TSL2522 Highly sensitive ambient light sensor with light flicker detection

1 General description

The TSL2522 features ambient light sensing and light flicker detection. The device comes in a low-profile and small footprint, L2.0mm x W1.0mm x H0.5mm OLGA package.

The Ambient Light Sensing function provides two concurrent ambient light sensing channels, which can be arbitrarily connected to the photodiodes via a programmable multiplexer. The device incorporates a set of Photopic photodiodes and a set of Infrared photodiodes.

This architecture accurately measures ambient light and enables the calculation of irradiance of different light sources. Calculation results help to improve display appearance and picture taking.

The device also integrates ambient light flicker detection. It is executed in parallel with ambient light sensing by using the same photodiodes. The flicker detection engine will sample and buffer data for calculating flicker frequencies externally on a host CPU.

1.1 Key benefits & features

The benefits and features of TSL2522 are listed below:

Table 1: Added value of using TSL2522

Benefits	Features

• Invisible ALS sensing under any glass type	• Configurable, high sensitivity
	  - Programmable gain and integration time
	  - 4096x dynamic range by gain adjustment only
	  - 1mlux detectable illuminance
	• Tailored ALS response
	  - Photopic filter for visible channel
	  - Independent IR channel
	• ALS interrupt with thresholds

• Integrated light flicker detection	• Concurrent flicker and ALS measurement with new simplified readout methodology • Independently configurable sample time • Up to 7kHz light flicker detection (14kHz sampling rate) • FIFO buffer interrupt
• Low power consumption and minimum I²C traffic	• 1.8V_{DD} operation • Configurable sleep mode • Interrupt-driven device • I²C interface up to 1 Mbit/s (Fast-mode plus)
• Integrated status checking for all functions	• Digital and analog saturation flags

1.2 Applications

TSL2522 integrates multiple applications within one device. The applications for TSL2522 include:

- Ambient light illuminance detection for display brightness management or camera auto exposure
- Light flicker detection for camera image correction

1.3 Block diagram

The functional blocks of this device are shown below:

Figure 1: Functional blocks of TSL2522
2 Ordering information

Ordering code	Address	Interface	Delivery form	Delivery quantity
TSL25223	0x39	1.8V I²C	Tape & reel	5000 pcs/reel

3 Pin assignments and photodiodes

3.1 Pin diagram

Device pinout is described below:

Figure 2: Pin diagram and photodiode location of TSL2522 (top view)
Table 2: Pin description of TSL2522

Pin number	Pin name	Description
1	INT	Interrupt. Open-drain output.
2	VDD	Supply voltage (1.8V).
3	VSS	Ground. All voltages are referenced to VSS.
4	SCL	I²C serial clock terminal.
5	SDA	I²C serial data I/O terminal.
6	VSYNC/GPIO	Synchronization input or general purpose open-drain input/output.

4 Absolute maximum ratings

Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only. Functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

All voltages with respect to VSS. Device parameters are guaranteed at V_{DD} = 1.8 V and T_A = 25°C unless otherwise noted.

Table 3: Absolute maximum ratings

Symbol	Parameter	Min	Max	Units	Comments
Electrical parameters					
V_{DD}	Supply voltage	-0.3	1.98	V	
V_{IO}	Digital I/O terminal voltage	-0.3	3.6		
I_{IO}	Output terminal current	-1	20	mA	
Electrostatic discharge					
ESD_{HBM}	HBM electrostatic discharge	± 2000		V	ANSI/ESDA/JEDEC JS-001-2017
ESD_{CDM}	CDM electrostatic discharge	± 500		V	ANSI/ESDA/JEDEC JS-002-2018
I_{SCR}	Input current (latch-up immunity)	± 100		mA	JEDEC JESD78E Class II
Temperature ranges and storage conditions					
T_{STRG}	Storage temperature range	-40	85	°C	
T_A	Operating temperature range	-30	85		
T_{BODY}	Package body temperature		260	°C	IPC/JEDEC J-STD-020. The reflow peak soldering temperature (body temperature) is specified according to IPC/ JEDEC J-STD-020 "Moisture/ Reflow Sensitivity Classification for Non-hermetic Solid State Surface Mount Devices."
RH_{NC}	Relative humidity (non - condensing)		85	%	
MSL	Moisture sensitivity level	3			Represents a max. floor life time of 168h

5 Optical characteristics

All limits are guaranteed. The parameters with min and max values are guaranteed with production tests or SQC (Statistical Quality Control) methods. Device parameters are guaranteed with V_{DD} = 1.8V and T_A = 25°C unless otherwise noted.

Table 4: ALS characteristics of TSL2522, ALS gain = 128x, integration time = 10ms (unless otherwise noted)

Parameter	Conditions	Min	Typ	Max	Unit
Dark ADC count value [1]	E_e = 0µW/cm^2 ALS gain: 512x Integration time: 100ms	0	1	3	counts
ALS gain ratios [2]	0.5x	1/270.78	1/249.13	1/230.68	
	1x	1/133.17	1/123.85	1/115.74	
	2x	1/66.99	1/62.97	1/59.41	
	4x	1/33.39	1/31.72	1/30.21	
	8x	1/16.17	1/15.53	1/14.93	
	16x	1/8.30	1/7.97	1/7.66	
	32x	1/4.15	1/3.99	1/3.83	
	64x	1/2.09	1/2.01	1/1.93	
	256x	1.78	1.93	2.07	
	512x	3.42	3.80	4.18	
	1024x	6.16	7.42	8.68	
	2048x	10.26	14.06	17.86	
	4096x	11.41	25.35	39.29	
Photopic channel irradiance responsivity	White LED, 2700K [3]	113	133	153	counts/ (µW/cm^2)
IR channel irradiance responsivity	IR LED = 940nm [5]		57		
ADC noise [4]	White LED, 2700K [3] Integration time: 100ms		0.05		
IR/Photopic channel ratio	White LED, 2700K [3]		1.8		%

(1) The typical 3-sigma distribution shows less than 1 count. For this measurement, each modulator is always connected to one photodiode whereas the photodiodes are sequentially multiplexed.

(2) The gain ratios are calculated relative to the response with ALS gain = 128x.

(3) The White LED is an InGaN light-emitting diode with integrated phosphor and the following characteristic: correlated color temperature = 2700K.

(4) ADC noise is calculated as the standard deviation relative to full scale. It is lab characterization from limited samples.

(5) The IR Emitter shall be an AlGaAs light-emitting diode with a peak wavelength of λ_P = 940nm.

6 Electrical characteristics

All limits are guaranteed. The parameters with min and max values are guaranteed with production tests or SQC (Statistical Quality Control) methods.

Table 5: Recommended operating conditions

Symbol	Parameter	Min	Typ	Max	Units	Comments
Electrical parameters						
V_{DD}	Supply voltage	1.7	1.8	1.98	V	
VDD/IO	I/O supply voltage	1.62	1.8	3.3	V	
Temperature ranges and storage conditions						
T_A	Operating free-air temperature[1]	-30	25	85	°C	

(1)   While the device is operational across the temperature range, functionality will vary with temperature.

Table 6: Electrical characteristics of TSL2522, V_{DD} = 1.8V, T_A = 25°C (unless otherwise noted)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$I_{DD;ALS}$	ALS supply current	Active ALS state[1] (PON=AEN=1)	140	195	250	
$I_{DD;IDLE}$	Idle current	Idle state[2] (PON=1, AEN=0, FDEN=0)		60		μA
$I_{DD;SLEEP}$	Sleep current	Sleep state[3]		0.7	5	
I_{LEAK}	Leakage current	Measured on SDA, SCL, INT, GPIO	-5		5	
V_{OL}	INT, SDA, GPIO output low voltage	6mA sink current			0.4	
V_{IH}	SCL, SDA, VSYNC input high voltage		1.26			V
V_{IL}	SCL, SDA, VSYNC input low voltage				0.54	
C_I	Input pin capacitance				10	pF
t_{ACTIVE}	Time from power-on to ready to receive I²C commands				0.5	ms

(1)   This parameter indicates the supply current during periods of ALS integration. The ALS gain setting will have an effect on the active supply current. The ALS gain setting used for this parameter is 128x and there are 2 modulators active.
(2)   Idle state occurs when PON=1 and all functions are disabled. This parameter is measured with LOWPOWER_IDLE=1.
(3)   Sleep state occurs when PON = 0 and I²C bus is idle. If Sleep state has been entered as the result of operational flow, SAI = 1, PON will remain high.

7 Timing characteristics

The timing parameters are specified by design and characterization and are not production tested unless otherwise noted. All parameters are measured with V_{DD} = 1.8V and T_A = 25°C unless otherwise noted.

Table 7: I²C timing characteristics of TSL2522

Symbol	Parameter	Min	Typ	Max	Unit
f_{SCL}	I²C clock frequency	0		1000	kHz
t_{BUF}	Bus free time between start and stop condition	0.5			
$t_{HD;STA}$	Hold time after (repeated) start condition. After this period, the first clock is generated	0.26			
$t_{SU;STA}$	Repeated start condition setup time	0.26			µs
$t_{SU;STO}$	Stop condition setup time	0.26			
t_{LOW}	SCL clock low period	0.5			
t_{HIGH}	SCL clock high period	0.26			
$t_{HD;DAT}$	Data hold time	0			
$t_{SU;DAT}$	Data setup time	50			ns
t_F	Clock/data fall time			120	
t_R	Clock/data rise time			120	

(1) Parameters in the table above are characterized in lab with capacitive load of C_b=100pF and pull-up resistor of R_P=500 ohm for each bus line. In applications, the minimum value of the I²C pull-up resistors must be higher than 500 ohm.

Figure 3: Timing diagram for TSL2522
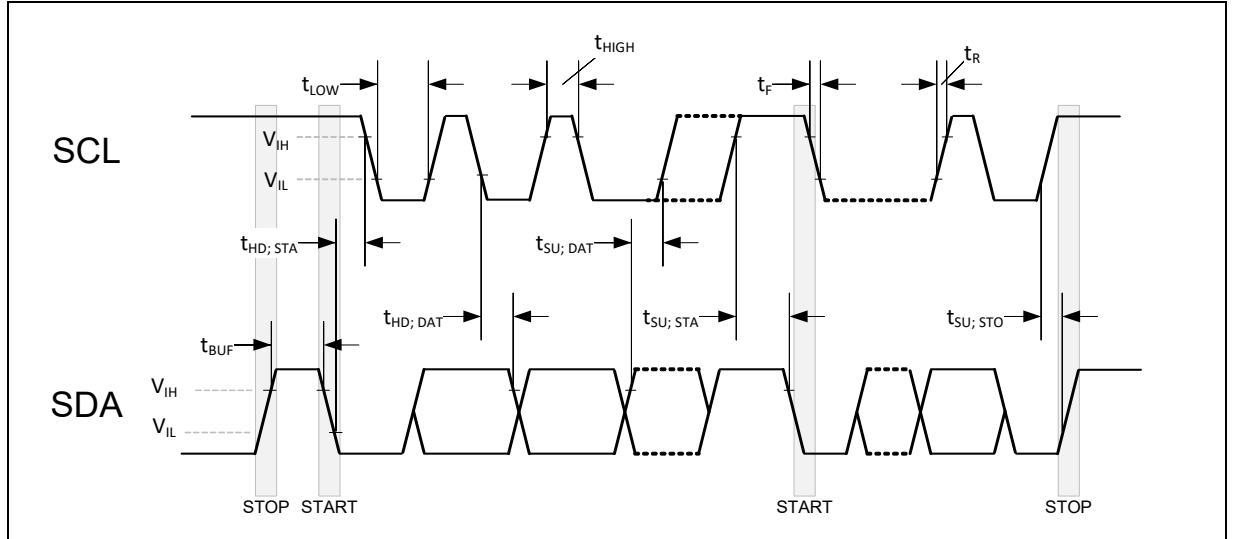

Table 8: Functional timing characteristics of TSL2522

Symbol	Parameter	Min	Typ	Max	Unit
f_{OSC}	Oscillator clock frequency[1]	700	720	740	kHz

(1)   100% production tested

8   Typical operating characteristics

Figure 4: Spectral responsivity
(1)   The spectral responsivities shown in the figure are measured under a diffusor and normalized to the Photopic channel.

Figure 5: Normalized angular response x-axis

Figure 6: Normalized angular response y-axis

(1) X and Y angular scans have been performed using an aperture which blocks light leakage through side walls of clear mold package.

