
|---------------|-----------|-------------------------|-----------|----------------|--------------------------------|---------------------------------|
| Format | BRS Bit | Received DLC Value | | Format | BRS Bit | DLC Value to be Transmitted |
| Classical CAN | None | DLC ≤ 1000 _B | 0 | Classical CAN | None | Not replaced |
| | | DLC > 1000 _B | | | | |
| CAN FD | Arbitrary | DLC ≤ 1000 _B | | | | |
| Classical CAN | None | DLC ≤ 1000 _B | 1 | CAN FD | According to GWBRS bit setting | Not replaced |
| | | DLC > 1000 _B | | | | Replaced with 1000 _B |
| CAN FD | Arbitrary | DLC ≤ 1000 _B | | | | Not replaced |

TDCO[6:0] Bits

These bits set the SSP offset value. How to use this value depends on the TDCOC bit in the RSCFDnCFDCmFDCFG register. These bits are based on CAN clock frequency (fCAN).

When the TDCOC bit is set to 0, the transmitter delay compensation result equals to the total value of the measured delay value and the TDCO[6:0] value (rounded down to the nearest integer Tq).

When the TDCOC bit is set to 1, the transmitter delay compensation result equals to the TDCO[6:0] value.

The SSP offset value = (set value of TDCO[6:0] bits + 1).

Modify these bits only in channel reset mode or channel halt mode.

ESIC Bit

When the ESIC bit is set to 1, if the channel is in the error active state, the ESI bit value (CFESI bit in the RSCFDnCFDCFFDCSTSk register or TMESI bit in the RSCFDnCFDTMFDCTRp register) set in the transmit/receive FIFO buffer or transmit buffer is transmitted as an ESI bit value of the transmit message. When the channel is in the error passive state or the ESIC bit is set to 0, the channel status is transmitted as an ESI bit value. Modify this bit only in channel reset mode or channel halt mode.

Table 17.102 ESI Value to Be Transmitted

| ESIC Bit | Channel Status | ESI Value to be Transmitted |
|----------|----------------|--|
| 0 | Error active | 0 (error active node) |
| | Error passive | 1 (error passive node) |
| 1 | Error active | ESI value set in the transmit/receive FIFO buffer or transmit buffer (CFESI bit in the RSCFDnCFDCFFDCSTSk register or TMESI bit in the RSCFDnCFDTMFDCTRp register) |
| | Error passive | 1 (error passive node) |

TDCE Bit

Setting this bit to 1 enables transmitter delay compensation. Modify this bit only in channel reset mode or channel halt mode.

TDCOC Bit

When this bit is set to 0, the SSP position is defined by the total of the measured delay value and the SSP offset value (fixed value).

When this bit is set to 1, the SSP position is defined only by the SSP offset value.

Modify this bit only in channel reset mode or channel halt mode.

EOCCFG[2:0] Bits

These bits are used to select a frame format and a transmission/reception direction when the error occurrence counter counts CAN bus errors.

Modify these bits only in channel reset mode or channel halt mode.

17.4.3.7 RSCFDnCFDCmFDCTR — Channel m CAN FD Control Register (m = 0 to 2)

Access: RSCFDnCFDCmFDCTR register can be read/written in 32-bit units
 RSCFDnCFDCmFDCTRL, RSCFDnCFDCmFDCTRH registers can be read/written in 16-bit units
 RSCFDnCFDCmFDCTRL, RSCFDnCFDCmFDCTRLH, RSCFDnCFDCmFDCTRHL,
 RSCFDnCFDCmFDCTRHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCmFDCTR: <RSCFDn_base> + 0508_H + (20_H × m)
 RSCFDnCFDCmFDCTRL: <RSCFDn_base> + 0508_H + (20_H × m),
 RSCFDnCFDCmFDCTRH: <RSCFDn_base> + 050A_H + (20_H × m)
 RSCFDnCFDCmFDCTRL: <RSCFDn_base> + 0508_H + (20_H × m),
 RSCFDnCFDCmFDCTRLH: <RSCFDn_base> + 0509_H + (20_H × m),
 RSCFDnCFDCmFDCTRHL: <RSCFDn_base> + 050A_H + (20_H × m),
 RSCFDnCFDCmFDCTRHH: <RSCFDn_base> + 050B_H + (20_H × m)

Table 17.103 RSCFDnCFDCmFDCTR Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 31 to 2 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |
| 1 | SOCCLR | Successful Occurrence Counter Clear Setting the SOCCLR bit to 1 clears the successful occurrence counter. This bit is always read as 0. |
| 0 | EOCCLR | Error Occurrence Counter Clear Setting the EOCCLR bit to 1 clears the error occurrence counter. This bit is always read as 0. |

SOCCLR Bit

Setting this bit to 1 clears the successful occurrence counter (SOC[7:0] bits in the RSCFDnCFDCmFDSTS register). This bit is automatically cleared to 0.

EOCCLR Bit

Setting this bit to 1 clears the error occurrence counter (EOC[7:0] bits in the RSCFDnCFDCmFDSTS register). This bit is automatically cleared to 0.

17.4.3.8 RSCFDnCFDCmFDSTS — Channel m CAN FD Status Register (m = 0 to 2)

Access: RSCFDnCFDCmFDSTS register can be read/written in 32-bit units
 RSCFDnCFDCmFDSTSL, RSCFDnCFDCmFDSTSH registers can be read/written in 16-bit units
 RSCFDnCFDCmFDSTSL, RSCFDnCFDCmFDSTSLH, RSCFDnCFDCmFDSTSHL,
 RSCFDnCFDCmFDSTSHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCmFDSTS: <RSCFDn_base> + 050C_H + (20_H × m)
 RSCFDnCFDCmFDSTSL: <RSCFDn_base> + 050C_H + (20_H × m),
 RSCFDnCFDCmFDSTSH: <RSCFDn_base> + 050E_H + (20_H × m)
 RSCFDnCFDCmFDSTSL: <RSCFDn_base> + 050C_H + (20_H × m),
 RSCFDnCFDCmFDSTSLH: <RSCFDn_base> + 050D_H + (20_H × m),
 RSCFDnCFDCmFDSTSHL: <RSCFDn_base> + 050E_H + (20_H × m),
 RSCFDnCFDCmFDSTSHH: <RSCFDn_base> + 050F_H + (20_H × m)

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 17.104 RSCFDnCFDCmFDSTS Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|--|
| 31 to 24 | SOC[7:0] | Successful Occurrence Counter The successful occurrence counter value can be read. |
| 23 to 16 | EOC[7:0] | Error Occurrence Counter The error occurrence counter value can be read. |
| 15 to 10 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 9 | SOCO | Successful Occurrence Counter Overflow Flag 0: The successful occurrence counter does not overflow. 1: The successful occurrence counter has overflowed. |
| 8 | EOCO | Error Occurrence Counter Overflow Flag 0: The error occurrence counter does not overflow. 1: The error occurrence counter has overflowed. |
| 7 | TDCVF | Transmitter Delay Compensation Violation Flag 0: No transmitter delay compensation violation is present. 1: A transmitter delay compensation violation is present. |
| 6 to 0 | TDCR[6:0] | Transmitter Delay Compensation Result Status The transmitter delay compensation result can be read. |

SOC[7:0] Bits

These bits show the successful occurrence counter value. The successful occurrence counter is incremented upon completion of message reception or transmission without an error. This counter stops counting when it reaches FF_H . In loopback mode, this counter is incremented twice.

These bits are cleared to 0 by writing 1 to the SOCCLR bit in the RSCFDnCFDCmCTR register. These bits are set to 0 in channel reset mode.

EOC[7:0] Bits

These bits show the error occurrence counter value. The error occurrence counter is incremented each time an error occurs according to the condition specified by the EOCCFG[2:0] bits in the RSCFDnCFDCmFDCFG register. This counter stops counting when it reaches FF_H .

These bits are cleared to 0 by writing 1 to the EOCCLR bit in the RSCFDnCFDCmCTR register. These bits are set to 0 in channel reset mode.

SOCO Flag

This bit indicates that successful occurrence counter overflow has occurred.

This flag is set to 1 when message reception or transmission is completed while the SOC[7:0] value has reached FF_H . This flag is set to 0 in channel reset mode.

EOCO Flag

This bit indicates that error occurrence counter overflow has occurred.

This flag is set to 1 when a CAN bus error is detected under the condition specified by the EOCCFG[2:0] bits in the RSCFDnCFDCmFDCFG register when the EOC[7:0] value has reached FF_H . This flag is set to 0 in channel reset mode.

TDCVF Flag

This bit indicates violation of transmitter delay compensation.

The transmit data is compared with the reception CAN bus level delayed due to the transceiver's loop delay. This delay changes due to physical factors such as temperature. Because the TDCR[6:0] flags are updated for each message, temporary maximum delay cannot be confirmed.

This bit is set to 1 when the transmitter delay compensation exceeds the maximum compensation $3 \text{ CANm bit times} - 2 \text{ fCAN}$ (CANm bit time is the value of data bit rate).

This flag is set to 0 in channel reset mode.

TDCR[6:0] Flags

These bits indicate the transmitter delay compensation result as a multiple of CAN clock frequency (fCAN).

This result depends on the settings of the TDCOC bit and TDCO[6:0] bits in the RSCFDnCFDCmFDCFG register.

These flags are updated at a falling edge between the FDF bit and res bit when the TDCE bit in the RSCFDnCFDCmFDCFG register is set to 1 (transmitter delay compensation enable) and also the TDCOC bit in the RSCFDnCFDCmFDCFG register is set to 0 (measurement and offset).

This flag is set to 0 in channel reset mode.

NOTE

To clear the flag of this register to 0, use a store instruction to write 0 to the given flag and 1 to the other flags.

