VoiceOFF
a great British brand
from System Q Ltd

What is VoiceOFF ?

First launched in 2011, the VoiceOFF is a useful audio device that can be used to welcome, warn, inform or deter passers-by with an audio message or sound.

The post pandemic chip shortage has forced us to rethink the design with a superb outcome, Mark 4 now has a built in network connection so you can trigger messages over a network using our bespoke software (pg 13) or via 3rd party devices such as access control equipment.

VoiceOFF has 6 hard-wired alarm inputs (suitable for a door contact, PIR, keyfob or even the alarm output or motion detection trigger on your CCTV system) and will automatically play an MP3 sound file associated with each one. You can record your own file or simply pick a pre-recorded one (pg27).

A line input even allows you to use the unit as a loudspeaker for talkback using a Zip CCTV recorder!

*Bespoke software
written here in the UK*

“Trade only CCTV, Access & Security Equipment ...protecting your margins, helping you grow“

System Q Ltd are a leading UK manufacturer and distributor of CCTV, access and security equipment.

We designed our first CCTV camera over 25 years ago and have rigidly stuck to our principle of only supplying the trade with products over all that time. Our latest VOX400 product is a fantastic addition for any installer to add to their offering to win new business.

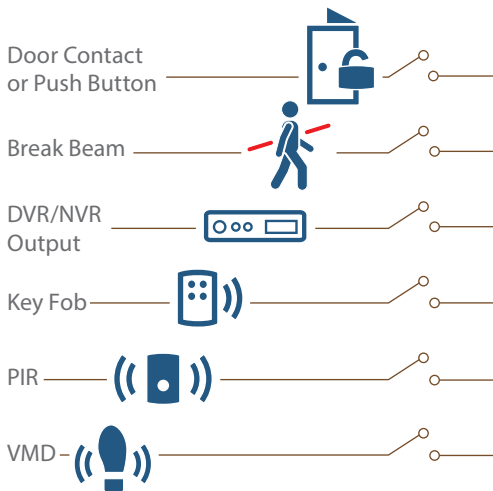

Our Latest ZIP CCTV equipment boasts Alexa & Google integration, facial recognition, vehicle detection and more. We use the best chipsets for our products and they frequently outperform our competition proving better value £ for £.

We run trade CCTV Installation Courses at our UK Head office in Chesterfield giving you the skills you need. So if you are looking for a loyal, long term partner to grow with, call us and get our latest product catalogue and account application. Let's work as a team to grow.

Call us on 01246 200 000 - Ask for Lisa or Phil.

- ✓ Auto-Activated Using Alarm Inputs
- ✓ Use as a Talkback Amp with DVRs
- ✓ PC/DVR Control Via RS485 Connection
- ✓ Stores & Plays 1K Sounds
- ✓ IP65 Rated for External Use
- ✓ Built-in Relay

VoiceOff is an affordable, professional hardware solution to play messages or sounds to welcome, warn or inform people.

It can be triggered to play one of its on-board MP3 sound files using a hard-wired trigger such as a door contact or PIR, by software, using its new network connection or via its RS485 input by interfacing it with an access control system.

The sound files are stored inside the VOX400 on a microSD card in MP3 format and the local file storage means messages are played instantly without any network delay. These sound files can be messages, alarm sounds, music or a mixture of all of them. You then can trigger the VoiceOFF to play the appropriate message or sound depending on your application, it can store and play 10K individual sound files making it more than capable of the most demanding installs.

A shop might use the VOX400 for example to play a welcome and special offer messages, an industrial unit may have a VOX400 in a yard area warning off intruders at night by saying "This area is protected by CCTV". A hospital might use it to play informative messages like "Now please wash your hands" or "These premises are strictly no smoking".

Many end-users and installers have their own applications such as playing "doors now closing", "alarm now setting" etc. The VOX400 is an extremely flexible product for the professional installer.

The VoiceOFF has voltage free contacts that change over whenever it plays a message. You can use these contacts by a suitable interface to control lights, access or CCTV equipment. The latest VOX400 model can be triggered and controlled with software so you can even trigger the relays remotely!

Housed in an IP65 case, it can be used either outside or inside and its built Stereo Amp delivers 10W per channel with an adjustable volume control both on the PCB and in the free **VoxPlayer Lite** software bundled with the product. The VOX400 has only one speaker leaving its second 10W channel available to drive a slave speaker unit the VOX120.