9 Detailed description

Upon power-up, POR, the device initializes. During initialization (typically 500µs), the device will deterministically send NAK on I²C and cannot accept I²C transactions. All communication with the device must be delayed, and all outputs from the device must be ignored including interrupts. After initialization, the device enters the SLEEP state. In this operational state the internal oscillator and other circuitry are not active, resulting in ultra-low power consumption. If an I²C transaction occurs during this state, the I²C core wakes up temporarily to service the communication. Once the Power ON bit, PON, is enabled, the device enters the IDLE state in which the internal oscillator and attendant circuitry are active, but power consumption remains low. Whenever a function is enabled (AEN = 1) the device exits the IDLE state. If all functions are disabled (AEN = 0), the device returns to the IDLE state.

As depicted in Figure 7 and Figure 8, the ambient light sensing and flicker sampling functions operate in parallel when enabled. Each function is individually configured (e.g. gain, ADC integration time, wait time, persistence, thresholds, etc.).

If Sleep after Interrupt is enabled (SAI = 1 in register 0xA1), the state machine will enter SLEEP when an interrupt occurs. Entering SLEEP does not automatically change any of the register settings (e.g. PON bit is still high, but the normal operational state is over-ridden by SLEEP state). SLEEP state is terminated when the SAI_ACTIVE bit is cleared (the status bit is in register 0x9F and the clear status bit is in register 0xB1).

Figure 7: Simplified state diagram
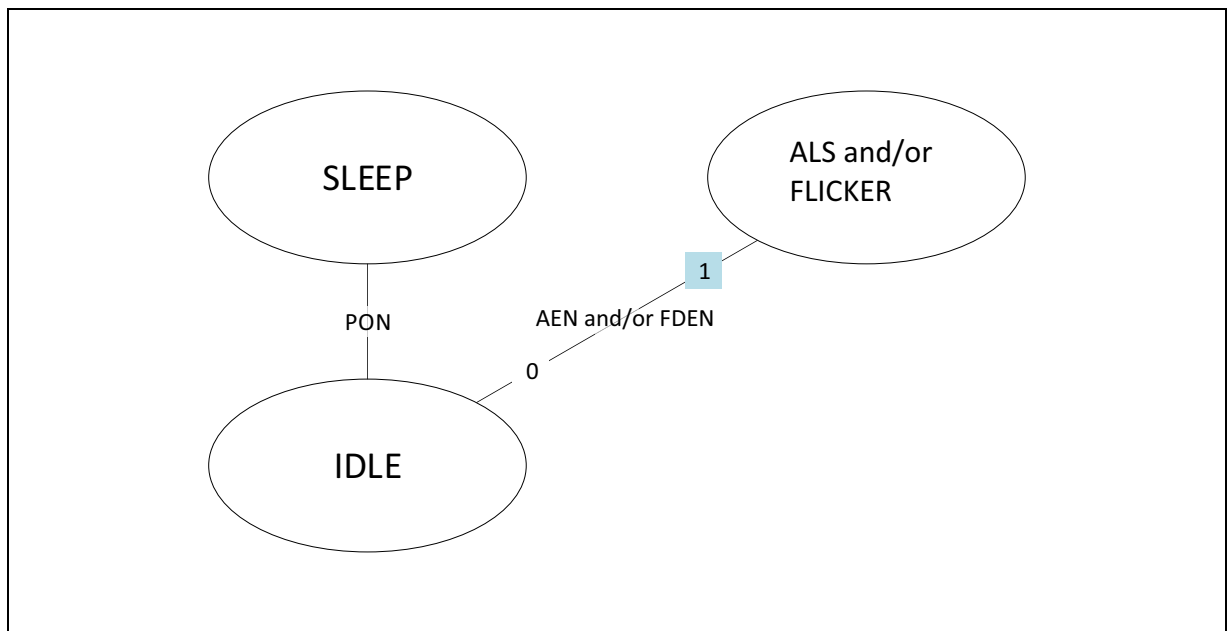

Figure 8: Detailed state diagram
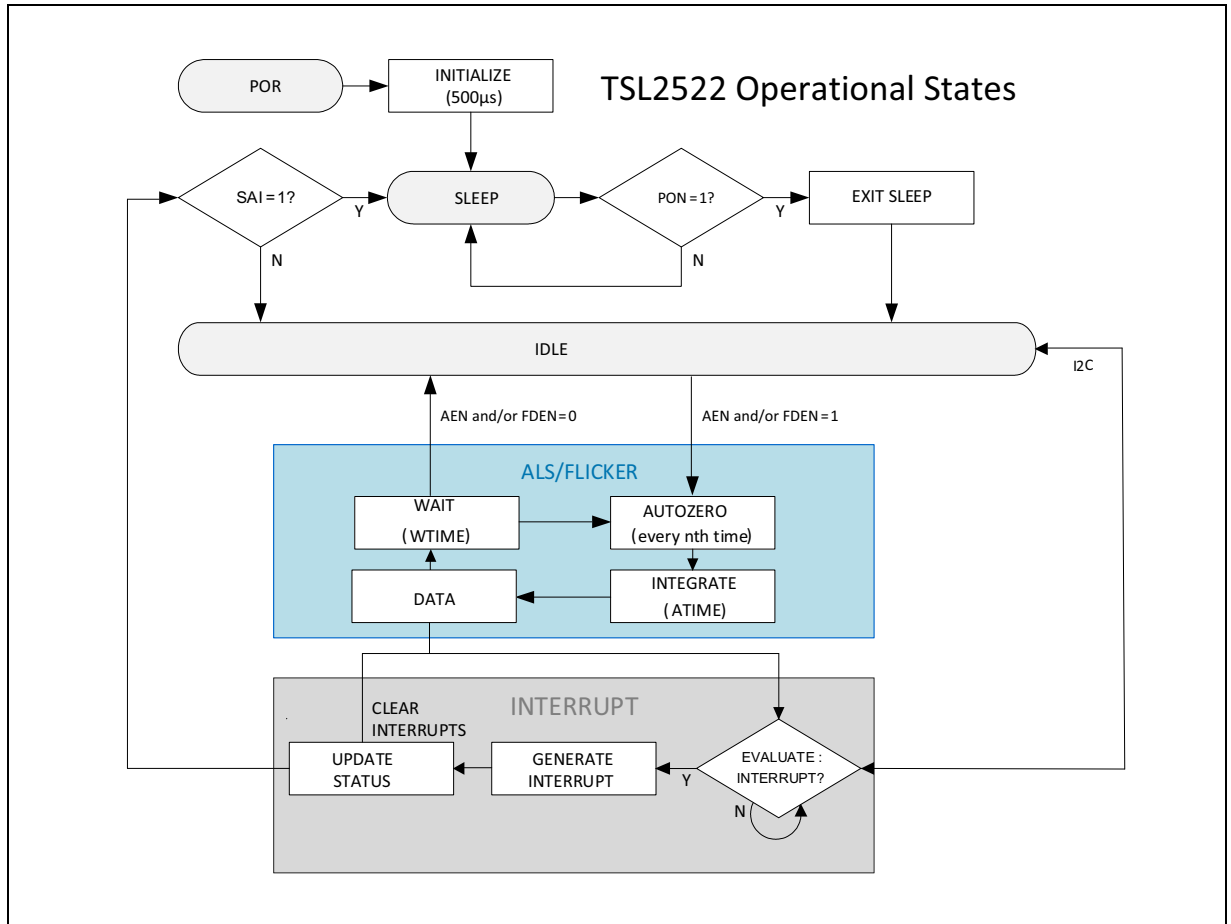

9.1   I²C protocol

The device uses I²C serial communication protocol for communication. The device supports 7-bit chip addressing and both standard and full-speed clock frequency modes. Read and Write transactions comply with the standard set by Philips (now NXP). For a complete description of the I²C protocol, please review the NXP I²C design specification.

Internal to the device, an 8-bit buffer stores the register address location of the desired byte to read or write. This buffer auto-increments upon each byte transfer and is retained between transaction events (I.e. valid even after the master issues a STOP command and the I²C bus is released). During consecutive Read transactions, the future/repeated I²C Read transaction may omit the memory address byte normally following the chip address byte; the buffer retains the last register address +1.

All 16-bit fields have a latching scheme for reading and writing. In general it is recommended to use I²C bursts whenever possible, especially in this case when accessing two bytes of one

logical entity. When reading these fields, the low byte must be read first, and it triggers a 16-bit latch that stores the 16-bit field. The high byte must be read immediately afterwards. When writing to these fields, the low byte must be written first, immediately followed by the high byte. Reading or writing to these registers without following these requirements will cause errors.

A Write transaction consists of a START, CHIP-ADDRESSWRITE, REGISTER-ADDRESS WRITE, DATA BYTE(S), and STOP. Following each byte (9TH clock pulse) the slave places an ACKNOWLEDGE/NOT- ACKNOWLEDGE (ACK/NACK) on the bus. If NACK is transmitted by the slave, the master may issue a STOP.

A Read transaction consists of a START, CHIP-ADDRESSWRITE, REGISTER-ADDRESS, RESTART, CHIP-ADDRESSREAD, DATA BYTE(S), and STOP. Following all but the final byte the master places an ACK on the bus (9TH clock pulse). Termination of the Read transaction is indicated by a NACK being placed on the bus by the master, followed by STOP.

10 Register overview

The device is controlled and monitored by registers accessed through the I²C serial interface. These registers provide device control functions and are read to determine device status and acquire device data.

10.1 Register map

The register set is summarized in Table 9. The values of all registers and fields that are listed as reserved or are not listed must not be changed at any time. The power-on reset values of each bit are indicated in these columns. Two-byte fields are always latched with the low byte followed by the high byte.

10.2 Register description

10.2.1 MOD_CHANNEL_CTRL register (Address 0x40)

Table 10: MOD_CHANNEL_CTRL

Addr: 0x40				MOD_CHANNEL_CTRL
Bit	Field	Reset	Type	Bit description
7:2	*Reserved*	0		
1	*MOD1_DISABLE*	0	R/W	When asserted modulator 1 is disabled.
0	*MOD0_DISABLE*	0	R/W	When asserted modulator 0 is disabled.

(1)   Return to the Register Map (0x40).

10.2.2 ENABLE register (Address 0x80)

Table 11: ENABLE

Addr: 0x80				ENABLE
Bit	Field	Reset	Type	Bit description
7	*Reserved*	0		
6	*FDEN*	0	R/W	**Flicker detection enable.** Writing a 1 activates flicker detection. Writing a 0 disables flicker detection.
5:2	*Reserved*	0		
1	*AEN*	0	R/W	**ALS enable.** Writing a 1 enables ALS. Writing a 0 disables ALS.
0	*PON*	0	R/W	**Power ON.** When asserted, the internal oscillator is activated, allowing timers and modulator channels to operate. Writing a 0 disables the oscillator and clears FDEN, and AEN. Only set this bit after all other registers have been initialized by the host.

(1)   Return to the Register Map (0x80).

10.2.3 MEAS_MODE0 register (Address 0x81)

Table 12: MEAS_MODE0

Addr: 0x81		MEAS_MODE0		
Bit	Field	Reset	Type	Bit description
7	*STOP_AFTER_NTH_ITERATION*	0	R/W	Stops a measurement after nth iterations by setting FDEN and AEN to 0. PON will stay at 1. Per default it stops after one measurement, which can be used for manual calibration.
6	*ENABLE_AGC_ASAT_ DOUBLE_STEP_DOWN*	0	R/W	Enables two gain steps down at once in case of an analogue AGC saturation and at a gain step still >0. This will allow a faster reach of 25% full-scale range and a more prompt reaction if analogue saturations occurs.
5	*MEASUREMENT_ SEQUENCER_SINGLE_SHOT_ MODE*	0	R/W	Start one measurement cycle with sequencer settings and stop it by asserting Sleep After Interrupt (SAI).
4	*MOD_FIFO_ALS_STATUS_ WRITE_ENABLE*	0	R/W	Enables writing of ALS status to the FIFO RAM in case ALS data scaling is used as well as 16-bit ALS data writing. It is needed to be able to correctly interpret the ALS data.
3:0	*ALS_SCALE*	0x4	R/W	ALS_SCALE is used to avoid that redundant ALS MSBs are transmitted and are reducing possible resolution, since the ALS data register is only 16 bits wide (internally the result can be 26 bits wide = 11-bit samples + 11-bit sampling time + 4-bit residuals - ALS_MSB_POSITION). The ALS_SCALE register defines the number of MSBs which must be 0 so that the scaled representation is used in the ALS data registers instead of the unscaled representation.