17.4.3.9 RSCFDnCFDCmFDCRC — Channel m CAN FD CRC Register (m = 0 to 2)

Access: RSCFDnCFDCmFDCRC register can be read only in 32-bit units
 RSCFDnCFDCmFDCRCL, RSCFDnCFDCmFDCRCH registers can be read only in 16-bit units
 RSCFDnCFDCmFDCRCLL, RSCFDnCFDCmFDCRCLH, RSCFDnCFDCmFDCRCHL,
 RSCFDnCFDCmFDCRCHH registers can be read only in 8-bit units

Address: RSCFDnCFDCmFDCRC: <RSCFDn_base> + 0510_H + (20_H × m)
 RSCFDnCFDCmFDCRCL: <RSCFDn_base> + 0510_H + (20_H × m),
 RSCFDnCFDCmFDCRCH: <RSCFDn_base> + 0512_H + (20_H × m)
 RSCFDnCFDCmFDCRCLL: <RSCFDn_base> + 0510_H + (20_H × m),
 RSCFDnCFDCmFDCRCLH: <RSCFDn_base> + 0511_H + (20_H × m),
 RSCFDnCFDCmFDCRCHL: <RSCFDn_base> + 0512_H + (20_H × m),

Table 17.105 RSCFDnCFDCmFDCRC Register Contents

| Bit Position | Bit Name | Function |
|--------------|--------------|--|
| 31 to 28 | Reserved | These bits are read as the value after reset. |
| 27 to 24 | SCNT[3:0] | Stuff count bit Indicate a value of the stuff count in a CAN FD frame. Bits 25 to 27 indicates the Gray-coded value of the stuff bit count modulo 8 in the transmitted/received frames. Bit 24 indicates an even parity value of bits 25 to 27. |
| 23 to 21 | Reserved | These bits are read as the value after reset. |
| 20 to 0 | CRCREG[20:0] | CRC Calculation Data (CRC Length:17 Bit or 21 Bit) These bits show the CRC value calculated based on the transmit message or receive message. When the CRC length is 17 bits, bits b20 to b17 are read as 0. |

SCNT[3:0] Flags

When the CTME bit in the RSCFDnCFDCmCTR register is set to 1 (communication test mode enabled), a stuff count bit value of the CAN FD frame can be read if a message transmitted/received is a CAN FD frame. When the CTME bit is 0 (communication test mode disabled), this flag is always read as 0. These flags are updated at the first bit in the CRC field of the CAN FD frame. These bits are cleared to 0 in channel reset mode.

CRCREG[20:0] Flags

When the CTME bit in the RSCFDnCFDCmCTR register is 1 (communication test mode enabled), if transmit or receive message is a CAN FD frame (CRC length = 17 or 21 bits), these flags are updated and the CRC value calculated based on the message can be read. When the CRC length of the message is 17 bits, bits b20 to b17 are always read as 0. When a classical CAN frame is transmitted or received, the CRCREG[14:0] value in the RSCFDnCFDCmERFL register is updated. When the CTME bit is 0 (communication test mode disabled), these bits are always read as 0.

17.4.4 Details of Global-Related Registers

17.4.4.1 RSCFDnCFDGCFCG — Global Configuration Register

Access: RSCFDnCFDGCFCG register can be read/written in 32-bit units
 RSCFDnCFDGCFCGL, RSCFDnCFDGCFCGH registers can be read/written in 16-bit units
 RSCFDnCFDGCFCGLL, RSCFDnCFDGCFCGLH, RSCFDnCFDGCFCGHL, RSCFDnCFDGCFCGHH registers
 can be read/written in 8-bit units

Address: RSCFDnCFDGCFCG: <RSCFDn_base> + 0084_H

| 11 to 8 | TSP[3:0] | Timestamp Clock Source Division b11 b10 b9 b8 0 0 0 0: Not divided 0 0 0 1: Divided by 2 0 0 1 0: Divided by 4 0 0 1 1: Divided by 8 0 1 0 0: Divided by 16 0 1 0 1: Divided by 32 0 1 1 0: Divided by 64 0 1 1 1: Divided by 128 1 0 0 0: Divided by 256 1 0 0 1: Divided by 512 1 0 1 0: Divided by 1024 1 0 1 1: Divided by 2048 1 1 0 0: Divided by 4096 1 1 0 1: Divided by 8192 1 1 1 0: Divided by 16384 1 1 1 1: Divided by 32768 |
| 7, 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | CMPOC | Payload Overflow Mode Select 0: No message is stored. 1: Messages are stored and payloads exceeding the buffer size are discarded. |
| 4 | DCS | CAN Clock Source Select*2 0: clkc 1: clk_xincan |
| 3 | MME | Mirror Function Enable 0: Mirror function is disabled. 1: Mirror function is enabled. |
| 2 | DRE | DLC Replacement Enable 0: DLC replacement is disabled. 1: DLC replacement is enabled. |
| 1 | DCE | DLC Check Enable 0: DLC check is disabled. 1: DLC check is enabled. |
| 0 | TPRI | Transmit Priority Select 0: ID priority 1: Transmit buffer number priority |

Note 1. When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to 000_B.

Note 2. For the CAN clock frequency settings, see **Table 17.7, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/P1M-E.**

Modify the RSCFDnCFDGCFG register only in global reset mode.

ITRCP[15:0] Bits

These bits are used to set a clock source division value of the interval timer for FIFO buffers. See **Section 17.8.3.1, Interval Transmission Function.**

TSBTCS[2:0] Bits

When the TSSS bit is 1, these bits are used to select the channel of the nominal bit time clock that will be the clock source of the timestamp counter. However, do not select the channel that handles the CAN FD frames.

TSSS Bit

This bit is used to select a clock source of the timestamp counter. Select pclk if there is no channel that handles only classical CAN frames.

TSP[3:0] Bits

A clock obtained by dividing the clock source selected with the TSBTCS[2:0] bits and TSSS bit according to the TSP[3:0] bits is used as the timestamp counter count source.

CMPOC Bit

This bit is used to select operation in case the payload length of received message exceeds the payload storage size of the storage buffer.

When this bit is 0, the received message in which the payload overflows is not stored in the buffer.

When this bit is 1, the received message in which the payload overflows is stored in the buffer, and depending on the DRE bit the received DLC value or the DLC value of the receive rule is stored in the buffer. At this time, payloads exceeding the buffer's payload storage size are discarded.

The buffer's payload storage size is set by the following bits.

- Receive buffer: RMPLS[1:0] bits in the RSCFDnCFDRMNB register
- Receive FIFO buffer: RFPLS[2:0] bits in the RSCFDnCFDRFCCx register
- Transmit/receive FIFO buffer: CFPLS[2:0] bits in the RSCFDnCFDCFCCk register

DCS Bit

When this bit is set to 0, clk is used as the clock source of the CAN clock (fCAN).

When this bit is set to 1, clk_xincan is used as the clock source of the CAN clock (fCAN).

For the CAN clock frequency settings, see **Table 17.7, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/P1M-E**.

MME Bit

Setting this bit to 1 makes the mirror function available.

DRE Bit

When the DRE bit is set to 1, the DLC value of the receive rule is stored in the buffer instead of the DLC value of the received message after the DLC value has passed through the DLC filter. In this case, a value of 00_H is stored in each data byte that exceeds the DLC value of the receive rule.

The DLC replacement function is only available when the DCE bit is set to 1 (DLC check is enabled).

DCE Bit

Setting this bit to 1 makes the DLC check function available. When disabling the DLC check function, set the GAFLDLC[3:0] bits in the RSCFDnCFDGAFLP0_j register to 0000_B before clearing the DCE bit in the RSCFDnCFDGCFCFG register to 0.

TPRI Bit

This bit is used to set the transmit priority.

When this bit is set to 0, ID priority is selected and the transmit priority complies with the CAN bus arbitration rule (ISO11898-1 specifications). When this bit is set to 1, transmit buffer number priority is selected and the transmit buffer with the smallest number has the highest priority.

When using the transmit queue, this bit should be set to 0.

17.4.4.2 RSCFDnCFDGCTR — Global Control Register

Access: RSCFDnCFDGCTR register can be read/written in 32-bit units
 RSCFDnCFDGCTRL, RSCFDnCFDGCTRH registers can be read/written in 16-bit units
 RSCFDnCFDGCTRLL, RSCFDnCFDGCTRLLH, RSCFDnCFDGCTRHL, RSCFDnCFDGCTRHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGCTR: <RSCFDn_base> + 0088_H
 RSCFDnCFDGCTRL: <RSCFDn_base> + 0088_H, RSCFDnCFDGCTRH: <RSCFDn_base> + 008A_H
 RSCFDnCFDGCTRLL: <RSCFDn_base> + 0088_H, RSCFDnCFDGCTRLLH: <RSCFDn_base> + 0089_H,
 RSCFDnCFDGCTRHL: <RSCFDn_base> + 008A_H, RSCFDnCFDGCTRHH: <RSCFDn_base> + 008B_H

Value after reset: 0000 0005_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 17.107 RSCFDnCFDGCTR Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|--|
| 31 to 17 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | TSRST | Timestamp Counter Reset Setting the TSRST bit to 1 resets the timestamp counter. This bit is always read as 0. |
| 15 to 12 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 | CMPOFIE | Payload Overflow Interrupt Enable 0: A payload overflow interrupt is disabled. 1: A payload overflow interrupt is enabled. |
| 10 | THLEIE | Transmit History Buffer Overflow Interrupt Enable 0: Transmit history buffer overflow interrupt is disabled. 1: Transmit history buffer overflow interrupt is enabled. |
| 9 | MEIE | FIFO Message Lost Interrupt Enable 0: FIFO message lost interrupt is disabled. 1: FIFO message lost interrupt is enabled. |
| 8 | DEIE | DLC Error Interrupt Enable 0: DLC error interrupt is disabled. 1: DLC error interrupt is enabled. |
| 7 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | GSLPR | Global Stop Mode 0: Other than global stop mode 1: Global stop mode |
| 1, 0 | GMDC[1:0] | Global Mode Select b1 b0 0 0: Global operating mode 0 1: Global reset mode 1 0: Global test mode 1 1: Setting prohibited |

TSRST Bit

This bit is used to reset the timestamp counter. When this bit is set to 1, the RSCFDnCFDGTSC register is cleared to 0000_H.

CMPOFIE Bit

When the CMPOF flag in the RSCFDnCFDGERFL register is set to 1 after the CMPOFIE bit is set to 1, an interrupt request occurs. Modify this bit only in global reset mode.