The FREE software **VoxPlayer Lite** allows a user to select a message and then trigger the VOX400 to play it remotely via a network connection. You can also adjust the volume of the unit remotely using the software. The **VoxPlayer Lite** software is downloaded from a link supplied with each VOX400.

IP65 Rated for External Use

SOFT1026
pg.14

VoxPlayer Pro

For more demanding applications we have also written **VoxPlayer Pro** which can control and schedule messages to be played from up to 20 different VoiceOFFs all controlled and managed independently. This is a perfect solution for playing various messages in-store in shops at times and frequencies to suit the environment. For example you could play special offer messages throughout the day and messages to say the store is closing in 10 minutes at the end of the day.

The **VoxPlayer Pro** software has a great pedigree and is our upgraded version of our scheduler software that has been used in bus depots to inform the public of messages relating to the station and also in retail parks such as Meadowhall informing the public with messages relating to the site.

VoxPlayer OEM

As we write our own software if you require custom features and applications these can be added in to our software at a cost. To do this we will need written details of your request and then would quote for the work, a non-refundable deposit would be taken.

**Low Cost
& Effective**

The all new VoiceOFF® "VOX111" is a great way to automatically play pre-recorded messages to visitors at your business.

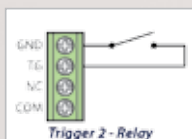

It features a built in PIR that when it detects movement of a person it then plays the pre-recorded message stored in it through a small built in speaker. You can change the message stored in the VOX111 with your own personal one to tailor the message to your particular requirements.

The automatic playing of messages is a great way to inform your visitors of special offers you may have, health and safety advice or you could use it to welcome guests and take a seat.

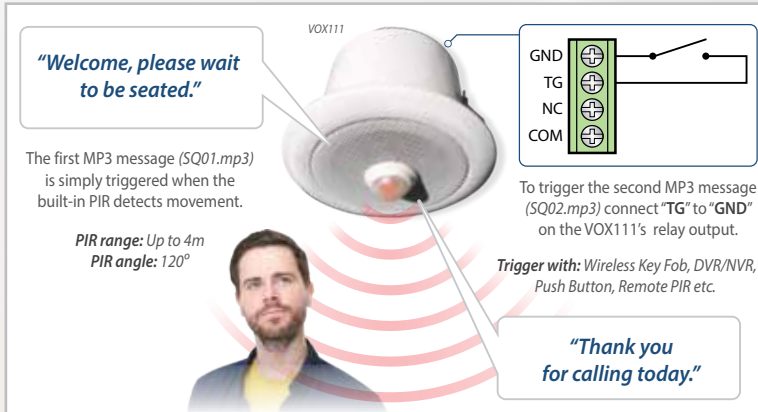

In retail environments you may use the VOX111 to play messages about offers and new items, in a hospital or similar you may inform people to wash or sanitise their hands and installed in school corridors the VOX111 could automatically announce that running is not permitted.

With the ability to change the built in MP3 message, it's really easy to then use the VOX111 to play new messages as requirements change.

The VOX111 can also be triggered to play a different MP3 message by triggering its alarm input. This allows you to link it to others devices such as automatic doors, alarm panels, fire alarms etc. Inside the VOX111 it has the ability to store the two MP3 messages, one is played back from being triggered by the PIR, the second being triggered by something external connected to its alarm input.

The VOX111 is an in-ceiling mount design so that it can sit in a ceiling tile or similar for a clean & easy installation, held in place by two simple spring clips. It is 12V powered and comes with a 12V power supply that would need plugging into a suitable outlet to power the VOX111. Alternatively you could run a 12V power supply from another 12V system within the premises for a neat installation.

To change the MP3 sound files stored on the VOX111 you simply connect it to a suitable computer or laptop and it will see it as a USB drive. Replace the MP3 files with your own using the correct naming protocol as listed in the VOX111's instructions.

Its easy to create your own mp3 messages for VOX11, but if you want an off the shelf message with have 1000's or pre done ones online at VoiceOff.com We have generic welcome messages, health and safety message even one related to alarms and access control systems.

We have a useful video on the VOX111 that gives a quick overview of it so scan this code to view or type in VOX111 Video into Google and you should find it there.

CONTENTS**Software (VoiceOFF)**

VoxPlayer Lite	14
VoxPlayer Pro	14-15
VoxPlayer OEM	15

Software to schedule playing messages from the new VOX400

Ideal for retail, health or transport sectors.

- Schedule Messages
- Windows Software
- Up to 20 VOX400s
- LAN or Internet
- Serial or Network
- Message Database
- Automated Solution
- Favourite Messages

The new VOX400 has a network interface which means that in addition to its hardware inputs you can trigger it to play messages by remote control software over a LAN or the internet.