(1) Return to the Register Map (0x81).

10.2.4   MEAS_MODE1 register (Address 0x82)

Table 13: MEAS_MODE1

Addr: 0x82		MEAS_MODE1		
Bit	Field	Reset	Type	Bit description
7	MOD_FIFO_FD_END_MARKER_WRITE_ENABLE	0	R/W	Enables writing of end marker to FIFO after each complete flicker measurement.
6	MOD_FIFO_FD_CHECKSUM_WRITE_ENABLE	0	R/W	Enables writing of flicker checksum to FIFO after each complete flicker measurement.
5	MOD_FIFO_FD_GAIN_WRITE_ENABLE	0	R/W	Enables writing of gain to FIFO after each complete flicker measurement. This is required in case AGC is enabled.
4:0	ALS_MSB_POSITION	0x0C	R/W	Internally the result can be 26 bits wide = 11-bit samples + 11-bit sampling time + 4-bit residuals and is stored in a 32-bit register. ALS_MSB_POSITION defines the MSB in this 32-bit register.

(1)   Return to the Register Map (0x82).

10.2.5   SAMPLE_TIME0 register (Address 0x83)

Table 14: SAMPLE_TIME0

Addr: 0x83		SAMPLE_TIME0		
Bit	Field	Reset	Type	Bit description
7:0	SAMPLE_TIME[7:0]	0xB3	R/W	ALS measurement time step. Sets the time in steps of 1.388889µs modulator clock. The modulator clock can be divided with MOD_DIVIDER_SELECT in register CFG7. Please observe that SAMPLE_TIME needs to be set in register 0x83 and 0x84 (11-bit wide). It counts from 0-2047 (2048 counts). SAMPLE_TIME = (1/SamplingFreq/1.388889µs)-1 Default: 179+1 = 1/4000Hz / 1.388889µs (180 counts as counted 0-179) ALSIntegrationTimeStep = (SAMPLE_TIME+1) x 1.388889µs Default: 250µs = (179+1) x 1.388889µs

(1)   Return to the Register Map (0x83).

10.2.6   SAMPLE_TIME1 register (Address 0x84)

Table 15: SAMPLE_TIME1

Addr: 0x84		SAMPLE_TIME1		
Bit	Field	Reset	Type	Bit description
7:3	*Reserved*	0		
2:0	*SAMPLE_TIME[10:8]*	0	R/W	Please see SAMPLE_TIME0

(1)   Return to the Register Map (0x84).

Table 16: ALS_NR_SAMPLES0

Addr: 0x85		ALS_NR_SAMPLES0		
Bit	Field	Reset	Type	Bit description
7:0	*ALS_NR_SAMPLES[7:0]*	0	R/W	ALS_NR_OF_SAMPLES defines the total measurement time for ALS atime = (ALS_NR_SAMPLES+1) x (SAMPLE_TIME+1) x 1.388889µs

(1)   Return to the Register Map (0x85).

10.2.8   ALS_NR_SAMPLES1 register (Address 0x86)

Table 17: ALS_NR_SAMPLES1

Addr: 0x86		ALS_NR_SAMPLES1		
Bit	Field	Reset	Type	Bit description
7:3	*Reserved*	0		
2:0	*ALS_NR_SAMPLES[10:8]*	0	R/W	Please see ALS_NR_SAMPLES0

(1)   Return to the Register Map (0x86).

10.2.9   FD_NR_SAMPLES0 register (Address 0x87)

Table 18: FD_NR_SAMPLES0

Addr: 0x87		FD_NR_SAMPLES0		
Bit	**Field**	**Reset**	**Type**	**Bit description**
7:0	*FD_NR_SAMPLES[7:0]*	0	R/W	FD_NR_OF_SAMPLES defines the number of samples+1 measured in one sequencer step. The sample time is defined in SAMPLE_TIME[10:0].

(1)   Return to the Register Map (0x87).

10.2.10   FD_NR_SAMPLES1 register (Address 0x88)

Table 19: FD_NR_SAMPLES1

Addr: 0x88		FD_NR_SAMPLES1		
Bit	**Field**	**Reset**	**Type**	**Bit description**
7	*FD_NR_SAMPLES_INFINITE*	0	R/W	When asserted flicker measurement sequences will be infinitely repeated. In this mode, no end markers are inserted but results are continuously written into the FIFO.
6:3	*Reserved*	0		
2:0	*FD_NR_SAMPLES[10:8]*	0	R/W	Please see FD_NR_SAMPLES0

(1)   Return to the Register Map (0x88).

10.2.11 WTIME register (Address 0x89)

Table 20: WTIME

Addr: 0x89				WTIME
Bit	**Field**	**Reset**	**Type**	**Bit description**
7:0	*WTIME*	0	R/W	Sets the WaitTime between 2 measurements of the modulator or sequencer. WTIME together with MOD_TRIGGER_TIMING (in register 0xAE TRIGGER_MODE) define the actual time between measurements. WaitTime = MOD_TRIGGER_TIMING x WTIME Default: 0 = 0 x (0+1) no WaitTime

(1) Return to the Register Map (0x89).

10.2.12 ALS interrupt low threshold registers (Address 0x8A-0x8C)

Table 21: ALS interrupt low threshold

Addr	Bit	Field	Reset	Type	Description
0x8A	7:0	*AILT0*	0	R/W	**ALS interrupt low threshold.** The ALS interrupt threshold registers are 24-bit wide. ALS interrupt level detection compares the threshold registers with the data accumulated by the selected modulator. The modulator can be selected via ALS_THRESHOLD_CHANNEL. If AIEN is asserted and the accumulated data is below AILT for the number of consecutive samples specified in APERS, an interrupt is asserted on the interrupt pin (internally AINT_AILT and AINT are asserted).
0x8B	7:0	*AILT1*	0	R/W	
0x8C	7:0	*AILT2*	0	R/W	

(1) Return to the Register Map (0x8A, 0x8B, 0x8C).

10.2.13 ALS interrupt high threshold registers (Address 0x8D-0x8E)

Table 22: ALS interrupt high threshold

Addr	Bit	Field	Reset	Type	Description
0x8D	7:0	AIHT0	0	R/W	**ALS interrupt high threshold.** The ALS interrupt threshold registers are 24-bit wide. ALS interrupt level detection compares the threshold registers with the data accumulated by the selected modulator. The modulator can be selected via ALS_THRESHOLD_CHANNEL. If AIEN is asserted and the accumulated data is above AIHT for the number of consecutive samples specified in APERS, an interrupt is asserted on the interrupt pin (internally AINT_AIHT and AINT are asserted).
0x8E	7:0	AIHT1	0	R/W	
0x8F	7:0	AIHT2	0	R/W	

(1) Return to the Register Map (0x8D, 0x8E, 0x8F).

10.2.14 Device identification registers (Address 0x90-0x92)

Table 23: Device identification

Addr	Bit	Field	Reset	Type	Description
0x90	3:0	AUX_ID	0101b	R	**Device identification.** AUX_ID: Identifies package and wafer factory REV_ID: Identifies function ID and revision number of CMOS die ID: Device identification
0x91	7:0	REV_ID	0x11 00010001b	R	
0x92	7:0	ID	0x5C 01011100b	R	

(1) Return to the Register Map (0x90, 0x91, 0x92).

10.2.15   STATUS register (Address 0x93)

Table 24: STATUS

Addr: 0x93				STATUS
Bit	**Field**	**Reset**	**Type**	**Bit description**
7	*MINT*	0	R/W	**Modulator interrupt:** Indicates that a modulator interrupt has occurred because of saturation. Check the STATUS2 register to differentiate between analog or digital saturation. Writing 1 to this bit clear MINT and all subsequent interrupts.
6:4	*Reserved*	0		
3	*AINT*	0	R/W	**ALS interrupt.** If AIEN is set, this interrupt indicates that an ALS event that met the programmed ALS thresholds (AILT or AIHT) and persistence (APERS) occurred. Check the STATUS3 register to differentiate. Writing 1 to this bit clear AINT and all subsequent interrupts.
2	*FINT*	0	R/W	**FIFO interrupt.** Indicates that the data level in the FIFO met the programmed FIFO thresholds (FIFO_LVL and FIFO_THR). This interrupt is automatically asserted/removed depending on the programmed FIFO thresholds. Writing 1 to this bit clears FINT. The interrupt, however, will be promptly asserted again in case the FIFO has not been read out or cleared.
1	*Reserved*	0		
0	*SINT*	0	R/W	**System interrupt**. If SIEN is set, indicates that one or more of several events has occurred or is complete. The events related to this interrupt are indicated in the **STATUS5** register.

(1)   Return to the Register Map (0x93).

10.2.16 ALS_STATUS register (Address 0x94)

Table 25: ALS_STATUS

Addr: 0x94		ALS_STATUS		
Bit	Field	Reset	Type	Bit description
7:6	*MEAS_SEQR_STEP*	0	R	Contains the sequencer step where ALS data was measured.
5	*ALS_DATA0_ANALOG_SATURATION_STATUS*	0	R	Indicates analog saturation of ALS data0 in data registers ALS_ADATA0.
4	*ALS_DATA1_ANALOG_SATURATION_STATUS*	0	R	Indicates analog saturation of ALS data1 in data registers ALS_ADATA1.
3	*Reserved*	0		
2	*ALS_DATA0_SCALED_STATUS*	0	R	Indicates if ALS data0 needs to be multiplied if bit is set to "0": 2^(ALS_SCALED) "1": 1
1	*ALS_DATA1_SCALED_STATUS*	0	R	Indicates if ALS data1 needs to be multiplied if bit is set to "0": 2^(ALS_SCALED) "1": 1
0	*Reserved*	0		

(1)   Return to the Register Map (0x94).

10.2.17   ALS data registers (Address 0x95-0x9A)

Table 26: ALS data registers

Addr	Bit	Field	Reset	Type	Description
0x95	7:0	*ALS_DATA0[7:0]*	0	R	**ALS data registers**
0x96	7:0	*ALS_DATA0[15:8]*	0	R	In order to update ALS Data Registers ALS_STATUS must be read first. The ALS channel data is stored in
0x97	7:0	*ALS_DATA1[7:0]*	0	R	two 8-bit registers and shall be interpreted as 16-bit data across 2 registers. All ALS data samples stored
0x98	7:0	*ALS_DATA1[15:8]*	0	R	are generated in the same integration cycle. Reading these bytes consecutively (low byte before high byte) ensures that the data is concurrent. The data, stored in the ALS_DATA registers, is obtained from a 26-bit wide result buffer depending on settings of ALS_SCALE in MEAS_MODE0 and ALS_MSB_POSITION in MEAS_MODE1. The ALS_STATUS register indicates whether the ALS data is scaled or unscaled. In case ALS_MSB_POSITION is exceeded, data is 0xFFFE. In case of analog saturation, data is 0xFFFF.

10.2.18   ALS_STATUS2 register (Address 0x9B)

Table 27: ALS_STATUS2

Addr: 0x9B				ALS_STATUS2	
Bit	Field	Reset	Type	Bit description	
7:4	*ALS_DATA1_GAIN_STATUS*	0	R	Contains gain for data in ALS_DATA1 registers.	
3:0	*ALS_DATA0_GAIN_STATUS*	0	R	Contains gain for data in ALS_DATA0 registers.	

10.2.19 STATUS2 register (Address 0x9D)

Table 28: STATUS2

Addr: 0x9D		Reset		STATUS2
Bit	**Field**	**Reset**	**Type**	**Bit description**
7	*Reserved*	0		
6	*ALS_DATA_VALID*	0	R	**ALS data valid**. Indicates that the ALS state has completed a cycle since either an assertion of AEN or the last readout of the ALS_STATUS register.
5	*Reserved*	0		
4	*ALS_DIGITAL_SATURATION*	0	R	**ALS digital saturation**. Indicates that a counter value has been reached that cannot be expressed with the selected data format defined with ALS_MSB_POSITION. Maximum counter value also depends on integration time set in the ATIME register.
3	*FD_DIGITAL_SATURATION*	0	R	**Flicker detect digital saturation.** Indicates that the maximum counter values has been reached during flicker detection.
2	*Reserved*	0		
1	*MOD_ANALOG_SATURATION1*	0	R	**ALS analog saturation of modulator1**. Indicates that the intensity of ambient light has exceeded the maximum integration level for the ALS analog circuit.
0	*MOD_ANALOG_SATURATION0*	0	R	**ALS analog saturation of modulator0**. Indicates that the intensity of ambient light has exceeded the maximum integration level for the ALS analog circuit.