THLEIE Bit

When the THLEIE bit is set to 1 and the THLES flag in the RSCFDnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

MEIE Bit

When the MEIE bit is set to 1 and the MES flag in the RSCFDnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

DEIE Bit

When the DEIE bit is set to 1 and the DEF flag in the RSCFDnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

GSLPR Bit

Setting this bit to 1 places the RS-CANFD module into global stop mode.
Clearing this bit to 0 releases the RS-CANFD module from global stop mode.
This bit should not be modified in global operating mode or global test mode.

GMDC[1:0] Bits

These bits are used to select the mode of entire RS-CANFD module (global operating mode, global reset mode, or global test mode). For details, see **Section 17.6.1, Global Modes**. Setting the GSLPR bit to 1 when in global reset mode places the RS-CANFD module in global stop mode.

17.4.4.3 RSCFDnCFDGSTS — Global Status Register

Access: RSCFDnCFDGSTS register can be read only in 32-bit units
RSCFDnCFDGSTSL, RSCFDnCFDGSTSH registers can be read only in 16-bit units
RSCFDnCFDGSTSL, RSCFDnCFDGSTSLH, RSCFDnCFDGSTSHL, RSCFDnCFDGSTSHH registers can be read only in 8-bit units

Address: RSCFDnCFDGSTS: <RSCFDn_base> + 008C_H
RSCFDnCFDGSTSL: <RSCFDn_base> + 008C_H, RSCFDnCFDGSTSH: <RSCFDn_base> + 008E_H
RSCFDnCFDGSTSL: <RSCFDn_base> + 008C_H, RSCFDnCFDGSTSLH: <RSCFDn_base> + 008D_H,
RSCFDnCFDGSTSHL: <RSCFDn_base> + 008E_H, RSCFDnCFDGSTSHH: <RSCFDn_base> + 008F_H

Value after reset: 0000 000D_H

| | | | | | | | | | | | | | | | | |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----------|---------|---------|---------|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 17.108 RSCFDnCFDGSTS Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 31 to 4 | Reserved | When read, the value after reset is returned. |
| 3 | GRAMINIT | CAN RAM Initialization Status Flag 0: CAN RAM initialization is completed. 1: CAN RAM initialization is ongoing. |
| 2 | GSLPSTS | Global Stop Status Flag 0: Not in global stop mode 1: In global stop mode |
| 1 | GHLTSTS | Global Test Status Flag 0: Not in global test mode 1: In global test mode |
| 0 | GRSTSTS | Global Reset Status Flag 0: Not in global reset mode 1: In global reset mode |

GRAMINIT Flag

This flag indicates the initialization status of the CAN RAM.

This flag is set to 1 after the MCU has been reset, and is cleared to 0 when CAN RAM initialization is completed.

GSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to global stop mode, and is cleared to 0 when the CAN module has returned from global stop mode.

GHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global test mode, and is cleared to 0 when the CAN module has exited global test mode.

GRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global reset mode, and is cleared to 0 when the CAN module has transitioned to a mode other than global reset mode. This flag remains 1 even when the CAN module has transitioned from global reset mode to global stop mode.

17.4.4.4 RSCFDnCFDGERFL — Global Error Flag Register

Access: RSCFDnCFDGERFL register can be read/written in 32-bit units
 RSCFDnCFDGERFLL, RSCFDnCFDGERFLH registers can be read/written in 16-bit units
 RSCFDnCFDGERFLLL, RSCFDnCFDGERFLLH, RSCFDnCFDGERFLHL, RSCFDnCFDGERFLHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGERFL: <RSCFDn_base> + 0090_H
 RSCFDnCFDGERFLL: <RSCFDn_base> + 0090_H, RSCFDnCFDGERFLH: <RSCFDn_base> + 0092_H
 RSCFDnCFDGERFLLL: <RSCFDn_base> + 0090_H, RSCFDnCFDGERFLLH: <RSCFDn_base> + 0091_H,
 RSCFDnCFDGERFLHL: <RSCFDn_base> + 0092_H, RSCFDnCFDGERFLHH: <RSCFDn_base> + 0093_H

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|-------|-------|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | EEF2 | EEF1 | EEF0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 | R/W*1 | R/W*1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------------------|----|----|----|----|----|----|---|---|---|---|---|---|-------|-------|-----|-------|
| | — | — | — | — | — | — | — | — | — | — | — | — | CMPOF | THLES | MES | DEF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 | R | R | R/W*1 |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 17.109 RSCFDnCFDGERFL Register Contents

| Bit Position | Bit Name | Function |
|---------------------------|----------|---|
| 31 to 19, 15, 14, 7, 6, 4 | Reserved | When read, the value after reset is returned. When writing these bits, write the value after reset. |
| 18 | EEF2 | ECC Error Flag for Channel 2 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority |
| 17 | EEF1 | ECC Error Flag for Channel 1 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority |
| 16 | EEF0 | ECC Error Flag for Channel 0 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority |
| 13 to 8, 5 | Reserved | When read, the undefined value is returned. When writing these bits, write the value after reset. |
| 3 | CMPOF | Payload Overflow Flag 0: No payload overflow has occurred. 1: A payload overflow has occurred. |
| 2 | THLES | Transmit History Buffer Overflow Status Flag 0: No transmit history buffer overflow has occurred. 1: A transmit history buffer overflow has occurred. |
| 1 | MES | FIFO Message Lost Status Flag 0: No FIFO message lost error has occurred. 1: A FIFO message lost error has occurred. |
| 0 | DEF | DLC Error Flag 0: No DLC error has occurred. 1: A DLC error has occurred. |

All flags in the RSCFDnCFDGERFL register are cleared to 0 in global reset mode.

EEFm Flag

When a 2-bit ECC error is detected during the transmission priority determination of channel m (m = 0 to 2), the EEFm flag is set to 1, disabling message transmission. This flag can be cleared to 0 by writing 0 by the program.

CMPOF Flag

When a payload overflow occurs in any of channel m (m = 0 to 2), the CMPOF flag is set to 1. This flag can be cleared to 0 by writing 0 to this bit by the program.

THLES Flag

The THLES flag is set to 1 when any one of the THLELT flags in the RSCFDnCFDTHLSTSm register (m = 0 to 5) is set to 1.

This flag is cleared to 0 when the THLELT flags of all channels are set to 0.

MES Flag

The MES flag is set to 1 when any one of the RFMLT flags in the RSCFDnCFDRFSTSx register (x = 0 to 7) or the CFMLT flags in the RSCFDnCFDCFSTSk register (k = 0 to 8) is set to 1.

This flag is cleared to 0 when all RFMLT flags and CFMLT flags are set to 0.

DEF Flag

The DEF flag is set to 1 when an error has been detected during the DLC check. The program can clear this flag by writing 0 to this bit.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

NOTE

To clear the flag of this register to 0, use a store instruction to write 0 to the given flag and 1 to the other flags.

17.4.4.5 RSCFDnCFDGTSC — Global Timestamp Counter Register

Access: RSCFDnCFDGTSC register can be read only in 32-bit units.
RSCFDnCFDGTSC_L, RSCFDnCFDGTSC_H registers can be read only in 16-bit units.

Address: RSCFDnCFDGTSC: <RSCFDn_base> + 0094_H
RSCFDnCFDGTSC_L: <RSCFDn_base> + 0094_H, RSCFDnCFDGTSC_H: <RSCFDn_base> + 0096_H

Value after reset: 0000 0000_H

| | | | | | | | | | | | | | | | | |
|-------------------|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 17.110 RSCFDnCFDGTSC Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 31 to 16 | Reserved | These bits are read as the value after reset. |
| 15 to 0 | TS[15:0] | Timestamp Value The timestamp counter value can be read. Counter Value: 0000 _H to FFFF _H |

TS[15:0] Bits

When the TS[15:0] bits are read, the read value shows the timestamp counter (16-bit free-running counter) value at that time. When the SOF is detected, the TS[15:0] value is captured and later stored in the receive buffer or the FIFO buffer. Furthermore, the TS[15:0] value is stored in the transmit history buffer. The timestamp counter is initialized in global reset mode.

The timestamp counter starts and stops counting differently, depending on the count source.

- When the TSSS bit in the RSCFDnCFDGCFCFG register is 0 (pclk):
The timestamp counter starts counting when the RSCAN module has transitioned to global operating mode.
This counter stops counting when the RSCAN module has transitioned to global stop mode or global test mode.
- When the TSSS bit is 1 (CANm nominal bit time clock):
The timestamp counter starts counting when the corresponding channel has transitioned to channel communication mode.
This counter stops counting when the corresponding channel has transitioned to channel reset mode or channel halt mode.

17.4.4.6 RSCFDnCFDGTINTSTS0 — Global TX Interrupt Status Register 0

Access: RSCFDnCFDGTINTSTS0 register can be read only in 32-bit units
 RSCFDnCFDGTINTSTS0L, RSCFDnCFDGTINTSTS0H registers can be read only in 16-bit units
 RSCFDnCFDGTINTSTS0LL, RSCFDnCFDGTINTSTS0LH, RSCFDnCFDGTINTSTS0HL,
 RSCFDnCFDGTINTSTS0HH registers can be read only in 8-bit units

Address: RSCFDnCFDGTINTSTS0: <RSCFDn_base> + 0460_H
 RSCFDnCFDGTINTSTS0L: <RSCFDn_base> + 0460_H, RSCFDnCFDGTINTSTS0H: <RSCFDn_base> +
 0462_H
 RSCFDnCFDGTINTSTS0LL: <RSCFDn_base> + 0460_H, RSCFDnCFDGTINTSTS0LH: <RSCFDn_base> +
 0461_H,
 RSCFDnCFDGTINTSTS0HL: <RSCFDn_base> + 0462_H, RSCFDnCFDGTINTSTS0HH: <RSCFDn_base> +

| 17 | TAIF2 | Channel 2 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested. |
| 16 | TSIF2 | Channel 2 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested. |
| 15 to 13 | Reserved | These bits are read as the value after reset. |
| 12 | THIF1 | Channel 1 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested. |
| 11 | CFTIF1 | Channel 1 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested. |
| 10 | TQIF1 | Channel 1 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested. |

Table 17.111 RSCFDnCFDGTINTSTS0 Register Contents (2/2)

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 9 | TAIF1 | Channel 1 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested. |
| 8 | TSIF1 | Channel 1 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested. |
| 7 to 5 | Reserved | These bits are read as the value after reset. |
| 4 | THIF0 | Channel 0 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested. |
| 3 | CFTIF0 | Channel 0 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested. |
| 2 | TQIF0 | Channel 0 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested. |
| 1 | TAIF0 | Channel 0 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested. |
| 0 | TSIF0 | Channel 0 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested. |

TSIFm Bits

The TSIFm bit is set to 1 when the TMIEp bit in the RSCFDnCFDTMIECy register is set to 1 (transmit buffer interrupt enabled) and the TMTRF[1:0] flags in the corresponding RSCFDnCFDTMSTSp register are set to 10_B (transmit completed without abort request) or 11_B (transmit completed with abort request).