Each VOX400 is supplied with free software called VoxPlayer Lite which supports basic play functions but not scheduled playing of messages. The software available is as follows;

FREE VoxPLAYER Lite

FREE
with
VOX400

This simple Windows program allows an operator to manually trigger the playing of a particular sound file by one of three VOX400 VoiceOff units. The software is preloaded with file information about the six default sounds that ship with the VOX400 but an operator may add new records up to the maximum 1K files. Three buttons on the user interface can be programmed with individual device details and a friendly name given to each in order to distinguish between them. The software supports units attached locally via serial port (your PC may need a suitable RS232-to-RS485 or USB-to-RS485 adapter) and network attached units via Ethernet. It is backwards compatible with the older VoiceOff units but be aware that VOX300 and earlier were serial port only.

PRO
version

VoxPLAYER Pro

The VoxPlayer Pro extends the functionality of the VoxPlayer Lite version by adding favourites and scheduling and sound file management. This too is a Windows application and again, is fully backwards compatible with the older VOX300 and earlier units.

Favourites

The device list user interface has programmable 'Favourite' buttons. There are ten favourite buttons for each of the 20 devices, 200 in all. Each button can display a friendly name identifying the underlying sound file to be played by the corresponding device.

Access to any of the supported files, 1K in total per device, is possible via the device record.

Scheduling

A very powerful feature of the VoxPlayer Pro is its flexible scheduling ability.

A schedule entry defines an individual sound file to be played by a specified device at a given time of day on a particular day of the week, or, more usually, every day of the week. A built-in schedule editor is able to create repeating entries quickly between globally defined start & stop times, this makes creating multiple entries throughout the day extremely easy. Example: a individual file can be scheduled to play at 7:00am, repeating every 30 minutes until 10:00pm on a particular day, multiple days, or every day. The scheduler supports multiple entries, can be stopped and started under operator control, and can show events pending and optionally completed and/or missed events for any or every day of the week.

Sound File Management

For larger deployments this software supports the import and export of sound file information via .csv, this makes the replication of file information between multiple sites or instances of VoxPlayer Pro an easy task. It also facilitates management in an external source such as a spreadsheet should you wish to do so.

**OEM
Option**

VoxPLAYER OEM

As we write our own software if you require custom features and applications these can be added in to our software at a cost. So we also offer software in OEM releases with similar features to the Pro version but with specific tailored features. To do this we will need written details of your request and then would quote for the work and a deposit requested prior to proceeding.