(1) Return to the Register Map (0x9D).

10.2.20   STATUS3 register (Address 0x9E)

Table 29: STATUS3

Addr: 0x9E				STATUS3
Bit	**Field**	**Reset**	**Type**	**Bit description**
7	*AINT_HYST_STATE_VALID*	0	R	Indicates that the ALS interrupt hysteresis state AINT_HYST_STATE is valid. It will get asserted as soon as the value exceeds the high or the low ALS interrupt thresholds by APERS times. It is automatically cleared with AEN or PON set to 0.
6	*AINT_HYST_STATE_RD*	0	R	This bit indicates the state in the hysteresis defined with AINT_AILT and AINT_AIHT, Preset of state is possible before AEN is set. The contents of this register is forwarded to the INT/VSYNC_GPIO pin in case of aint interrupt direct mode.
5	*AINT_AIHT*	0	R/W	**ALS interrupt high.** Indicates that an ALS interrupt occurred because the ALS data exceeded the high threshold. Writing '1' to this bit clears this interrupt.
4	*AINT_AILT*	0	R/W	**ALS interrupt low.** Indicates that an ALS interrupt occurred because the ALS data is below the low threshold. Writing '1' to this bit clears this interrupt.
3	*VSYNC_LOST*	1	R	Indicates that synchronization is out of sync with clock provided at vsync pin. Default value is "1" since device always starts unsynchronized. The detected vsync clock is not within the expected range. Please see VSYNC_PERIOD_TARGET for more details.
2	*Reserved*	0		
1	*OSC_CALIB_SATURATION*	0	R	Indicates that oscillator calibration with the current values of TRIM_OSC and OSC_TUNE is out of range abs(TRIM_OSC+OSC_TUNE) > 32
0	*OSC_CALIB_FINISHED*	0	R	Indicates that oscillator calibration is finished.

(1)   Return to the Register Map (0x9E).

10.2.21   STATUS4 register (Address 0x9F)

Table 30: STATUS4

Addr: 0x9F		STATUS4		
Bit	**Field**	**Reset**	**Type**	**Bit description**
7:4	*Reserved*	0		
3	*MOD_SAMPLE_TRIGGER_ ERROR*	0	R	Indicates that measured data is corrupted. For a valid measurement, this bit must not be asserted. This error condition does not trigger an interrupt, however AEN and FDEN will be cleared and SINT_MEASURMENT_SEQUENCER will be set. Writing "1" clears this bit.
2	*MOD_TRIGGER_ERROR*	0	R	Indicates that WTIME is too short for the programmed configuration (SAMPLE_TIME, ALS_NR_SAMPLES). This error condition does not trigger an interrupt. Writing "1" clears this bit.
1	*SAI_ACTIVE*	0	R	**Sleep after interrupt active.** Indicates that the device is in sleep due to an interrupt. To exit sleep mode, clear this bit by writing '1' to CLEAR_SAI_ACTIVE.
0	*INIT_BUSY*	0	R	**Initialization busy.** Indicates that the device is initializing. This bit will remain 1 for about 300µs after power on. Do not interact with the device until initialization is complete (e.g. via I²C).

(1)   Return to the Register Map (0x9F).

10.2.22   STATUS5 register (Address 0xA0)

Table 31: STATUS5

Addr: 0xA0				STATUS5
Bit	**Field**	**Reset**	**Type**	**Bit description**
7:2	*Reserved*	0		
1	*SINT_MEASUREMENT_ SEQUENCER*	0	R/W	Indicates a measurement sequencer system interrupt in case MOD_SAMPLE_TRIGGER_ERROR occurs or after each sequencer step/round depending on the status of MEASUREMENT_SEQUENCER_SIENT_ PER_STEP. In parallel SIEN_MEASUREMENT_ SEQUENCER must be set. Writing '1' to this bit clears this interrupt.
0	*SINT_VSYNC*	0	R/W	Indicates that VSYNC_LOST is set or reset. VSYNC_LOST gets set if the waiting timeout for VSYNC_TIMEOUT is reached. In parallel SIEN_VSYNC must be set. Writing '1' to this bit clears this interrupt.

(1)   Return to the Register Map (0xA0).

10.2.23   CFG0 register (Address 0xA1)

Table 32: CFG0

Addr: 0xA1				CFG0
Bit	**Field**	**Reset**	**Type**	**Bit description**
7	*Reserved*	0		
6	*SAI*	0	R/W	**Sleep after interrupt.** If asserted, the oscillator is turned off whenever interrupt is active (low). SAI_ ACTIVE is set in this event. To activate the oscillator again, service and clear all interrupts plus clear the SAI_ACTIVE bit by writing "1" to CLEAR_SAI_ACTIVE. Sleep after interrupt is asserted only in combination with MEASUREMENT_ SEQUENCER_SINT_PER_STEP or SIEN or SIEN_MEASUREMENT_SEQUENCER
5	*LOWPOWER_IDLE*	0	R/W	**Low power idle.** When asserted, the device will automatically run in a low power mode whenever all functions are in wait states or disabled.
4:0	*Reserved*	01000b	R	Do not overwrite default.

(1)   Return to the Register Map (0xA1).

10.2.24   CFG1 register (Address 0xA2)

Table 33: CFG1

Addr: 0xA2				CFG1
Bit	**Field**	**Reset**	**Type**	**Bit description**
7:3	*Reserved*	0		
2	*DO_ALS_FINAL_PROCESSING*	0	R/W	If this bit is set to "1" and flicker measurement takes longer than ALS measurement, ALS measurement writings are postponed until flicker measurement is finished. Otherwise ALS data is not written to FIFO.
1:0	*Reserved*	0		

(1)   Return to the Register Map (0xA2).

10.2.25   CFG2 register (Address 0xA3)

Table 34: CFG2

Addr: 0xA3		CFG2		
Bit	**Field**	**Reset**	**Type**	**Bit description**
7	*AINT_DIRECT*	0	R/W	**ALS interrupt direct.** Enables the direct mode of ALS interrupt. ALS interrupts are only generated when ALS_DATA (selected by ALS_THRESHOLD_CHANNEL) moves over the hysteresis edges (AINT_AILT and AINT_AIHT). If bit is "0", interrupts are always generated if ALS_DATA is above AIHT or below AILT. The status of the ALS interrupt is directly output on the INT or GPIO pin if this mode is enabled and either of those pins are configured to do so according to the INT_PINMAP and VSYNC_GPIO_PINMAP settings.
6:1	*Reserved*	0		
0	*FIFO_THR[0]*	1	R/W	**FIFO threshold LSB.** Please see FIFO_THR for information.

(1)   Return to the Register Map (0xA3).

10.2.26 CFG3 register (Address 0xA4)

Addr: 0xA4				CFG3
Bit	**Field**	**Reset**	**Type**	**Bit description**
7:6	*Reserved*	0		
5:4	*INT_PINMAP*	0	R/W	Interrupt Pin Mapping. Defines internal signal which is routed to the external INT pin. 00: Default, INTERRUPT 01: AINT_HYST_STATE 10: Reserved, do not use 11: Reserved, do not use
3:2	*Reserved*	0		
1:0	*VSYNC_GPIO_PINMAP*	0	R/W	Vsync/GPIO Pin Mapping. Defines internal signal which is routed to the external VSYNC/GPIO pin. 00: Default, VSYNC_GPIO_OUT 01: AINT_HYST_STATE 10: Reserved, do not use 11: Reserved, do not use

(1)   Return to the Register Map (0xA4).

10.2.27   CFG4 register (Address 0xA5)

Table 36: CFG4

Addr: 0xA5				CFG4
Bit	Field	Reset	Type	Bit description
7	*Reserved*	0		
6	*MOD_CALIBRATION_ NTH_ITERATION_ STEP_ENABLE*	0	R/W	Enable a modulator calibration with nth iterations per sequencer step instead of waiting for a full round for all sequencers to be finished. In case of AGC enabled (MOD_CALIB_NTH_ITERATION_AGC_ENABLE) this bit must be set "0", otherwise AGC will not properly work.
5	*MEASUREMENT_ SEQUENCER_AGC_ PREDICT_TARGET_ LEVEL*	0	R/W	Sets the target measurement levels for AGC prediction. 0: 50% of max value 1: 25% of max value
4	*MEASURMENT_ SEQUENCER_ SINT_PER_STEP*	0	R/W	Invokes the system interrupt SINT_MEASUREMENT_ SEQUENCER per sequencer step instead of after a full sequencer round.
3	*OSC_TUNE_NO_RESET*	0	R/W	OSC_TUNE is set to "0" at each transition of PON from "0" to "1". If OSC_TUNE_NO_RESET is asserted, OSC_TUNE is not reset to "0".
2	*Reserved*	0		
1:0	*MOD_ALS_FIFO_ DATA_FORMAT*	0	R/W	Sets the format for ALS data written to FIFO. Please observe readout pattern if digital or analog saturation has occurred 00: 16-bit (0xFFFF is encoded as analog saturation, 0xFFFE is encoded as digital saturation) 01: 24-bit (0xFFFFFF is encoded as analog saturation, 0xFFFFFE is encoded as digital saturation) 10: Reserved 11: 32-bit (0xFFFFFFFF is encoded as analog saturation, no digital saturation will happen)

(1)   Return to the Register Map (0xA5).

10.2.28 CFG5 register (Address 0xA6)

Table 37: CFG5

Addr: 0xA6		CFG5		
Bit	Field	Reset	Type	Bit description
7:6	*Reserved*	0		
5:4	*ALS_THRESHOLD_CHANNEL*	0	R/W	Selects the modulator channel used for the ALS threshold metering and subsequent interrupt. 00: Default, modulator0 01: Modulator1
3:0	*APERS*	0	R/W	**ALS interrupt persistence.** Defines a filter for the number of consecutive occurrences that ALS measurement data must remain outside the threshold range between AILT and AIHT before an interrupt is generated. The ALS data channel used for the persistence filter is set by ALS_THRESHOLD_CHANNEL. Any sample that is inside the threshold range resets the counter to 0. Interrupts are generated at 0x0: Every ALS cycle 0x1: Any ALS value outside the threshold range 0x2: 2 consecutive ALS values outside the range 0x3: 3 consecutive ALS values outside the range 0x4: 5 … 0x5: 10 … …… continued in increments of 5 values 0xE: 55 … 0xF: 60 consecutive ALS values outside the range

(1) Return to the Register Map (0xA6).

10.2.29   CFG6 register (Address 0xA7)

Table 38: CFG6

Addr: 0xA7				CFG6
Bit	Field	Reset	Type	Bit description
7:6	*Reserved*	0		
5	*MOD_MEASUREMENT_ COMPLETE_STARTUP*	0	R/W	Activated complete start procedure in for each measurement sample. This reduces measurement time per sample by 9 modulator clock cycles.
4	*Reserved*	0		
3:2	*MOD_MINIMUM_RESIDUAL_BITS*	0	R/W	Limits the number of residual bits to a minimum within this value. ATTENTION: When this function is used, the default settings for the gains are not correct anymore. Thus a residual calibration is mandatory (use MOD_CALIB_RESIDUAL_ENABLE_AUTO_C ALIB_ON_GAIN_CHANGE or MOD_CALIB_NTH_ITERATION_RC_ENABLE to enforce residual calibration) 00b: 0 residual bits at minimum (default, turned off) 01b: 1 residual bits at minimum 10b: 2 residual bits at minimum 11b: 3 residual bits at minimum
1:0	*MOD_MAXIMUM_RESIDUAL_BITS*	0x3	R/W	Limits the number of residual bits to a maximum within this value. ATTENTION: When this function is used, the default settings for the gains are not correct anymore. Thus a residual calibration is mandatory (use MOD_CALIB_RESIDUAL_ENABLE_AUTO_C ALIB_ON_GAIN_CHANGE or MOD_CALIB_NTH_ITERATION_RC_ENABLE to enforce residual calibration) 00b: 1 residual bits at maximum 01b: 2 residual bits at maximum 10b: 3 residual bits at maximum 11b: 4 residual bits at maximum

(1)   Return to the Register Map (0xA7).