When the TMTRF[1:0] flags are cleared to 00_B under the condition that the TSIFm bit can be set to 1, this flag is cleared to 0. In addition, clearing the TMIEp bit to 0 also clears this flag to 0.

TAIFm Bits

The TAIFm bit is set to 1 when the TAIE bit in the RSCFDnCFDCmCTR register is 1 (transmit abort interrupt enabled) and the TMTRF[1:0] flags in the RSCFDnCFDTMSTSp register are set to 01_B (transmit abort completed).

This flag is cleared to 0 when the TMTRF[1:0] flags are cleared to 00_B after the transmit abort is completed.

TQIFm Bits

When the TXQIE bit in the RSCFDnCFDTXQCCm register is set to 1 (transmit queue interrupt enabled) and the TXQIF bit in the RSCFDnCFDTXQSTSm register is set to 1 (transmit queue interrupt request), the TQIFm bit is set to 1.

When the TXQIF bit (transmit queue interrupt request) in the RSCFDnCFDTXQSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the TXQIE bit is cleared to 0.

CFTIFm Bits

When the CFTXIE bit in the RSCFDnCFDCFCCk register is set to 1 (transmit/receive FIFO transmit interrupt enabled) and the CFTXIF bit in the RSCFDnCFDCFSTSk register is set to 1 (transmit/receive FIFO transmit interrupt request), the CFTIFm bit is set to 1.

When the CFTXIF bit is cleared to 0 under the conditions that the CFTIFm bit can be set to 1, this bit is cleared to 0. This flag is also cleared to 0 when the CFTXIE bit is cleared to 0.

THIFm Bits

When the THLIE bit in the RSCFDnCFDTHLCCm register is set to 1 (transmit history interrupt enabled) and the THLIF bit in the RSCFDnCFDTHLSTSm register is set to 1 (transmit history interrupt request), the THIFm bit is set to 1.

When the THLIF bit in the RSCFDnCFDTHLSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the THLIE bit is cleared to 0.

17.4.4.7 RSCFDnCFDGFDCFG — Global FD Configuration Register

Access: RSCFDnCFDGFDCFG register can be read/written in 32-bit unit
 RSCFDnCFDGFDCFG L and RSCFDnCFDGFDCFG H registers can be read/written in 16-bit unit
 RSCFDnCFDGFDCFG LL, RSCFDnCFDGFDCFG LH, RSCFDnCFDGFDCFG HL, RSCFDnCFDGFDCFG HH registers can be read/written in 8-bit unit

Address: RSCFDnCFDGFDCFG: <RSCFDn_base> + 0474_H
 RSCFDnCFDGFDCFG L: <RSCFDn_base> + 0474_H, RSCFDnCFDGFDCFG H: <RSCFDn_base> + 0476_H
 RSCFDnCFDGFDCFG LL: <RSCFDn_base> + 0474_H, RSCFDnCFDGFDCFG LH: <RSCFDn_base> + 0475_H,
 RSCFDnCFDGFDCFG HL: <RSCFDn_base> + 0476_H, RSCFDnCFDGFDCFG HH: <RSCFDn_base> + 0477_H

Value after reset: 0000 0000_H

Table 17.112 RSCFDnCFDGFDCFG Register Contents

| Bit Position | Bit Name | Function |
|--------------|-------------|--|
| 31 to 10 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |
| 9, 8 | TSCCFG[1:0] | Time-stamp capture setting bit b9 b8 0 0: Captured at a sample point in the SOF bit. 0 1: Captured when a valid frame has been transmitted/received. 1 0: Captured at a sample point of the res bit. ^{Note 1} 1 1: Setting prohibited. |
| 7 to 1 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |
| 0 | RPED | Protocol exception event detection disabled bit 0: Protocol exception event detection is enabled. 1: Protocol exception event detection is disabled. |

Note 1. When a Classical CAN frame is transmitted/received, a time-stamp value will be captured at the sample point in the SOF bit.

TSCCFG bit

Select a point where a time-stamp value is captured. Modify this bit only in global reset mode.

RPED bit

Setting this bit to 1 disables the protocol exception event detection. When a protocol exception event is detected while this bit is set to 1, the event is regarded as a form error and an error frame will be output. Modify this bit only in global reset mode.

17.4.5 Details of Receive Rule-related Registers

17.4.5.1 RSCFDnCFDGAFLECTR — Receive Rule Entry Control Register

Access: RSCFDnCFDGAFLECTR register can be read/written in 32-bit units
RSCFDnCFDGAFLECTRL, RSCFDnCFDGAFLECTRH registers can be read/written in 16-bit units
RSCFDnCFDGAFLECTRLL, RSCFDnCFDGAFLECTRLH, RSCFDnCFDGAFLECTRHL,
RSCFDnCFDGAFLECTRHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGAFLECTR: <RSCFDn_base> + 0098_H
RSCFDnCFDGAFLECTRL: <RSCFDn_base> + 0098_H, RSCFDnCFDGAFLECTRH: <RSCFDn_base> + 009A_H
RSCFDnCFDGAFLECTRLL: <RSCFDn_base> + 0098_H, RSCFDnCFDGAFLECTRLH: <RSCFDn_base> + 0099_H,
RSCFDnCFDGAFLECTRHL: <RSCFDn_base> + 009A_H, RSCFDnCFDGAFLECTRHH: <RSCFDn_base> + 009B_H

Value after reset: 0000 0000_H

Table 17.113 RSCFDnCFDGAFLECTR Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------|---|
| 31 to 9 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |
| 8 | AFLDAE | Receive Rule Table Write Enable 0: Receive rule table write is disabled. 1: Receive rule table write is enabled. |
| 7 to 5 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |
| 4 to 0 | AFLPN[4:0] | Receive Rule Table Page Number Configuration A page number can be selected in the range of page 0 (0000 _B) to page 11 (01011 _B). |

AFLDAE Bit

Setting this bit to 0 disables the write to the receive rule table. After writes to the receive rule table are completed, set this bit to 0 to disable the write to the table. The receive rule table can be read regardless of the value of this bit.

Set the AFLDAE bit to 1 only in global reset mode.

AFLPN[4:0] Bits

These bits are used to set the page number of the receive rule table. Sixteen receive rules can be set per page.

Set these bits to a value within the range of 00000_B to 01011_B.

17.4.5.2 RSCFDnCFDGAFLCFG0 — Receive Rule Configuration Register 0

Access: RSCFDnCFDGAFLCFG0 register can be read/written in 32-bit units
 RSCFDnCFDGAFLCFG0L, RSCFDnCFDGAFLCFG0H registers can be read/written in 16-bit units
 RSCFDnCFDGAFLCFG0LL, RSCFDnCFDGAFLCFG0LH, RSCFDnCFDGAFLCFG0HL,
 RSCFDnCFDGAFLCFG0HH registers can be read/written in 8-bit units

Address: RSCFDnCFDGAFLCFG0: <RSCFDn_base> + 009C_H
 RSCFDnCFDGAFLCFG0L: <RSCFDn_base> + 009C_H, RSCFDnCFDGAFLCFG0H: <RSCFDn_base> +
 009E_H
 RSCFDnCFDGAFLCFG0LL: <RSCFDn_base> + 009C_H, RSCFDnCFDGAFLCFG0LH: <RSCFDn_base> +
 009D_H,
 RSCFDnCFDGAFLCFG0HL: <RSCFDn_base> + 009E_H, RSCFDnCFDGAFLCFG0HH: <RSCFDn_base> +
 009F_H

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 17.114 RSCFDnCFDGAFLCFG0 Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|--|
| 31 to 24 | RNC0[7:0] | Number of Rules for Channel 0 Set the number of receive rules used for channel 0. |
| 23 to 16 | RNC1[7:0] | Number of Rules for Channel 1 Set the number of receive rules used for channel 1. |
| 15 to 8 | RNC2[7:0] | Number of Rules for Channel 2 Set the number of receive rules used for channel 2. |
| 7 to 0 | Reserved | These bits are read as the value after reset. When writing, write the value after reset. |

Modify the RSCFDnCFDGAFLCFG0 register only in global reset mode.

Up to 64 × (number of channels) rules can be registered in the receive rule table for the entire unit. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 128.
- The total number of rules allocated to each channel does not exceed the number of rules that can be registered for the entire unit.

