SYST-09PKEC043

Microchip has released a new Datasheet for the MIC94090/1/2/3/4/5 - High Side Load Switches for Consumer Applications of devices. If you are using one of these devices please read the document located at [MIC94090/1/2/3/4/5 - High Side Load Switches for Consumer Applications](#).

Data Sheet - MIC94090/1/2/3/4/5 - High Side Load Switches for Consumer Applications

Notification Status: Final

Description of Change: • Updated details for Typical Application Circuits.

- Updated Table 4-1.
- Updated package drawings in Section 6.0, Packaging Information.
- Minor text and format changes throughout.

Impacts to Data Sheet: None

Reason for Change: To improve productivity

Change Implementation Status: Complete

Date Document Changes Effective: 15 Apr 2024

NOTE: Please be advised that this is a change to the document only the product has not been changed.

Markings to Distinguish Revised from Unrevised Devices: N/A

High Side Load Switches for Consumer Applications

Features

- 1.7V to 5.5V Input Voltage Range
- 1.2A Continuous Operating Current
- 130 mΩ $R_{DS(ON)}$
- Internal Level Shift for CMOS/TTL Control Logic
- Ultra-Low Quiescent Current
- Micro-Power Shutdown Current
- Rapid Turn-On: MIC94090/1
- Soft-Start: MIC94092/3 (790 μs), MIC94094/5 (120 μs)
- Load Discharge Circuit: MIC94091/3/5
- Space Saving and Thermally Capable
1.25 mm x 1.25 mm UDFN Package
- Industry Standard SC-70-6 Package

Applications

- Cellular Phones
- Portable Navigation Devices (PND)
- GPS Modules
- Personal Media Players (PMP)
- Ultra Mobile PCs
- Other Portable Applications
- PDAs
- Portable Instrumentation
- Industrial and DataComm Equipment

General Description

The MIC94090/1/2/3/4/5 is a family of high-side load switches designed for operation from 1.7V to 5.5V input voltage. The load switch pass element is an internal 130 mΩ $R_{DS(ON)}$ P-channel MOSFET which enables each device to support up to 1.2A continuous current. Additionally, the load switch supports 1.5V logic level control and shutdown features.

The MIC94090 and MIC94091 feature rapid turn on. The MIC94092 and MIC94093 provide a slew rate controlled soft-start turn-on of 790 μs, while the MIC94094 and MIC94095 provide a slew rate controlled soft-start turn-on of 120 μs. The soft-start feature option prevents an in-rush current event from pulling down the input supply voltage.

The MIC94091, MIC94093, and MIC94095 include a 250Ω auto discharge load circuit that is switched on when the load switch is disabled.

An active pull-down on the enable input keeps MIC94090/1/2/3/4/5 devices in a default OFF state until the enable pin is pulled above 1.25V. Internal level shift circuitry allows low voltage logic signals to switch higher supply voltages. The enable voltage can be as high as 5.5V and is not limited by the input voltage.