10.2.30   CFG7 register (Address 0xA8)

Table 39: CFG7

Addr: 0xA8		CFG7		
Bit	**Field**	**Reset**	**Type**	**Bit description**
7:0	*Reserved*	0x01		

(1)   Return to the Register Map (0xA8).

10.2.31   CFG8 register (Address 0xA9)

Table 40: CFG8

Addr: 0xA9		CFG8		
Bit	**Field**	**Reset**	**Type**	**Bit description**
7:4	*MEASUREMENT_SEQUENCER_ MAX_MOD_GAIN*	0xC	R/W	Sets the maximum gain for all channels in all sequencer steps
3:0	*MEASUREMENT_SEQUENCER_ AGC_PREDICT_MOD_GAIN_REDUCTION*	0x4	R/W	Sets the modulator gain reduction in AGC predict mode. All channels in the actual measurement sequence are reduced by the programmed gain reduction before gain prediction starts.

(1)   Return to the Register Map (0xA9).

10.2.32   CFG9 register (Address 0xAA)

Table 41: CFG9

Addr: 0xAA				CFG9
Bit	**Field**	**Reset**	**Type**	**Bit description**
7:2	*Reserved*	0		
1:0	*MOD_RESIDUAL_BITS_IGNORE*	0	R/W	Sets the number of residual bits ignored and shifted in flicker data. Please observe to set MOD_FD_FIFO_DATAx_WIDTH accordingly.

(1)   Return to the Register Map (0xAA).

10.2.33   AGC number of samples registers (Address 0xAC-0xAD)

Table 42: AGC number of samples

Addr	Bit	Field	Reset	Type	Description
0xAC	7:0	*AGC_NR_SAMPLES[7:0]*	0	R/W	**AGC number of samples.** Sets the time for every AGC measurement and is calculated as: agc_atime = (AGC_NR_SAMPLES+1) x (SAMPLE_TIME+1) x 1.388889µs
0xAD	7:3	*Reserved*	0		
0xAD	2:0	*AGC_NR_SAMPLES[10:8]*	0	R/W	

(1)   Return to the Register Map (0xAC, 0xAD).

10.2.34 TRIGGER_MODE register (Address 0xAE)

Table 43: TRIGGER_MODE

Addr: 0xAE				TRIGGER_MODE
Bit	Field	Reset	Type	Bit description
7:3	*Reserved*	0		
2:0	*MOD_TRIGGER_TIMING*	0	R/W	Sets the repetition rate of a modulator or sequencer measurement. Counting will immediately start or will wait for the first vsync pulse. 000: OFF 001: Normal = 2.844ms * WTIME 010: Long = 45.511ms * WTIME 011: Fast = 88.889µs * WTIME 100: Fastlong = 1.422ms * WTIME 101: vsync = one vsync per WTIME step 110: Reserved 111: Reserved

(1)   Return to the Register Map (0xAE).

10.2.35 CONTROL register (Address 0xB1)

Table 44: CONTROL

Addr: 0xB1				CONTROL
Bit	Field	Reset	Type	Bit description
7:4	*Reserved*	0		
3	*SOFT_RESET*	0	R/W	Software Reset. If set and executable, the Software Reset will initialize the device in the same way as hardware reset. Prior to invoking a SOFT_RESET the oscillator must be switched on. Set PON=1
2	*Reserved*	0		
1	*FIFO_CLR*	0	R/W	Setting this bit will clear the FIFO, as well as FINT, FIFO_OVERFLOW, FIFO_UNDERFLOW and FIFO_LVL.
0	*CLEAR_SAI_ACTIVE*	0	R/W	Setting this bit will clear the Sleep After Interrupt Active SAI_ACTIVE and start measurements if enabled.

(1)   Return to the Register Map (0xB1).

10.2.36   INTENAB register (Address 0xBA)

Addr: 0xBA				INTENAB
Bit	**Field**	**Reset**	**Type**	**Bit description**
7	*MIEN*	0	R/W	Modulator Interrupt Enable. Setting this bit will allow a modulator interrupt on the external INT pin. Please check in STATUS2 for the reason of the interrupt.
6:4	*Reserved*	0		
3	*AIEN*	0	R/W	ALS Interrupt Enable. Setting this bit will allow an ALS interrupt on the external INT pin. Please check in STATUS3 for the reason of the interrupt.
2	*FIEN*	0		FIFO Interrupt Enable. Setting this bit will allow a FIFO interrupt on the external INT pin. Check FINT for further information.
1	*Reserved*	0		
0	*SIEN*	0	R/W	System Interrupt Enable. Setting this bit will allow a system interrupt on the external INT pin. Please check in STATUS5 for the reason of the interrupt.

(1)   Return to the Register Map (0xBA).

10.2.37   SIEN register (Address 0xBB)

Addr: 0xBB				SIEN
Bit	**Field**	**Reset**	**Type**	**Bit description**
7:2	*Reserved*	0		
1	*SIEN_MEASUREMENT_ SEQUENCER*	0	R/W	Measurement Sequencer Interrupt Enable. Setting this bit will allow a system interrupt SINT as soon as invoked by a measurement sequencer event. Please see SINT_MEASUREMENT_ SEQUENCER for further information.
0	*SIEN_VSYNC*	0	R/W	Vsync Interrupt Enable. Setting this bit will allow a system interrupt SINT as soon as soon as a vysnc interrupt occurs. Please see SINT_VSYNC for further information.

(1)   Return to the Register Map (0xBB).

10.2.38 MOD_COMP_CFG1 register (Address 0xCE)

Table 47: MOD_COMP_CFG1

Addr: 0xCE				MOD_COMP_CFG1
Bit	Field	Reset	Type	Bit description
7:6	*MOD_IDAC_RANGE*	10b	R/W	Sets the auto zero range of the current digital-to-analog converter. 00: 58µV 01: 38µV 10: 18µV 11: 9µV
5:0	*Reserved*	0		

(1)   Return to the Register Map (0xCE).

10.2.39 MEAS_SEQR_FD_0 register (Address 0xCF)

Table 48: MEAS_SEQR_FD_0

Addr: 0xCF				MEAS_SEQR_FD_0
Bit	Field	Reset	Type	Bit description
7:4	*MEASUREMENT_ SEQUENCER_MOD1_ FD_PATTERN*	0	R/W	Defines the sequence of a flicker measurement on modulator 1. The bit pattern does not represent a value but controls bitwise which sequencer step shall be used. The leftmost position of "0000" refers to sequencer step 3, the rightmost refers to sequencer step 0.
3:0	*MEASUREMENT_ SEQUENCER_MOD0_ FD_PATTERN*	0x1	R/W	Defines the sequence of a flicker measurement on modulator 0. The bit pattern does not represent a value but controls bitwise which sequencer step shall be used. The leftmost position of "0000" refers to sequencer step 3, the rightmost refers to sequencer step 0. By default sequencer step 0 is used on modulator 0.

(1)   Return to the Register Map (0xCF).

10.2.40   MEAS_SEQR_ALS_1 register (Address 0xD0)

Table 49: MEAS_SEQR_ALS_1

Addr: 0xD0		MEAS_SEQR_ALS_1		
Bit	**Field**	**Reset**	**Type**	**Bit description**
7:4	*Reserved*	0	R/W	
3:0	*MEASUREMENT_SEQUENCER_ALS_PATTERN*	0x1	R/W	Defines the sequence of an ALS measurement on modulators. The bit pattern does not represent a value but controls bitwise which sequencer step shall be used. The leftmost position of "0000" refers to sequencer step 3, the rightmost refers to sequencer step 0. By default sequencer step 0 is executed on all modulators.

(1)   Return to the Register Map (0xD0).

10.2.41   MEAS_SEQR_APERS_AND_VSYNC_WAIT register (Address 0xD1)

Table 50: MEAS_SEQR_APERS_AND_VSYNC_WAIT

Addr: 0xD1		MEAS_SEQR_APERS_AND_VSYNC_WAIT		
Bit	**Field**	**Reset**	**Type**	**Bit description**
7:4	*MEASUREMENT_ SEQUENCER_VSYNC_ WAIT_PATTERN*	0	R/W	Defines if a measurement sequence shall wait for a vsync before starting the measurement. The bit pattern does not represent a value but controls bitwise which sequencer step shall be used. The leftmost position of "0000" refers to sequencer step 3, the rightmost refers to sequencer step 0.
3:0	*MEASUREMENT_ SEQUENCER_APERS_ PATTERN*	0x1	R/W	Defines the sequencer steps where an ALS persistence evaluation shall be performed on modulator data selected by ALS_THRESHOLD_CHANNEL. The bit pattern does not represent a value but controls bitwise which sequencer step shall be used. The leftmost position of "0000" refers to sequencer step 3, the rightmost refers to sequencer step 0. By default step 0 is used on all modulators.

(1)   Return to the Register Map (0xD1).

10.2.42 MEAS_SEQR_RESIDUAL_0 register (Address 0xD2)

Table 51: MEAS_SEQR_RESIDUAL_0

Addr: 0xD2		MEAS_SEQR_RESIDUAL_0		
Bit	**Field**	**Reset**	**Type**	**Bit description**
7:4	*MEASUREMENT_ SEQUENCER_MOD1_ RESIDUAL_ENABLE_ PATTERN*	0xF	R/W	Defines if a residual measurement on modulator 1 shall be executed. The bit pattern does not represent a value but controls bitwise which sequencer step shall be used. The leftmost position of "0000" refers to sequencer step 3, the rightmost refers to sequencer step 0. By default a residual measurement is done in all sequencer steps.
3:0	*MEASUREMENT_ SEQUENCER_MOD0_ RESIDUAL_ENABLE_ PATTERN*	0xF	R/W	Defines if a residual measurement on modulator 0 shall be executed. The bit pattern does not represent a value but controls bitwise which sequencer step shall be used. The leftmost position of "0000" refers to sequencer step 3, the rightmost refers to sequencer step 0. By default a residual measurement is done in all sequencer steps.

(1)   Return to the Register Map (0xD2).

10.2.43 MEAS_SEQR_RESIDUAL_1_AND_WAIT register (Address 0xD3)

Table 52: MEAS_SEQR_RESIDUAL_1_AND_WAIT

Addr: 0xD3				MEAS_SEQR_RESIDUAL_1_AND_WAIT
Bit	Field	Reset	Type	Bit description
7:4	*MEASUREMENT_ SEQUENCER_ WAIT_PATTERN*	0x1	R/W	Defines if a sequencer step will wait for the modulator trigger timer to finish as programmed in MOD_TRIGGER_TIMING and WTIME. At the same time the timer is restarted. In case this bit is not set, the next sequencer step will start as soon as all measurements in the prior step are completed. Please observe that MOD_TRIGGER_TIMING is "0" by default. In this case the programmed wait pattern is ignored since measurement time has always priority over wait time. The bit pattern does not represent a value but controls bitwise which sequencer step shall be used. The leftmost position of "0000" refers to sequencer step 3, the rightmost refers to sequencer step 0. By default the wait is executed for sequencer step 0 (first sequencer step).
3:0	*Reserved*	0xF	R/W	

(1)   Return to the Register Map (0xD3).

10.2.44 MEAS_SEQR_STEP0_MOD_GAINX_L register (Address 0xD4)

Table 53: MEAS_SEQR_STEP0_MOD_GAINX_L

Addr: 0xD4		MEAS_SEQR_STEP0_MOD_GAINX_L		
Bit	**Field**	**Reset**	**Type**	**Bit description**
7:4	*MEASUREMENT_ SEQUENCER_STEP0_ MOD_GAIN1*	0x8	R/W	Defines the gain of modulator 1 for the measurement sequencer step 0. The gain is also updated by the AGC, if activated. 0x00: 1/2x 0x01: 1x 0x02: 2x 0x03: 4x 0x04: 8x 0x05: 16x 0x06: 32x 0x07: 64x 0x08: 128x 0x09: 256x 0x0A: 512x 0x0B: 1024x 0x0C: 2048x 0x0D: 4096x
3:0	*MEASUREMENT_ SEQUENCER_STEP0_ MOD_GAIN0*	0x8	R/W	Defines the gain of modulator 0 for the measurement sequencer step 0. The gain is also updated by the AGC, if activated. Gain steps see under modulator 1 above.

(1)   Return to the Register Map (0xD4).