**SYSTEM
REQUIREMENTS**
Windows 7 or later
Network Connection

• Promotional Messages	23
• Deterrents	23
• Scheduled Announcements	23

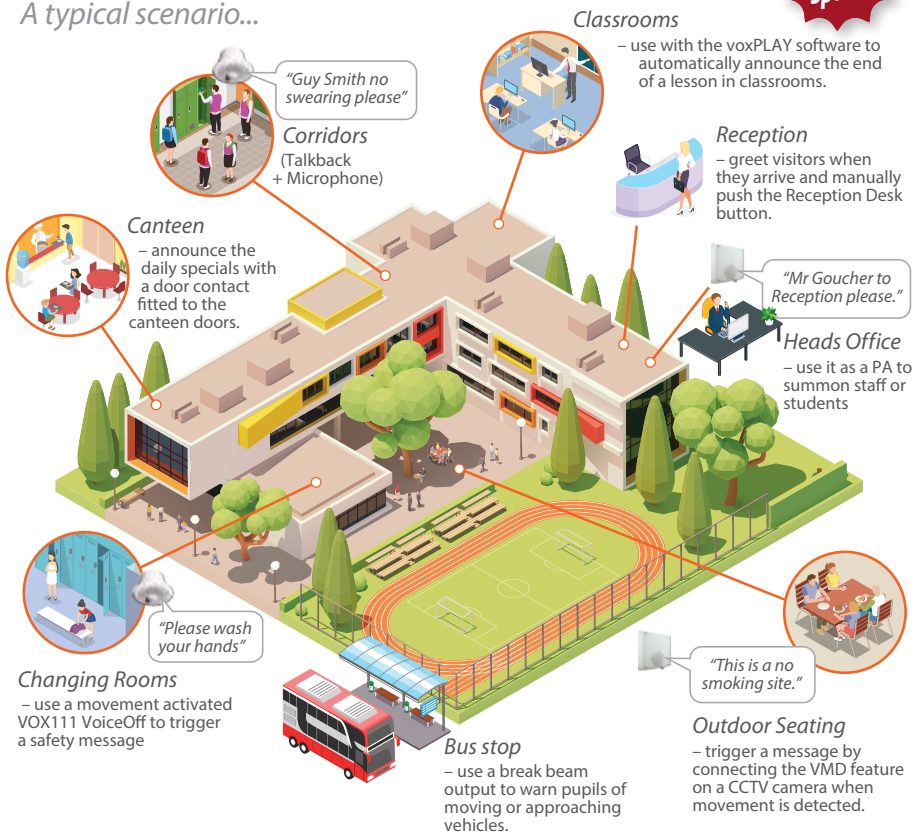

Ideal for use in Schools, Colleges ...

Often used in schools, the VoiceOff is a handy loudspeaker and PA solution with automatic, manual and scheduled triggers for playing a message or sound file.

Ideal in Public Spaces

A typical scenario...

Voice Off uses are limited only by your imagination, use it for...

Health & Safety

A popular use for the VoiceOFF range of MP3 message players is for site safety. Up to 6 hard-wired alarm inputs can be used to trigger a message, helping a business comply with the latest health & safety regulations. Or use the **VoxPlayer Pro** software to make scheduled announcements throughout the day without any operator required.

Welcome Messages

The VoiceOFF can be set up to automatically welcome visitors to your site when they are detected by a movement detector such as a PIR, break beam, door contact or simply when they press the button on the reception desk. Recording your own personal message is easy or our professional voice over artist can do one for you, find out more on pg 28.

Sounds & Music

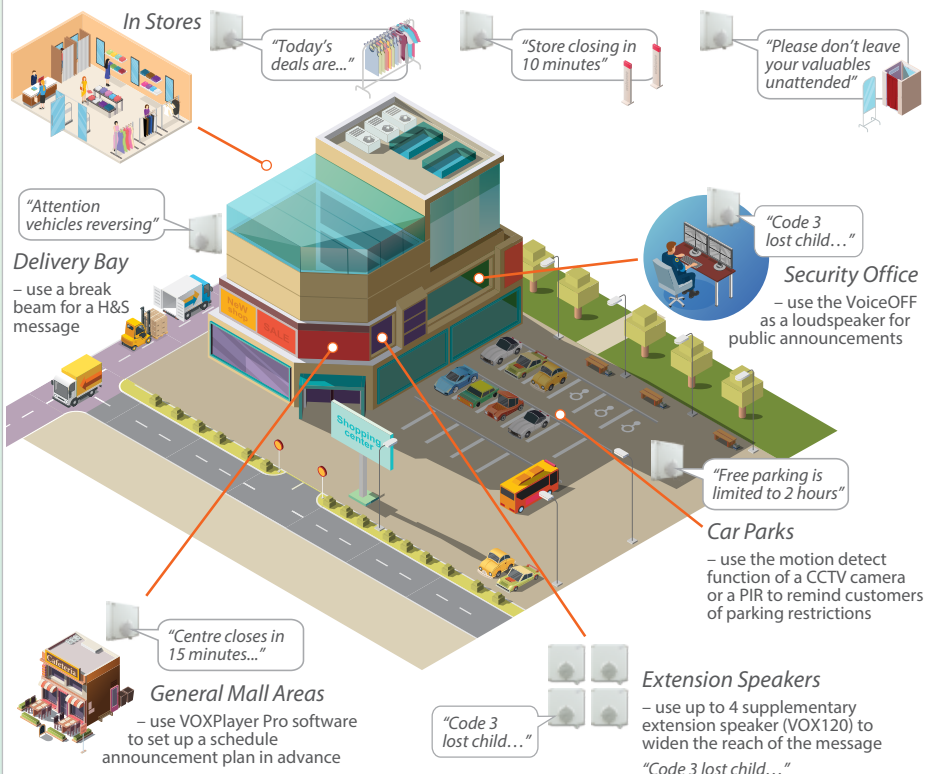

The VoiceOFF can play any MP3 file so that includes sound effects and music too. Check out the range of sounds on pg 27 such as a dog barking or a police car siren designed to deter trespassers onto a property or site. TIP 287 (voiceOFF.com) explains how you can even record your own files.

A great solution for Retail Environments

VoiceOff units have multiple uses in a retail site, they can be used in parking areas, delivery bays, transport hubs, dining areas for announcements and general health & safety messages. Or inside the stores themselves for promotional purposes.