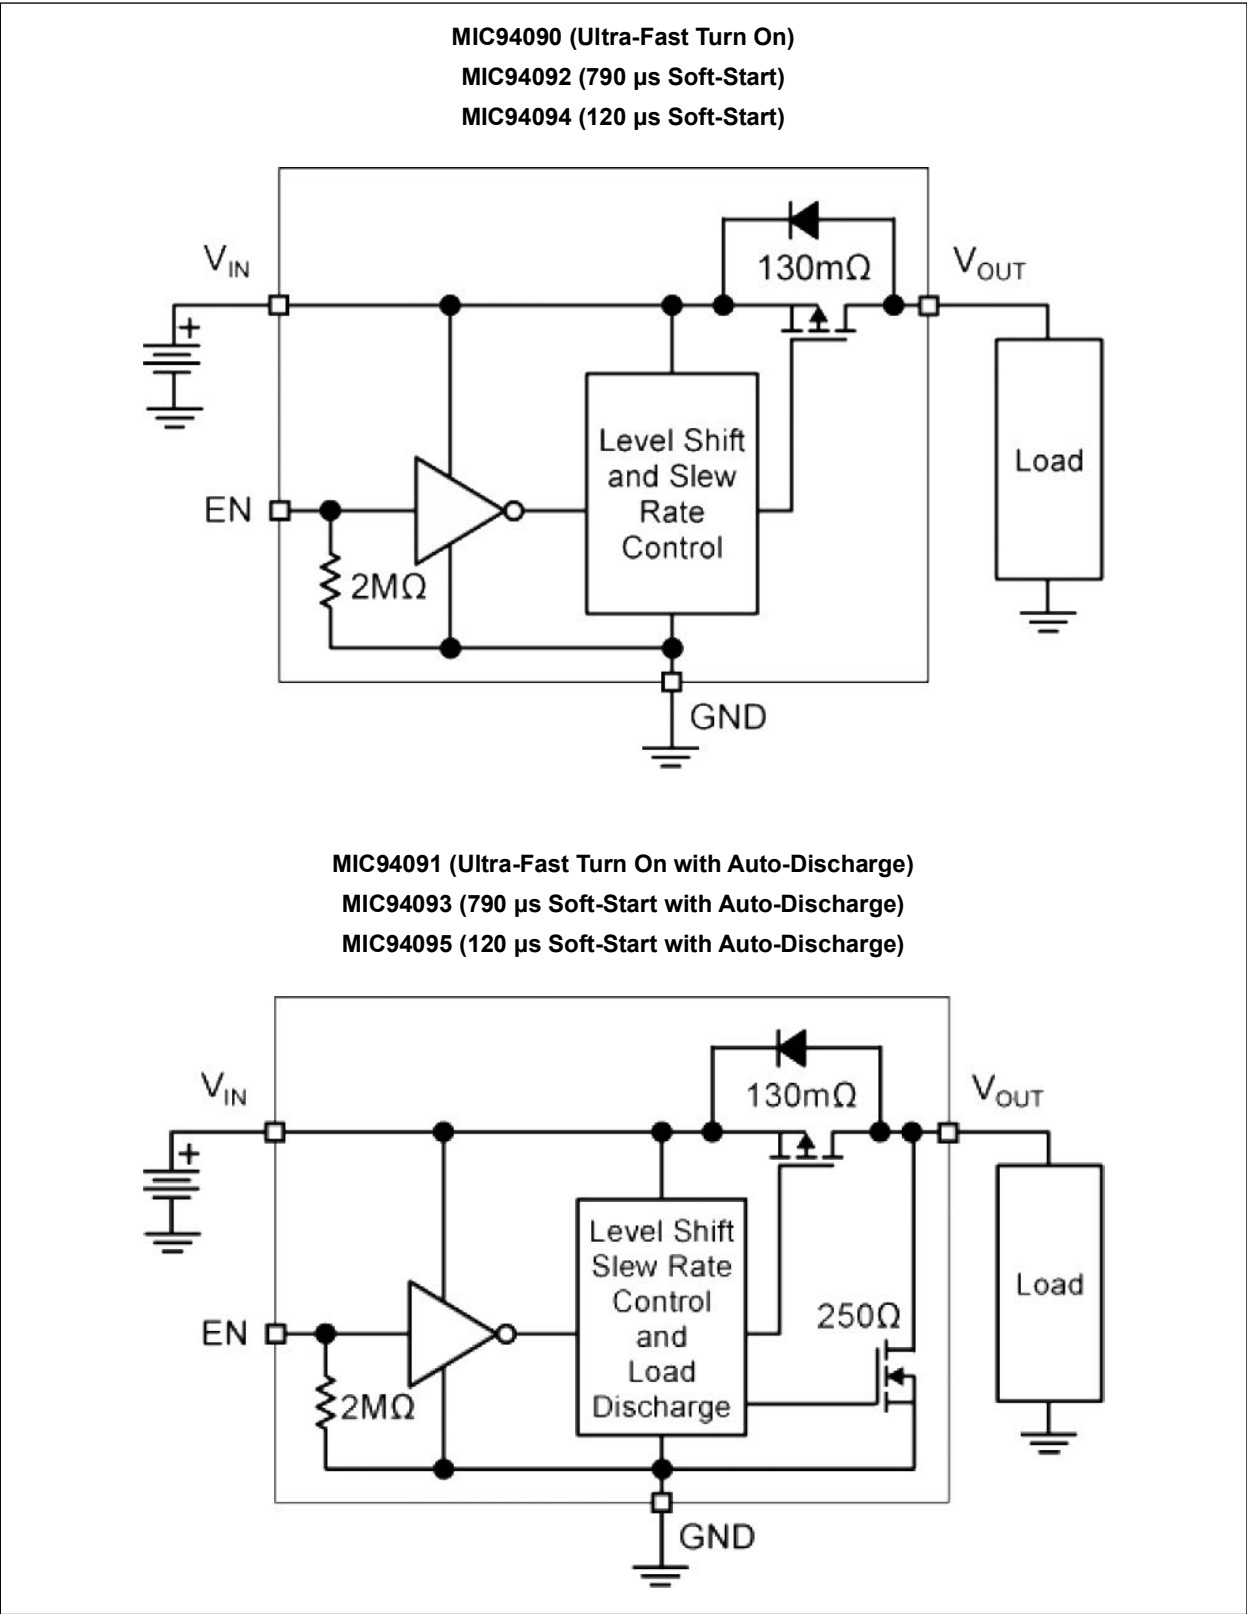

The MIC94090/1/2/3/4/5 device family's operating voltage range makes them ideal for Lithium ion as well as both NiMH, NiCad, and Alkaline battery powered systems and non-battery powered applications. The devices provide low quiescent current and low shutdown current to maximize battery life.

Operating Ratings ‡

Input Voltage (V_{IN})	+1.7 to +5.5V
----------------------------	---------------

† **Notice:** Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational sections of this specification is not intended. Exposure to maximum rating conditions for extended periods may affect device reliability.

‡ **Notice:** The device is not guaranteed to function outside its operating ratings.

Note 1: With backside thermal contact to PCB.

2: Pulse width < 300 μs with < 2% duty cycle.

3: Continuous body diode current conduction (reverse conduction, i.e. V_{OUT} to V_{IN}) is not recommended.

4: Devices are ESD sensitive. Handling precautions recommended. HBM (Human body model), 1.5 k Ω in series with 100 pF.

Note 1: The maximum allowable power dissipation is a function of ambient temperature, the maximum allowable junction temperature and the thermal resistance from junction to air (i.e., T_A , T_J , θ_{JA}). Exceeding the maximum allowable power dissipation will cause the device operating junction temperature to exceed the maximum rating. Sustained junction temperatures above that maximum can impact device reliability.

2: With backside thermal contact to PCB.

4.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in [Table 4-1](#).

TABLE 4-1: PIN FUNCTION TABLE

Pin Number		Pin Name	Pin Function
UDFN	SC-70-6		
1	1	VOUT	Drain of P-Channel MOSFET.
4	2, 5	GND	Ground: Connect to electrical ground.
3	4	VIN	Source of P-Channel MOSFET.
2	6	EN	Enable (Input): Active-high CMOS-compatible control input for switch. Internal 2 M Ω pull down resistor to GND, output will be off if this pin is left floating.
—	3	NC	No Internal Connection. A signal or voltage applied to this pin will have no effect on device operation.

5.0 APPLICATION INFORMATION

5.1 Power Dissipation Considerations

As with all power switches, the ultimate current rating of the switch is limited by the thermal properties of the package and the PCB it is mounted on. There is a simple, ohms law type relationship between thermal resistance, power dissipation and temperature which are analogous to an electrical circuit:

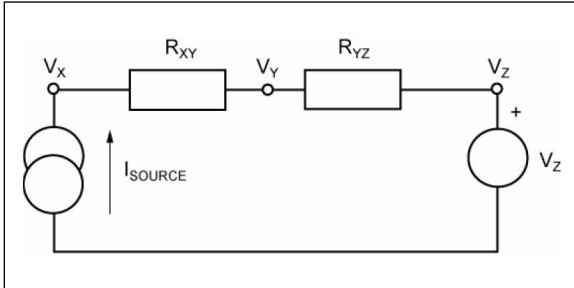

FIGURE 5-1: Electrical Circuit.