10.2.45 MEAS_SEQR_STEP1_MOD_GAINX_L register (Address 0xD6)

Table 54: MEAS_SEQR_STEP1_MOD_GAINX_L

Addr: 0xD6		MEAS_SEQR_STEP1_MOD_GAINX_L		
Bit	Field	Reset	Type	Bit description
7:4	*MEASUREMENT_ SEQUENCER_STEP1_ MOD_GAIN1*	0x8	R/W	Defines the gain of modulator 1 for the measurement sequencer step 1.
3:0	*MEASUREMENT_ SEQUENCER_STEP1_ MOD_GAIN0*	0x8	R/W	Defines the gain of modulator 0 for the measurement sequencer step 1.

(1) Return to the Register Map (0xD6).

Bit	Field	Reset	Type	Bit description
7:6	*MEASUREMENT_ SEQUENCER_STEP3_ MOD_PHD3_SMUX*	00b	R/W	Defines connection of photodiode 3 to modulator for sequencer step 3 00: No connection 01: Modulator 0 10: Modulator 1
5:4	*MEASUREMENT_ SEQUENCER_STEP3_ MOD_PHD2_SMUX*	10b	R/W	Defines connection of photodiode 2 to modulator for sequencer step 3 00: No connection 01: Modulator 0 10: Modulator 1
3:2	*MEASUREMENT_ SEQUENCER_STEP3_ MOD_PHD1_SMUX*	01b	R/W	Defines connection of photodiode 1 to modulator for sequencer step 3 00: No connection 01: Modulator 0 10: Modulator 1
1:0	*MEASUREMENT_ SEQUENCER_STEP3_ MOD_PHD0_SMUX*	00b	R/W	Defines connection of photodiode 0 to modulator for sequencer step 3 00: No connection 01: Modulator 0 10: Modulator 1

(1) Return to the Register Map (0xE2).

10.2.55 MEAS_SEQR_STEP3_MOD_PHDX_SMUX_H register (Address 0xE3)

Table 64: MEAS_SEQR_STEP3_MOD_PHDX_SMUX_H

Addr: 0xE3				MEAS_SEQR_STEP3_MOD_PHDX_SMUX_H
Bit	Field	Reset	Type	Bit description
7:4	*Reserved*	0		
3:2	*MEASUREMENT_ SEQUENCER_STEP3_ MOD_PHD5_SMUX*	00b	R/W	Defines connection of photodiode 5 to modulator for sequencer step 3 00: No connection 01: Modulator 0 10: Modulator 1
1:0	*MEASUREMENT_ SEQUENCER_STEP3_ MOD_PHD4_SMUX*	11b	R/W	Defines connection of photodiode 4 to modulator for sequencer step 3 00: No connection 01: Modulator 0 10: Modulator 1

(1)   Return to the Register Map (0xE3).

10.2.56 MOD_CALIB_CFG0 register (Address 0xE4)

Table 65: MOD_CALIB_CFG0

Addr: 0xE4				MOD_CALIB_CFG0
Bit	Field	Reset	Type	Bit description
7:0	*MOD_CALIB_NTH_ ITERATION*	0xFF	R/W	Defines the repetition rate of calibrations in sequencer rounds or steps depending on MOD_CALIB_NTH_ITERATION_STEP_ENABLE. 0x00: Never 0x01-0xFE: Every n^{th} time 0xFF: Only once at start

(1)   Return to the Register Map (0xE4).

10.2.57 MOD_CALIB_CFG2 register (Address 0xE6)

Table 66: MOD_CALIB_CFG2

Addr: 0xE6				MOD_CALIB_CFG2
Bit	**Field**	**Reset**	**Type**	**Bit description**
7	*MOD_CALIB_NTH_ ITERATION_RC_ ENABLE*	1	R/W	Enables a residual calibration during the nth iteration. Please observe that this residual calibration feature only makes sense for modulators which are enabled in the first sequences step, since a gain calibration only happens in the first sequencer step.
6	*MOD_CALIB_NTH_ ITERATION_AZ_ ENABLE*	1	R/W	Enables auto-zero calibration during the nth iteration.
5	*MOD_CALIB_NTH_ ITERATION_AGC_ ENABLE*	0	R/W	Enables AGC calibration during the nth iteration. Please observe in this case, that MOD_CALIB_NTH_ITERATION_STEP_ENABLE must be "0" otherwise AGC will not be properly executed.
4	*MOD_CALIB_ RESIDUAL_ENABLE_ AUTO_CALIB_ON_ GAIN_CHANGE*	1	R/W	Enables an automatic re-calibration in case of a change in gain. This re-calibration is executed at the beginning of each sequencer step.
3:0	*Reserved*	0x3		

(1)   Return to the Register Map (0xE6).

10.2.58 VSYNC period registers (Address 0xF2-F3)

Table 67: VSYNC Period

Addr	Bit	Field	Reset	Type	Description
0xF2	7:0	*VSYNC_PERIOD[7:0]*	0	R/W	**VSYNC period.** Contains the measured VSYNC in multiples of 1.3888µs Reading this register clears HOLD_VSYNC_PERIOD
0xF3	7:0	*VSYNC_PERIOD[15:8]*	0	R/W	

(1)   Return to the Register Map (0xF2, 0xF3).

10.2.59   VSYNC_PERIOD_TARGET registers (Address 0xF4-F5)

Table 68: VSYNC_PERIOD_TARGET

Addr	Bit	Field	Reset	Type	Description
0xF4	7:0	*VSYNC_PERIOD_ TARGET[7:0]*	0	R/W	**VSYNC period target** Defines the ideal target value for the VSYNC_PERIOD. Configure properly before enabling the oscillator calibration, otherwise it will cause malfunction or overflow. See VSYNC_PERIOD_ USE_FAST_ TIMING_EVAL for the calculation of VSYNC_PERIOD_TARGET.
0xF5	6:0	*VSYNC_PERIOD_ TARGET[14:8]*	0	R/W	
0xF5	7	*VSYNC_PERIOD_ USE_FAST_ TIMING_EVAL*	0	R/W	If set to "0", the VSYNC_PERIOD_TARGET shall match VSYNC_PERIOD[15:1], supports range from 15Hz to 500Hz. VSYNC_PERIOD_TARGET = (720KHz / f_{VSYNC})/2 e.g. for f_{VSYNC} = 60Hz, VSYNC_PERIOD_TARGET = 0x1770 If set to "1", the VSYNC_PERIOD_TARGET shall match VSYNC_PERIOD[14:0], supports range from 30Hz to 1KHz. VSYNC_PERIOD_TARGET = 720KHz / f_{VSYNC} e.g. for f_{VSYNC} = 60Hz, VSYNC_PERIOD_TARGET = 0x2EE0

(1)   Return to the Register Map (0xF4, 0xF5).

10.2.60   VSYNC_CONTROL register (Address 0xF6)

Table 69: VSYNC_CONTROL

Addr: 0xF6		VSYNC_CONTROL		
Bit	**Field**	**Reset**	**Type**	**Bit description**
7:2	*Reserved*	0		
1	*HOLD_VSYNC_PERIOD*	0	R/W	If set to "1" VSYNC_PERIOD[15:8] and VSYNC_PERIOD[7:0] cannot be updated until VSYNC_PERIOD[15:8] has been read. It will avoid that updates during I²C readings.
0	*SW_VSYNC_TRIGGER*	0	R/W	If VSYNC_MODE is set to "1", this bit can be used to trigger a SW sync. In case the exact time is known between two consecutive I²C writes the offset of the oscillator frequency can be calculated from the result in VSYNC_PERIOD registers.

(1)   Return to the Register Map (0xF6).

10.2.61   VSYNC_CFG register (Address 0xF7)

Table 70: VSYNC_CFG

Addr: 0xF7		VSYNC_CFG		
Bit	**Field**	**Reset**	**Type**	**Bit description**
7:6	*OSC_CALIB_MODE*	0	R/W	**Oscillator calibration mode register.** 00: Osc cal disabled 01: Osc cal after PON, if PON goes to "1" or after each VSYNC_LOST goes to "0" an oscillator calibration is performed if no measurement cycle is active 10: Osc cal always on, an oscillator calibration is permanently performed if no measurement cycle is active and no VSYNC_LOST is set. 11: Reserved, do not use
5:3	*Reserved*	0		
2	*VSYNC_MODE*	0	R/W	Determines which VSYNC signal is used as a trigger 0: Use the external pin signal from VSYNC/GPIO/INT as a trigger 1: Use SW_VSYNC_TRIGGER as a trigger
1	*VSYNC_SELECT*	0	R/W	Determines whether the external VSYNC/GPIO pin or the INT pin is used a trigger signal 0: VSYNC/GPIO 1: INT
0	*VSYNC_INVERT*	0	R/W	If set to "1" the vsync input signal is inverted.

(1)   Return to the Register Map (0xF7).

10.2.62   VSYNC_GPIO_INT register (Address 0xF8)

Table 71: VSYNC_GPIO_INT

Addr: 0xF8		VSYNC_GPIO_INT		
Bit	**Field**	**Reset**	**Type**	**Bit description**
7	*Reserved*	0		
6	*INT_INVERT*	0	R/W	If set to "1" the INT pin output is inverted. This applies to all output signals as selected in INT_PINMAP
5	*INT_IN_EN*	0	R/W	If programmed to "1" the INT pin is set as input. Please observe that the connected net must not be floating since INT is an open drain input.
4	*INT_IN*	0	R	External HIGH or LO value applied to INT pin.
3	*VSYNC_GPIO_INVERT*	0	R/W	If set to "1" the VSYNC/GPIO pin output is inverted. This applies to all output signals as selected in VSYNC_GPIO_PINMAP
2	*VSYNC_GPIO_IN_EN*	0	R/W	If programmed to "1" the VSYNC/GPIO pin is set as input. Please observe that the connected net must not be floating since VSYNC/GPIO is an open drain input.
1	*VSYNC_GPIO_OUT*	1	R/W	Programs the VSYNC/GPIO pin HI or LOW. Since the pin is an open drain I/O pin, the default value is HIGH to avoid any unintended power consumption through pull-up resistor. The routed internal signal is selected in VSYNC_GPIO_PINMAP.
0	*VSYNC_GPIO_IN*	0	R	External HIGH or LO value applied to VSYNC/GPIO pin.

(1)   Return to the Register Map (0xF8).

10.2.63   MOD_FIFO_DATA_CFG0 register (Address 0xF9)

Table 72: MOD_FIFO_DATA_CFG0

Addr: 0xF9		MOD_FIFO_DATA_CFG0		
Bit	Field	Reset	Type	Bit description
7	*MOD_ALS_FIFO_DATA0_ WRITE_ENABLE*	1	R/W	Enables to write ALS data of modulator 0 into the FIFO under the following conditions: • Flicker measurement is disabled in the sequencer step or flicker measurement has been finished (ALS_NR_SAMPLES >= FD_NR_SAMPLES) • In case (ALS_NR_SAMPLES < FD_NR_SAMPLES) then DO_ALS_FINAL_PROCESSING_AFTER_FLICKER must be set to "1"
6	*Reserved*	0		
5	*MOD_FD_FIFO_DATA0_ COMPRESSION_ENABLE*	0	R/W	Enables data compression in case of flicker measurements.
4	*MOD_FD_FIFO_DATA0_ DIFFERENCE_ENABLE*	0	R/W	If set, only the delta value between two consecutive samples is written into FIFO. The setting makes only sense in combination with enabled data compression (MOD_FD_FIFO_DATA0_COMPRESSION_ENABLE).
3:0	*MOD_FD_FIFO_ DATA0_WIDTH*	0xF	R/W	Defines absolute number of bits from a sample written to FIFO E.g. if set to 10, 11 bits (0-10) are written into the FIFO.

(1)   Return to the Register Map (0xF9).