RNC0[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 0 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

RNC1[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 1 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

RNC2[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 2 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

17.4.5.3 RSCFDnCFDGAFLIDj — Receive Rule ID Register j (j = 0 to 15)

Access: RSCFDnCFDGAFLIDj register can be read/written in 32-bit units
 RSCFDnCFDGAFLIDjL, RSCFDnCFDGAFLIDjH registers can be read/written in 16-bit units
 RSCFDnCFDGAFLIDjLL, RSCFDnCFDGAFLIDjLH, RSCFDnCFDGAFLIDjHL, RSCFDnCFDGAFLIDjHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGAFLIDj: $\langle \text{RSCFDn_base} \rangle + 1000_{\text{H}} + (10_{\text{H}} \times j)$
 RSCFDnCFDGAFLIDjL: $\langle \text{RSCFDn_base} \rangle + 1000_{\text{H}} + (10_{\text{H}} \times j)$,
 RSCFDnCFDGAFLIDjH: $\langle \text{RSCFDn_base} \rangle + 1002_{\text{H}} + (10_{\text{H}} \times j)$
 RSCFDnCFDGAFLIDjLL: $\langle \text{RSCFDn_base} \rangle + 1000_{\text{H}} + (10_{\text{H}} \times j)$,
 RSCFDnCFDGAFLIDjLH: $\langle \text{RSCFDn_base} \rangle + 1001_{\text{H}} + (10_{\text{H}} \times j)$,
 RSCFDnCFDGAFLIDjHL: $\langle \text{RSCFDn_base} \rangle + 1002_{\text{H}} + (10_{\text{H}} \times j)$,
 RSCFDnCFDGAFLIDjHH: $\langle \text{RSCFDn_base} \rangle + 1003_{\text{H}} + (10_{\text{H}} \times j)$

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 17.115 RSCFDnCFDGAFLIDj Register Contents

| Bit Position | Bit Name | Function |
|--------------|--------------|--|
| 31 | GAFLIDE | IDE Select 0: Standard ID 1: Extended ID |
| 30 | GAFLRTR | RTR Select 0: Data frame 1: Remote frame |
| 29 | GAFLLB | Receive Rule Target Message Select 0: When a message transmitted from another CAN node is received 1: When the own transmitted message is received |
| 28 to 0 | GAFLID[28:0] | ID Set the ID of the receive rule. For the standard ID, set the ID in bits b10 to b0 and set bits b28 to b11 to 0. |

Modify the RSCFDnCFDGAFLIDj register when the AFLDAE bit in the RSCFDnCFDGAFLLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDE Bit

This bit is used to select the ID format (standard ID or extended ID) of the receive rule. This bit is compared with the IDE bit in the received message during the acceptance filter processing.

GAFLRTR Bit

This bit is used to select the frame format (data frame or remote frame) of the receive rule. This bit is compared with the RTR bit in the received message during the acceptance filter processing.

GAFLLB Bit

When this bit is set to 0, data processing using the receive rule is performed when receiving messages transmitted from another CAN node.

When this bit is set to 1 when the mirror function is used, data processing using the receive rule is performed when the CAN node is receiving its own transmitted messages.

GAFLID[28:0] Bits

These bits are used to set the ID field of the receive rule. The ID value set by these bits is compared with the ID of the received message during the acceptance filter processing.

17.4.5.4 RSCFDnCFDGAFLMj — Receive Rule Mask Register j (j = 0 to 15)

Access: RSCFDnCFDGAFLMj register can be read/written in 32-bit units
 RSCFDnCFDGAFLMjL, RSCFDnCFDGAFLMjH registers can be read/written in 16-bit units
 RSCFDnCFDGAFLMjLL, RSCFDnCFDGAFLMjLH, RSCFDnCFDGAFLMjHL, RSCFDnCFDGAFLMjHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGAFLMj: <RSCFDn_base> + 1004_H + (10_H × j)
 RSCFDnCFDGAFLMjL: <RSCFDn_base> + 1004_H + (10_H × j),
 RSCFDnCFDGAFLMjH: <RSCFDn_base> + 1006_H + (10_H × j)
 RSCFDnCFDGAFLMjLL: <RSCFDn_base> + 1004_H + (10_H × j),
 RSCFDnCFDGAFLMjLH: <RSCFDn_base> + 1005_H + (10_H × j),
 RSCFDnCFDGAFLMjHL: <RSCFDn_base> + 1006_H + (10_H × j),
 RSCFDnCFDGAFLMjHH: <RSCFDn_base> + 1007_H + (10_H × j)

Value after reset: 0000 0000_H

| | | | | | | | | | | | | | | | | |
|-------------------|---------------|--------------|-----|----------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 17.116 RSCFDnCFDGAFLMj Register Contents

| Bit Position | Bit Name | Function |
|--------------|---------------|---|
| 31 | GAFLIDEM | IDE Mask 0: The IDE bit is not compared. 1: The IDE bit is compared. |
| 30 | GAFLRTRM | RTR Mask 0: The RTR bit is not compared. 1: The RTR bit is compared. |
| 29 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |
| 28 to 0 | GAFLIDM[28:0] | ID Mask 0: The corresponding ID bit is not compared. 1: The corresponding ID bit is compared. |

Modify the RSCFDnCFDGAFLMj register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDEM Bit

When this bit is set to 1, filter processing is performed only for messages of the ID format specified by the GAFLIDE bit in the RSCFDnCFDGAFLIDj register.

When this bit is cleared to 0, the IDs of all the receive messages and the specified IDs are regarded as matched. To set the GAFLIDEM bit to 0, set all the GAFLIDM[28:0] bits to 0 at the same time.

GAFLRTRM Bit

This bit is used to mask the RTR bit of the receive rule.

GAFLIDM[28:0] Bits

These bits are used to mask the corresponding ID bit of the receive rule.

17.4.5.5 RSCFDnCFDGAFLP0_j — Receive Rule Pointer 0 Register j (j = 0 to 15)

Access: RSCFDnCFDGAFLP0j register can be read/written in 32-bit units
 RSCFDnCFDGAFLP0jL, RSCFDnCFDGAFLP0jH registers can be read/written in 16-bit units
 RSCFDnCFDGAFLP0jLL, RSCFDnCFDGAFLP0jLH, RSCFDnCFDGAFLP0jHL, RSCFDnCFDGAFLP0jHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGAFLP0j: <RSCFDn_base> + 1008_H + (10_H × j)
 RSCFDnCFDGAFLP0jL: <RSCFDn_base> + 1008_H + (10_H × j),
 RSCFDnCFDGAFLP0jH: <RSCFDn_base> + 100A_H + (10_H × j)
 RSCFDnCFDGAFLP0jLL: <RSCFDn_base> + 1008_H + (10_H × j),
 RSCFDnCFDGAFLP0jLH: <RSCFDn_base> + 1009_H + (10_H × j),
 RSCFDnCFDGAFLP0jHL: <RSCFDn_base> + 100A_H + (10_H × j),
 RSCFDnCFDGAFLP0jHH: <RSCFDn_base> + 100B_H + (10_H × j)

Value after reset: 0000 0000_H

| 14 to 8 | GAFLRMDP[6:0] | Receive Buffer Number Select Set the receive buffer number to store receive messages. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Table 17.117 RSCFDnCFDGAFLP0_j Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 7 to 0 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |

Modify the RSCFDnCFDGAFLP0_j register when the AFLDAE bit in the RSCFDnCFDGAFLP0_j register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLDLC[3:0] Bits

These bits are used to set the minimum data length necessary for receiving messages. If the data length of a message that is being filtered is equal to or larger than the value set by the GAFLDLC[3:0] bits, the message passes the DLC check. Setting these bits to 0000_B disables the DLC check function allowing messages with any data length to pass the DLC check.

GAFLPTR[11:0] Bits

These bits are used to set a 12-bit label to be attached to messages that have passed through the filter. A label is attached when a message is stored in the receive buffer or the FIFO buffer.

GAFLRMV Bit

When this bit is set to 1, receive messages that have passed through the filter are stored in the receive buffer selected by the GAFLRMDP[6:0] bits.

GAFLRMDP[6:0] Bits

These bits are used to select the number of the receive buffer that stores receive messages that have passed through the filter when the GAFLRMV bit is set to 1. Set these bits to a value smaller than the value set by the NRXMB[7:0] bits in the RSCFDnCFDRMNB register.

17.4.5.6 RSCFDnCFDGAFLP1_j — Receive Rule Pointer 1 Register j (j = 0 to 15)

Access: RSCFDnCFDGAFLP1_j register can be read/written in 32-bit units
 RSCFDnCFDGAFLP1_jL, RSCFDnCFDGAFLP1_jH registers can be read/written in 16-bit units
 RSCFDnCFDGAFLP1_jLL, RSCFDnCFDGAFLP1_jLH, RSCFDnCFDGAFLP1_jHL,
 RSCFDnCFDGAFLP1_jHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGAFLP1_j: <RSCFDn_base> + 100C_H + (10_H × j)
 RSCFDnCFDGAFLP1_jL: <RSCFDn_base> + 100C_H + (10_H × j),
 RSCFDnCFDGAFLP1_jH: <RSCFDn_base> + 100E_H + (10_H × j)
 RSCFDnCFDGAFLP1_jLL: <RSCFDn_base> + 100C_H + (10_H × j),
 RSCFDnCFDGAFLP1_jLH: <RSCFDn_base> + 100D_H + (10_H × j),
 RSCFDnCFDGAFLP1_jHL: <RSCFDn_base> + 100E_H + (10_H × j),
 RSCFDnCFDGAFLP1_jHH: <RSCFDn_base> + 100F_H + (10_H × j)

Table 17.118 RSCFDnCFDGAFLP1_j Register Contents

| Bit Position | Bit Name | Function |
|--------------|---------------|--|
| 31 to 17 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |
| 16 to 8 | GAFLFDP[16:8] | Transmit/Receive FIFO Buffer k Select (Bit position – 8 = target transmit/receive FIFO buffer number k) 0: Transmit/receive FIFO buffer is not selected. 1: Transmit/receive FIFO buffer is selected. |
| 7 to 0 | GAFLFDP[7:0] | Receive FIFO Buffer x Select (Bit position = target receive FIFO buffer number x) 0: Receive FIFO buffer is not selected. 1: Receive FIFO buffer is selected. |

Modify the RSCFDnCFDGAFLP1_j register when the AFLDAE bit in the RSCFDnCFDGAFLFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLFDP[16:0] Bits

These bits are used to specify FIFO buffers that store receive messages that have passed through the filter. Up to eight FIFO buffers can be selected. However, when the GAFLRMV bit in the RSCFDnCFDGAFLP0_j register is set to 1 (messages are stored in the receive buffer), up to seven FIFO buffers can be selected. Only receive FIFO buffers and the transmit/receive FIFO buffer for which the CFM[1:0] bits in the RSCFDnCFDGFCCk register are set to 00_B (receive mode) or 10_B (gateway mode) can be selected.