A typical scenario...

There's a Voice Off message to suit most sites...

Promotional Messages

VoiceOFF is a great way to promote your business with the latest deals & offers. Management can play their own MP3 message files and play them directly or over a network using the free **VoxPlayer Lite** widget. They can also use the VoiceOFF as a simple loudspeaker to speak live to their customers.

Deterrents

Sounds of dogs barking, sirens approaching or loud music might sound like fun but they can be an effective deterrent especially in remote locations where they can be triggered by a simple PIR or break beam detector. We've pre-recorded a full range of sound effects for you available at a small cost at voiceOFF.com.

Scheduled Announcements

The **VoxPlayer Pro** add-on software is a superb scheduling tool to give extra functionality to a single or many VoiceOff units on a site. An operator is able to preselect a message, when to play it, how many times to repeat and on which of up to 20 VoiceOFF units to play it on! They can even select the preferred volume depending on where the VoiceOFF is located or how it is being used.

Other uses for the VoiceOFF unit and its Sound files include...

CCTV Warnings

Fire Alarms

Phone Systems

Alarm & Network Activated MP3 Message Player (VOX400)

VoiceOFF®
MKIV

All MP3 files need to be stored on the Micro SD card in a folder called SYSQ

Name your files 0001.mp3, 0002.mp3 etc.

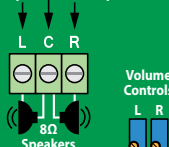

How Do The Inputs Work?

Connecting 0V (C) to 1 triggers sound file 0001.mp3 to play
Connecting 0V (C) to 2 triggers sound file 0002.mp3 to play
Connecting 0V (C) to 3 triggers sound file 0003.mp3 to play ... and so on.

You can use switches, contacts, PIRs, alarm outputs or anything you like to trigger the VoiceOff to play sounds or pre-recorded messages.

(-) Audio Speaker Common (Left & Right)

Left Audio Speaker (+) Output
Right Audio Speaker (+) Output

VoiceOFF Model: PCB940

As soon as the audio input detects a line input it plays this sound through the speakers. So the VoiceOff can also be used for "talk back" from NVRs and DVRs.

Pre-recorded sounds are stored on micro SD card here.

Connects it to the network so you can control & play messages via software. This means you can automate the playing of messages on pre-defined schedules.

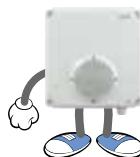

The relay energises whenever the VoiceOff plays a file. Use this to interface other equipment etc.

Trigger the playing of the pre-recorded sounds/messages via RS485 if required.

Key Features

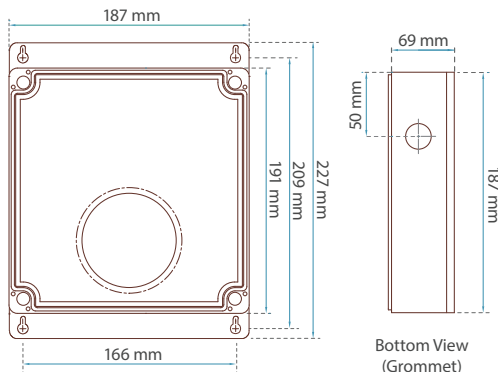

- ✓ 6 Alarm Inputs
- ✓ Built In Relay
- ✓ 1K Messages
- ✓ Ext/Int. Use

Your **VoiceOFFTM 4** questions

answered by our expert

What can be used to trigger the VoiceOff unit?

The VoiceOff is triggered by simply connecting any of its 6 alarm input terminals to ground or zero volts. It can also be triggered using its RS485 and Ethernet connections from other devices such as cameras or access control gear.

What happens when more than one alarm is triggered in quick succession?

A common question people ask about the VoiceOff is "What happens if a message is playing and another alarm or perhaps the same alarm input is re-triggered?" The answer is the original message plays out until it reaches the end of that message. A trigger from the RS485 or Ethernet connections will override this.

Can I add an extra speaker to the VoiceOff unit?

Yes, The VOX120 is a slave speaker for the VoiceOff Unit and you can fit up to 4 of these. These are wired via the AUX connection.

What do I need to power the VoiceOff unit?

The unit requires a regulated 12V DC power supply rated at 200mA. This can be from a power supply or battery.

Top Tip

If cabling is tricky you could use a compact PoE splitter inside the case to power the unit from a network using its Ethernet connection.

How many sound files can I add to the VoiceOff unit?

1K recordings can be added to the VoiceOff. The first 6 can be triggered by the on-board alarm inputs and the rest via the Ethernet and RS485 functions.