10.2.64　MOD_FIFO_DATA_CFG1 register (Address 0xFA)

Table 73: MOD_FIFO_DATA_CFG1

Addr: 0xFA				MOD_FIFO_DATA_CFG1
Bit	**Field**	**Reset**	**Type**	**Bit description**
7	*MOD_ALS_FIFO_DATA1 _WRITE_ENABLE*	1	R/W	Enables to write ALS data of modulator 1 into the FIFO under the following conditions: Flicker measurement is disabled in the sequencer step or flicker measurement has been finished (ALS_NR_SAMPLES >= FD_NR_SAMPLES) In case (ALS_NR_SAMPLES < FD_NR_SAMPLES) then DO_ALS_FINAL_PROCESSING_AFTER_FLICKER must be set to "1".
6	*Reserved*	0		
5	*MOD_FD_FIFO_DATA1_ COMPRESSION_ENABLE*	0	R/W	Enables data compression in case of flicker measure-ments.
4	*MOD_FD_FIFO_DATA1_ DIFFERENCE_ENABLE*	0	R/W	If set, only the delta value between two consecutive samples is written into FIFO. The setting makes only sense in combination with enabled data compression (MOD_FD_FIFO_DATA0_COMPRESSION_ENABLE) .
3:0	*MOD_FD_FIFO_ DATA1_WIDTH*	0xF	R/W	Defines absolute number of bits from a sample written to FIFO E.g. if set to 10, 11 bits (0-10) are written into the FIFO.

(1)　Return to the Register Map (0xFA).

10.2.65　FIFO_THR register (Address 0xFC)

Table 74: FIFO_THR

Addr: 0xFC				FIFO_THR
Bit	**Field**	**Reset**	**Type**	**Bit description**
7:0	*FIFO_THR[8:1]*	0x7F	R/W	If FIFO_LVL > FIFO_THR a FIFO interrupt FINT is invoked.

(1)　Return to the Register Map (0xFC).

10.2.66   FIFO_STATUS0 register (Address 0xFD)

Table 75: FIFO_STATUS0

Addr: 0xFD				FIFO_STATUS0
Bit	Field	Reset	Type	Bit description
7:0	*FIFO_LVL[9:2]*	0	R	**FIFO level.** Indicates the number of bytes in FIFO. The FIFO size is 512byte, thus FIFO_LVL ranges between 0 (empty) and 512 (full). Always read FIFO_STATUS0 first and then FIFO_STATUS1 to get correct FIFO_LVL and the status information.

(1)   Return to the Register Map (0xFD).

10.2.67   FIFO_STATUS1 register (Address 0xFE)

Table 76: FIFO_STATUS1

Addr: 0xFE				FIFO_STATUS1
Bit	Field	Reset	Type	Bit description
7	*FIFO_OVERFLOW*	0	R	If set to "1" a FIFO overflow has occurred and data for the FIFO was lost (e.g. reading from FIFO was too slow). This flag is cleared by PON and FIFO_CLR. Always check this flag before and after reading the FIFO.
6	*FIFO_UNDERFLOW*	0	R	If set to "1" the FIFO was read out too often and has returned 0 at least once. In such case the read-out data may not consistent anymore. This flag is cleared by PON and FIFO_CLR. Always check this flag before and after reading the FIFO.
5:2	*Reserved*	0		
1:0	*FIFO_LVL[1:0]*	0	R	See FIFO_STATUS0 for description.

(1)   Return to the Register Map (0xFE).

## 10.2.68   FIFO_DATA registers (Address 0xFF)

Table 77: FIFO_DATA

Addr: 0xFF				FIFO_DATA
Bit	**Field**	**Reset**	**Type**	**Bit description**
7:0	*FIFO_DATA*	0	R	The register FIFO_DATA can be read-out with single reads or with a block-read. Upon reading out FIFO_DATA, the internal FIFO read pointer is advanced and FIFO_LVL is decreased. A false reading upon the FIFO_LVL will return 0 and set the FIFO_UNDERFLOW flag.

(1)   Return to the Register Map (0xFF).

11   Application information

It is highly recommended to consult the ams OSRAM application team for circuit diagram and layout review at design-in.

Figure 9: TSL2522 typical application circuit
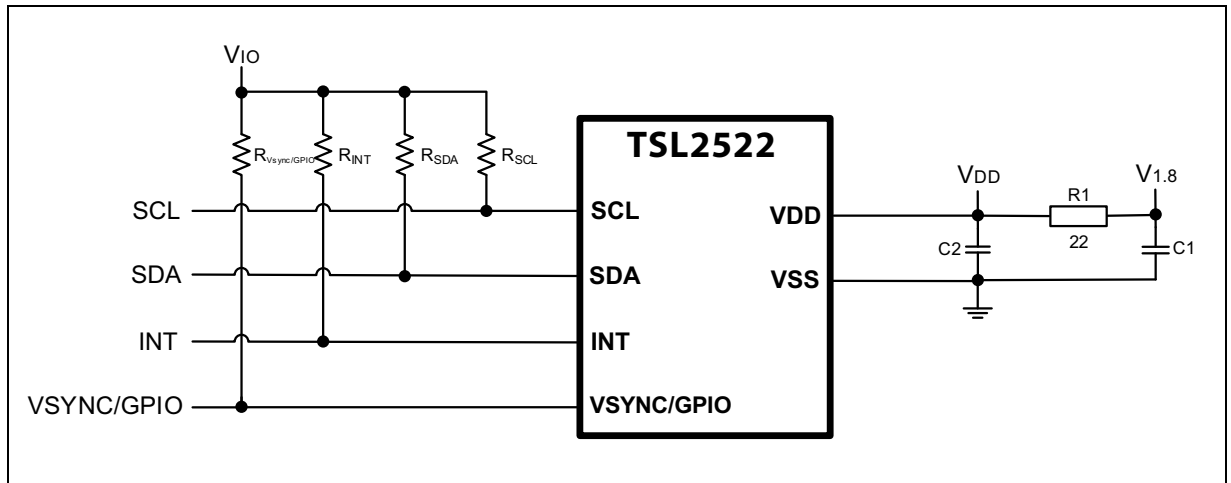

(1)   C1 in the graphic above shall be 4.7µF, 6.3V, 10% and C2 in the graphic above shall be 1µF, 6.3V, 20%. All ground vias shall be connected to a solid ground plane.

(2)   The value of the I²C pull-up resistors (RSDA, RSCL) should be determined according to the bus voltage, bus speed and bus capacitance. Please note that the minimum value of the I²C pull-up resistors must be higher than 500 ohm.

Figure 10: TSL2522 recommended part placement
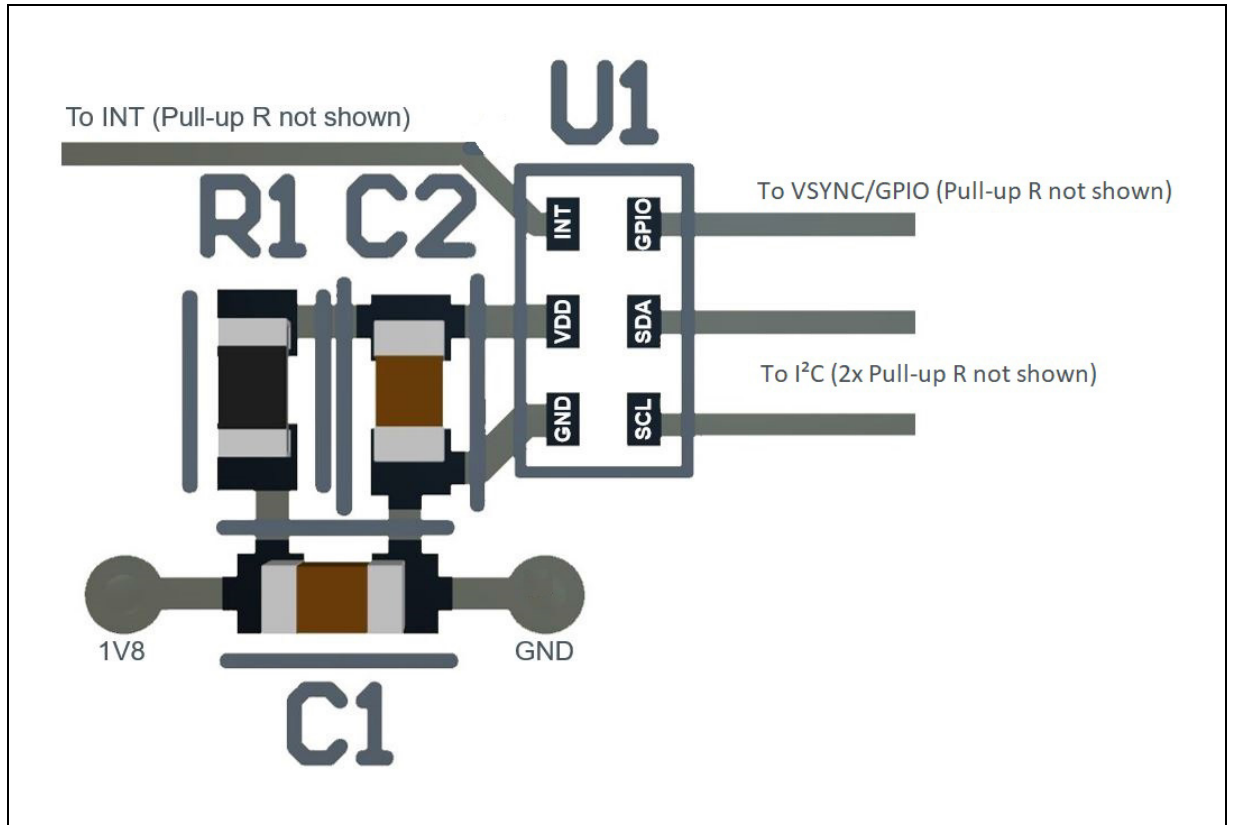

12 Package drawings & markings
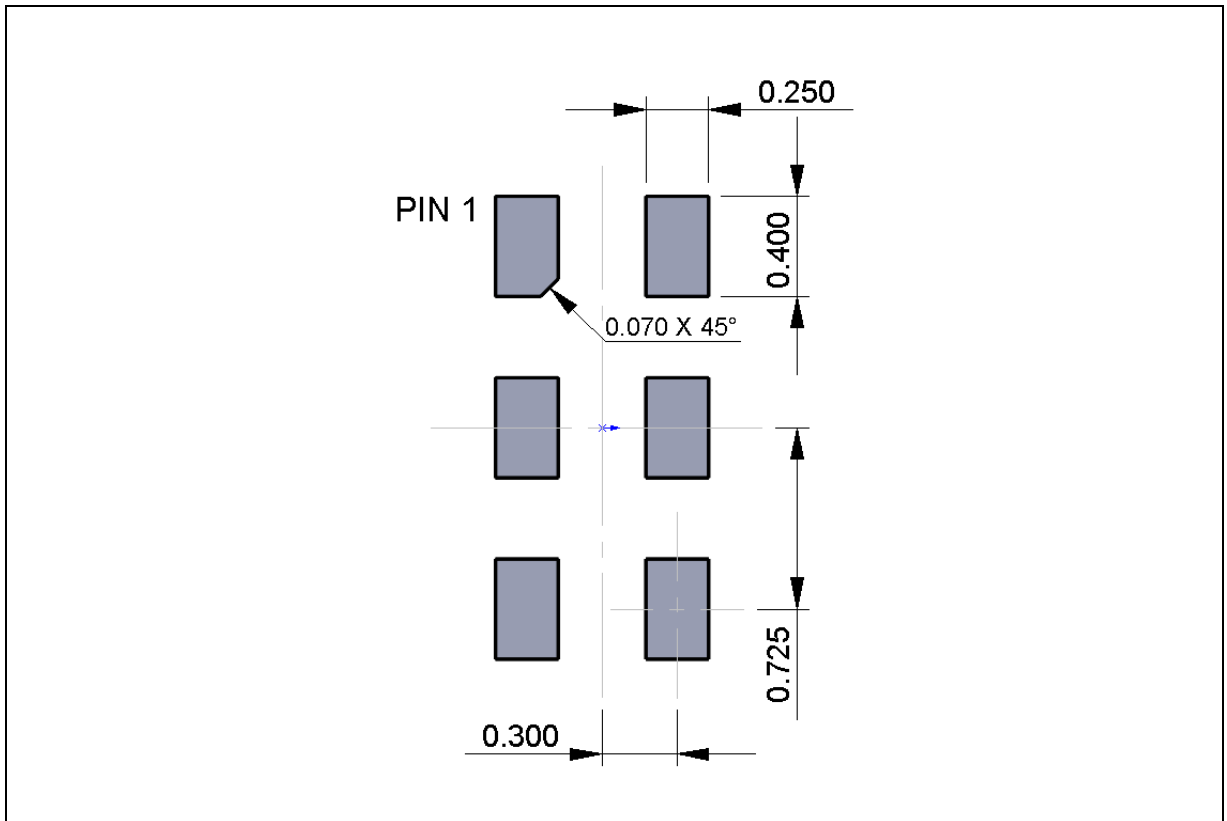

Figure 11: TSL2522 module dimensions
(1) All linear dimensions are in millimeters. Dimension tolerances are ±0.05mm unless otherwise noted.