17.4.6 Details of Receive Buffer-related Registers

17.4.6.1 RSCFDnCFDRMNB — Receive Buffer Number Register

Access: RSCFDnCFDRMNB register can be read/written in 32-bit units
 RSCFDnCFDRMNBL, RSCFDnCFDRMNBH registers can be read/written in 16-bit units
 RSCFDnCFDRMNBLL, RSCFDnCFDRMNBHL, RSCFDnCFDRMNBHL, RSCFDnCFDRMNBHH registers
 can be read/written in 8-bit units

Address: RSCFDnCFDRMNB: <RSCFDn_base> + 00A4_H
 RSCFDnCFDRMNBL: <RSCFDn_base> + 00A4_H, RSCFDnCFDRMNBH: <RSCFDn_base> + 00A6_H
 RSCFDnCFDRMNBLL: <RSCFDn_base> + 00A4_H, RSCFDnCFDRMNBHL: <RSCFDn_base> + 00A5_H,
 RSCFDnCFDRMNBHL: <RSCFDn_base> + 00A6_H, RSCFDnCFDRMNBHH: <RSCFDn_base> + 00A7_H

Value after reset: 0000 0000_H

Table 17.119 RSCFDnCFDRMNB Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------|--|
| 31 to 8 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |
| 9, 8 | RMPLS[1:0] | Receive Buffer Payload Storage Size Select b9 b8 0 0: 8 bytes 0 1: 12 bytes 1 0: 16 bytes 1 1: 20 bytes |
| 7 to 0 | NRXMB[7:0] | Receive Buffer Number Configuration Set the number of receive buffers. Set a value of 0 to 48. |

Modify the RSCFDnCFDRMNB register only in global reset mode.

RMPLS[1:0] Bits

These bits are used to select the maximum payload size that can be stored in the receive buffer.

NRXMB[7:0] Bits

These bits are used to set the total number of receive buffers of the RS-CANFD module. The maximum value is $16 \times$ (number of channels).

Setting all of these bits to 0 makes receive buffers unavailable.

17.4.6.2 RSCFDnCFDRMNDy — Receive Buffer New Data Register y (y = 0, 1)

Access: RSCFDnCFDRMNDy register can be read/written in 32-bit units
 RSCFDnCFDRMNDyL, RSCFDnCFDRMNDyH registers can be read/written in 16-bit units
 RSCFDnCFDRMNDyLL, RSCFDnCFDRMNDyLH, RSCFDnCFDRMNDyHL, RSCFDnCFDRMNDyHH registers can be read/written in 8-bit units

Address: RSCFDnCFDRMNDy: <RSCFDn_base> + 00A8_H + (04_H × y)
 RSCFDnCFDRMNDyL: <RSCFDn_base> + 00A8_H + (04_H × y),
 RSCFDnCFDRMNDyH: <RSCFDn_base> + 00AA_H + (04_H × y)
 RSCFDnCFDRMNDyLL: <RSCFDn_base> + 00A8_H + (04_H × y),
 RSCFDnCFDRMNDyLH: <RSCFDn_base> + 00A9_H + (04_H × y),
 RSCFDnCFDRMNDyHL: <RSCFDn_base> + 00AA_H + (04_H × y),
 RSCFDnCFDRMNDyHH: <RSCFDn_base> + 00AB_H + (04_H × y)

Value after reset: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 17.120 RSCFDnCFDRMNDy Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|--|
| 31 to 16 | RMNSq | Receive Buffer Receive Complete Flag q (q = y × 32 + 31 to y × 32 + 16) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q. |
| 15 to 0 | RMNSq | Receive Buffer Receive Complete Flag q (q = y × 32 + 15 to y × 32 + 0) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q. |

Write 0 to the RSCFDnCFDRMNDy register in global operating mode or global test mode.

RMNSq Flags (q = 0 to 47)

Each RMNSq flag is set to 1 when the processing for storing a message in the corresponding receive buffer starts.

To clear a flag to 0, the program must write 0 to the flag. Use a store instruction to write “0” to the flag and “1” to other flags. These bits cannot be set to 0 while a message is being stored. The message storing time depends on the storage payload size of the receive buffer. When the RMPLS[1:0] value in the RSCFDnCFDRMNB register is 00_B (8 bytes), the message storing time is 12 pclk clock cycles. When the RMPLS[1:0] value is 11_B (20 bytes), the message storing time is 18 pclk clock cycles. (2 pclk clock cycles per 4 bytes of storage payload size).

These flags are cleared to 0 in global reset mode.

17.4.6.3 RSCFDnCFDRMIDq — Receive Buffer ID Register q (q = 0 to 47)

Access: RSCFDnCFDRMIDq register can be read only in 32-bit units
 RSCFDnCFDRMIDqL, RSCFDnCFDRMIDqH registers can be read only in 16-bit units
 RSCFDnCFDRMIDqLL, RSCFDnCFDRMIDqLH, RSCFDnCFDRMIDqHL, RSCFDnCFDRMIDqHH registers can be read only in 8-bit units

Address: RSCFDnCFDRMIDq: <RSCFDn_base> + 2000_H + (20_H × q)
 RSCFDnCFDRMIDqL: <RSCFDn_base> + 2000_H + (20_H × q),
 RSCFDnCFDRMIDqH: <RSCFDn_base> + 2002_H + (20_H × q)
 RSCFDnCFDRMIDqLL: <RSCFDn_base> + 2000_H + (20_H × q),

Table 17.121 RSCFDnCFDRMIDq Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------|---|
| 31 | RMIDE | Receive Buffer IDE 0: Standard ID 1: Extended ID |
| 30 | RMRTR | Receive Buffer RTR/RRS <ul style="list-style-type: none"> When the received message is a classical CAN frame 0: Data frame 1: Remote frame When the received message is a CAN FD frame The RRS bit value of the received message can be read. |
| 29 | Reserved | These bits are read as the value after reset. |
| 28 to 0 | RMID[28:0] | Receive Buffer ID Data These bits contain the standard ID or extended ID of the received message. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0. |

RMIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive buffer.

RMRTR Bit

When the received message is a classical CAN frame, this bit indicates the frame format (data frame or remote frame) of the message stored in the receive buffer. When the received message is a CAN FD frame, this bit indicates the RRS bit value in the message.

RMID[28:0] Bits

These bits contain the ID of the message stored in the receive buffer.

17.4.6.4 RSCFDnCFDRMPTRq — Receive Buffer Pointer Register q (q = 0 to 47)

Access: RSCFDnCFDRMPTRq register can be read only in 32-bit units
 RSCFDnCFDRMPTRqL, RSCFDnCFDRMPTRqH registers can be read only in 16-bit units
 RSCFDnCFDRMPTRqLL, RSCFDnCFDRMPTRqLH, RSCFDnCFDRMPTRqHL, RSCFDnCFDRMPTRqHH registers can be read only in 8-bit units

Address: RSCFDnCFDRMPTRq: <RSCFDn_base> + 2004_H + (20_H × q)
 RSCFDnCFDRMPTRqL: <RSCFDn_base> + 2004_H + (20_H × q),

RMDLC[3:0] Bits

These bits indicate the data length of the message stored in the receive buffer. The number of bytes of the payload to be stored in the receive buffer is determined by the RMPLS[1:0] bits in the RSCFDnCFDRMNB register.

RMPTR[11:0] Bits

These bits indicate the label information of the message stored in the receive buffer.

RMTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the receive buffer.

17.4.6.5 RSCFDnCFDRMFDSTSq — Receive Buffer CAN FD Status Register q (q = 0 to 47)

Access: RSCFDnCFDRMFDSTSq register can be read only in 32-bit units
 RSCFDnCFDRMFDSTSqL, RSCFDnCFDRMFDSTSqH registers can be read only in 16-bit units
 RSCFDnCFDRMFDSTSqLL, RSCFDnCFDRMFDSTSqLH, RSCFDnCFDRMFDSTSqHL,
 RSCFDnCFDRMFDSTSqHH registers can be read only in 8-bit units

Address: RSCFDnCFDRMFDSTSq: <RSCFDn_base> + 2008_H + (20_H × q)
 RSCFDnCFDRMFDSTSqL: <RSCFDn_base> + 2008_H + (20_H × q),
 RSCFDnCFDRMFDSTSqH: <RSCFDn_base> + 200A_H + (20_H × q)
 RSCFDnCFDRMFDSTSqLL: <RSCFDn_base> + 2008_H + (20_H × q),

Table 17.123 RSCFDnCFDRMFDSTSq Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 3 | Reserved | These bits are read as the value after reset. |
| 2 | RMFDF | FD Format 0: Classical CAN frame 1: CAN FD frame |
| 1 | RMBRS | BRS 0: The bit rate in the data area does not change. 1: The bit rate in the data area changes. |
| 0 | RMESI | ESI 0: Error active node 1: Error passive node |

RMFDF Bit

This bit indicates the FD format (classical CAN frame or CAN FD frame) of the message stored in the receive buffer.

RMBRS Bit

When the RMFDF bit is set to 1, this bit indicates the BRS bit value of the message stored in the receive buffer. When the RMFDF bit is set to 0, this bit is always read as 0.

RMESI Bit

When the RMFDF bit is set to 1, this bit indicates the ESI bit value of the message stored in the receive buffer. When the RMFDF bit is set to 0, this bit is always read as 0.

