Note : the arcing time depends on the circuit switched by the poles. For normal three-phase applications, arcing time is normally less than 10 ms. The load is isolated from the supply after a time equal to the sum of the opening time and the arcing time.

(1) The operating times depend on the type of contactor electromagnet and its control mode. The closing time "C" is measured from the moment the coil supply is switched on to initial contact of the main poles. The opening time "O" is measured from the moment the coil supply is switched off to the moment the mains poles separate.