(2) The die is centered within the package within a tolerance of ±75 micrometers.

(3) Package top surface is molded with an electrically nonconductive clear plastic compound having an index of refraction of 1.55.

(4) Contact finish is copper alloy A194 with pre-plated NiPdAu lead finish (ENEPIG).

(5) This package contains no lead (Pb).

(6) This drawing is subject to change without notice.

13 PCB pad layout

Suggested PCB pad layout guidelines for the surface mount module are shown. Flash Gold is recommended as a surface finish for the landing pads.
Figure 12: Recommended PCB pad layout

(1) All linear dimensions are in millimeters.
(2) Dimension tolerances are ±0.05mm unless otherwise noted.
(3) This drawing is subject to change without notice.

14   Tape & reel information

Figure 13: Tape and reel mechanical drawing

Ao	1.20	+/- 0.05
Bo	2.20	+/- 0.05
Ko	0.66	+/- 0.05
F	3.50	+/- 0.05
P1	4.00	+/- 0.10
W	8.00	+0.3/-0.1

(I)   Measured from centreline of sprocket hole to centreline of pocket.

(II)   Cumulative tolerance of 10 sprocket holes is ± 0.20 .

(III)   Measured from centreline of sprocket hole to centreline of pocket.

(IV)   Other material available.

(V)   Dimension with ( ) is used for design reference purposes, NO measurement required.

(1)   All linear dimensions are in millimeters. Dimension tolerance is ±0.10mm unless otherwise noted.

(2)   The dimensions on this drawing are for illustrative purposes only. Dimensions of an actual carrier may vary slightly.

(3)   Symbols on drawing Ao, Bo, and Ko are defined in ANSI EIA Standard 481-B 2001

(4)   ams OSRAM packaging tape and reel conform to the requirements of EIA Standard 481-B.

(5)   In accordance with EIA standard device pin 1 is located next to the sprocket holes in the tape.

(6)   This drawing is subject to change without notice.

15 Soldering & storage information
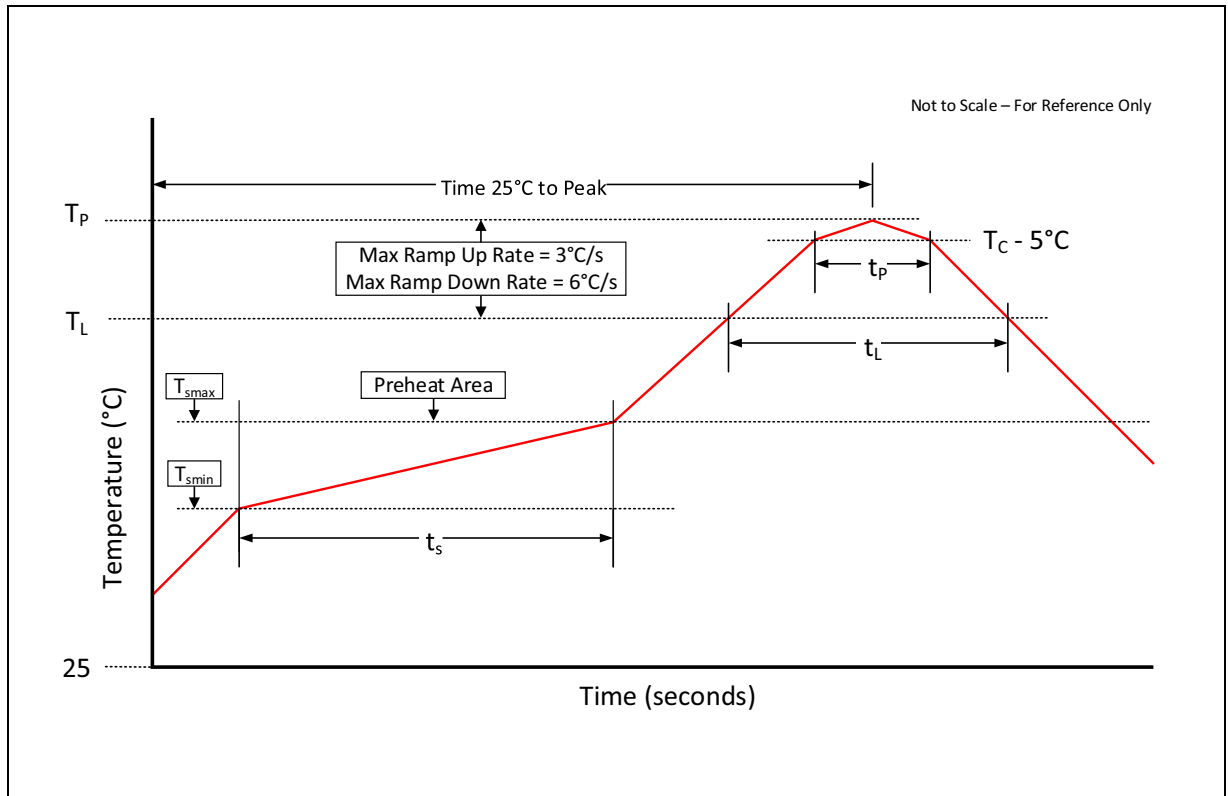

15.1 Soldering information

The module has been tested and has demonstrated an ability to be reflow soldered to a PCB substrate. The solder reflow profile describes the expected maximum heat exposure of components during the solder reflow process of product on a PCB. Temperature is measured on top of component. The components should be limited to a maximum of three passes through this solder reflow profile.

Table 78: Solder reflow profile

Profile feature preheat/soak	Sn-Pb eutectic assembly	Pb-free assembly
Temperature min (T_{smin})	100°C	150°C
Temperature max (T_{smax})	150°C	200°C
Time (t_s) from (T_{smin} to T_{smax})	60-120 s	60-120 s
Ramp-up rate (T_L to T_P)	3°C/s max.	3°C/s max.
Liquidous temperature (T_L) Time (t_L) maintained above T_L	183°C 60-150 s	217°C 60-150 s
Peak package body temperature (T_P)	For users T_P must not exceed the Classification temp of 235°C For suppliers T_P must equal or exceed the classification temp of 235°C	For users T_P must not exceed the Classification temp of 260°C For suppliers T_P must equal or exceed the classification temp of 260°C
Time (t_P)[1] within 5°C of the specified classification temperature (T_c)	20[1] s	30[1] s
Ramp-down rate (T_P to T_L)	6°C/s max.	6°C/s max.
Time 25°C to peak temperature	6 minutes max.	8 minutes max.

(1) Tolerance for peak profile temperature (TP) is defined as a supplier minimum and a user maximum.

Figure 14: Solder reflow profile graph

15.2 Storage information

15.2.1 Moisture sensitivity

Optical characteristics of the device can be adversely affected during the soldering process by the release and vaporization of moisture that has been previously absorbed into the package. To ensure the package contains the smallest amount of absorbed moisture possible, each device is baked prior to being dry packed for shipping. Devices are dry packed in a sealed aluminized envelope called a moisture-barrier bag with silica gel to protect them from ambient moisture during shipping, handling, and storage before use.

15.2.2 Shelf life

The calculated shelf life of the device in an unopened moisture barrier bag is 24 months from the date code on the bag when stored under the following conditions:

- Shelf life: 24 months

- Ambient temperature: <40°C

- Relative humidity: <90%

Rebaking of the devices will be required if the devices exceed the 24 months shelf life or the Humidity Indicator Card shows that the devices were exposed to conditions beyond the allowable moisture region.

15.2.3 Floor life

The module has been assigned a moisture sensitivity level of MSL 3. As a result, the floor life of devices removed from the moisture barrier bag is 168 hours from the time the bag was opened, provided that the devices are stored under the following conditions:

- Floor life: 168 hours

- Ambient temperature: <30°C

- Relative humidity: <60%

If the floor life or the temperature/humidity conditions have been exceeded, the devices must be rebaked prior to solder reflow or dry packing.

15.2.4 Rebaking instructions

When the shelf life or floor life limits have been exceeded, rebake at 50°C for 12 hours.

16 Revision information

Document status	Product status	Definition
Product Preview	Pre-Development	Information in this datasheet is based on product ideas in the planning phase of development. All specifications are design goals without any warranty and are subject to change without notice
Preliminary Datasheet	Pre-Production	Information in this datasheet is based on products in the design, validation or qualification phase of development. The performance and parameters shown in this document are preliminary without any warranty and are subject to change without notice
Datasheet	Production	Information in this datasheet is based on products in ramp-up to full production or full production which conform to specifications in accordance with the terms of ams-OSRAM AG standard warranty as given in the General Terms of Trade

Other definitions

Draft / Preliminary:
The draft / preliminary status of a document indicates that the content is still under internal review and subject to change without notice. ams-OSRAM AG does not give any warranties as to the accuracy or completeness of information included in a draft / preliminary version of a document and shall have no liability for the consequences of use of such information.

Short datasheet:
A short datasheet is intended for quick reference only, it is an extract from a full datasheet with the same product number(s) and title. For detailed and full information always see the relevant full datasheet. In case of any inconsistency or conflict with the short datasheet, the full datasheet shall prevail.

Changes from previous released version to current revision v6-00	Page
Datasheet contents transferred to latest ams OSRAM template	
Updated "Ordering information"	6

- Page and figure numbers for the previous version may differ from page and figure numbers in the current revision.

- Correction of typographical errors is not explicitly mentioned.

17 Legal information

Copyright & disclaimer

Copyright ams-OSRAM AG, Tobelbader Strasse 30, 8141 Premstaetten, Austria-Europe. Trademarks Registered. All rights reserved. The material herein may not be reproduced, adapted, merged, translated, stored, or used without the prior written consent of the copyright owner.

Devices sold by ams-OSRAM AG are covered by the warranty and patent indemnification provisions appearing in its General Terms of Trade. ams-OSRAM AG makes no warranty, express, statutory, implied, or by description regarding the information set forth herein. ams-OSRAM AG reserves the right to change specifications and prices at any time and without notice. Therefore, prior to designing this product into a system, it is necessary to check with ams-OSRAM AG for current information. This product is intended for use in commercial applications. Applications requiring extended temperature range, unusual environmental requirements, or high reliability applications, such as military, medical life-support or life-sustaining equipment are specifically not recommended without additional processing by ams-OSRAM AG for each application. This product is provided by ams-OSRAM AG "AS IS" and any express or implied warranties, including, but not limited to the implied warranties of merchantability and fitness for a particular purpose are disclaimed.

ams-OSRAM AG shall not be liable to recipient or any third party for any damages, including but not limited to personal injury, property damage, loss of profits, loss of use, interruption of business or indirect, special, incidental or consequential damages, of any kind, in connection with or arising out of the furnishing, performance or use of the technical data herein. No obligation or liability to recipient or any third party shall arise or flow out of ams-OSRAM AG rendering of technical or other services.

Product and functional safety devices/applications or medical devices/applications:
ams-OSRAM AG components are not developed, constructed or tested for the application as safety relevant component or for the application in medical devices. ams-OSRAM AG products are not qualified at module and system level for such application.

In case buyer – or customer supplied by buyer – considers using ams-OSRAM AG components in product safety devices/applications or medical devices/applications, buyer and/or customer has to inform the local sales partner of ams-OSRAM AG immediately and ams-OSRAM AG and buyer and /or customer will analyze and coordinate the customer-specific request between ams-OSRAM AG and buyer and/or customer.

ams OSRAM RoHS and REACH compliance statements for semiconductor products

RoHS compliant: The term "RoHS compliant" means that semiconductor products from ams OSRAM fully comply with current RoHS directives, and China RoHS. Our semiconductor products do not contain any chemicals for all 6 substance categories plus additional 4 substance categories (per amendment EU2015/863) above the defined threshold limit in the Annex II.

REACH compliant: Semiconductor products from ams OSRAM are free of Substances of Very High Concern (SVHC) according Article 33 of the REACH Regulation 2006/1907/EC; please refer to the Candidate List of Substances of ECHA here.

Important information: The information provided in this statement represents ams OSRAM knowledge and belief as of the date that it is provided. ams OSRAM bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. We are undertaking efforts to better integrate information from third parties. ams OSRAM has taken and will continue to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. ams OSRAM and its suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.