17.4.6.6 RSCFDnCFDRMDFb_q — Receive Buffer Data Field b Register q (b = 0 to 4, q = 0 to 47)

Access: RSCFDnCFDRMDFb_q register can be read only in 32-bit units
RSCFDnCFDRMDFb_qL, RSCFDnCFDRMDFb_qH registers can be read only in 16-bit units
RSCFDnCFDRMDFb_qLL, RSCFDnCFDRMDFb_qLH, RSCFDnCFDRMDFb_qHL,
RSCFDnCFDRMDFb_qHH registers can be read only in 8-bit units

Address: RSCFDnCFDRMDFb_q: $\langle \text{RSCFDn_base} \rangle + 200C_H + (04_H \times b) + (20_H \times q)$
RSCFDnCFDRMDFb_qL: $\langle \text{RSCFDn_base} \rangle + 200C_H + (04_H \times b) + (20_H \times q)$,
RSCFDnCFDRMDFb_qH: $\langle \text{RSCFDn_base} \rangle + 200E_H + (04_H \times b) + (20_H \times q)$
RSCFDnCFDRMDFb_qLL: $\langle \text{RSCFDn_base} \rangle + 200C_H + (04_H \times b) + (20_H \times q)$,
RSCFDnCFDRMDFb_qLH: $\langle \text{RSCFDn_base} \rangle + 200D_H + (04_H \times b) + (20_H \times q)$,
RSCFDnCFDRMDFb_qHL: $\langle \text{RSCFDn_base} \rangle + 200E_H + (04_H \times b) + (20_H \times q)$,
RSCFDnCFDRMDFb_qHH: $\langle \text{RSCFDn_base} \rangle + 200F_H + (04_H \times b) + (20_H \times q)$

Initial value: 0000 0000_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 17.124 RSCFDnCFDRMDFb_q Register Contents

| Bit Position | Bit Name | Function |
|--------------|---------------------|--|
| 31 to 24 | RMDB4 × b + 3 [7:0] | Receive Buffer Data Byte 4 × b + 3 |
| | | Receive Buffer Data Byte 4 × b + 2 |
| 23 to 16 | RMDB4 × b + 2 [7:0] | Receive Buffer Data Byte 4 × b + 1 |
| | | Receive Buffer Data Byte 4 × b + 0 |
| 15 to 8 | RMDB4 × b + 1 [7:0] | Data for a message stored in the receive buffer can be read. |
| 7 to 0 | RMDB4 × b + 0 [7:0] | |

When the RMDLC[3:0] value in the RSCFDnCFDRMPTRq register is smaller than the payload storage size of the receive buffer, data bytes for which no data is set are read as 00_H.

Specify the payload storage size of the receive buffer by the RMPLS[1:0] bits in the RSCFDnCFDRMNB register. Do not read or write the RSCFDnCFDRMDFb_q register corresponding to an area that exceeds the specified size.

17.4.7 Details of Receive FIFO Buffer-related Registers

17.4.7.1 RSCFDnCFDRFCCx — Receive FIFO Buffer Configuration and Control Register x (x = 0 to 7)

Access: RSCFDnCFDRFCCx register can be read/written in 32-bit units
 RSCFDnCFDRFCCxL, RSCFDnCFDRFCCxH registers can be read/written in 16-bit units
 RSCFDnCFDRFCCxLL, RSCFDnCFDRFCCxLH, RSCFDnCFDRFCCxHL, RSCFDnCFDRFCCxHH registers can be read/written in 8-bit units

Address: RSCFDnCFDRFCCx: <RSCFDn_base> + 00B8_H + (04_H × x)
 RSCFDnCFDRFCCxL: <RSCFDn_base> + 00B8_H + (04_H × x),

| 3, 2 | Reserved | These bits are read as the value after reset. The write value should be the value after reset. |
| 1 | RFIE | Receive FIFO Interrupt Enable 0: Receive FIFO interrupt is disabled. 1: Receive FIFO interrupt is enabled. |
| 0 | RFE | Receive FIFO Buffer Enable 0: No receive FIFO buffer is used. 1: Receive FIFO buffers are used. |

RFIGCV[2:0] Bits

These bits are used to specify the number of received messages required to generate a receive FIFO interrupt request when the RFIM bit is set to 0 with a fraction for the total number of buffers (the setting of RFDC[2:0]).

When the RFDC[2:0] bits are set to 001_B (4 messages), set the RFIGCV[2:0] bits to 001_B, 011_B, 101_B, or 111_B. Modify these bits only in global reset mode.

RFIM Bit

This bit is used to select a FIFO interrupt source. Modify this bit only in global reset mode.

RFDC[2:0] Bits

These bits are used to select the number of messages that can be stored in a single receive FIFO buffer. When these bits are set to 000_B, no receive FIFO buffer should be used. Modify these bits only in global reset mode.

RFPLS[2:0] Bits

These bits are used to select the maximum payload size that can be stored in the receive FIFO buffer. Modify these bits only in global reset mode.

RFIE Bit

Setting the RFIE bit to 1 enables receive FIFO interrupts. Modify this bit when the RFE bit is set to 0 (no receive FIFO buffer is used).

RFE Bit

Setting the RFE bit to 1 enables the use of FIFO buffers. Clearing this bit to 0 sets the RFEMP flag in the RSCFDnCFDRFSTSx register to 1 (buffer empty). Modify this bit in global operating mode or global test mode. Set this bit to 1 with another instruction after the settings to all bits in the RSCFDnCFDRFCCx register have been done. This bit is cleared to 0 in global reset mode.

17.4.7.2 RSCFDnCFDRFSTSx — Receive FIFO Buffer Status Register x (x = 0 to 7)

Access: RSCFDnCFDRFSTSx register can be read/written in 32-bit units
 RSCFDnCFDRFSTSxL, RSCFDnCFDRFSTSxH registers can be read/written in 16-bit units
 RSCFDnCFDRFSTSxLL, RSCFDnCFDRFSTSxLH, RSCFDnCFDRFSTSxHL, RSCFDnCFDRFSTSxHH registers can be read/written in 8-bit units

Address: RSCFDnCFDRFSTSx: <RSCFDn_base> + 00D8_H + (04_H × x)
 RSCFDnCFDRFSTSxL: <RSCFDn_base> + 00D8_H + (04_H × x),
 RSCFDnCFDRFSTSxH: <RSCFDn_base> + 00DA_H + (04_H × x)
 RSCFDnCFDRFSTSxLL: <RSCFDn_base> + 00D8_H + (04_H × x),
 RSCFDnCFDRFSTSxLH: <RSCFDn_base> + 00D9_H + (04_H × x),
 RSCFDnCFDRFSTSxHL: <RSCFDn_base> + 00DA_H + (04_H × x),
 RSCFDnCFDRFSTSxHH: <RSCFDn_base> + 00DB_H + (04_H × x)

Value after reset: 0000 0001_H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 | R/W*1 | R | R |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 17.126 RSCFDnCFDRFSTSx Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|---|
| 31 to 16 | Reserved | These bits are read as the value after reset. When writing, write the value after reset. |
| 15 to 8 | RFMC[7:0] | Receive FIFO Unread Message Counter The number of unread messages stored in the receive FIFO buffer is displayed. |
| 7 to 4 | Reserved | These bits are read as the value after reset. When writing, write the value after reset. |
| 3 | RFIF | Receive FIFO Interrupt Request Flag 0: No receive FIFO interrupt request is present. 1: A receive FIFO interrupt request is present. |
| 2 | RFMLT | Receive FIFO Message Lost Flag 0: No receive FIFO message is lost. 1: A receive FIFO message is lost. |
| 1 | RFFLL | Receive FIFO Buffer Full Status Flag 0: The receive FIFO buffer is not full. 1: The receive FIFO buffer is full. |
| 0 | RFEMP | Receive FIFO Buffer Empty Status Flag 0: The receive FIFO buffer contains unread message. 1: The receive FIFO buffer contains no unread message (buffer empty). |

RFMC[7:0] Flag

This flag indicates the number of unread messages in the receive FIFO buffer. This flag becomes 00_H when the RFE bit in the RSCFDnCFDRFCCx register is set to 0.

This flag is 00_H in global reset mode.

RFIF Flag

This flag is set to 1 when the receive FIFO interrupt request generation conditions set by the RFIGCV[2:0] bits and the RFIM bit in the RSCFDnCFDRFCCx register are met. This flag is cleared to 0 in global reset mode or by writing 0 to this flag. Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flags to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

RFMLT Flag

This flag is set to 1 when an attempt is made to store a new message while the receive FIFO buffer is full. In this case, the new message is discarded.

This flag is cleared to 0 in global reset mode or by writing 0 to this flag.

Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flags to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

RFFLL Flag

This flag is set to 1 when the number of messages stored in the receive FIFO buffer matches the FIFO buffer depth set by the RFDC[2:0] bits in the RSCFDnCFDRFCCx register.

If the number of messages stored in the receive FIFO buffer becomes smaller than the FIFO buffer depth set by the RFDC[2:0] bits, this flag is cleared to 0. This flag is also cleared to 0 when the RFE bit in the RSCFDnCFDRFCCx register is set to 0 (no receive FIFO buffer is used) or in global reset mode.

RFEMP Flag

This flag is set to 1 when all messages in the receive FIFO buffer have been read. This flag is also set to 1 when the RFE bit in the RSCFDnCFDRFCCx register is 0 or in global reset mode.

This flag is cleared to 0 when a received message is in the receive FIFO buffer.

NOTE

To clear the RFMLT or RFIF flag to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

17.4.7.3 RSCFDnCFDRFPCTR_x — Receive FIFO Buffer Pointer Control Register _x (x = 0 to 7)

Access: RSCFDnCFDRFPCTR_x register can only be written in 32-bit units
RSCFDnCFDRFPCTR_{xL}, RSCFDnCFDRFPCTR_{xH} registers can only be written in 16-bit units
RSCFDnCFDRFPCTR_{xLL}, RSCFDnCFDRFPCTR_{xLH}, RSCFDnCFDRFPCTR_{xHL},
RSCFDnCFDRFPCTR_{xHH} registers can only be written in 8-bit units

Address: RSCFDnCFDRFPCTR_x: <RSCFDn_base> + 00F8_H + (04_H × x)
RSCFDnCFDRFPCTR_{xL}: <RSCFDn_base> + 00F8_H + (04_H × x),
RSCFDnCFDRFPCTR_{xH}: <RSCFDn_base> + 00FA_H + (04_H × x)
RSCFDnCFDRFPCTR_{xLL}: <RSCFDn_base> + 00F8_H + (04_H × x),
RSCFDnCFDRFPCTR_{xLH}: <RSCFDn_base> + 00F9_H + (04_H × x),
RSCFDnCFDRFPCTR_{xHL}: <RSCFDn_base> + 00FA_H + (04_H × x),
RSCFDnCFDRFPCTR_{xHH}: <RSCFDn_base> + 00FB_H + (04_H × x)

Value after reset: 0000 0000_H

| R/W | R | R | R | R | R | R | R | R | W | W | W | W | W | W | W | W |

Table 17.127 RSCFDnCFDRFPCTR_x Register Contents

| Bit Position | Bit Name | Function |
|--------------|-----------|--|
| 31 to 8 | Reserved | The write value should be the value after reset. |
| 7 to 0 | RFPC[7:0] | Receive FIFO Pointer Control When these bits are set to FF _H , the read pointer moves to the next unread message in the receive FIFO buffer. |

When the RFDMAEx value in the RSCFDnCFDCDTCT register is 1 (DMA transfer request enabled), do not write a value to this register.