From this simple circuit we can calculate Vx if we know Isource, Vz and the resistor values, Rxy and Ryz using the equation:

EQUATION 5-1:

$$V_x = I_{SOURCE} \times (R_{xy} + R_{yz}) + V_z$$

Thermal circuits can be considered using these same rules and can be drawn similarly replacing current sources with Power dissipation (in Watts), Resistance with Thermal Resistance (in °C/W) and Voltage sources with temperature (in °C).

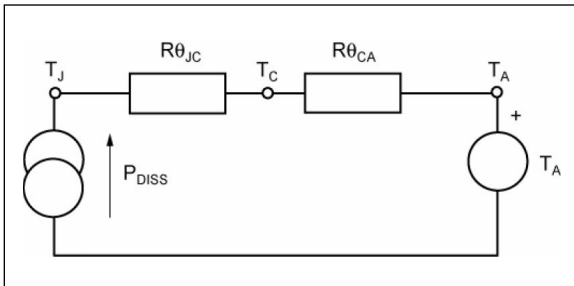

FIGURE 5-2: Thermal Equivalent Circuit.

Now replacing the variables in the equation for Vx, we can find the junction temperature (Tj) from power dissipation, ambient temperature and the known thermal resistance of the PCB (RθCA) and the package (RθJA).

EQUATION 5-2:

$$T_J = P_{DISS} \times (R_{\theta JC} + R_{\theta CA}) + T_{AMB}$$

It is this equation that is used to determine the graphs in [Section 2.0, Typical Performance Curves](#). PDISS is calculated as (ISWITCH² x RSWmax). RθJC is found in the operating ratings section of the data sheet and RθCA (the PCB thermal resistance) values for various PCB copper areas can be taken from [Designing with Low Dropout Voltage Regulators](#), available on the Microchip website.

EXAMPLE 5-1:

A switch is intended to drive a 500 mA load and is placed on a printed circuit board which has a ground plane area of at least 25 mm square. The Voltage source is a Li-ion battery with a lower operating threshold of 3V and the ambient temperature of the assembly can be up to 50°C.

Summary of variables:

- ISW = 0.5A
- VIN = 3V to 4.2V
- TAMB = 50°C
- RθJC = 60°C/W
- RθCA = 53°C/W, read from [Figure 5-3](#).

FIGURE 5-3: Electrical Circuit.

EQUATION 5-3:

$$P_{DISS} = I_{SW}^2 \times R_{SWmax}$$

The worst case switch resistance (R_{SWmax}) at the lowest V_{IN} of 3V is not available in the data sheet, so the next lower value of V_{IN} is used: R_{SWmax} at 2.5V = 315 m Ω .

If this were a figure for worst case R_{SWmax} for 25°C, an additional consideration is to allow for the maximum junction temperature of 125°C, the actual worst case resistance in this case will be 30% higher (see $R_{DS(ON)}$ variance vs. temperature graph):

R_{SWmax} at 2.5V (at 125°C) = 315 x 1.3 = 410 m Ω .

Therefore, junction temperature (T_J):

$T_J = 0.52 \times 0.41 \times (60+53) + 50$ (from [Equation 5-2](#)) and

$T_J = 62^\circ\text{C}$. This is well below the maximum 125°C.

NOTES:

APPENDIX A: REVISION HISTORY

Revision B (April 2024)

- Updated details for [Typical Application Circuits](#).
- Updated [Table 4-1](#).
- Updated package drawings in [Section 6.0, Packaging Information](#).
- Minor text and format changes throughout.

Revision A (September 2022)

- Converted Micrel document MIC94090/1/2/3/4/5 to Microchip data sheet DS20006706A.
- Minor text changes throughout.

NOTES:

Note the following details of the code protection feature on Microchip products:

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
 - Microchip believes that its family of products is secure when used in the intended manner, within operating specifications, and under normal conditions.
 - Microchip values and aggressively protects its intellectual property rights. Attempts to breach the code protection features of Microchip product is strictly prohibited and may violate the Digital Millennium Copyright Act.
 - Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is "unbreakable" Code protection is constantly evolving. Microchip is committed to continuously improving the code protection features of our products.