Can I download extra files for the VoiceOff unit?

A wide range of additional voice messages and sounds can be downloaded from the VoiceOff website at: voiceoff.com

Can I use music files on the VoiceOff unit?

Yes, you can use any sound file provided that it is in the MP3 format and you have saved it using the correct file naming convention. Don't forget any file will play until the end before a new file can be played.

Can I record my own files for the VoiceOff unit?

It's quite easy to record your own audio for the VoiceOff unit. You just need an audio recording device and a computer. The VoiceOff only plays audio files that are stored in the industry standard MP3 format.

Can I use the VoiceOFF as a loudspeaker?

Yes, a secondary feature of the VoiceOFF is its useful audio amplifier, it has a phono socket accepting line-level input allowing you to deliver

content from a variety of other devices. This can be used as an internal or external loudspeaker, to allow the operator to convey clear messages to visitors or even crowds within proximity to the VoiceOFF speaker. Your message will play out of the main VoiceOff unit (VOX400) as well as any slave extension speakers (VOX120) connected to it.

Where should I site the VoiceOff for the best results?

The Voice OFF is fully weatherproof and can be installed in or outdoors to suit your exact requirements. The VOX400 model is usually best located at head height to attract people's attention when walking past but could easily be installed onto the ceiling or above a door.

Order Code: **VOX111**

There's a smaller movement activated model (VOX111 on pg.10) too that's designed to be mounted flush to an internal ceiling and incorporates a PIR movement detector to activate when someone passes by. This model is ideal for inside a doorway to activate as someone walks into an area such as a waiting room.

What do I need to install the VoiceOFF?

The Voice OFF is really easy and fast to install requiring no special tools other than what is in your toolbox already. It has 4 fixing lugs, so simply use appropriate screws and wall plugs depending on the surface you are fitting the VoiceOFF to. You will need a drill, wall plugs, screws and a screwdriver set. To cable and power the unit you will also need a power supply unit, your MP3 sound files stored on the micro SD card supplied as well as cable such as alarm or CAT5 for the alarm input triggers.

Can I adjust the unit's volume control?

The VoiceOff has a volume control on its PCB that can be set on installation to match your site requirements. It has 9 levels (0-8) that can also be adjusted remotely using the RS485 and Ethernet controls.

Now with
Network
Function!

VOX400

Can I manually trigger the VoiceOFF to play a message file on my command?

Yes, you can use a simple push button (like a doorbell or panic button) to activate a message, this is handy for a Receptionist to trigger a welcome message to a visitor for example when they see someone has arrived on CCTV. The RS485 and Ethernet allows for a CCTV operator to play a warning message when an intruder or vandal has been spotted on a site.

Can I trigger the VoiceOFF over a LAN or the Internet?

You can. The latest VoiceOFF (Model VOX400 launched 2022) has an Ethernet connection so you can setup a network device of your choice to trigger a specific message. This might be via a standalone network relay (REL019) or from third party devices such as a fire or alarm panel.

This network connectivity also allows you to use the **VoxPlayer Pro** software (pg.14) to schedule and repeat messages at your will and even remotely adjust the unit's volume. The Lite version is a free download to all VoiceOFF customers.

More detailed FAQs about the VoiceOFF mp3 message player & software range can be found on our dedicated website voiceoff.com

New! Networkable VoiceOFF (VOX400)

VoiceOFF[®]
MKIV

All MP3 files need to be stored on the Micro SD card in a folder called SYSQ

Name your files 0001.mp3, 0002.mp3 etc.

How Do The Inputs Work?

Connecting 0V (C) to 1 triggers sound file 0001.mp3 to play
Connecting 0V (C) to 2 triggers sound file 0002.mp3 to play
Connecting 0V (C) to 3 triggers sound file 0003.mp3 to play
... and so on.

You can use switches, contacts, PIRs, alarm outputs or anything you like to trigger the VoiceOff to play sounds or pre-recorded messages.

As soon as the audio input detects a line input it plays this sound through the speakers. So the VoiceOff can also be used for "talk back" from NVRs and DVRs.

Pre-recorded sounds are stored on micro SD card here.

Connects it to the network so you can control & play messages via software. This means you can automate the playing of messages on pre-defined schedules.

C = Common

The relay energises whenever the VoiceOff plays a file. Use this to interface other equipment etc.

Take the voiceOff output to another Amp if required.

Trigger the playing of the pre-recorded sounds/messages via RS485 if required.