RFPC[7:0] Bits

When the RFPC[7:0] bits are set to FF_H, the read pointer moves to the next unread message in the receive FIFO buffer. At this time, the RFMC[7:0] (receive FIFO unread message counter) value in the RSCFDnCFDRFSTSt_x register is decremented by 1. Read the RSCFDnCFDRFID_x, RSCFDnCFDRFPTR_x, RSCFDnCFDRFFDSTSt_x, and RSCFDnCFDRFDFd_x registers to read messages in the receive FIFO buffer, and then write FF_H to the RFPC[7:0] bits.

When writing FF_H to these bits, make sure that the RFE bit in the RSCFDnCFDRFCC_x register is set to 1 (receive FIFO buffers are used) and the RFEMP flag in the RSCFDnCFDRFSTSt_x register is 0 (the receive FIFO buffer contains unread messages).

17.4.7.4 RSCFDnCFDRFIDx — Receive FIFO Buffer Access ID Register x (x = 0 to 7)

Access: RSCFDnCFDRFIDx register can be read only in 32-bit units
 RSCFDnCFDRFIDxL, RSCFDnCFDRFIDxH registers can be read only in 16-bit units
 RSCFDnCFDRFIDxLL, RSCFDnCFDRFIDxLH, RSCFDnCFDRFIDxHL, RSCFDnCFDRFIDxHH registers can be read only in 8-bit units

Address: RSCFDnCFDRFIDx: <RSCFDn_base> + 3000_H + (80_H × x)
 RSCFDnCFDRFIDxL: <RSCFDn_base> + 3000_H + (80_H × x),
 RSCFDnCFDRFIDxH: <RSCFDn_base> + 3002_H + (80_H × x)

Table 17.128 RSCFDnCFDRFIDx Register Contents

| Bit Position | Bit Name | Function |
|--------------|------------|---|
| 31 | RFIDE | Receive FIFO Buffer IDE 0: Standard ID 1: Extended ID |
| 30 | RFRTR | Receive FIFO Buffer RTR/RRS <ul style="list-style-type: none"> When the received message is a classical CAN frame 0: Data frame 1: Remote frame When the received message is a CAN FD frame The RRS bit value of the received message can be read. |
| 29 | Reserved | These bits are read as the value after reset. |
| 28 to 0 | RFID[28:0] | Receive FIFO Buffer ID Data The standard ID or extended ID of received message can be read. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0. |

RFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive FIFO buffer.

RFRTR Bit

When the received message is a classical CAN frame, this bit indicates the frame format (data frame or remote frame) of the message stored in the receive FIFO buffer. When the received message is a CAN FD frame, this bit indicates the RRS bit value in the message.

RFID[28:0] Bits

These bits indicate the ID of the message stored in the receive FIFO buffer.

17.4.7.5 RSCFDnCFDRFPTRx — Receive FIFO Buffer Access Pointer Register x (x = 0 to 7)

Access: RSCFDnCFDRFPTRx register can be read only in 32-bit units
 RSCFDnCFDRFPTRxL, RSCFDnCFDRFPTRxH registers can be read only in 16-bit units

RFDLC[3:0] Bits

These bits contain the data length of the message stored in the receive FIFO buffer.

RFPTR[11:0] Bits

These bits contain the label information of the message stored in the receive FIFO buffer.

RFTS[15:0] Bits

These bits contain the timestamp value of the message stored in the receive FIFO buffer.

17.4.7.6 RSCFDnCFDRFFDSTSx — Receive FIFO CAN FD Status Register x (x = 0 to 7)

Access: RSCFDnCFDRFFDSTSx register can be read only in 32-bit units
 RSCFDnCFDRFFDSTSxL, RSCFDnCFDRFFDSTSxH registers can be read only in 16-bit units
 RSCFDnCFDRFFDSTSxLL, RSCFDnCFDRFFDSTSxLH, RSCFDnCFDRFFDSTSxHL,
 RSCFDnCFDRFFDSTSxHH registers can be read only in 8-bit units

Address: RSCFDnCFDRFFDSTSx: <RSCFDn_base> + 3008_H + (80_H × x)
 RSCFDnCFDRFFDSTSxL: <RSCFDn_base> + 3008_H + (80_H × x),
 RSCFDnCFDRFFDSTSxH: <RSCFDn_base> + 300A_H + (80_H × x)
 RSCFDnCFDRFFDSTSxLL: <RSCFDn_base> + 3008_H + (80_H × x),
 RSCFDnCFDRFFDSTSxLH: <RSCFDn_base> + 3009_H + (80_H × x),
 RSCFDnCFDRFFDSTSxHL: <RSCFDn_base> + 300A_H + (80_H × x),
 RSCFDnCFDRFFDSTSxHH: <RSCFDn_base> + 300B_H + (80_H × x)

Initial value: 0000 0000_H

Table 17.130 RSCFDnCFDRFFDSTSx Register Contents

| Bit Position | Bit Name | Function |
|--------------|----------|---|
| 31 to 3 | Reserved | These bits are read as the value after reset. |
| 2 | RFFDF | FD Format 0: Classical CAN frame 1: CAN FD frame |
| 1 | RFBRS | BRS 0: The bit rate in the data area does not change. 1: The bit rate in the data area changes. |
| 0 | RFESI | ESI 0: Error active node 1: Error passive node |

RFFDF Bit

This bit indicates the FD format (classical CAN frame or CAN FD frame) of the message stored in the receive FIFO buffer.

RFBRS Bit

When the RFFDF bit is set to 1, this bit indicates the BRS bit value of the message stored in the receive FIFO buffer. When the RFFDF bit is set to 0, this bit is always read as 0.

RFESI Bit

When the RFFDF bit is set to 1, this bit indicates the ESI bit value of the message stored in the receive FIFO buffer. When the RFFDF bit is set to 0, this bit is always read as 0.

17.4.7.7 RSCFDnCFDRFDFd_x — Receive FIFO Buffer Access Data Field d Register x (d = 0 to 15, x = 0 to 7)

Access: RSCFDnCFDRFDFd_x register can be read only in 32-bit units
 RSCFDnCFDRFDFdx_LL, RSCFDnCFDRFDFdx_H registers can be read only in 16-bit units
 RSCFDnCFDRFDFdx_LL, RSCFDnCFDRFDFdx_LH, RSCFDnCFDRFDFdx_HL, RSCFDnCFDRFDFdx_HH registers can be read only in 8-bit units

Address: RSCFDnCFDRFDFd_x: <RSCFDn_base> + 300C_H + (04_H × d) + (80_H × x)
 RSCFDnCFDRFDFd_xL: <RSCFDn_base> + 300C_H + (04_H × d) + (80_H × x),
 RSCFDnCFDRFDFd_xH: <RSCFDn_base> + 300E_H + (04_H × d) + (80_H × x)
 RSCFDnCFDRFDFd_xLL: <RSCFDn_base> + 300C_H + (04_H × d) + (80_H × x),
 RSCFDnCFDRFDFd_xLH: <RSCFDn_base> + 300D_H + (04_H × d) + (80_H × x),

Table 17.131 RSCFDnCFDRFDFd_x Register Contents

| Bit Position | Bit Name | Function |
|--------------|---------------------|--|
| 31 to 24 | RFDB4 × d + 3 [7:0] | Receive Buffer Data Byte 4 × d + 3 |
| | | Receive Buffer Data Byte 4 × d + 2 |
| 23 to 16 | RFDB4 × d + 2 [7:0] | Receive Buffer Data Byte 4 × d + 1 |
| | | Receive Buffer Data Byte 4 × d + 0 |
| 15 to 8 | RFDB4 × d + 1 [7:0] | Data for a message stored in the receive buffer can be read. |
| 7 to 0 | RFDB4 × d + 0 [7:0] | |

When the RFDLC[3:0] value in the RSCFDnCFDRFPTRx register is smaller than the payload storage size of the receive FIFO buffer, data bytes for which no data is set are read as 00_H.

Specify the payload storage size of the receive FIFO buffer by the RFPLS[2:0] bits in the RSCFDnCFDRFCCx register. Do not read or write the RSCFDnCFDRFDFd_x register corresponding to an area that exceeds the specified size.

17.4.8 Transmit/Receive FIFO Buffer Related Registers

17.4.8.1 RSCFDnCFDCFCCK — Transmit/receive FIFO Buffer Configuration and Control Register k (k = 0 to 8)

Access: RSCFDnCFDCFCCK register can be read/written in 32-bit units
 RSCFDnCFDCFCCKL, RSCFDnCFDCFCCKH registers can be read/written in 16-bit units
 RSCFDnCFDCFCCKLL, RSCFDnCFDCFCCKLH, RSCFDnCFDCFCCKHL, RSCFDnCFDCFCCKHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCFCCK: <RSCFDn_base> + 0118_H + (04_H × k)
 RSCFDnCFDCFCCKL: <RSCFDn_base> + 0118_H + (04_H × k),
 RSCFDnCFDCFCCKH: <RSCFDn_base> + 011A_H + (04_H × k)
 RSCFDnCFDCFCCKLL: <RSCFDn_base> + 0118_H + (04_H × k),
 RSCFDnCFDCFCCKLH: <RSCFDn_base> + 0119_H + (04_H × k),
 RSCFDnCFDCFCCKHL: <RSCFDn_base> + 011A_H + (04_H × k),
 RSCFDnCFDCFCCKHH: <RSCFDn_base> + 011B_H + (04_H × k)

Value after reset: 0000 0000_H
