NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfm. Electrical parameters are guaranteed only over the declared operating temperature range. Functional operation of the device exceeding these conditions is not implied. Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

- Input and output parameters vary 1:1 with V_{CC} . V_{EE} can vary $\pm 0.3\text{ V}$.
- Outputs are terminated through a $50\ \Omega$ resistor to $V_{CC} - 2.0\text{ V}$.
- V_{IHCMR} min varies 1:1 with V_{EE} , maximum varies 1:1 with V_{CC} . V_{IHCMR} is defined as the range within which the V_{IH} level may vary, with the device still meeting the propagation delay specification. The V_{IL} level must be such that the peak to peak voltage is less than 1.0 V and greater than or equal to $V_{PP}(\text{min})$.

Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

8. V_{EE} can vary $\pm 0.3\text{ V}$.

9. The differential propagation delay is defined as the delay from the crossing points of the differential input signals to the crossing point of the differential output signals.

10. The single-ended propagation delay is defined as the delay from the 50% point of the input signal to the 50% point of the output signal.

11. The within-device skew is defined as the worst case difference between any two similar delay paths within a single device.

12. $V_{PP}(\text{min})$ is defined as the minimum input differential voltage which will cause no increase in the propagation delay. The $V_{PP}(\text{min})$ is AC limited for the E111 as a differential input as low as 50 mV will still produce full ECL levels at the output.
