EVQ4323-D-01A

36V, 3A, Low Quiescent Current, Synchronous Step-Down Converter Evaluation Board, AEC-Q100 Qualified

DESCRIPTION

The EVQ4323-D-01A is an evaluation board for the MPQ4323GDE-AEC1, a configurable-frequency (350kHz to 2.5MHz), synchronous, step-down switching regulator with integrated internal high-side MOSFETs (HS-FETs) and low-side MOSFETs (LS-FETs).

The MPQ4323-AEC1 provides 3A of highly efficient output current (I_{OUT}) with peak current mode control. The wide 3.3V to 36V input voltage (V_{IN}) range and 42V load dump tolerance accommodates a variety of step-down applications in automotive input environments. A 1µA shutdown mode quiescent current (I_Q) allows the device to be used in battery-powered applications.

High power conversion efficiency across a wide load range is achieved by scaling down the switching frequency (f_{SW}) under light-load conditions to reduce the switching and gate driving losses.

An open-drain power good (PG) signal indicates whether the output is within 94.5% to 105.5% of its nominal voltage.

Frequency foldback helps prevent inductor current runaway during start-up. Thermal shutdown provides reliable, fault-tolerant operation.

A high duty cycle and low-dropout (LDO) mode are provided for automotive cold-crank conditions.

The EVQ4323-D-01A is fully assembled and tested. The MPQ4323-AEC1 is available in a QFN-12 (2mmx3mm) package with wettable flanks.

PERFORMANCE SUMMARY

Specifications are at T_A = 25°C, unless otherwise noted.

Parameters	Conditions	Value
Input voltage (V_{IN}) range		3.3V to 36V
Output voltage (V_{OUT})	V_{IN} = 6V to 36V, I_{OUT} = 0A to 3A	5V
Maximum output current (I_{OUT})	V_{IN} = 3.3V to 36V	3A
Typical efficiency	V_{IN} = 12V, V_{OUT} = 5V, I_{OUT} = 3A	90.8%
Peak efficiency	V_{IN} = 8V, V_{OUT} = 5V, I_{OUT} = 1A	94.4%
Switching frequency (f_{SW})		2.2MHz

QUICK START GUIDE

The EVQ4323-D-01A evaluation board is easy to set up and use to evaluate the performance of the MPQ4323. For proper measurement equipment set-up, refer to Figure 2 on page 4 and follow the steps below:

1. Preset the power supply (V_{IN}) between 6V and 36V, then turn off the power supply.
2. Set the load current between 0A and 3A. Electronic loads represent a negative impedance to the regulator, and setting the current too high can trigger hiccup mode.
3. If longer cables (>0.5m total) are used between the source and the EVB, place a damping capacitor at the input terminals, especially when $V_{IN} \geq 24V$.
4. Connect the power supply terminals to:
   a. Positive (+): VEMI
   b. Negative (-): GND
5. Connect the load terminals to:
   a. Positive (+): VOUT
   b. Negative (-): GND
6. After making the connections, turn on the power supply.
7. To use the enable function, apply a digital input to the EN pin. Drive EN above 1.02V to turn the regulator on; drive EN below 0.85V to turn it off. If the enable function is not used, EN can be connected directly to VIN.
8. Connect a resistor between the FREQ and GND pins to set the internal oscillator frequency.
9. Set the output voltage (V_{OUT}) using the external resistor divider (see Figure 1).

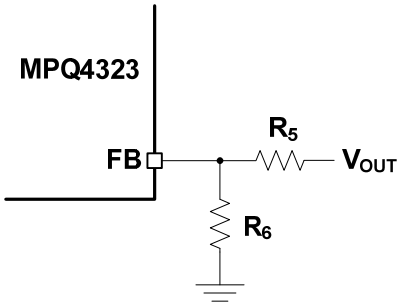

Figure 1: Feedback Divider Network with Adjustable Output

R5 is selected to be 100kΩ. R6 can then be calculated with Equation (1):

$$R_6 = \frac{R_5}{\frac{V_{OUT}}{0.8V} - 1} \quad (1)$$

Refer to the Application Information section in the MPQ4323 datasheet to calculate the inductance and output capacitance for different V_{OUT} values.
